Am writing you to tell you how much I appreciate the fight you are putting up for the poor people who are compelled to go to the County Hospital for aid, and they go there because they haven't the means to go anywhere else.

My husband had cancer of the larynx. He became so violently ill one night, so I had to call the ambulance and have him taken to the County Hospital. It was around six o'clock. I sat and waited until 9 p. m. until he was assigned to a ward. The next morning I received a telegram from my husband to come and get him, so I immediately went to the hospital. He told me he lay there from 9 until 2 a. m. and he couldn't even get a drink of water or a match to light a cigarette. I begged him to stay. They put him in a ward with six other patients. It was in the month of July, and the odor was so terrible in that ward, I don't know how he ever stood it; and for this service I am charged $4 per day. The first bill I received was for $115. Then when they found out my husband had a little money coming through an estate, they sent another bill in for $150, charging $35 extra for treatments and ambulance, and that claim they put in against the estate. They burned his throat so unmercifully that he was worse off than before he went to the hospital, so I brought him home and cared for him, He was in such terrible pain I kept him under morphine until he passed on September 22, 1937.

I lost my job after ten years of service with the May Company just the time I needed it most, so I had to borrow money from a friend, to see me through, and this debt I still owe. By the time I pay funeral, doctor bill, and my friend, there will be very little left, so I feel it very unfair for the County Hospital to put a bill charging extra for all treatments, besides $4 per day. Do you think it advisable to see the superintendent of the hospital personally and tell him the circumstances, or will I be compelled to pay the bill extended me. I would appreciate hearing from you, and do keep on fighting. I glory in your spunk. Many, many people read your article in the paper and many of my friends called me and they all think you are doing a great work. After all, what is the County Hospital for? The way it's run now is far from being a charitable institution.

There is a lady living at this same address. She went on relief in 1936. They made her sign over everything she owned, which were two lots—one in Compton and one in Harbor City. The valuation on these lots are, at the most, worth about $200 each. She gets old-age pension now (she's 73 years old) and she had to go to the County Hospital for a glaucoma on her eye. They removed her eye, and I am enclosing a letter which she received which means that her hospital bill will be charged against those lots the county now holds. I went to the county tax office and inquired as to what right she would have as to sale of these lots, and I was told that she would have to pay back every cent she received from the county while on relief, plus taxes, and that means they keep the lots, and this hospital bill is added on, so what chance has any poor devil; in fact, she is paying for all services rendered.

I hope, Doctor, I haven't bored you with all this trouble. You are so grand to take up this fight, and I only hope you will carry on, and you will win out for the betterment of the less fortunate.

Very sincerely,

In re: (name and address)

Mr. (name) brought these bills. They have gone back seven years for the bill against Mrs. (name), and two years each for her two children.

She is a widow with six children, and Mr. (name) says she has all she can do to feed and clothe the children.

He also asked if this seven-year bill was not outlawed? A doctor's bill is outlawed in four years; but what about a hospital bill?

[Query.—If the present fee table of the Los Angeles County Hospital became legally operative on July 1, 1937, is there any legal warrant for sending a statement, based on that fee table, to a former patient of several years ago, at a time when present fee table charges were not operative?]

Dear Doctor:

I am deeply puzzled regarding this bill, which has been standing for a couple of years. I cannot see why they keep on hounding me. I have written them at least four or five times referring to the same.

In the first place, Doctor, I did not want to be sent to the hospital, and as soon as my arm was set I begged, daily, to be sent to my home, as I knew that I could not pay the big bill of $103, and my husband who was, and is yet out of employment was quite able to care for me at home. They insisted on keeping me there, at any rate, in the room with eight other patients, who were on the county and being taken care of. I was not, as I had a small house and was renting rooms for a livelihood in order to keep away from the county care.

At first, when I returned to my home and they kept hounding me, I wrote them and said that I would try to make payments as I could, but I have not been able to do so. Each letter that reaches me makes me panicky, and I am truly frightened to death at being sent to prison or having to be punished for not paying.

In the first place, it is a charity hospital, and three or four or more could not pay or even intended to pay, as they, too, knew they could not do so. When I found the bill sent me I was beside myself, and have written them several times regarding same.

May I ask your advice as to what I should do? I simply have not the means, and am trying my best to keep up and not go to anyone for aid.

I shall patiently await your advice or some word from you, as I do not wish to be dragged to court in this mix-up.

Very kindly, I remain

Re: (name)
Col. File (number)

(Name of above patient)
(Address)

Dear Mrs. (name)

Our last letter to you advised that unless your account was given immediate attention, it would be referred for legal action. Evidently you fail to realize its seriousness, as that letter also has been ignored.

We feel that you should understand your legal liability, so that an amicable settlement can be arranged with this office rather than permitting action by the county attorney.

State law and county ordinance demand action against all persons able to pay, or against their relatives of the degree of spouse, parent, and adult child. The county attorney is required to prosecute such cases to the fullest extent of the law, should it become necessary.

Unless you are fully prepared to defend legal action, we must ask that you communicate with us before February (date). It is our desire to be helpful if you show a spirit of coöperation; otherwise we shall be obliged to follow the above procedure.

Yours very truly,
DEPARTMENT OF CHARITIES

February 10, 1937.

Dear Sir:

No doubt your recent article anent our County Hospital will create hostility among the politicians who usurp the right to control those things purchased with public money and finally, through some quirk of mind peculiar to politicians, come to consider themselves the owners thereof, instead of courteous servants the taxpayers guilelessly expected.

What I have to relate may help your effort to correct abuses that confront poor people who, with faith and gratitude, attempt to avail themselves of the services for which the Hospital was dedicated.

Some eighteen months ago, my wife, suffering from a bad case of prolapsus—a sore having developed on one of the organs, was advised by Dr. (name of physician) to seek treatment at the County Hospital, as we were no longer able to pay for treatment. After a lengthy interview in which we laid bare our previous lives and present condition, against which I do not complain, my wife was admitted and I returned home.

That same evening I was called to come and take her home. I did so, learning that her blood pressure was too high to permit an operation and that she should be treated at the Clinic until her condition was more favorable to correct the cause of her illness. That sounded reasonable. Visits to the Clinic continued for some time, until the pain caused by the pressure, exerted by the prolapsed organs in the pelvic area, became acute, and I had no alternative but to take her back to the hospital. That was on May 1, 1937.

The following day I was told by the attending physician that my wife was a gynecological case, that the bladder had a tendency to tip, backing the urine to the kidneys. The cause being known, I thankfully expected a cure.

To my surprise, my wife was discharged May 17, with no explanation other than that she should resume Clinic treatment. Notwithstanding her weakened condition, these visits were continued, she at first paying 50 cents a treatment, later raised to one dollar per. Later, my wife was advised she was no longer entitled to treatments at the General Hospital and was given a transfer to White Memorial.

By this time, while the sore appeared to have been successfully treated, nothing had been done to rectify the basic cause. Besides, the poor woman had been in suspense for months in fear of cancer, was worn out and despondent. In fact she no longer was in condition to stand the strain of hours of waiting at a clinic. Of course, one realizes that one must take their turn where so many are seeking relief.

Subsequently I received the attached bill for $64, and on interviewing Mr. (name) (a most courteous man) I was informed that a social worker had reported I had two single adult sons who each had earned $70 the month investigated, whereas he had been advised that the combined earnings of the two had been that amount.

My wife has suffered grievously through that error. How much more human it would have been to have given us an opportunity for correction of that mistake, instead of arbitrarily discharging a sick and harassed woman!

From then on, my wife lay on a cot, under a tree, at home, with me as attendant.

She being 69 and I, 68, we applied for the old-age pension last August and, while I am told it is still under investigation, we have been granted temporary assistance, the amount for February being $12.18 for me, $12.17 for my wife. After rent and utilities are deducted there is not much left to subsist for a month on, especially where the housewife is sick. However, we were given medical treatment, Doctor (name of physician) attending.

On December 28, Doctor (name) considered it advisable to commit my wife to the General Hospital. Again I was subjected to a long interview, notwithstanding the previous file must have been available. At this interview I was asked how much money I had on my person at present. I had exactly 20 cents. Imagine our surprise when nine days later—January 7—my wife was again discharged. She was asked if she had a home to go to, and on the answer to the question, why? (knowing she was not well) was told, "This is not a free boarding house." There are witnesses to that remark. Remember, a physician, acting for the county, sent her to the hospital. Of course, his authority ceased with that action.

My wife is now lying at home, unable to be on her feet but briefly. Doctor (name) informs me he has reported her condition. Apparently it is being regarded as just another report. . . .

There really seems no way for the aged and poor to get by unsympathetic officialdom without some influence. It is a travesty on that beautifully carved inscription that appears above the portal that it should be so willfully misinterpreted by officials who assume now to rule our destinies.

It would really seem that the object is to shunt out those unable to pay to make room for paying patients. The reason for this I leave to the conscience of those responsible. This is a long recital, Doctor, and I thank you for the patience that has brought you thus far. I am somewhat in despair myself and can but hope that this will help you in your endeavor to correct the injustices and abuses enacted by those in charge, which seem to be contrary to the ideal that inspired the building of our magnificent hospital.

Yours very respectfully,

(Name)
(Address)

P. S.—I am confiding my name and address to you, Doctor, with the request it not be revealed, unless you deem it necessary, to those in whose power it is to exert reprisals, as, whether you believe it or not, I know that punishment will be meted out by those on whose toes you tread—even to the extent of denying us the present abundant living we are enjoying! My wife and I have been married forty-four years, two sons were in France twenty months helping to win the war to end wars, and I worked over for forty-five years for American corporations—and now this! [Three references were also given.]

FOR THE GOOD OF THE CAUSE—IN RE: LOS ANGELES COUNTY HOSPITAL*

At a recent meeting of the general staff of the Los Angeles County Hospital a question was raised which should receive the further and particular attention of this (Surgical) Section.

When the newly appointed statistician concluded his fantastic dissertation on the novel method of accounting about to be instituted in the auditing department, the chairman of the meeting offered certain pungent comments on regimentation of the profession—to the huge delight of most of those present. It is to this question that I would invite your special attention; rather reluctantly, I confess, because some of the observations which I have long felt should be made and discussed openly may not appeal to the powers that be as "for the good of the cause."

A former superintendent of this hospital once said in my hearing, when he was a little peeved by the chance remark of a staff member: "Any attending man who does not approve of the way things are conducted in this hospital, always has the privilege of resigning. There is an average of more than twenty applications for every possible vacancy." Such a statement from such a source makes me fully aware that I may be about to tread on dangerous ground. I insist, however, that my purpose is not to criticize, but merely to point out certain abuses which could be—and should be—corrected.

I yield to no one in admiration for and loyalty to this great institution. I realize the many difficulties attending its administration, and that red-tape tangles and instances of unintentional injustice are perhaps inevitable. But I share the common opinion that the underlying cause of most of the difficulties and injustices lies in the patent fact that the Hospital is, and always has been, the puppet of politics.

A long list of complaints and abuses might be pointed out, but my purpose here is to discuss only one of the most flagrant which especially concerns the surgical staff. That one is best approached by asking a simple question: Why is the Los Angeles County Hospital?

The law declares that its purpose is to provide medical and surgical care for the *indigent sick* of Los Angeles County. By implication, at least, the purport of the law is that no other class than the indigent sick is to be cared for. Everyone recognizes that, in the nature of things, it is not possible for the Hospital to know the exact economic status of all patients at the time of admittance. But a subsequent check-up is always possible, and is regularly made. When it is found that the Hospital costs can be extracted from a patient, the law permits and the authorities demand that this be done. Do the law and the authorities take a similar view of the value of the medical and surgical services rendered when the patient is found able to pay? *They do not.* On the contrary, even though a wealthy patient is

* Condensation of a paper read before the Surgical Section of the Los Angeles General Hospital staff at the October, 1936, meeting by A. B. Cooke, M. D., a senior attending surgeon of more than twenty years' continuous service.

treated, there is no provision for compensating the doctor. Indeed, the distinct understanding is that no bill for professional services may be rendered, even though the services may have been of a life-saving nature, and notwithstanding that the patient has been found abundantly able to pay, so that no remuneration of any kind may be expected, sought, or accepted if offered. In other words, the medical man is entitled to no consideration: let the Hospital be paid—and to hell with the doctor!

It is a self-evident truth that there would be and could be no such thing as a hospital without the medical profession. Of course, an administration department is necessary; of course, a culinary department is necessary; of course, a nursing department is necessary; and equally, of course, a long and varied list of more humble employees are necessary for the efficient maintenance of miles of expensive corridors and acres of imposing space. And each one of these employees, in every department, expects and receives adequate compensation for his or her services—which is as it should be. It may be mentioned, in passing, that the average number of employees, exclusive of the attending staff, exceeds the average number of patients at all times!

But the medical man, the very heart of the institution, the basic factor which renders its existence possible, not only receives no monetary consideration, but is expected to serve skillfully and faithfully, bearing the major burden of safeguarding human lives, without regard to the justice involved.

We all know that the conditions under which the Hospital operates today are vastly different from those of twenty years ago. Complexities resulting from enormous increase in population and tremendous changes in the hazards of modern life, have brought many new problems to be dealt with. Among these may be cited the great increase in the number of motor vehicles and the resultant multiplied traffic casualties.

As an illustration: a messenger from some outlying apartment house rushes into the corner drug store at midnight in quest of relief for Tom, Dick, or Harry, who is suffering with intense abdominal pain or has been seriously injured in an automobile accident. He is advised to send the patient, not to *a* hospital, but to the General Hospital. When the patient arrives, it is soon evident that immediate surgery is imperative. There is no time to discuss matters of finance: a life is in danger. The operation is performed, the life saved. Afterward, it is ascertained that the patient is a visitor in the city and that he has unlimited means. Does the surgeon receive compensation for his life-saving work at midnight? *He does not, but the hospital is always paid!*

Or an automobile accident on a county highway results in abdominal trauma, with a ruptured viscus and concealed hemorrhage. The patient is probably unconscious. Immediate surgery is necessary—no time to investigate the matter of ability to pay. Later it comes to light that the patient is a wealthy man or woman, or collects substantial liability insurance. Who gets paid? The Hospital *always*—the surgeon *never!*

Again: scarcely a week passes in which the newspapers fail to record that some patient of a prominent family, or of known prosperous business connections, is confined in the General Hospital or has died there. In all such instances the medical man, as usual, is left with the bag to hold. It can hardly be expected to promote his happiness and peace of mind to observe that the patient is provided with one or more special nurses, for whom the requisite funds apparently can always be found.

Boiled down to a few words the point of the foregoing is this: As a matter of ordinary right thinking, *the surgeon who does the life-saving work is entitled to, and should receive compensation in every case in which the Hospital collects payment.* This should be the law on the subject, and should represent the attitude of the governing authorities. The profession does not seek or desire remuneration for services rendered to the *truly indigent.*

The layman whose attention is directed to the facts above set forth, without exception finds himself unable to credit them. "True," says he, "physicians have long been looked upon as 'easy marks,' but surely they are not such *chumps* as that!"

Between regimentation on the one hand and open exploitation on the other, the practice of medicine bids fair soon to become the least inviting of all vocations. Will it be forced to abandon its cherished ideals and traditions? Yes, unless, in self-defense, it arouses to oppose abuses wherever and whenever they are encountered.

What is a *charity* hospital?

2007 Wilshire Boulevard.

MALPRACTICE INSURANCE*

To the Board of Directors of the San Francisco County Medical Society:

Your special committee on malpractice insurance submits this its formal report of the extensive investigation it has conducted with respect to the various physicians' defense and indemnity insurance contracts now available to the members of the San Francisco County Medical Society.

Upon undertaking its work, the committee found that the following insurance companies, authorized to transact the business of liability insurance in the State of California, were issuing physicians' defense and indemnity insurance contracts: The Medical Protective Company of Fort Wayne, Indiana; The United States Fidelity and Guaranty Company; and Zurich General Accident and Liability Insurance Company, Ltd.

The committee also found that a number of surplus line brokers were engaged in writing physicians' defense and indemnity insurance contracts on behalf of different groups of underwriters at Lloyd's in London, England. The committee has been informed by the Society's attorney that surplus line brokers are authorized by the California Insurance Code to issue contracts of insurance in any particular field after it has been determined by the Insurance Commissioner that less than 50 per cent of the authorized and admitted insurers doing the particular class of insurance business involved (in this case liability insurance) are refusing to issue insurance contracts of the type sought to be issued by the surplus line brokers.

With respect to those insurance companies authorized to transact a liability insurance business in the State of California, the committee found the following: The Medical Protective Company of Fort Wayne, Indiana, issues physicians' defense and indemnity policies to members of the California Medical Association only, at the rate of $32 per annum and with a coverage of $5,000 to $15,000, but excludes the following: (*a*) most surgery unless done in an emergency; (*b*) any liability growing out of the ownership, operation, and supervision of any x-ray equipment for therapeutic work; or (*c*) any liability arising out of the ownership, operation, and supervision of any hospital, sanitarium, or clinic, or any business enterprise. Upon payment of a premium of $48 per annum the company will remove the surgery restriction. In other words, a surgeon must pay $48 per year for coverage of $5,000 to $15,000. It appears that the Medical Protective Company will insure against liability arising from the use of x-ray equipment for therapeutic work at a premium of not less than $150 for the minimum coverage.

The United States Fidelity and Guaranty Company issues a physicians' defense and indemnity insurance contract to members of the California Medical Association only with a rider which excepts x-ray treatment and hospital ownership or employment, but does not restrict coverage as to surgery. The committee has been informed from time to time by individuals, physicians, and others, that the rates of the United States Fidelity and Guaranty Company have increased considerably in the past year. The committee understands that the present rates vary from a minimum of $40 per year for $5,000 to $15,000 coverage for general practitioners to a maximum of $92 per year for $50,000 to $150,000 for surgeons and $147.20 per year for a like coverage for x-ray specialists.

The Zurich General Accident and Liability Insurance Company, Ltd., according to the committee's information, will issue physicians' indemnity policies in certain instances, but the committee is also informed that the Zurich will not issue a policy to a physician who is not a member of his county society and the state association, and even

* This is a copy of the report submitted to the San Francisco County Medical Society by its Special Committee on Malpractice. See also February issue, on page 148, for report of the Los Angeles County Medical Association Committee.

though a physician is a member of his state and county societies the company exercises a rigid selection; in other words, the committee is informed that the Zurich is not at all anxious to enter the malpractice field on a large scale. The committee has not had an opportunity (through no fault of the Zurich) to examine its policy forms.

There may be other insurance companies authorized to do business in California which will write malpractice policies, but an exhaustive inquiry by your committee has failed to disclose them. However, there are so many insurance companies operating in this State that it was impossible for the committee to address an inquiry to each.

On the whole, the insurance companies which have just been discussed, their policies and their premium rates, are well known to the medical profession and, consequently, need not be further discussed herein. On the other hand, the large number of surplus line brokers representing various groups of underwriters located at Lloyd's in London, England, who are engaging in the malpractice insurance business in this State, are not so well known to the medical profession nor are their policies or, in fact, the very nature of Lloyd's insurance.

Before discussing malpractice policies issued in the name of Lloyd's of London, it may be advisable to relate briefly the nature and functioning of Lloyd's of London. Lloyd's is divided into many groups of underwriters, each operating independently of the other. In California these groups are represented by approximately thirty-seven agencies known as "surplus line brokers." Insurance agents in the various towns and cities of the State place the insurance of their clients (*i. e.*, physicians) with the surplus line broker. In insurance terminology the insurance agent is known as the "producer," and the surplus line broker is often referred to as the "broker," "underwriter," or "agent." (Mr. Peart advises that this language utterly disregards the legal distinction between an "agent" and a "broker.")

The various Lloyd's groups (often referred to as "underwriters"), each acting for itself, prepare so-called underwriting contracts by the terms of which the particular group authorizes specified agents (surplus line brokers) in various parts of the world to issue contracts of insurance to individuals in the name of "Lloyd's of London." Each member of the underwriting group signs his name to this underlying contract and indicates after his name the proportion of the total liability which may be incurred on all of the insurance contracts ultimately issued which he agrees to be personally responsible for. Copies of this underlying contract are then made available to the agents of the particular underwriting group all over the world. Acting pursuant to the authority contained in an underlying contract, surplus line brokers in California issue and sign malpractice insurance contracts bearing the name "Lloyd's of London."

At this point your committee desires to quote from a letter received by the committee from an insurance agent in San Francisco:

"To begin with, Lloyd's have had little experience with malpractice insurance. If the London market should be opened up generally, it will not be done as a gesture to the professional man. From our own experience we can definitely state that it has been and will be used as an accommodation to the insurance agent to further his volume of business with the surplus line broker, who also represents other carriers writing all forms of insurance. Typical of this point is the letter at hand from one of these agencies and with respect to malpractice insurance, which states in part: 'Following the existing custom, we shall require the placing with our office of correlated lines of insurance such as fire, casualty, etc.' Inevitably the insurance producer, valuable in other lines of insurance and using his volume of other business as an inducement, will place malpractice insurance for his doctor client, regardless of affiliation (as in the past, we can conclude that little thought will be given to membership in medical societies or associations), claims frequency or reputation. In this manner many undesirable risks will be obtained, thereby adversely affecting the experience of the business in general. Likewise, rate competition will enter into the picture. At the present time there is one representative of Lloyd's advertising a malpractice policy for $16 for three years, needless to say a totally unsatisfactory contract. Further than this it is obvious that, should a number of groups write this policy, none of them would have a large premium income. With an annual premium of approximately $30 in the average instance and an isolated loss of $10,000, the carrier would suffer an irreparable loss and would immediately refuse to handle further business. The repercussion of this experience would resound throughout the entire group. With a volume of preferred business concentrated in one group, the same loss could be absorbed. Another complication would be the danger of various groups changing their policy from time to time. In our own case neither the policy form nor rates would ever be changed without notification to attorneys and medical societies. This could not be done with all producers and surplus line brokers, and the result would be an impossible situation wherein attorneys would be called upon to review as many as six thousand policies annually."

From the foregoing it is apparent that the question of placing malpractice insurance with surplus line brokers representing underwriting groups at Lloyd's in London, England, is a serious and immensely complicated problem. In addition to the problems created by the very nature of Lloyd's, there are the legal problems which exist as a consequence of Lloyd's being situated several thousand miles away from the State of California. During its investigation your committee sought the opinion of Mr. Hartley F. Peart, the Society's attorney, and a portion of his exhaustive reply is quoted herein for the careful consideration of all members of the Society.

"*Actions to Enforce the Assured's Rights.*—The most important legal problem with respect to Lloyd's of London malpractice policies, arises from the fact that the Lloyd's underwriters are in England, not in California. If for any reason a physician holding a Lloyd's policy found it necessary to take action against the insurer, such physician would be required to bring suit or present his claim in England. This problem is of extreme importance because insurance protection is no protection at all if the various insured persons are unable to hold the insurer to the terms of its contract except by proceeding in a jurisdiction five or six thousand miles away. Of course, we realize that Lloyd's of London has never failed to meet its obligations—but no one can foretell the future—and even though Lloyd's should not actually refuse to pay claims or judgments, there is always the distinct possibility of a difference of opinion in a particular case with respect to whether or not the terms of the policy cover the injury. Disputes relating to coverage often occur and are inherent in the nature of insurance contracts.

"The draftsman of the policy which has been submitted to us has recognized this point and has made a praiseworthy effort to overcome the disadvantage of tremendous distances. Paragraph 10 reads as follows:

" 'It is agreed that in the event of dispute as to the validity of any claim made by the assured under this policy of insurance, underwriters hereon, at the request of the assured, will submit to the jurisdiction of the courts of the state in which the principal office of the assured is located; and will comply with all legal requirements necessary to give such courts jurisdiction; and that in any suit instituted by the assured against any one of them upon this contract, underwriters herein will abide by the final decision of the courts of such state and settle accordingly.'

"The purpose of the above paragraph is to provide specifically that the underwriters of Lloyd's may in all cases be sued in California, thus obviating, to some extent at least, the difficulty. Paragraph 10 will overcome the problem under discussion *if* it is enforceable. In order to determine whether or not it is enforceable, we have devoted considerable time to an examination of the English law. It is necessary to determine the English law upon this point, because in the last analysis, even though the underwriters are sued in California, in order to collect any judgment in England (assuming, of course, that the underwriters have no property upon which execution can be levied in California).

"The English law appears to be fairly well settled to the effect that a party to a contract may consent in advance to the jurisdiction of a particular court, even though that party is not actually within the territorial limits of the court's process. See *Earl of Halsbury, Laws of England*, Vol. VI, pp. 284-286; *Vallee* vs. *Dumergue* (1849) 4 Exch. 290; *Rousillon* vs. *Rousillon*, 14 Ch. Div. 351; *Copin* vs. *Adamson*, L. R. 9 Exch. 345, 31 Law Times 242; and *Gilbert* vs. *Burnstine*, 73 A. L. R. at 1458.

"In the *Copin* case it was held that an English shareholder in a French company was bound by a clause in the articles of association of the Company by which all disputes between English shareholders were required to be submitted to the French courts and by which every shareholder was required to effect a domicile for the purpose of service of process in France and in default of such acquisition of domicile service was authorized to be made at a certain public office in Paris.

"The above cases go to the question of the validity of a contractual provision such as paragraph 10. In addition, there is a second question, viz.: If a judgment is obtained in California, will the English courts enforce it without re-examining the merits of the case? Early English decisions generally held that while a foreign judgment in a personal

suit was sufficient to give a ground of action and amounted to *prima facie* evidence of debt, yet it was not conclusive and the case might be reëxamined on the merits. It is now settled that a foreign judgment, when rendered by a court having jurisdiction and without fraud and while still remaining in force abroad, is binding and conclusive in the English courts in all cases and not open to impeachment or reëxamination on the merits. See 26 *Harvard Law Review* 298-301; *Harvey* vs. *Farnie*, 8 App. Cas. 43, 5 Eng. Rul. Cases 703; *Castrique* vs. *Imrie*, L. R. 4 H. L. 414, 5 Eng. Rul. Cases 899; and 34 *Corpus Juris* 1167.

"From English decisions we may conclude, first, that a party may by contract consent to the jurisdiction of a foreign court; and, second, that a judgment obtained in a foreign country pursuant to such a consent will be enforced in England. However, there is one point with respect to the English law which must be considered. The cases upholding consent by contract are cases in which some means of serving process was specifically provided in the contract. Paragraph 10 in the policy under consideration does not provide any such means; therefore, it is our opinion that it should be revised to include an agent in California for the purpose of accepting process."

In addition to the problems discussed by Mr. Peart, the committee was advised of the fact that there are at least a dozen and probably many more different types of Lloyd's contracts issued in this State by different surplus line brokers, each representing a particular underwriting group in London. Some of the Lloyd's policies brought to the attention of the committee were wholly inadequate, others afforded a fair degree of coverage, and a few compared favorably with policies issued by domestic insurers. But all of these policies presented the problem of enforcement in England and the additional problem of financial reserves in California.

Finally, one broker, the Lloyd M. Kahn Company of San Francisco, submitted a policy form to the committee for its approval or disapproval. This form was submitted to Mr. Peart with the request that he review it and suggest any changes that, in his opinion, would benefit the medical profession. Mr. Peart reviewed the policy and submitted a written opinion in which several changes were strongly recommended, including a paragraph by which the surplus line broker acting for the underwriting group at Lloyd's would consent to the jurisdiction of the California courts and a paragraph by which the underwriters would appoint an agent in San Francisco to act for them in all matters arising under the policy. All of these recommendations were immediately accepted by the Lloyd M. Kahn Company, and your committee was subsequently informed by Mr. Lloyd M. Kahn that the underwriting group at Lloyd's in London, upon whose behalf he was acting through a surplus line broker in San Francisco, had likewise accepted all of the recommendations. Thereupon your committee expressed its approval of this particular policy and caused such approval to be published in the Bulletin of the Society.

Only one other surplus line broker or agent representing underwriters at Lloyd's has submitted to your committee any form for approval or disapproval, and, unfortunately, that policy (submitted by O'Brien and Blackman Company) has not as yet been received from the Society's attorney, to whom it was recently referred by the Board of Directors.

Therefore, and taking into account the admittedly chaotic condition which exists with respect to Lloyd's of London malpractice insurance, your committee expressly recommends that the San Francisco County Medical Society express for the time being its lack of approval of all malpractice insurance policies issued in the name of Lloyd's of London, except the particular policy form issued by the Lloyd M. Kahn Company and previously approved, as stated above.

Before concluding, your committee once again desires to recommend to the members of the San Francisco County Medical Society that each and every member obtain membership in the Medical Society of the State of California. Membership in the Medical Society is obtainable upon application by any physician who is a member of the California Medical Association and who carries at least $5,000 of malpractice insurance. Membership cost is nominal, and it means that competent expert legal assistance can be obtained by the member to guard his personal interests and to aid his insurer's attorney if he is sued or threatened with suit. Your committee specifically recommends that every member of the County Society communicate with Dr. F. C. Warnshuis, Secretary of the Medical Society of the State of California, for further details.

The committee approves the three old line companies—Fort Wayne, United States Fidelity and Guaranty, and the Zurich—and of the Lloyd's policies studied by the committee, the committee believes the policy issued by the Lloyd M. Kahn Company to be the best available at the present time.

Respectfully submitted,

P. K. Gilman, *Chairman.*

January 10, 1938.

THE PHYSICIAN'S INCOME TAX—1938*

This discussion relates only to the requirements of the Federal income tax law. Information with respect to the requirements of state income tax laws should be obtained from responsible state sources.

The Revenue Act of 1936 amended in numerous respects the prior income tax law, but none of the changes made relate to physicians as a class distinct from the main body of federal income taxpayers.

Every one who is required to make a Federal income tax return must do so on or before March 15, unless an extension of time for filing his return has been granted. For cause shown, the collector of internal revenue for the district in which the taxpayer files his return may grant such an extension, on application filed with him by the taxpayer. This application must state fully the causes for the delay. Failure to make a return may subject the taxpayer to a penalty of 25 per cent of the amount of the tax due.

The normal rate of tax on residents of the United States and on all citizens of the United States regardless of their places of residence is 4 per cent on net income in excess of the exemptions and credits.

WHO MUST FILE RETURNS

1. If gross income was less than $5,000 during 1937, a return must be filed (*a*) by every unmarried person, and by every married person not living with her husband or his wife, whose net income was $1,000 or more, and (*b*) by every married person living with her husband or his wife, whose net income was $2,500 or more. If the aggregate net income of husband and wife, living together, was $2,500 or more, each may make a return or the two may unite in a joint return.

2. Returns must be filed by every person whose gross income in 1937 was $5,000 or more, regardless of the amount of his net income and of his marital status. If the aggregate gross income of husband and wife, living together, was $5,000 or more, they must file either a joint return or separate returns, regardless of the amounts of their joint or individual net incomes.

If the status of a taxpayer, so far as it affects the personal exemption or credit for dependents, changed during the year, the personal exemption and credit must be apportioned, under rules and regulations prescribed by the Commissioner of Internal Revenue with the approval of the Secretary of the Treasury, in accordance with the number of months before and after such change. For the purpose of such apportionment a fractional part of a month should be disregarded unless it amounts to more than half a month, in which case it is to be considered as a month.

As a matter of courtesy only, blanks for returns are sent to taxpayers by the collectors of internal revenue, without request. Failure to receive a blank does not excuse any one from making a return; the taxpayer should obtain the necessary blank from the local collector of internal revenue.

The following discussion covers only matters relating specifically to physicians. Full information concerning questions of general interest may be obtained from the official return blank and from the collectors of internal revenue.

GROSS AND NET INCOMES: WHAT THEY ARE

Gross Income.—A physician's gross income is the total amount of money received by him during the year for pro-

* Prepared by the American Medical Association Bureau of Legal Medicine and Legislation. From the *Journal of the American Medical Association*, January 20, 1938.

fessional services, regardless of the time when the services were rendered for which the money was paid, plus such money as he has received as profits from investments and speculation and as compensation and profits from other sources.

Net Income.—Certain professional expenses and the expenses of carrying on any enterprise in which the physician may be engaged for gain may be subtracted as "deductions" from the gross income, to determine the net income on which the tax is to be paid. An "exemption" is allowed, the amount depending on the taxpayer's marital status during the tax year as stated before. These matters are fully covered in the instructions on the tax return blanks.

Earned Income.—In computing the normal tax, but not the surtax, there may be subtracted from net income from all sources an amount equal to 10 per cent of the earned net income, except that the amount so subtracted shall in no case exceed 10 per cent of the net income from all sources. Earned income means professional fees, salaries, and wages received as compensation for personal services, as distinguished from receipts from other sources.

The first $3,000 of a physician's net income from all sources may be regarded under the law as earned net income, whether it was or was not in fact earned within the meaning set forth in the preceding paragraph. Net income in excess of $3,000 may not be claimed as earned unless it in fact comes within that category. No physician may claim as earned net income any income in excess of $14,000.

DEDUCTIONS FOR PROFESSIONAL EXPENSES

A physician is entitled to deduct all current expenses necessary in carrying on his practice. The taxpayer should make no claim for the deduction of expenses unless he is prepared to prove the expenditure by competent evidence. So far as practicable, accurate itemized records should be kept of expenses and substantiating evidence should be carefully preserved. The following statement shows what such deductible expenses are and how they are to be computed:

Office Rent.—Office rent is deductible. If a physician rents an office for professional purposes alone, the entire rent may be deducted. If he rents a building or apartment for use as a residence as well as for office purposes, he may deduct a part of the rental fairly proportionate to the amount of space used for professional purposes. If the physician occasionally sees a patient in his dwelling house or apartment, he may not, however, deduct any part of the rent of such house or apartment as professional expense; to entitle him to such a deduction he must have an office there, with regular office hours. If a physician owns the building in which his office is located, he cannot charge himself with "rent" and deduct the amount so charged.

Office Maintenance.—Expenditures for office maintenance, as for heating, lighting, telephone service and the services of attendants, are deductible.

Supplies.—Payments for supplies for professional use are deductible. Supplies may be fairly described as articles consumed in the using; for instance, dressings, clinical thermometers, drugs and chemicals. Professional journals may be classified as supplies, and the subscription price deducted. Amounts currently expended for books, furniture and professional instruments and equipment, "the useful life of which is short," generally less than one year, may be deducted; but if such articles have a more or less permanent value, their purchase price is a capital expenditure and is not deductible.

Equipment.—Equipment comprises property of a more or less permanent nature. It may ultimately wear out, deteriorate or become obsolete, but it is not in the ordinary sense of the word "consumed in the using."

The cost of equipment, such as is described above, for professional use, cannot be deducted as expense in the year acquired. Examples of this class of property are automobiles, office furniture, medical, surgical, and laboratory equipment of more or less permanent nature, and instruments and appliances constituting a part of the physician's professional outfit, to be used over a considerable period of time, generally over one year. Books of more or less permanent nature are regarded as equipment and the purchase price is, therefore, not deductible.

Although the cost of such equipment is not deductible in the year acquired, nevertheless it may be recovered through depreciation deductions taken year by year over its useful life, as described below.

No hard and fast rule can be laid down as to what part of the cost of equipment is deductible each year as depreciation. The amount depends to some extent on the nature of the property and on the extent and character of its use. The length of its useful life should be the primary consideration. The most that can be done is to suggest certain average or normal rates of depreciation for each of several classes of articles and to leave to the taxpayer the modification of the suggested rates as the circumstances of his particular case may dictate. As fair, normal or average rates of depreciation, the following have been suggested: automobiles, 25 per cent a year; ordinary medical libraries, x-ray equipment, physical therapy equipment, electrical sterilizers, surgical instruments and diagnostic apparatus, 10 per cent a year; office furniture, 5 per cent a year.

The principle governing the determination of all rates of depreciation is that the total amount claimed by the taxpayer as depreciation during the life of the article, plus the salvage value of the article at the end of its useful life, shall not be greater than its purchase price or, if purchased before March, 1913, either its fair market value as of that date or its original cost, whichever may be greater. The physician must in good faith use his best judgment and claim only such allowance for depreciation as the facts justify. The estimate of useful life, on which the rate of depreciation is based, should be carefully considered in his individual case.

In a Treasury Decision, approved February 28, 1934, No. 4422, it is held, among other things, that

1. The cost to be recovered shall be charged off over the useful life of the property.

2. The reasonableness of any claim for depreciation shall be determined on the conditions known to exist at the end of the period for which the return was made.

3. Where the cost or other basis of the property has been recovered through depreciation or other allowances, no further deduction for depreciation shall be allowed.

4. The burden of proof will rest on the taxpayer to sustain the deduction claimed.

5. The deduction for depreciation in respect to any depreciable property for any taxable year shall be limited to such ratable amount as may reasonably be considered necessary to recover during the remaining life of the property the unrecovered cost or other basis.

Particular attention is called to the last of the foregoing provisions. If, in prior years, rates have been claimed which, if continued, will fully depreciate the cost, less salvage, before the end of its useful life, based on conditions now known, a reëstimate of the remaining useful life should now be made and the portion of the cost that had not been depreciated at the beginning of the year 1937 (for a return for the year 1937) should be spread over this reestimated life.

Medical Dues.—Dues paid to societies of a strictly professional character are deductible. Dues paid to social organizations, even though their membership is limited to physicians, are personal expenses and not deductible.

Postgraduate Study. — The Commissioner of Internal Revenue holds that the expense of postgraduate study is not deductible.

Traveling Expenses. — Traveling expenses, including amounts paid for transportation, meals and lodging, necessarily incurred in professional visits to patients and in attending medical meetings for a professional purpose, are deductible.

Automobiles.—Payment for an automobile is a payment for permanent equipment and is not deductible. The cost of operation and repair, and loss through depreciation, are deductible. The cost of operation and repair includes the cost of gasoline, oil, tires, insurance, repairs, garage rental (when the garage is not owned by the physician), chauffeurs' wages, and the like.

Deductible loss through depreciation of an automobile is the actual diminution in value resulting from obsolescence and use and from accidental injury against which the physician is not insured. If depreciation is computed on the basis of the average loss during a series of years, the series must extend over the entire estimated life of the car, not merely over the period in which the car is in the possession of the present taxpayer.

If an automobile is used for professional and also for personal purposes—as when used by the physician partly for recreation, or so used by his family—only so much of the expense as arises out of the use for professional purposes may be deducted. A physician doing an exclusive office practice and using his car merely to go to and from his office cannot deduct depreciation or operating expenses; he is regarded as using his car for his personal convenience and not as a means of gaining a livelihood.

What has been said in respect to automobiles applies with equal force to horses and vehicles and the equipment incident to their use.

MISCELLANEOUS

Contributions to Charitable Organizations. — For detailed information with respect to the deductibility of charitable contributions generally, physicians should consult the official return blank or obtain information from the collectors of internal revenue or from other reliable sources. A physician may not, however, deduct as a charitable contribution the value of services rendered an organization operated for charitable purposes.

Laboratory Expenses. — The deductibility of the expenses of establishing and maintaining laboratories is determined by the same principles that determine the deductibility of corresponding professional expenses. Laboratory rental and the expenses of laboratory equipment and supplies and of laboratory assistants are deductible when under corresponding circumstances they would be deductible if they related to a physician's office.

Losses by Fire or Other Causes.—Loss of and damage to a physician's equipment by fire, theft or other cause, not compensated by insurance or otherwise recoverable, may be computed as a business expense and is deductible, provided evidence of such loss or damage can be produced. Such loss or damage is deductible, however, only to the extent to which it has not been made good by repair and the cost of repair claimed as a deduction.

Insurance Premiums. — Premiums paid for insurance against professional losses are deductible. This includes insurance against damages for alleged malpractice, against liability for injuries by a physician's automobile while in use for professional purposes, and against loss from theft of professional equipment and damage to or loss of professional equipment by fire or otherwise. Under professional equipment is to be included any automobile belonging to the physician and used for strictly professional purposes.

Expense in Defending Malpractice Suits.—Expense incurred in the defense of a suit for malpractice is deductible as a business expense.

Sale of Spectacles.—Oculists who furnish spectacles, etc., may charge as income money received from such sales and deduct as an expense the cost of the article sold. Entries on the physician's account books should in such cases show charges for services separate and apart from charges for spectacles, etc.

CALIFORNIA CLINICAL LABORATORY LAW AND CHIROPRACTORS*

San Francisco, January 13, 1938.

C. C. Hunt, D.C.,
Secretary, Board of Chiropractic Examiners,
404 Forum Building,
Sacramento, California.

Dear Sir:

In your communication of December 23, 1937, you refer to Chapter 804, Statutes 1937, being "an Act relating to the conduct of clinical laboratories and the licensing of clinical laboratory technologists and clinical laboratory technicians for the purpose of protecting public health," etc. You refer to the printed copy of a communication entitled, "Information Concerning the New Laboratory Law," and recite certain statements which you state to be contained therein.

The first statement is as follows:

> A clinical laboratory is defined to be a place or establishment where any tests, no matter how limited, are made.

This statement is in conflict with Section 2 of Chapter 804, which reads as follows:

> For the purpose of this Act a clinical laboratory is defined as follows: Any place, establishment or institution organized and operated for the practical application of one or more of the fundamental sciences by the use of specialized apparatus, equipment, and methods for the purpose of obtaining scientific data which may be used as an aid to ascertain the presence, progress, and source of disease.

Consequently, the information or statements in the work referred to by you are erroneous.

Section 3 of the Act referred to defines technologist as being "any person who engages in the work and direction of a clinical laboratory as herein defined." Therefore, resort must be taken to Section 2 of the Act defining a clinical laboratory, and the second statement which you state is contained in the document referred to by you is, likewise, erroneous for the reason that it is too broad. There may be many kinds of laboratories which are not covered by the definition of clinical laboratory set forth in the Act.

The expression "technician" is defined in Section 4 of the chapter under discussion, and the information contained in the document referred to by you is incorrect in so far as it conflicts with the definition of technician contained in the Act.

The fourth statement contained in the work referred to by you is correct, provided the technologist is licensed.

You state the applicant for a license under this act, either with or without examination, must have experience and educational qualifications far in excess of those required for license under the Chiropractic Act, and refer to paragraph 12 of the information concerning the new laboratory law, and quote as follows:

> The law does not require technicians working in a doctor's office to be licensed, unless work is done for other doctors, or for the patients of other doctors.

The statement immediately above quoted is correct under the law in so far as it relates to technicians employed in a physician's and surgeon's office who do work for other physicians or the patients of other physicians, said work not being under the immediate control and supervision of his employer. The test is, does the technician do work for his immediate physician and surgeon employer, or does he do work indiscriminately for other physicians and surgeons or for patients of other physicians and surgeons.

The quoted statement is erroneous in so far as it purports to require technicians working in a licensed physician's and surgeon's office to be licensed, if it be construed to require a technician to be licensed if his physician and surgeon employer does work for other doctors or for the patients of other doctors.

The test under the law itself is whether a physician's and surgeon's office is organized and operated as a place for the practical application of one or more of the fundamental sciences by the use of specialized apparatus, equipment, and methods for the purpose of obtaining scientific data which may be used as an aid to ascertain the presence, progress or source of disease. The offices of many physicians and surgeons are not in the nature of things necessarily organized and operated for the purposes hereinabove specifically enumerated. Furthermore, the fact that such physicians and surgeons might "do work" for other doctors or for patients of other doctors does not necessarily make the office of such physician and surgeon a clinical laboratory within the definition thereof contained in the Act.

You quote Section 5 of the Chiropractic Act, which requires one hundred hours of study in chemistry and toxicology and four hundred hours in diagnosis or analysis. You then refer to Section 7 of the Chiropractic Act, and quote that portion thereof relating to the issuance of a chiropractic license, particularly that said "license shall authorize the holder thereof to practice chiropractic in the State of California as taught in chiropractic schools or colleges." The above-quoted provision has been interpreted in the case of *In re Hartman*, 10 Cal. App. (2d) 213, as authorizing the holder of a chiropractic license to practice chiropractic—whatever chiropractic may be—regardless of what the individual was taught in a chiropractic school or college. To the same effect is the opinion rendered by Honorable John J. Van Nostrand, in the Superior Court of the State of California, in that case numbered 257362,

* See letter in this issue from Dr. C. B. Pinkham, on page 214.

and entitled "In re the matter of the application of H. James McGranaghan for Declaratory Relief."

Your primary question is whether a licensed chiropractor must hold an additional license as a technologist and a technician pursuant to the provision of Chapter 804, Statutes of 1937, in order that he may make chemical tests from specimens of his own private patients in his own private office for his exclusive use in arriving at a proper diagnosis of the physical condition of his patient.

In reply, permit me to state that neither a technologist nor a technician, nor a chiropractor, is permitted under the law to make chemical tests from specimens of anyone in order to make diagnoses of the physical condition of a patient for the purpose of preventing the development of progressive malphysical conditions or alleviating or treating diseases or injuries. In our opinion dated January 26, 1926, addressed to your predecessor, Dr. James Compton, this office indicated that measures used by chiropractic licensees had to be founded upon the theory of chiropractic. According to the controlling cases decided since the rendition of such opinion, the making of a chemical test upon humans is within the purview of the practice of medicine, which is specifically prohibited to chiropractors under the provisions of Section 7 of the Chiropractic Act not quoted by you. Those provisions are to the effect that a license to practice chiropractic "shall not authorize the practice of medicine, surgery, osteopathy, dentistry, or optometry, nor the use of any drug or medicine now or hereafter included in materia medica."

In conclusion, may I point out that while persons who can qualify as technologists or technicians may examine specimens to ascertain the existence or nonexistence of certain germs, virus, bacteria or the like, they may not, as above indicated, go so far as to make a diagnosis of the physical condition of the patient without violating the provisions of the Medical Practice Act. This was particularly held in the case of *People* vs. *Jordan*, 172 Cal. 391, where the Supreme Court stated:

> Diagnosis is as much a part of the practice of medicine as is the administration of remedies, and it is a vastly more important branch thereof because, generally speaking, the treatment of disease is governed by the practitioner's theory regarding its cause. . . . To diagnose a case is as much a part of the practice of medicine as the drawing of pleadings and the giving of advice are parts of the practice of law. . . . It is impossible to disassociate diagnosis from the practice of the art of healing by any physical, medical, mechanical, hygienic or surgical means. It is, therefore, competent for the legislature to permit only those persons who are proficient who have been found to be educated up to certain standards to diagnose "ailments."

Very truly yours,
U. S. Webb, *Attorney-General.*
By Lionel Browne, *Deputy.*

GENERAL MEETING PROGRAMS: A PLAN FOR LARGER COUNTY MEDICAL SOCIETIES

"The Bulletin" of the Los Angeles County Medical Association, in the issue of February 17, 1938, printed the following, on the subject of General Meeting Programs. The plan outlined may have suggestive value to county societies having headquarters in the larger cities:

"Members of the Los Angeles County Medical Association are aware that, in recent years, the fifteen scientific sections and the twelve geographical branches of the Society have taken on increased growth and activity; so much so, that the general meetings of the Association not infrequently have had fewer members in attendance than could be counted at section or branch gatherings.

"This splendid development of the sections and branches should go forward, but on the other hand, the good of the whole should not be lost sight of, in the growth of the parts.

"To promote more interest in the general meetings, the Committee on Scientific Work and Programs, with the approval of the Board of Trustees and Council, proposes during the present year to change the character of the general meeting programs, in the hope of securing a larger attendance and interest. It is concerning these innovations that this letter is written.

"The plan, in short, comprehends brief but to-the-point papers on topics of interest to physicians in general practice, dealing with phases of scientific and organized medicine. In addition, it is planned to have a buffet supper (no charge) at the end of each meeting.

"Here are more of the details:

"Each regular, general meeting, to be held on the first Thursday of each month, will have a program presented by three speakers from one of the scientific sections, each essayist presenting a paper or talk that will not take longer than fifteen minutes to deliver (essayists' papers may be of any length, but in his presentation, each speaker will take only fifteen minutes for presentation of its 'high-points.')

"Each of the three topics will be on specialty problems in which men in general practice have an interest. This plan will permit a diversified presentation of three papers in forty-five minutes, with opportunity for discussion in another forty-five minutes (each essayist being requested to send, in advance, carbons of his paper to two friends, who will lead in the discussion).

"In addition, a fifteen minute discussion of some pertinent topic on organized medicine will be given, on subjects such as: County Hospital Problems, Basic Science Act; Anti-Vivisection Initiative; Malpractice Defense.

"Following the completion of the above program, an informal buffet supper will be served at the expense of the Association. Members can go to the table, help themselves to sandwiches and coffee and then move from one group of friends to the other for a half hour or so, and thus promote the friendly and fraternal relationships so necessary in modern day medical societies. Years ago, such buffet suppers were a regular feature of the Association's gatherings and added much to their value.

"Meetings will start promptly at eight o'clock, and the programs be concluded by ten o'clock or before, depending upon the amount of discussion. As to the good fellowship, it to continue as long as the spirit and sandwiches and coffee hold out.

"Also, and by no means the least important, in the months of March, April, and May, special general meetings will be called for the third Thursday evenings, at which the Los Angeles County Medical Association will be host, in turn, to the County Bar, the County Dental and the County Pharmaceutical associations. At these sessions, programs of mutual interest will be given, with talks by members of the professions represented. Of all this however, more later.

"Mention may also be made of a plan that the Committee on Scientific Work and Programs has in mind, to have some well known eastern colleagues, who will have been in attendance at the American Medical Association meeting in San Francisco (June 13-17), to join in presenting a seminar on Saturday morning and afternoon (June 18). If that plan materializes, in due time, special announcement will be made.

"In the meantime, the Association officers ask members to keep in mind the proposed programs, and to give generous aid, through coöperation in attendance and taking part in the meetings."

Before the full force of public health can be realized, we must face the obstacles squarely and resolve to deal with them intelligently. Some of the major obstacles are:

(*a*) Public ignorance and indifference.
(*b*) Lack of sufficient financial support.
(*c*) Political interference.
(*d*) Lack of technically trained and experienced personnel.
(*e*) The stigma associated with certain diseases.
(*f*) Lack of basic public health knowledge on which to build administrative control measures.

It is not necessarily intended that all the items in the foregoing list of obstacles are arranged in the order of their importance, but certainly the last mentioned is the least important, and the first on the list is the most important. When this one is adequately disposed of, (*b*), (*c*), (*d*), and (*e*) will readily cease to be serious problems. Volumes could be written about each one of these obstacles, but in general their handicapping influences are readily understood and self-explanatory.—The Health Officer.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 3, March, 1913

From some Editorial Notes:

Important Suit Won.—On January 28 a most important suit against a member of the Society, Dr. C. A. Shepard, was begun in Los Angeles and lasted over a period of seven days' trial, resulting in a verdict for Doctor Shepard. The suit was for $50,000, and it was alleged that he had fraudulently or untruthfully diagnosed a case of tuberculosis when in truth the patient did not have tuberculosis. . . . Doctor Shepard writes: "I am proud to belong to a State Society that takes such good care of its members in such blackmail cases. The able defense put up by Mr. H. T. Morrow, the attorney for the Society, and the indefatigable efforts of the Secretary of the Los Angeles County Association, Dr. George H. Kress, with the willing assistance of the members of the Society who left their offices and patients to testify on my behalf, is certainly very gratifying." Is it better to keep your dues paid up and get this sort of defense, or to let them lapse and depend on the chances of an "insurance" company's defense?

* * *

Chinese Medicine.—The Pacific Coast members of the medical profession have had very definite notions concerning the absurdities of so-called Chinese medicine. Elsewhere in this issue is printed an article on the subject by a medical missionary, Dr. C. R. Roys of Wei-hsien, China, who discusses the subject from a wide and first-hand knowledge. His paper on the subject is, therefore, of real value. Not the least of what Doctor Roys states is the point which he makes, judging from the newspaper advertisements and sign-board publicity of American patent medicines akin to those of the Chinese, that we of our own land are, after all, not so greatly superior to the heathen (?), upon whom we would look down with such scorn and pity.

* * *

Medical Bills in the Legislature.—In discussing the various bills which have been introduced in the present legislature, and they are more numerous and more dangerous than at any previous session of the legislature in the history of the State, a few fundamental facts must be remembered.

A license to practice medicine or any mode of treating the sick or afflicted is not a piece of property given to an individual; it is a police license intended for the protection of the people and not for the benefit of the person to whom it is issued.

All such licenses, wherever issued, had their origin in the fact that uneducated and unqualified persons were desirous of making money out of sick people.

As it became harder for uneducated persons to obtain license to practice medicine, other systems or modes of treating the sick or afflicted were "discovered," and the followers of these systems asked for special licensing boards in their special systems, claiming that, as they did not wish to practice "medicine," but merely their special "mode," they should not be required to take the regular examination. But it was quite evident that, as a matter of fact, no matter what they said they *wanted* to practice, they all *actually practiced medicine;* or at least they all treated sick or afflicted persons in whatsoever way they saw fit.

The fundamental point of all laws regulating the requirements for a license for anyone to treat the sick or afflicted, is this:

Before being allowed by the State to treat a sick or afflicted person, the individual should be required to prove that he knows how the body is made (anatomy), how it is supposed to perform its functions (physiology), and what accidents or material afflictions are liable to occur to it.

Senate Bill 510, Gates (same as A. B. 425, Ambrose), is a type of bills lowering standards. It provides for three boards of examiners: "a board of medical examiners, a

(Continued in Front Advertising Section, Page 13)

† This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

Board Proceedings

Governor Merriam has announced the reappointment of Doctors Clark L. Abbott of Oakland, Percival Dolman of San Francisco, and George Thomason of Los Angeles, as members of the Board of Medical Examiners for terms ending January 15, 1942. Dr. John MacLean of Los Angeles was appointed to fill the unexpired term of Dr. Harry V. Brown, deceased, ending January 15, 1939.

News

"Governor Frank F. Merriam last night reappointed Doctors Howard Morrow and William P. Clark, both of San Francisco, as members of the State Department of Public Health." (Sacramento *Bee,* January 28, 1938.)

"Attorney-General U. S. Webb today told C. O. Hunt, Secretary of the Board of Chiropractic Examiners, that a chiropractor may not make chemical tests on a human being. Hunt asked the Attorney-General whether the law requiring licensing of laboratory technicians also required a chiropractor to have a laboratory technician's license if he wished to make chemical tests for his own patients. Webb replied by calling attention to the California law forbidding chiropractors to diagnose. He said chemical tests for patients for the purpose of making a diagnosis would constitute medical practice, and that also is forbidden by law in California." (Associated Press dispatch, dated San Francisco, January 14, and printed in the San Jose *Mercury-Herald,* January 15, 1938.)

"Charges against three Los Angeles doctors whose conviction of participating in a state-wide illegal operations ring was reversed, were dismissed yesterday by Superior Judge Arthur Crum on motion of Deputy District Attorney Vernon Ferguson. The three doctors—Valentine St. John, James Beggs, and Jesse C. Ross—were convicted with eight other persons on charges of conspiracy to perform illegal operations. The State Supreme Court held, however, that corroborative evidence against the doctors was insufficient. Among the others convicted are R. L. Rankin, President of the Medical Acceptance Corporation, now in San Quentin Penitentiary; William Byrne, former State Medical Board investigator, who has applied for probation; and Dr. George E. Watts, who died in San Quentin last year." (Los Angeles *Daily News,* January 29, 1938.)

"A new trial was today denied Dr. G. O. McKeehan, Huntington Park physician, who was recently convicted on one count of conspiracy to defraud an insurance company and one count of grand theft in connection with an asserted 'fake accident' ring. In denying the new trial, Superior Judge Frank M. Smith set February 10 as the date for hearing a probation plea and pronouncing sentence. In his trial the prosecution accused him of treating Thomas G. Nelson, assertedly a member of the ring, for injuries inflicted on Nelson by other members of the 'fake accident' group in a plot to collect insurance benefits." (Los Angeles *Herald and Express,* January 28, 1938.)

"With the case attracting the attention of more than 3,500 associates in the chiropractic business in California, the trial of Dr. L. E. Dollarhide, Long Beach chiropractor, in the Riverside justice court here on March 2, is expected to apply an important test to the California laws governing chiropractors. The Long Beach man, who has patients in Riverside and several other towns of the county, recently was arrested on a warrant charging that he illegally

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

B A X T E R ' S

INTRAVENOUS SOLUTIONS IN VACOLITERS

You never have to wait *for Baxter's Solutions*

Baxter's Dextrose, Saline and Acacia Solutions are packed ready for use in Vacoliters. In *Vacoliters* they will be *ready* when *you* are ready to use them.

We package these solutions in a container, the Vacoliter, which makes it possible to stock Baxter's Dextrose, Saline and Acacia Solutions in any quantity for long periods, on your storage shelves. The solutions resist deterioration because they are packed in a high vacuum. They cannot become contaminated because they are tightly sealed with a metal closure.

In the hospitals where Baxter's Solutions are used, the routine of intravenous therapy is smooth . . . convenient . . . free from unnecessary complication.

Perhaps that is why so many of *America's hospitals* use Baxter's Solutions in Vacoliters regularly.

and manner of recording essential tests. For example, the Snellen test card for determining visual acuity, Ishihara book or colored disks for detecting color blindness, simple methods for detecting gross defects in field, and cover tests to determine binocular single vision or the more conspicuous muscle abnormalities.

(*b*) When applicants are discovered with defects of vision which fall below the standards set for an unlimited license, such applicants shall be referred to an eye physician for correction of any possible defects. (The major portion of such defects are correctable.)

(*c*) The eye physician shall furnish the applicant or bureau with a written statement of best results obtained by correction of any defects uncorrectable and a recommendation of the fitness or unfitness of the applicant.

6. *Minimum Visual Standards for Licensure: For an unlimited license, provided that physical, mental and aptitude tests are satisfactory, an applicant shall meet the following minimum visual standards:*

(*a*) Visual acuity with or without glasses of 20/40 Sn. in one eye and 20/100 Sn. in the other.

(*b*) A form field of not less than 45 degrees to both sides laterally from point of fixation.

(*c*) Binocular single vision.

(*d*) Ability to distinguish red, green, and yellow.

Glasses, when required, must be worn while driving, and those employed in public transportation shall carry an extra pair.

7. *Visual Standards for Limited License: A limited or restricted license may be issued to applicants who are unable to meet the visual standards set for unlimited license.* The minimum requirements for this shall be:

(*a*) Visual acuity shall be not less than 20/65 Sn. in the better eye. (The one eyed, the aphakic and the color blind are not disqualified.)

(*b*) Field of vision shall be not less than 125 degrees horizontally in one eye.

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

I. CLEANSING OPERATIONS

● As reference to a recent text on canning will disclose (1) the details of commercial canning procedures will vary from product to product. There are, however, certain basic operations which are included in practically all canning procedures. In the belief that they may prove of interest, it is our intention to describe in broad detail the nature and purposes of these essential operations.

One of the first and most important steps in commercial canning is the thorough cleansing of the raw food material received at the cannery. The purpose of such an operation is, of course, immediately evident, namely, to remove soil, dirt or other inedible substances which may be present. However, cleaning also serves to reduce substantially the load of spoilage bacteria with which Nature usually endows raw foods.

Commercially, cleansing is effected in a variety of ways. In general, however, water washers specifically designed for the various types of products are used. In these machines, the raw food material is subjected to high-pressure sprays or strong flowing streams of potable water while passing along a moving belt or while being tumbled by agitating or revolving screens. Sometimes a "flotation" type of washer is also used to remove chaff or similar material. With certain products, water washing is preceded by a "dry" cleaning treatment in which adhering soil and dirt is mechanically removed from the food by revolving or agitating screens, or by strong air-blasts.

Also, in certain canning procedures, operations whose basic functions are not primarily to clean the raw material may also exert a cleansing effect. Thus, the "blanch" or scalding treatment accorded many products serves to clean the food, as does the water spray sometimes applied to foods after the blanch.

Modern canners know the necessity of thorough cleansing of the raw materials they use. They appreciate that thorough cleaning and removal of extraneous material decreases the load of spoilage organisms which must be destroyed by the heat processes to which all canned foods are subjected. They also appreciate the necessity of maintaining strict plant and equipment sanitation to destroy spoilage bacteria which may be carried in by raw foods.

Because of the efficient cleansing of raw materials and close attention to the other important operations in the commercial canning procedures, modern canned foods must be ranked among the most wholesome foods coming to the American table. (2)

mental or visual defect which has developed during the past year.

(*b*) If any such defects have developed, an examination by a physician and the report thereof shall be required before the license is reissued.

(*c*) When the applicant for renewal of license has a record of repeated accidents, such applicant shall be required to obtain a report from experts duly qualified to determine the probable cause for such accidents before the renewal is issued. Physical fitness (including ocular), psychologic status and general aptitude shall be reconsidered and license granted only on convincing evidence of ability to operate a motor vehicle efficiently.

The Prevalence of Smallpox in the United States and Canada During 1936.—Following a serious setback in 1935, the year 1936 saw practically no improvement in the smallpox situation in the United States. The cases reported by forty-seven states and the District of Columbia totaled 7,813, or close to the 7,904 in these states in 1935. In spite of our vaunted leadership in the control of preventable diseases, there are still large sections of the country where the presence of this loathsome disease is taken as a matter of course. As a result, the United States continues to bear the disgrace of tolerating one of the highest smallpox rates in the civilized world. During seventeen years, 1920 to 1936, more than 650,000 cases of smallpox were reported—a number almost as large as the population of Pittsburgh or of San Francisco.

During 1936, as in previous years, smallpox was most prevalent in the North Central States, the Mountain States, and on the Pacific Coast. There were comparatively few cases in the states bordering the Atlantic Ocean and in the southeastern section of the country. In proportion to its population, the highest incidence of smallpox occurred, last year, in Montana. Here the cases numbered 762 in a population of only 531,000. Close in line was South Dakota with 705 cases in a population of 692,000, while Wyoming, with a population of less than 235,000, registered 202 cases. Other states with outstandingly bad smallpox records in 1936 were Iowa, Kansas, and Nebraska, each of which reported more than seven hundred cases during that year. In other words, six states which contained less than 6 per cent of our entire population registered nearly 51 per cent of the total number of smallpox cases reported last year.

In contrast with the above, it is reassuring to compare the records of the following states: Rhode Island, where there has not been a case of smallpox since 1927; Delaware and Maryland, each of which has reported only one case since 1929; New Jersey, which has been entirely free from the disease since 1931; and Maine and New Hampshire with only two cases each since 1929 and 1931, respectively. Neither Massachusetts nor Pennsylvania has reported a case of smallpox in four years. The District of Columbia has reported only one case in the past eight years.

Fortunately, the disease continues to be of a mild character. Among the 7,813 cases reported in 1936, there were only thirty-three deaths, corresponding to a case-fatality rate of 0.42 per cent. That is to say, there was only one death in every 237 cases. In Canada, on the other hand, the disease seems to have been more fatal, since there were four deaths among only sixty-two cases. Assuming that there was no deficiency in reporting, this is equal to a case-fatality rate of 6.45 per cent, or one death in every sixteen cases. Had this ratio prevailed in the United States last year, the number of smallpox fatalities would have exceeded five hundred, instead of the thirty-three deaths that were actually reported.

In the cities, the figures for 1936 exceeded those for 1935. In 743 cities of the United States there were 1,710 cases as compared with 1,459 during 1935.

In this day of wide public interest in community health, such rates are inexcusable. Smallpox is a preventable disease. By the simple measure of general vaccination and revaccination, it can be entirely eradicated from any community. This has been proved time and again.

CORAMINE "Ciba," the powerful circulatory and respiratory stimulant, is termed "an emergency drug of the highest possible value." *

Physicians everywhere are making a practice of carrying CORAMINE in their emergency kits.

Several recent papers have warmly praised Coramine for its effective, prolonged stimulating action in cardiac involvement (coronary thrombosis, hypertensive and arteriosclerotic heart disease, angina pectoris, etc.). Dramatic, often life-saving, is the speedy resuscitation brought about by Coramine in accident cases, pneumonia, asphyxiation, poisoning, surgical shock and other collapse states. It has a wide margin of safety.

A supply of Coramine can, and should be, in your bag, ready for instant use . . . Literature and reprints upon request.

EXERCISE

FOR BOWEL REGULATION

The patient who is unable to exercise or adhere to a suitable diet will appreciate the aid of Petrolagar to maintain a regular bowel movement. Petrolagar softens hard stools and assists the bowel to function normally. Its pleasant flavor, devoid of the oily taste associated with plain mineral oil, makes Petrolagar very easy to take. Prescribe Petrolagar for bowel management, it's "Council Accepted." Petrolagar Laboratories, Inc. • Chicago, Ill.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

(Continued from Page 38)

In New York City, where the vaccination of all minors is compulsory, there has not been recorded a case of smallpox since 1932 and there have been only seventeen cases during the past ten years. In other cities where vaccination of school children is compulsory, smallpox cases are equally rare. For example, in Philadelphia, only four cases have appeared since 1926; in Boston there have been only fifteen cases, and in Newark, New Jersey, only ten cases during this period. There has not been a smallpox death in Newark since 1909, and, with the exception of 1925, there have been no deaths from this disease in Philadelphia since 1912.

None of the cities of 1,000,000 or more population in the United States reported high prevalence of smallpox in 1936; but there are records even within the last two decades of high incidence of the disease in certain of the large centers of population. Los Angeles, for example, as late as 1933, registered a smallpox sickness rate of forty-two cases per 100,000 population, and one of 137 in 1925. Philadelphia, whose excellent record since 1926 has just been mentioned, recorded 184 cases and a smallpox morbidity rate of ten per 100,000 in 1925. If cities of this size had suffered a visitation of smallpox comparable with that recorded in Sioux City, Iowa, last year (525 cases per 100,000 population), the number of smallpox patients would have exceeded 10,000.

"Benzedrine Sulfate" in Narcolepsy.—Ulrich (N. E. J. Med., 217:696, October 28, 1937), makes a second report on the treatment of narcolepsy with "Benzedrine Sulfate" (benzyl methyl carbinamine sulfate, S. K. F.). Some of his patients have now had continuous treatment for nearly two years.

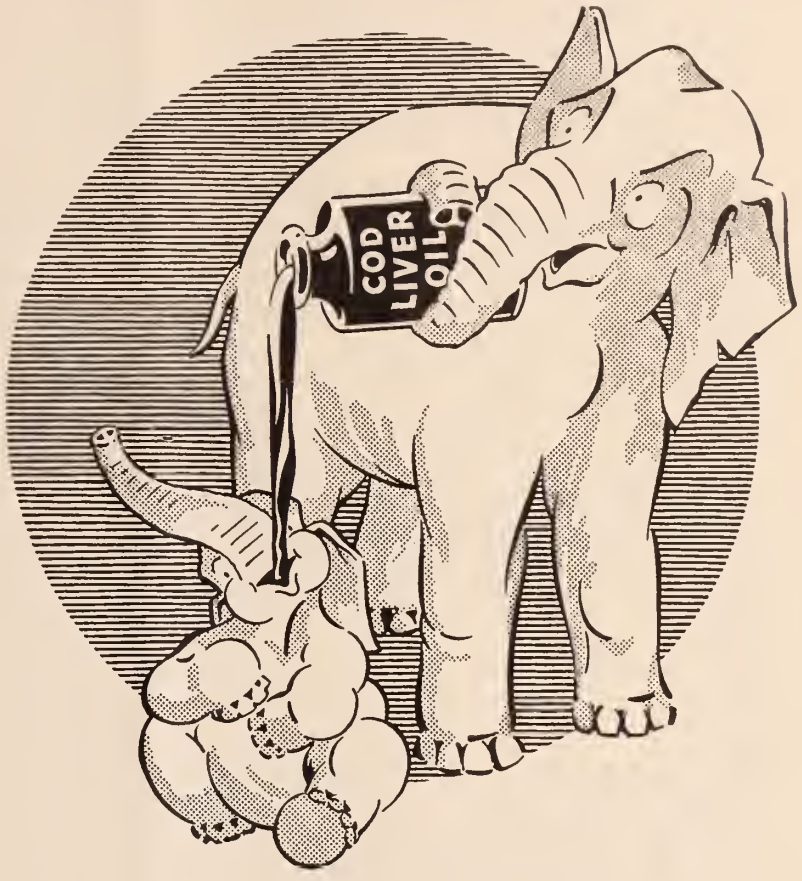
Seven of the ten cases of narcolepsy were complicated by cataplexy. All had complete or marked relief on administration of "Benzedrine Sulfate" in doses varying from 10 to 60 milligrams a day, the average daily dose being 25 milligrams. In only one case was there an apparent tolerance developed. Cataplectic symptoms were particularly benefited, and did not reappear even after withdrawal of therapy.

No evidence of permanent deleterious effects or habit formation was found. Slight rise in blood pressure and basal metabolic rate was produced in some instances, but these effects were transitory. Anorexia and momentary discomfort were prevented by reducing the dose or changing the time of administration.

Two patients who suffered from obesity had an 11 per cent loss of weight with "Benzedrine Sulfate" in doses of 20 to 30 milligrams a day. This effect was not observed in patients of normal weight.

Ephedrine was tried in three cases of narcolepsy, but was found to be of slight or no benefit. Dibenzyl carbinamine, given to four patients, failed to relieve narcoleptic symptoms and produced gastro-intestinal reactions, especially in large doses.

The author concludes that "Benzedrine Sulfate" provides the only satisfactory treatment for narcolepsy, but cautions against unsupervised use.



A Practical Handbook on Vitamins.—A most refreshing departure from the usual pharmaceutical manufacturers' effusions, on the overly discussed subject of vitamins, is represented by a new booklet which has just been released by E. R. Squibb & Sons, 745 Fifth Avenue, New York. The cover carries the title, "Physicians' Vitamin Reference Book."

The book is divided into several sections, seven describing from the clinical viewpoint, the requirements and deficiency manifestations, of vitamins A, B_1, G Complex, B_2, C, D, and E. Another section deals with multiple deficiencies and there is a list of other vitamin-like factors.

The description of each of the vitamins is preceded by a useful condensed summary. Estimated daily requirements of various vitamins are stated in International Units where these are available. The vitamin potencies of a number of foods, selected because of their relatively high potency and general availability, are also given.

The subject matter appears to have been carefully selected and conservatively presented, and it repeatedly

(Continued on Page 46)

—Maybe an Elephant Never Forgets,

But Human Beings DO!

Modern mothers with constant distractions sometimes do forget. But if you have prescribed S. M. A., the antirachitic and antispasmophilic breast milk adaptation, the mother cannot forget to give her infant the antirachitic factor it needs. For ample vitamin D is ***included in*** S. M. A.

Ever since the inception of S. M. A. in 1914, there has been incorporated in S. M. A. enough cod liver oil to prevent rickets and spasmophilia. Infants fed S. M. A. automatically get the antirachitic factor in every feeding. Careless or forgetful mothers cannot fail to provide necessary vitamin D activity nor can they give the wrong amount.

Furthermore—exclusive with S. M. A.—the vitamin A activity in each S.M.A. feeding is uniform and constant every month of the year, unlike cows' milk, fresh or evaporated.

Inclusion of these vital factors in S. M. A. is another reason why physicians prescribing S. M. A. continue to report excellent results and why they find S. M. A. so easy to prescribe.

S. M. A. is a food for infants—derived from tuberculin-tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, it is *essentially similar to human milk* in percentages of protein, fat, carbohydrate and ash, in chemical constants of the fat and in physical properties.

Physiological action of DIGITOL

DIGITOL is a uniform and thoroughly dependable tincture of digitalis. Each lot is physiologically standardized by the "one-hour frog method" official in the U.S.P. XI. The date of this test appears on the label of each bottle.

Digitol is a fat-free tincture, thus making a more sightly mixture with water on administration. Absence of precipitation, accurate standardization and dependable activity are characteristic advantages of Digitol. It is supplied only in one-ounce sealed bottles with a dropper for ease of administration.

reproduces the attitude of the Council on Pharmacy and Chemistry toward the clinical use of the vitamins in certain pathologic states. With a frankness that is commendable, negative reports are cited without bias, leaving, as should be done, the choice of therapy strictly with the physician.

The book is not cluttered with extensive reports of animal nutrition experiments and deductions of possible clinical applications. Conservative clinical data are cited, whenever possible to show what may be expected therapeutically from the administration of the different vitamins. There is no historical section, but the chemistry of the vitamins is very briefly outlined.

The manufacturer does not state under what terms the book is available, so it must be inferred that any physician who is interested need only write to the firm to obtain a copy. The opportunity to secure so much useful information, so handily compiled, is relatively infrequent.

Posture.—"There is but one way to stand," says the *Journal of the American Medical Association*: "The head is up and the chin in and back; the head is balanced above the shoulders, hips, and ankles. The chest is elevated, with the breast bone part of the body farthest forward. The lower abdomen is in and flat, and the back curves are within the normal limits." It is not difficult to take this position because it means bringing the body to its natural lines and balance.

As a fundamental exercise to correct bad posture: Stand with the heels four inches from a wall, but with hips, shoulders, and head touching the wall. Flatten in the lower back against the wall by pulling in the abdominal muscles while strongly contracting the buttock muscles. All motion occurs at the waistline and hips. The shoulders are held perfectly still. Relax the contracted muscles and allow the lumbar curve to return. Now stand away from the wall, keeping the abdominal muscles in the lower back flattened. Raise the ribs and chest so that the breast bone is the part of the body farthest forward.

Service by Medical Students.—In Hungary, it has long been a desire of medical students to act, during summer vacation, as assistants to physicians in public hospitals or with district physicians in villages, thus making themselves acquainted with the details of medical practice. These assistantships were realized for the first time last summer and resulted in full satisfaction to both the students and their employers. The students received free board and rendered valuable services. The position of famulus, as it is called in Hungary, will be officially recognized and continued.

A MAJOR ADVANCEMENT IN CIGARETTES

Patients with irritation of the nose and throat due to smoking were directed to change to Philip Morris. Within a limited number of days not only did the *patients* report definite relief, but medical examination showed every case of irritation had cleared completely or definitely improved.

This Philip Morris superiority* is due to a distinct difference in manufacture. Philip Morris employs diethylene glycol as the hygroscopic agent—proved a major advancement in cigarettes.

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

Effects of "Benzedrine Sulfate" on Problem Children.—Bradley (Am. J. Psych., 94:577, November, 1937), reports on the effects of "Benzedrine Sulfate" (benzyl methyl carbinamine sulfate, S. K. F.) administered to a group of thirty "problem" children, aged five to fourteen years, under very favorable conditions.

The children chosen for the study manifested various behavior disorders, ranging from specific educational disabilities to the retiring schizoid type and the aggressive, egocentric epileptic. They were observed, without subjective questioning, by a special psychiatric nurse for a period of three weeks. Each child received a daily morning dose of "Benzedrine Sulfate" during the second week, the first and third weeks being regarded as control periods. Twenty milligrams was the usual dose, but this varied according to the individual.

Although these children had been receiving the usual intensive training available at the Bradley Home, fourteen of them, or 47 per cent, promptly "responded in a spectacular fashion" to "Benzedrine Sulfate" therapy, showing marked improvement in speed of comprehension and accuracy of performance, together with a keen desire for accomplishment. Eight others showed some improvement. In all cases improvement disappeared the first day therapy was discontinued.

In emotional response, fifteen children, or 50 per cent, became subdued. Seven of these were of the erratic and aggressive type, and the author suggests that "Benzedrine Sulfate," by stimulating the higher centers, may increase voluntary control in such cases. Seven other children reported a definite euphoria. The remaining eight had varied responses. One case of agitation and two cases of anxiety were observed.

In spite of the "attractive results obtained . . . and the apparent low toxicity of the drug," the author concludes that it is too early definitely to recommend "Benzedrine Sulfate" in the general treatment of pediatric behavior problems, and that additional studies should be made in this field.

Dependable extracts in the diagnosis and treatment of HAY FEVER

IT IS NOT TOO EARLY to initiate the prophylactic treatment of early and late summer hay fever subjects.

A single diagnostic test usually suffices to classify the subjects according to their constitutional sensitivity and to indicate the size of the dosage. For spring hay fever (April to July) a grass pollen extract is used in the majority of cases, while for late summer or fall hay fever, a ragweed pollen extract (the usual excitant east of the Rocky Mountains) is most often used.

The size of the wheal resulting from a simple ⅛ inch scratch through the drop of pollen diagnostic extract expelled upon the upper arm indicates the approximate dosage in each case.

The absence of any detectable deterioration in the glycerolated "Pollen Antigens *Lederle*" tested after six years' storage is eloquent testimony to the dependability of these products.

Standardized with the greatest accuracy, these extracts afford the physician a valuable, safe and reliable agent for the diagnosis and therapy of hay fever.

Now distributed in bulk vial packages of three convenient strengths, enabling the physician conveniently to adjust the dosage from time to time in accordance with local or other reactions.

A condensed practical manual on Hay Fever will be sent physicians upon request.

POLLEN ANTIGENS
Lederle

CUTTER POLLEN EXTRACTS

"clean up" hay fever with a minimum of fuss and bother

Cutter *test sets*, split up according to season and geographical region, eliminate non-essentials and avoid the confusion (in choosing the proper pollens for treatment), of reactions to pollens which are either not indigenous to the patient's locality, or whose pollenating dates do not coincide with the patient's symptoms.

Cutter *treatment sets* are made up to your prescription, and each set of serial dilutions contains more than 150,000 pollen units—five to ten times the pollen unitage in the average "treatment set," but not more than enough in many cases.

Test sets—$1.50. Treatment sets—$9.00 plus $.50 for each additional pollen where more than a single pollen is required.

WHY SO MANY DOCTORS PREFER

Ralston Wheat Cereal

Ralston Cooks Quickly—is completely digestible, thoroughly cooked in only 5 minutes over an open flame, thus providing all the advantages of a hot wheat cereal with a minimum of effort.

Supplies Abundant Vitamin B. Enriched with pure wheat germ, Ralston supplies 1½ International units of vitamin B in each gram. Consequently each serving assures generous quantities of this vitamin so essential to normal appetite and digestion.

Appeals to Adults and Children. Made of premium whole wheat (with only coarsest bran removed) Ralston has a rich appetizing flavor that appeals to persons of all ages. This simplifies the preparation of breakfast in both home and hospital.

Costs So Little—less than 1¢ for a generous serving.

Research Laboratory Report and samples of Ralston Wheat Cereal will be sent on request. Use the coupon.

RALSTON WHEAT CEREAL

Carotene and Vitamin A from Butter.—To measure the recovery of carotene and vitamin A in butter under pasturage conditions, Atkeson and his associates determined the carotene and vitamin A content of the butter from three cows which were individually stall-fed only green rye, the carotene content of which was known. Each cow was offered in two feeds daily all the rye she would consume. The carotene ingested daily averaged 3,507 grams, equivalent to nearly 6,000,000 international units of vitamin A. The butter produced had an average carotene content per pound of 4,700 international units and 8,490 units of vitamin A. Of the carotene ingested daily only an average of 0.086 per cent was recovered daily as carotene in the butter and only an average of 0.154 per cent as vitamin A. The data seem to indicate that, when excessive amounts of carotene are fed, the ratio of carotene to vitamin A in the butter becomes rather constant at about 1 to 2.—*Journal of Nutrition.*

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

President, Charles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

(Roster lists continued on advertising page 6)

A Margin of Safety[1]—Plus[2]

VITAMIN A
2000 U. S. P. Units added to each Tall Can (13 Fl. Oz.)

VITAMIN D
400 U. S. P. Units added to each Tall Can (13 Fl. Oz.)

[1] *From Journal AMA, 108:206 (Jan. 16, 1937):*

REQUIREMENTS AND ALLOWABLE CLAIMS FOR VITAMIN D MILK:

To be acceptable to the Council on Foods, bottle caps and labels for Vitamin D milks must declare unitage of the vitamin D in terms of U. S. P. units and the source of the vitamin D, unless local government regulations prohibit such declarations.

For all milks containing a minimum of 135 units, an enhanced nutritive value, especially for growing children, may be claimed; it is also permissible to state that these milks usually will prevent clinical rickets when they are fed to normal infants in customary quantities.

For milk with only 135 units to the quart there shall be no claim or intimation that an adequate amount of vitamin D is being supplied to infants. When the milk contains as much as 400 units to the quart, the claim may be made that the amount of vitamin D is greater than that usually required for the prevention of rickets in normal infants and thus that a margin of safety is offered when customary amounts of milk are taken.

The foregoing statements which have been made concerning vitamin D in fresh milk apply equally to evaporated milk after it has been diluted with an equal volume of water.

[2] Special Morning Milk contains 496 U.S.P. units of Vitamin D per reconstituted quart (16 fluid ounces of milk and 16 fluid ounces of water). Thus Special Morning Milk has an additional margin over "a margin of safety" of 96 units of Vitamin D per reconstituted quart or approximately 24%.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA TO WHICH HAS BEEN ADDED 400 U.S.P. UNITS PER TALL (13 FLUID OZ.) CAN.
- THE VITAMIN D ADDED TO SPECIAL MORNING MILK REPRESENTS THE AMOUNT IN 1¼ TEASPOONS OF U.S.P. COD LIVER OIL (315 UNITS PER TEASPOON).

No Cod Liver Oil taste in the Milk!

COÖPERATE WITH YOUR ADVERTISERS

CALIFORNIA AND WESTERN MEDICINE, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention CALIFORNIA AND WESTERN MEDICINE.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this JOURNAL to members and readers.

A SERVICE AGENCY—FOR READERS

THE JOURNAL of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Co-operative Bureau is equipped with catalogues and price lists of manufacturers. and can supply you information hy return mail.

Perhaps you want a certain kind of instrument which is not advertised in CALIFORNIA AND WESTERN MEDICINE, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearhorn Street, Chicago, Illinois. CALIFORNIA AND WESTERN MEDICINE and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

For the General Surgeon

A combined surgical course comprising General Surgery, Traumatic Surgery, Abdominal Surgery, Gastro-Enterology, Proctology, Gynecological Surgery, Urological Surgery, Thoracic Surgery, Pathology, Roentgenology, Physical Therapy, Operative Surgery and Operative Gynecology on the Cadaver.

Obstetrics and Gynecology

A full-time course. In Obstetrics: Lectures; prenatal clinics, witnessing normal and operative deliveries; operative obstetrics (manikin). Gynecology: Lectures; touch clinics; witnessing operations; examination of patients, pre-operatively; follow-up in wards post-operatively. Obstetrical and Gynecological pathology. Regional anesthesia (cadaver). Attendance at conferences in Obstetrics and Gynecology. Operative Gynecology on the Cadaver.

5 REASONS FOR AN AGENCY ACCOUNT

Our Agency Service has five outstanding advantages for anyone having a sizable investment portfolio:

1. It relieves the client of all bookkeeping details and annoying routine.
2. It prevents losses due to mistakes, to delays in depositing dividends and collecting interest, to failure to observe redemption notices, etc.
3. It provides records helpful in preparing tax returns.
4. Its cost is moderate — frequently it pays for itself.
5. Flexible, it is adapted to the client's individual needs and operates under his direct authority.

"Benzedrine Sulfate" as a Mental Stimulant.—Gwynn and Yater (Med. Ann. D. C., 6:356, Dec., 1937) report on the effects of Benzedrine Sulfate (benzyl methyl carbinamine sulfate, S. K. F.) administered to a group of 147 normal medical students.

Half the group received 10 milligrams of Benzedrine Sulfate after breakfast and again after lunch for three successive days, the other half receiving lactose. Five days later the procedure was reversed, so that the entire group was tried both on Benzedrine Sulfate and on placebos.

One hundred and thirteen, or 77 per cent, experienced a temporary increase in energy while on Benzedrine Sulfate; seventy-two, or 49 per cent, reported temporary exhilaration; and sixty-one, or 41 per cent, found that Benzedrine Sulfate increased their power of mental concentration, while only eight, or 5 per cent, thought that their power of concentration was decreased. The entire group of 147 reported definite effects from Benzedrine Sulfate, with only sixteen reported imagined effects of the placebo.

With Benzedrine Sulfate unpleasant reactions were reported in varying percentages, but were not considered serious. They included insomnia, decreased appetite, rise in blood pressure, headache, and nervousness.

There was no indication of the likelihood of habit formation. Only thirty-eight students, or 25 per cent, expressed a desire to continue to use Benzedrine Sulfate, and 80 per cent of these qualified this desire by limiting it to times when it would be necessary to stay awake.

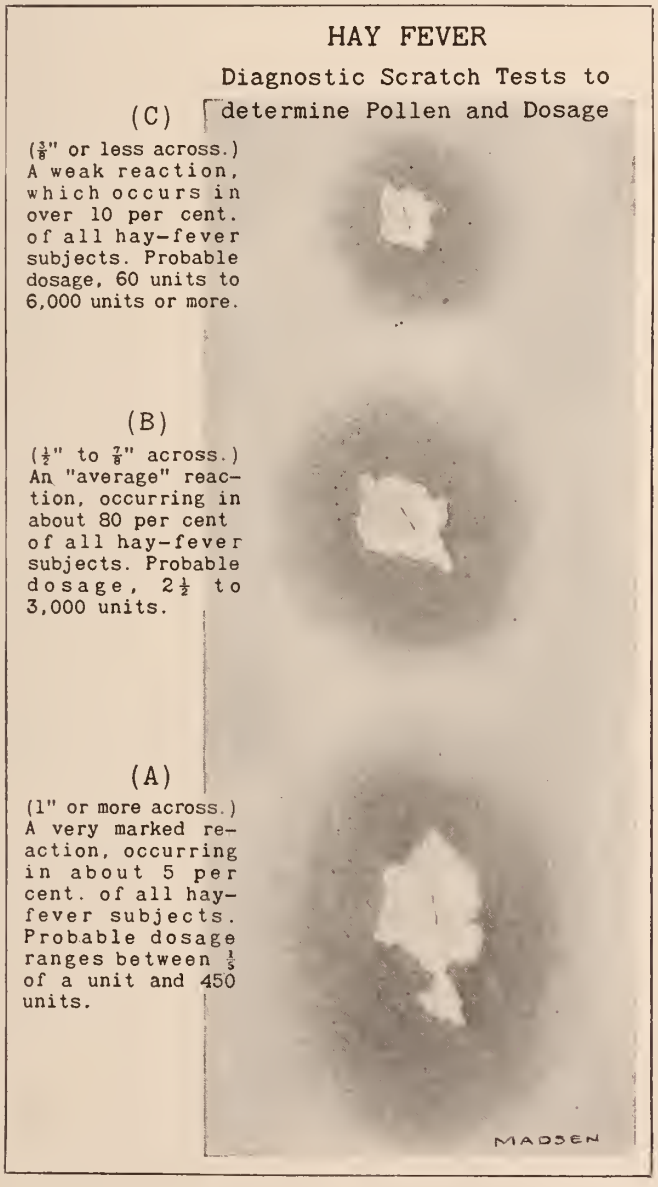
The authors conclude that Benzedrine Sulfate may prove valuable to restore self-confidence, to combat mild depressions and to increase mental or physical alertness. They point out, however, that it should be used only as an emergency measure and in small doses.

Many dietetic fads sound convincing. In fact, it is often difficult not to be influenced by the pseudo-scientific reasoning of faddists and quacks. The difficulty lies in the fact that most fads contain a germ of truth. A fad is often a truth carried to extreme.

Two million sufferers . . . 80 per cent.
will be benefited by proper

HAY FEVER TREATMENT

THE INCIDENCE OF HAY FEVER has been variously estimated as between 1 and 2 per cent. of the population of the United States. Some recent estimates are even higher. Thus there are about two million hay fever sufferers in this country.



Clinical reports indicate that at least 80 per cent. of the cases will obtain satisfactory relief following properly managed pollen therapy.

With the development of Lederle's glycerolated pollen extracts, the testing and treatment of pollen sensitiveness have been simplified and improved.

A single diagnostic scratch test usually suffices to classify the patients according to their constitutional sensitivity, and to indicate the size of the dosage.

"Pollen Antigens *Lederle*" have shown no measurable deterioration after six years. Physicians will therefore find it advantageous to keep on hand a supply of diagnostic tests (each package contains sufficient material to test 3 individual cases). The scratch test may be performed at any season and treatment by the preferred perennial method commenced at any time.

Hoagland, 1149 Euclid Avenue, Berkeley, California; telephone AShberry 6669.

COACHING FOR STATE MEDICAL BOARD—CHARLES L. Rubenstein, M. D., 450 Sutter Street, Suite 1612. Telephone SUtter 4576.

ARE YOU READING A PAPER AT THE NEXT A. M. A. meeting, or meeting of state or county society? Florence Annan Carpenter will take the drudgery off your hands. Research, editing, or preparing the paper from instructions. Twelve years' experience with leading medical journals. 1801 Sixteenth Street, N.-W., Washington, D. C.

WANTED—A WELL-TRAINED OPHTHALMOLOGIST for eye program under Blind Division of State Department of Social Welfare, California. Full time position; salary $3,500 to $4,200, with traveling expenses. References required. Address J. L., 2007 Wilshire Boulevard, Room 901, Los Angeles, California.

Parke, Davis & Company Elects New President and New Finance Chairman.—Dr. A. William Lescohier was elected president of Parke, Davis & Company, and Norman H. F. McLeod, chairman of the Finance Committee, at a meeting of the Company's Board of Directors held in Detroit on March 1. Both men have been actively connected with the Company for about thirty years. Doctor Lescohier has been general manager and a director since 1929, and Mr. McLeod a member of the Board since 1921, and secretary and treasurer since 1923.

Prevention of Deformities.—No antiricketic substance will completely straighten bones that have become grossly misshapen as the result of rickets. But Oleum Percomorphum can aid in the prevention of ricketic deformities if given early and in adequate dosage. This is not true of all antiricketic agents, many of which are so limited by tolerance or bulk that they cannot be given in quantities sufficient to arrest the ricketic process promptly, with the result that the bones are not sufficiently calcified to bear weight or muscle-pull and hence become deformed.

"I feel that you have really done something for the medical profession in this matter."

. . . So writes a very prominent doctor concerning our new malpractice policy.

1—The policy that has everything.
2—Lower in cost.
3—Liability limits to $50/150,000.
4—The most experienced defense attorneys.
5—THE policy approved by medical societies.

BOOK REVIEWS

Books received for review are placed in the Library of the California Medical Association, in its central office at San Francisco. Book reviews are written by the Association Secretary.

BOOKS RECEIVED

Handbook on Social Hygiene. Edited by W. Bayard Long, M.D., Attending Dermatologist and Director of Dermatology and Syphilis Clinics in St. Luke's Hospital, New York; Chairman, Social Hygiene Committee, New York Tuberculosis and Health Association, and Jacob A. Goldberg, M.D., Ph.D., F. A. P. H. A., Secretary, Social Hygiene Committee, New York Tuberculosis and Health Association, and Social Hygiene Council of Greater New York. With a Foreword by Edward L. Keyes, M.D., Professor Emeritus of Clinical Surgery (Urology) in Cornell University Medical College, New York; Honorary President, American Social Hygiene Association. Cloth. Pp. 412, illustrated with 62 engravings. Price, $4. Philadelphia: Lea & Febiger, 1938.

A Biological Approach to the Problem of Abnormal Behavior. By Milton Harrington, M.D., Psychiatrist, Institution for Male Defective Delinquents, Napanoch, New York, Formerly Consultant in Mental Hygiene, Dartmouth College. Cloth. Pp. 459. Lancaster, Pennsylvania: The Science Press Printing Company, 1938.

Claude Bernard, Physiologist. By J. M. D. Olsted, Professor of Physiology, University of California. Cloth. Pp. 272, illustrated. Price, $4. New York: Harper Brothers, 1938.

Clinical Methods. A Guide to the Practical Study of Medicine. By Robert Hutchison, M.D., LL.D., F.R.C.P., Consulting Physician to the London Hospital and to the Hospital for Sick Children, Great Ormond Street, and Donald Hunter, M.D., F.R.C.P., Physician (with charge of out-patients) to the London Hospital. Tenth Edition. Cloth. Pp. 658, with nineteen color and two halftone plates and 142 figures in the text. New York: Paul B. Hoeber, Inc., 1938.

A Textbook of Ophthalmology. By Sanford R. Gifford, M.A., M.D., F.A.C.S., Professor of Ophthalmology, Northwestern University Medical School, Chicago; Attending Ophthalmologist, Passavant Memorial, Cook County, Wesley Memorial and Evanston Hospitals. Cloth. Pp. 492, with 249 illustrations. Price, $4. Philadelphia: W. B. Saunders Company, 1938.

Treatment in General Practice. By Harry Beckman, M.D., Professor of Pharmacology at Marquette University School of Medicine, Milwaukee, Wisconsin. Third Edition, Revised and entirely reset. Cloth. Pp. 787. Price, $10. Philadelphia: W. B. Saunders Company, 1938.

How Ancient Healing Governs Modern Therapeutics. The Contribution of Hellenic Science to Modern Medicine and Scientific Progress. By Kleanthes A. Ligeros, M.D., Ph. D., Athens, Greece. Cloth. Pp. 523, fully illustrated. Price, $10. New York: G. P. Putnam's Sons, 1937.

Pneumonia and Serum Therapy. By Frederick T. Lord, M. D., Clinical Professor of Medicine, Emeritus, Harvard Medical School; Member of the Board of Consultation, Massachusetts General Hospital; and Member of Massachusetts Advisory Committee on Pneumonia, 1931-1935, and Roderick Heffron, M.D., Field Director, Pneumonia Study and Service, Massachusetts Department of Public Health, 1931-1935. Revised Edition of Lobar Pneumonia and Serum Therapy. Cloth. Pp. 148. Price, $1. New York: The Commonwealth Fund, 1938.

No one who is deeply interested in a large variety of subjects can remain unhappy. The real pessimist is a person who has lost interest.—Phelps.

Iodobismitol

INDUCES AND MAINTAINS A THERAPEUTIC LEVEL OF BISMUTH IN THE BLOOD STREAM

Urinary excretion of bismuth after multiple injections of Iodobismitol. Arrows indicate injections

IN A RECENT CLINICAL STUDY,[1] patients were given 2-cc. doses of Iodobismitol twice weekly for a period of three weeks. The charts illustrated above show the urinary excretion of bismuth over a period of four weeks—49 per cent of the bismuth having been excreted. This would serve to "indicate that Iodobismitol is capable of developing a potent bismuth level in the blood stream. . . ."

This effect seems highly desirable for, according to the Council on Pharmacy and Chemistry, "Probably those compounds of bismuth will have the best antispirocheticidal value that are able to keep the therapeutic level of bismuth in the blood stream at such a continuous height that it will be reflected in the urine with a level of 0.003 Gm. or more of metallic bismuth per day."

Iodobismitol may be used alone or with the arsenicals. It is well tolerated in both early and late syphilis. Iodobismitol is almost completely absorbed, exerts a relatively prolonged effect at a high level, and a very high efficiency with respect to therapeutic utilization of the dosage given.

Iodobismitol with Saligenin is a propylene glycol solution containing 6% sodium iodobismuthite, 12% sodium iodide, and 4% saligenin (a local anesthetic). It presents bismuth largely in anionic (electronegative) form.

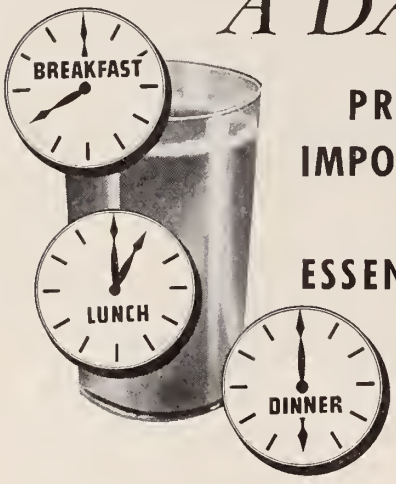
(Continued from Text Page 304)

From an Article on "Psychiatric Duties of Large Cities" by Robert L. Richards, M.D., Medical Superintendent, Mendocino State Hospital.—To the community at large the important point about the insane is that they are unsocial or antisocial. The directing or dominating part of an individual is found in his mental faculties; when these are disturbed, his relations to others are disturbed, and he becomes unsocial or antisocial. The lack of community of interests and thoughts is one of the striking features of a hospital for the insane. The environment of these patients is parallel with that of soldiers in barracks, for example; and yet the reaction of the insane under these circumstances is radically different. Unless convalescent they rarely talk to one another, and usually on parole or in the wards each is thinking or talking about his own personal affairs, and paying no attention to anyone else. On this account, and contrary to the usual conception, a state hospital is quieter in general than an institution housing an equal number of sane people. By training and reëducation is secured an adaptation to a routine way of living, and a gradual resumption of social duties. The finer adjustments of social life are the latest acquisition of the human race, and naturally the point where mental derangements are first noticed, and where recovery is last established. Hence our chief interest is in the social manifestations of the insane.



From an Article on "Are We Doing as Much for the Tuberculous Patient as We Should?" by Francis Marion Pottenger, M.D., Monrovia.—While the subject of my talk before you may be criticized because of its almost limitless scope, yet I shall attempt to treat it concretely and not in the rambling manner that might be suggested by the title. I shall attempt to discuss tuberculosis in the light of the recent advanced studies of its pathology and to bring to your attention the breach which exists between our ability to diagnose the disease early and the diagnosis which is usually made; the curability of the disease established by the best clinical methods and the result usually obtained; and the preventability of the disease as based upon both theory and experience, and the actual prevention which is being carried out.

From an Article on "Interauricular or Interventricular Deficiency of Septum? A Question of Diagnosis," by Dr. William Watt Kerr, San Francisco.—The symptoms and physical signs in this case indicate a septal deficiency, but it is difficult to decide whether the communication is interauricular or interventricular. The dusky color is comparatively slight, the mucous membranes are dark red, not blue, the patient never has suffered from an abnormal degree of dyspnea on exertion, he can perform his daily work even when it is laborious as actively as any of his associates, and very frequently after working all day he has run out to the Ocean beach and back again, a distance of more than six miles, just for the pleasure of the exercise.

From an Article on "Prospects and Retrospects" by A. Barkan, M.D., San Francisco.—This sketch of forty years' experience as a teacher and a specialist for eye, ear, nose, and throat in California was prompted by a friend, who asked to have it put before the medical profession of Vienna with whom I studied and worked forty years ago but from whose ways and works I have diverged under the influence of different conditions and obvious necessities. Although a specialist, I cannot avoid including general medicine in the field of my consideration, but I shall avoid figures and names. I shall present only those general ideas that my life work as a teacher and a physician have brought home to me, with such facts (outside of my own experiences) as my trips and visits to the medical centers of the East have enabled me to gather through personal observation.

THESE 3 *Drinks* *A DAY...*

PROVIDE IMPORTANT FOOD ESSENTIALS

In their search for a food that supplies Calcium, Phosphorus, Iron and Vitamin D—usually lacking or deficient in the average 3-meal-a-day diet—physicians have found in Cocomalt an appetizing answer. More and more, they are prescribing Cocomalt, the *"protective food drink"*, for expectant and nursing mothers, run-down men and women, and under-nourished children.

Each ounce-serving of Cocomalt provides .15 gram of Calcium, .16 gram of Phosphorus. And aiding in the utilization of these food minerals, each ounce of Cocomalt also contains 134 U.S.P. Units of Vitamin D, derived from natural oils and biologically tested for potency. Further, leading authorities agree that Cocomalt supplies the normal patient's daily Iron requirement . . . each ounce-serving being fortified with 5 milligrams of effective Iron biologically tested for assimilation.

Hot or cold, Cocomalt's distinctive flavor appeals to old and young, alike. It is obtainable in ½-lb., 1-lb. and the economical 5-lb. hospital size, purity-sealed cans at grocery and drug stores.

Cocomalt is the registered trade-mark of R. B. Davis Co., Hoboken, N. J.

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

From an Article on "Granuloma Inguinale Tropicum" by D. Friedlander, M. D., San Francisco.—The only excuse that I have to offer for the presentation of this paper, since it carries nothing original with it, is the fact that this disease is so infrequent in the temperate zone. In view of the constantly increasing number of tropical affections with which we come in contact, it seems to me that a résumé of the subject, together with the report of two cases occurring in San Francisco, might be of interest.

From an Article on "Some Conclusions Regarding the Present Knowledge of Vermiform Appendix by C. J. Teass, M. D., San Francisco.—The subject was prompted not alone from the constant erroneous expressions one hears through the laity, but from the thoughtless and unjust remarks made by members in the profession.

From an Article on "Treatment of Fractures of Patella" by Rexwald Brown, M. D., Santa Barbara.—Simple fractures of the patella in otherwise healthy individuals being, therefore, the indication for open operative measures to its cure, the technique of the operation, the time for its institution, and the postoperative procedures, are the chief matters for attention.

From Some News Notes From Newspapers:

Dr. J. B. Murphy of Chicago, principal promoter of the proposed "American Royal College of Surgeons," has been visiting in the southern part of the State.

"Los Angeles the Chemically Pure," is the title of a most brilliant and entertaining article in the March number of the *Smart Set*. It is a delicious morsel!

Antityphoid treatment is to be administered to the students of the University of California, as they may request it. The announcement was made that the treatments would be begun March 24, and a very large number of students immediately filed the request. Probably, in time, antityphoid treatment will be as much a requirement as vaccination.

The California Eclectic Medical College, Los Angeles, dined a dozen of the legislators during the legislative vacation and devoted their energies to denouncing the American Medical Association, the Association of American Medical Colleges, and everybody who wanted to have medical men properly educated. It must have been an encouraging banquet—for the twentieth centurry!

The Los Angeles County health officer, Dr. E. O. Sawyer. is to investigate the islands off the southern California coast with the object of finding one that would make a suitable quarantine station for lepers.

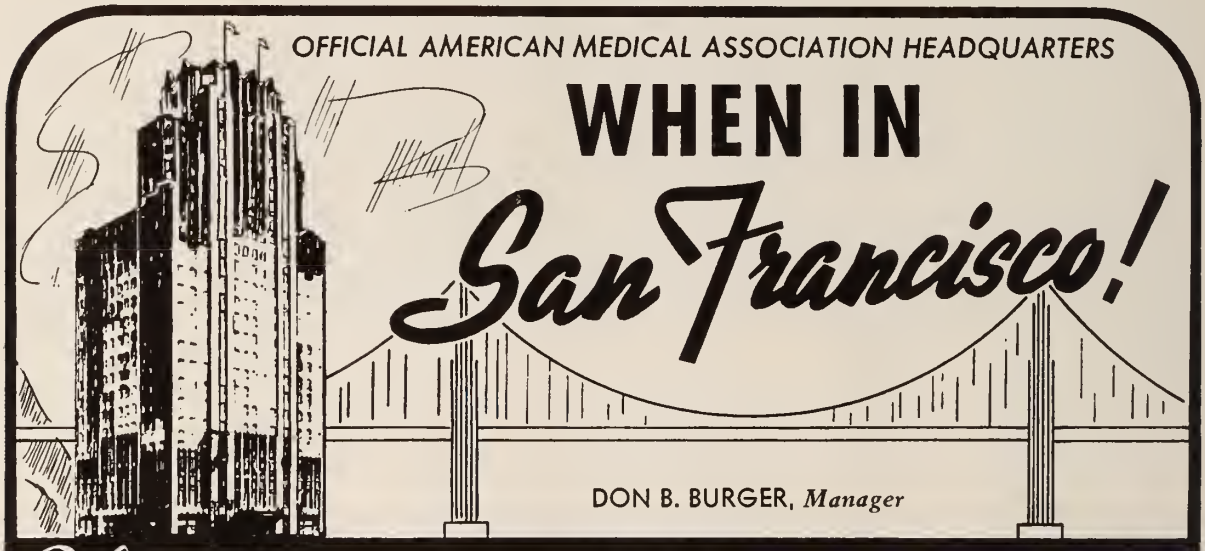
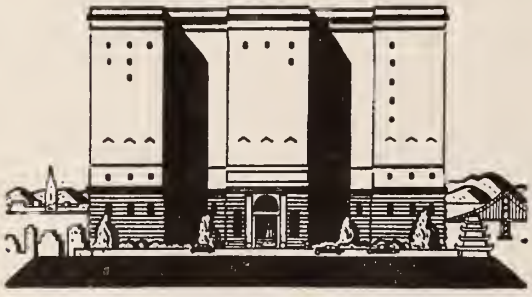
Frank Adrian Pearl, M.D., convicted in the Los Angeles insurance fraud. License revoked on March 10, 1938. (Previous entry, December, 1937.)

James Willard Nicholson, M.D. Placed on probation on October 17, 1934, and charged with violation of the terms of his probation, was on March 10, 1938, found guilty and placed on probation for five years additional, during which time he is not to use alcoholic or intoxicating liquors and is to abide by all the laws of the State of California and the United States.

News



"The influx of foreign physicians because of political conditions abroad during recent years is providing medical licensing authorities in the United States with a serious problem. Various aspects of it were presented by Dr. Charles B. Pinkham, Secretary of the California Board of Medical Examiners, at the Congress on Medical Education and Licensure here this morning. . . . Since the native medical profession is already increasing faster than the population, the foreign influx will 'add a hundredfold to the already serious condition,' Doctor Pinkham said. The problem of foreign students includes both American students, who because of restrictions in enrollment cannot enter American medical schools and native graduates of foreign schools, who seek to practice in the United States because of economic or political difficulties in their own countries. . . . Doctor Pinkham reported that during the fiscal year ending June 30, 1936, 537 alien doctors entered the United States; the next year the number was 533. Of the 1936 group 312 were from Germany. Licensing Boards in the United States find it extremely difficult to validate the credentials of foreign medical graduates. . . . In the first place medical training in many foreign schools is inferior to that in the United States. In 1936 35 per cent of the 588 foreign graduates who were examined in the United States failed to pass the examination. . . ." (Associated Press Dispatch, dated Chicago, February 15, printed Berkeley *Gazette*, February 15, 1938.)



"Three years of investigation by the State Board of Medical Examiners culminated in conviction of 'Dr.' Richard Howard, Hacienda rancher, on two counts of violation of the medical practice act. . . . The charges on which Howard was convicted involved treatment of Amos H. Stanger, Dry Creek rancher, and his late wife, Mrs. Laura

Stanger, who died recently. Howard, it is charged, prescribed for and directed the treatment for the pair—selling them herbs which he prepared, along with a combination of epsom salts, baking soda and powdered bay leaves. . . . The verdict was reached after thirty minutes' deliberation. Howard faces maximum fines of $500 and not more than six months in the county jail on each of two counts." (Healdsburg *Scimitar*, February 10, 1938.)

"Richard J. Howard, self-styled 'doctor' of Hacienda, was fined $300 or one hundred days in the county jail by Judge Edward Quinn in Justice Court Monday morning, the penalty for violation of the State Medical Practice Act. On his plea of financial inability to raise the fine, Howard was granted a ten day stay of execution. . . . A long list of previous law violations and offenses was revealed in the probation report, running from 1929 until November, 1937, when the charges on which Howard was convicted were filed in Healdsburg Justice Court. Having come to California from Texas where reports indicated he had practiced medicine without a license, Howard was arrested for the same offense in 1929 in Shasta County, but was later released, the report asserted. In 1932 Howard was arrested in Sonoma County on a petty theft charge, but jumped bail, leaving the State, and was not extradited. After having been suspected of medical practice without a license in Calistoga and Santa Cruz, he was again arrested in Sonoma County for violation of the medical practice act in 1934. He entered a plea of guilty, the report says,

Put Yourself Under the Sun's Care

No medicine in bottles can do as much to snap you out of winter's doldrums as a week or two in the sun at debonair Del Monte. Romp through its 20,000 acre playground as the spirit moves you. Four championship golf courses include Pebble Beach. Miles of bridle paths wind through pine-scented forests down to the spectacular Western shore ...and here are swimming, sailing, fishing. Each day's end will find you laying plans for another and another carefree tomorrow ... as you fall asleep to muted, distant Pacific surf sounds.

and was placed on probation on a promise to desist. After failing to complete the case of conspiracy against Howard in the Justice Court in Guerneville, the district attorney's office prosecuted the case on a misdemeanor charge in Healdsburg Justice Court February 9, and obtained a conviction. . . ." (Healdsburg *Tribune*, February 28, 1938.) (Previous entries, December, 1929; June, 1932.)

"Conviction of a Sonoma County rancher for violating the State code governing medical practice emphasizes the importance of spreading knowledge that no one should permit treatment for disease at the hands of any but a regularly licensed physician and surgeon. In many instances persons have suffered for years or even died under such 'treatment' when their lives and health might have been preserved. In any case such unlawful practitioners delay proper medication to a point where science may be unable to help the afflicted." (Editorial, Santa Rosa *Press Democrat*, February 13, 1938.)

"Dr. George H. Parchen, chiropractor, yesterday was free for the third time on charges of performing illegal operations. Charges pending against him were dismissed by Judge Eugene Daney, Jr., in Municipal Court when Katherine Ellis, age 19, refused to testify that she was the victim of an operation barred by law. Her mother, Mrs. Mabel Ellis, had sworn to the complaint against Doctor Parchem." (San Diego *Union*, February 25, 1938.) (Previous entries, December, 1933; October, 1934; January and April, 1935.)

"Dr. Louis LaVine, Los Gatos chiropractor, faces a $3,382 judgment awarded Friday to Mr. and Mrs. C. O. Wallace of Los Gatos by Superior Judge Maxwell McNutt of San Mateo County, in San Jose. Judge McNutt allowed $3,000 general and $382 special damages for the alleged unskillful treatment of Mrs. Wallace's fractured arm a year ago. Asking damages of $8,625, Mrs. Wallace testified that Doctor LaVine placed a cast on her arm so tightly that it restricted circulation, resulting in her arm becoming withered. Doctor LaVine was arrested last spring, in connection with the same case, on a charge of violating the State Medical Practice Act, on complaint of Thomas P. Hunter, agent for the State Board of Medical Examiners. A jury acquitted the chiropractor. Doctor LaVine filed suit, now pending, for $10,300 damages against the Wallaces, Dr. R. E. Graun, Dr. William R. Harder, and Thomas P. Hunter, charging malicious prosecution." (Los Gatos *Mail News*, February 24, 1938.) (Previous entries, August, September, November, and December, 1937.)

"State medical authorities, working with District Attorney Matthew Brady, last night arrested a massage parlor operator on charges of violating the medical practice act. The woman arrested was Jean Adams, 2511 Sacramento Street. Assistant Special Agent Joseph W. Williams of the State Medical Board, who made the arrest with Policewoman Ada Kennedy, accused Mrs. Adams of bilking a 25-year-old woman for six months with treatment for a nonexistent social disease." (San Francisco *Examiner*, March 2, 1938.)

"Convicted nearly two years ago of conspiring with a group of doctors who specialized in illegal surgery, William Byrne, former investigator for the State Medical Board, finally escaped a prison term today. Byrne, who has been in jail for sixteen months while he unsuccessfully appealed his conviction, must serve another year behind jail bars, however. The former state official appeared yesterday before Superior Judge Arthur Crum on probation plea. Following his conviction, along with a group of doctors in October, 1936, Byrne had been sentenced to prison by Judge Crum. Heeding a plea on the part of Attorney Russell Parsons that Byrne's rehabilita-

(Continued on Next Page)

Helium-Oxygen Mixtures used in treatment of asthma

The general effect of a mixture of helium with oxygen (usually 80% helium, 20% oxygen) is to increase the permeability of the gas, enabling it to pass through the alveoli and relieve congestion. Helium-Oxygen also has a tendency to reëstablish sensitivity to epinephrine.

It is preferable to administer by mask, although it may be given in an oxygen tent.

We are furnishing these mixtures of Helium and Oxygen, prepared with our customary exacting care; and also the proper equipment to use them. For clinical data and other information, address us at 211 Bay Street, San Francisco.

tion should begin now, Judge Crum suspended the prison term, placing the defendant on probation for ten years and ordered him to spend the first twelve months in jail. According to the testimony on which he was convicted, Byrne conspired with a group of doctors who opened a series of illegal surgery 'clinics' in California, when he should have arrested them." (Los Angeles *Examiner*, February 10, 1938.)

"A socialized medicine plan, under which families would pay a monthly fee to insure medical care in time of sickness or accident, was declared illegal here today by Attorney-General U. S. Webb. Webb told Dr. Charles B. Pinkham, secretary-treasurer of the State Board of Medical Examiners, that circulars of the so-called 'health foundation' indicated the plan violated the State business and professions code which prohibits the practice of medicine 'under a fictitious name.'" (Riverside *Press*, February 21, 1938.)

"Dr. G. O. McKeehan, well-known southeast district physician, Friday stood free of charges he was an 'ambulance chaser' in connection with 'fake accident' frauds. Dr. McKeehan, defended by Attorney W. LeRoy Thomas of Huntington Park, stood trial on charges of violation of State 'ambulance chasing' law, a measure designed to prevent doctors from soliciting business for attorneys. After hearing evidence for two days, Deputy District Attorney George Thalman moved to dismiss charges against Dr. McKeehan in Superior Judge Frank M. Smith's court. Thomas stated he 'had every reason to believe that Dr. McKeehan will receive leniency' when he appears for sentence on charges of conspiracy to defraud in connection with the previous 'fake accident' charges. The jury found Dr. McKeehan guilty; also recommended leniency, Thomas stated. . . . Dr. McKeehan was arrested following the arrest of George O'Dell Dorris and Mr. and Mrs. Weir McKean in Huntington Park, during 'fake auto accident' activity. Dorris' alleged confession implicated Dr. McKeehan, investigators asserted, and charges were filed against him." (Huntington Park *Signal*, February 18, 1938.)

"The toll of convictions and guilty pleas in the State Bar's campaign to smash Los Angeles' 'fake accident' ring, reached thirty-nine yesterday when Attorney Louis Feinstein and Dr. W. B. Humphrey were convicted on two counts each of soliciting the commission of a crime. (653-f Penal Code.) The jury in Judge Frank M. Smith's court was out twenty-eight minutes after a two weeks' trial. First information on the workings of the ring was turned over to District Attorney Buron Fitts' office in May, 1937, by Herbert S. Hallner, special operative for the State Bar. Fitts assigned Deputy District Attorney George Stahlman to prosecute the cases. Sixty persons were indicted by the grand jury. Numerous guilty pleas and convictions under the vigorous work of Stahlman and Hallner followed. Several physicians were found guilty of entered pleas, although Feinstein was the first attorney to be convicted. Six other attorneys and fourteen physicians were scheduled to appear before Judge Bull next Tuesday in a further phase of the racket-smashing campaign. They are charged with an ambulance chasing conspiracy, a felony under a

city ordinance. . . . Maximum penalty for the felony conviction is ten years in prison. However, Superior Judge Frank M. Smith, in whose court the case was tried, has the alternative of reducing the charge to a misdemeanor, in which the maximum penalty is two years in jail or a $10,000 fine for each defendant. Fake accidents had netted conspirators approximately $500,000 until evidence of them was laid before the district attorney's office, by Attorney Hallner, according to the district attorney's office. The sweeping grand jury indictments followed." (Los Angeles *Journal,* February 4, 1938.)

"A thirty-five-page indictment embodying two conspiracies and 130 overt acts linking fifteen doctors, lawyers and laymen in an asserted gigantic district ambulance chasing ring was read in Superior Judge Frank M. Smith's court this week at the first trial of its kind in the history of the country. . . . Drs. E. D. Abraham, John E. Porter, and P. C. Lawyer gained dismissals on the understanding by the prosecution that they would turn state's evidence, it is reported. Doctor Abraham has denied this report, stating that he is in no way involved in the case. He has been 'excused from trial,' he asserted." (Huntington Park *Bulletin,* February 14, 1938.)

"Charged with implication in a $500,000 'fake accident' ring which operated in the Southeast district, fifteen men, all physicians or attorneys but one, this week went on trial in Superior Judge Frank M. Smith's court. The men were indicted several months ago on charges of conspiracy to violate the ambulance-chasing laws. . . . Of the original twenty-two persons indicted, four doctors pleaded guilty, one layman was sentenced to San Quentin. In another

Cosmetics and Your Patient's Morale

THE DOCTOR IS OF NECESSITY A STUDENT OF LIFE Each new patient presents a new study, a new problem. Psychology plays an important role in the course of treatment he prescribes. With some patients he must be frank to a point of harshness, with others he must be gentle and coaxing. The nature of the illness and, more particularly, the nature of the patient determine his attitude. He knows from experience the value of bolstering his patient's morale. As a student of psychology he knows that few things are more depressing to a woman than the fear that she is losing her charm, that when she no longer cares how she looks the chances are she has lost touch with a vital interest in life. And because he appreciates the importance of a sensible interest in personal appearance he quite rightly encourages his patients to look their best at all times. FINE COSMETICS appeal to that interest. That is why they deserve to be recommended by doctors who are, after all, greatly concerned with their patient's morale.

LUZIER'S, INC., MAKERS OF FINE COSMETICS & PERFUMES

KANSAS CITY, MO.

case, one doctor gained a dismissal on conviction in another case, and another doctor submitted his fate on the transcript of the preliminary hearing without standing trial. Those who went to trial this week were: Drs. W. B. Humphrey, M. C. Cooley, E. H. Anthony, John E. Porter, G. O. McKeehan, P. C. Lawyer, E. D. Abraham, and F. A. Pearl." (Los Angeles *Bulletin*, February 10, 1938.)

"Dr. W. B. Humphrey, one of a group of seven attorneys and doctors on trial on conspiracy charges growing out of their alleged affiliation with an asserted ambulance-chasing ring, yesterday halted the trial when he rose suddenly and pleaded guilty to the charges. Doctor Humphrey has already been convicted in another case and is awaiting a probation hearing next March 24. . . . Doctor Humphrey's plea of guilty left only one physician on trial, Doctor E. H. Anthony. . . ." (Los Angeles *Daily News*, February 18, 1938.)

"Superior Judge E. J. Tyrrell of Oakland yesterday granted Mrs. Annabel MacLellan, forty-six, and Mrs. Lucille Bouton, fifty-one, two years' probation on their plea of guilty to charges of conspiracy to perform an illegal operation. Mrs. MacLellan is the widow of Dr. Gordon L. MacLellan, San Leandro physician, who committed suicide last October rather than face similar charges. The operation allegedly was performed last year by Doctor and Mrs. MacLellan with Mrs. Bouton as nurse." (San Francisco *Chronicle*, February 10, 1938.)

"Something should be done about Gypsy 'healers' who use their patients' money to pay off their own doctor bills. Mrs. Pearl Heller of 1040 Temple Street, told district attorney's investigators yesterday. The investigators listened to Mrs. Heller's story of how she lost $1,000, agreed with her, and issued a complaint naming Mrs. R. Kasko, alias Isabel Sherlock, alias Isabel Brewer, Gypsy of 1119 West Sixth Street who is reported missing. Mrs. Heller, still suffering from injuries received several years ago, told Deputy District Attorney Howard Hinshaw she consulted Mrs. Kasko at 501 South Figueroa Street, after reading an advertisement. She said she was told to bring $300, have it 'blessed' and to carry it on her person. She followed directions. Last January 27, as instructed, she declared she drew $700 more from a bank, and added it to the $300. Finally, on last Wednesday, Mrs. Heller said she was told to leave the entire sum with the healer, which she did. Back-tracking on the trail of the $1,000, it was learned that on the day after Mrs. Heller allegedly surrendered her 'blessed' cash, the Gypsy paid Dr. W. P. Cook, 1136 West Sixth Street, his bill for medical services to the 'healer' totaling $700. If and when Mrs. Kasko is found, she will be charged with grand theft." (Los Angeles *Daily News*, February 8, 1938.)

"'Dr.' W. J. Bolle, self-styled naturopath and conceded Don Juan, has been indicted by the Marin County Grand Jury on charges of bigamy, grand theft and issuance of fictitious checks. Bolle, now in custody in the east for impersonating a Federal officer, will be returned here for trial after the other sentence is disposed of, District Attorney Albert E. Bagshaw said. The 'doctor,' former operator of a Texas lovelorn correspondence club, assertedly married two bay district women before leaving here. One, Mrs. Evelyn Hough of Martinez, testified before the Grand Jury. The other Miss Areta Lofthouse, San Anselmo nurse, from whom he assertedly took a car and several hundred dollars." (Oakland *Tribune*, February 9, 1938.) (Previous entry, November, 1937.)

"After thirty years of successful practice as a physician and surgeon, Dr. Allen H. Peek of Ventura, formerly of Oxnard, announced today that he is retiring from practice. . . ." (Oxnard *Press*, February 10, 1938.)

"Two Generations of Appliance Makers"

BOARD OF MEDICAL EXAMINERS

(Continued from Preceding Page)

"An echo of the statewide abortion ring, of which R. L. Rankin was reputed master mind, was heard today when the Federal Grand Jury voted income tax evasion indictments against two men once indicted in connection with the ring's activities. After today's indictments, bench warrants were issued for Lawrence J. Giubbini, Livermore chiropractor, and Marvin Raithel, former druggist. Bail for Giubbini was set at $5,000 and for Raithel at $1,000. Giubbini was accused of evading payment of taxes on an income of $12,439 in 1934 and $9,629 in 1935, while Raithel's indictment was based on incomes of $10,095 in 1934 and $3,445 in 1935. The indictments were the result of two years of work by Internal Revenue Department investigators under the direction of Ralph Reed, the investigation dating back to the time when the abortion ring was most active. The two men were among the twenty-three persons indicted here as the result of the death of Vivian Dryden of Oroville. Raithel turned state's evidence, while charges against Giubbini were dismissed." (San Francisco *News*, March 11, 1938.)

Investigation reports relate Paul Fowler, licensed chiropractor, on February 4, 1938, in Los Angeles Municipal Court was sentenced to serve 180 days in jail, the court denying motion for new trial, whereupon Fowler filed notice of appeal and was released on $15,000 bail. (Previous entry, February, 1938.)

"Back from a brush with death, Mrs. Dorothy Marks yesterday told San Francisco police a story of terror and pain. On the basis of the pretty Oakland woman's evidence, Mrs. Ann Brown, sixty-eight, of 1304 Fillmore Street, was jailed on a charge of committing an abortion. . . . Last Sunday the young Oakland woman said she went to the Fillmore Street flat and paid Mrs. Brown, whom she knew as 'Mrs. Emerson' to perform an abortion. Details of a crude operation performed on a kitchen table were given the San Francisco inspectors. Mrs. Marks remained at the Fillmore Street address until Tuesday, when she returned to the hotel in Oakland. On Saturday, Mrs. Marks called Dr. George V. Vandervert. Doctor Vandervert found the young woman seriously ill from an infection, and so reported to police. The physician yesterday declared Mrs. Marks will recover. Inspectors took Mrs. Brown to Mrs. Marks' room. There, Mrs. Marks identified Mrs. Brown as the woman she employed for the abortion. At the City Jail, officers said Mrs. Brown was arrested under the name of Jane Wright on October 22, 1927, and charged with performing an abortion. She was acquitted." (San Francisco *Examiner*, March 14, 1938.) The files of the Board of Medical Examiners show Jane Wright arrested on November 26, 1937. Off calendar pending outcome of felony-abortion charge.

United States Department of Agriculture: Federal Food and Drug Administration.—Seizures recently made under the authority of the pure food law involved a variety of foods found to be dirty or decomposed, the current report of the Federal Food and Drug Administration shows. There were fifteen seizures of scattered small lots of fudge bars and similar candy, the output of one manufacturer. . . .

Parasitic infestation led to confiscation of 300 pounds of whitefish. Insect infestation accounted for the confiscation of 45 cases of canned mustard greens, 970 jars and 1,932 cans of apple butter, 230 cases of canned "field peas with snaps," and 19 cases of tomato catsup. Eight cases of tomato paste showing a high mold content also were seized. The remainder of seizures on grounds of decomposition involved 35 sacks of rabbits, 1,600 pounds of skim-milk powder, 5 cases of canned clams, and 26 cases of canned celery-and-tomato juice.

A survey of the output of certain alimentary paste manufacturers revealed an insistent use of artificial color in

noodles purporting to be "egg noodles," but found to contain little or no egg. . . .

Potatoes, Onions, and Canned Foods Seized

Three carloads of potatoes were seized when examination revealed a form of internal decomposition known as net necrosis, rendering the tubers unsuitable for food.

Substandard canned foods not labeled in accordance with the regulations promulgated by the Secretary of Agriculture, were seized in the following quantities: 660 cases of canned cherries, 218 of "diced" pears, 4,390 of peas, and 372 of tomatoes.

The roundup of flavors and solvents containing poisonous glycols continued during January, the report states. A total of 287 gallons in large containers, and 12,625 small bottles were seized. One hundred six bushels of apples were also confiscated on account of high arsenic and lead residues.

Drug Preparations Seized

Drug preparations and related products were seized as follows: 86 bottles of substandard chloroform, 280 bottles of substandard hydrogen peroxid, short in volume, and containing four times the declared amount of acetanilid; 4 gallons of "Astra-D" (an oil vitamin preparation) containing less vitamin D than represented; 350 boxes of a glandular preparation called "Endofollicolina," not of the claimed strength; 2,835 gross of defective mechanical prophylactics; and the following patent medicines allegedly bearing false and fraudulent therapeutic claims; Arthox, Diatene (a diabetes medicine), Femisan Suppositories, Kolorok, McDonald's Crystalene (for dropsy, diabetes, and rheumatism), Pinolator, Renolin (a dangerous cinchophen preparation), San-Nap-Pak Mentholated Kerchiefs, Tricasco, and Vegetrate Formulas A-45, A-417, D-44, and H-410.

Drug Case Terminations

Drug case terminations during the month are reported as follows: for shipments of pharmaceuticals below the official standards, Levy Products, Inc., Tampa, Florida,

Carmichael, Bessemer, Alabama (aspirin tablets), fine $25, and Carmichael placed on five years' probation; W. D. Taylor & Company, and Clemmie L. Carmichael, Bessemer, Alabama (Kroup Monia Cough Syrup, Kroup Monia Penetrating Salve, and Taylor's Red Oil Liniment), fine $25, and Carmichael placed on five years' probation; Tampa Drug Company, and William G. Allen, Tampa, Florida (Dr. Isaac's Big Jim, and Dr. Isaac's Big Jim Healing Liquid), fine $35; Dr. Ward's Medical Company, Winona, Minnesota (Cough Syrup, Poultry Antiseptic and Astringent, Colic Remedy, and Anti-Pain Remedy), fine $80.

Government Loses Five Cases

Five cases were terminated unfavorably to the Government. In one, involving an alleged departure of a pharmaceutical product from official standard, the court returned a decision of not guilty. Two other pharmaceutical cases were dropped on motion of the United States Attorney because of their extreme age, and one case involving the shipment of a swine remedy and other stock medicines was dismissed by the court because of a fine imposed recently in a similar action against the products. In the fifth adverse termination, the court held that there is no fixed and definite standard to maintain a verdict of guilty in a case alleging deficiency of fruit in preserves.

Fernand Bezançon Elected President of Académie de Médecine.—The internationally known phthisiologist, Prof. Fernand Bezançon has been elected president of the Académie de Médecine of Paris for 1938. This is a well-merited recognition of the many contributions made by Professor Bezançon to the diagnosis and treatment of pulmonary tuberculosis.

Scientists' Habits Scored: Inventor Deplores Ponderance and Lack of Creative Minds.*—Scientific world progress is being held back by two factors, Charles F. Kettering, famed inventor and head of General Motors Research Corporation, said in Miami, Florida, on March 1, as he put the finishing touches to the latest of his many mechanical "brain children."

Those stumbling-blocks are:

The propensity of scientific men to cloak their ignorance with a mass of unintelligible terms and an aura of mystery, and the great lack of creative minds.

Measures Sun

Kettering—"Boss Kett" to those who work with him—has been in Miami for the past month developing a sunshine recording machine by which greater accuracy may be attained in obtaining constant measurement of the sun's intensity.

"We don't know very much about anything," said the man who invented the self-starter, an efficient Diesel engine, the artificial fever machine, and countless thousands of other devices. "We're so terribly ignorant, and if we'd only admit it instead of hiding our ignorance behind high-sounding scientific terms, we'd go farther.

Scores Pretentions

"For that matter," he continued, "we never know just how far we will go scientifically when we start to investigate some problem. All we can do is keep on the road and hope we'll come out somewhere. The trouble with most of us scientific fellows is that we hate to admit we don't know it all, and we keep ourselves back by pretending to have knowledge we don't possess."

Yet, in his opinion, the second stumbling-block to scientific progress is equally important. The world's dearth of creative minds is to him one of mankind's tragedies.

APPROVED CLINICAL PATHOLOGISTS

American Medical Association Essentials for An Approved Clinical Pathologist

An approved clinical pathologist should be a licensed graduate of medicine. He shall have specialized in clinical pathology, bacteriology, pathology, chemistry, and other allied subjects for at least three years, and he should be reasonably familiar with the manifestations of disease in the body. The director of a clinical laboratory shall be on full time or have definite hours of attendance, devoting the major part of his time to this specialty. A clinical laboratory is an institution organized for the practical application of the fundamental sciences by the use of specialized apparatus, equipment and methods, for the purpose of ascertaining the presence, nature, source, and progress of disease in the human body.

The following Clinical Pathologists directing private laboratories in California are approved by the Council on Medical Education and Hospitals of the American Medical Association:

Clinical Laboratory of Drs. W. V. Brem, A. H. Zeiler, Roy W. Hammack and G. D. Maner, 657 So. Westlake Avenue, Los Angeles, California.

Zera E. Bolin, M. D., 490 Post Street, San Francisco, California.

These laboratories use standard methods and are fully equipped to make all clinical examinations of recognized value in: **Tissue Pathology, Bacteriology, Hematology, Serology, Bio-Chemistry, Kolmer, Wassermann, Kahn test, Medico-legal, Basal metabolism, Blood chemistry, Hormone Test for Pregnancy, Parasitology, Cardiology, Autogenous vaccines, etc.**

Mailing containers sent on request. Special delivery postage insures prompt, accurate service.

(Continued from Preceding Page)

Admits Engineering

"Some persons seem to think that science has gone so far that culture and social progress have been unable to keep pace," he said. "That, of course, is foolishness. When a man picks up a telephone in Miami to talk to London or Paris, the trouble with the picture isn't the telephone; it's that so few men would ever have anything important enough to say over such a distance."

Kettering has often described himself as a "pretty fair engineer" and will admit to no other prowess.

Says Engines Simple

"There's nothing mysterious about science," he said. "Take Diesel engines, for example. They seem to be highly complicated mechanisms, but the fundamental principle on which they are run was in use by natives of Burma hundreds of years ago.

"All so-called internal combustion engines, as you know, operate on the fire-making principles. There are three divisions to that principle: fire by friction, as illustrated by the common match; fire by spark, as illustrated by the flint and steel, and fire by pressure.

"All So Simple!'"

"Gasoline motors run on the fire-by-spark method; you build and extinguish three hundred fires a second when running your car. The Diesel engine, on the other hand, uses the fire-by-pressure system.

"Burma natives used to start their cooking fires by taking hollowed-out elephant tusks and compressing the air in it with a plunger. That is precisely what is done in a Diesel engine; air in the cylinders is compressed until it gets hot enough to ignite the fuel in the bottom.

"You see, it's all very simple."

Developing Motors

Kettering admitted, however, that in the last five years his company has spent $18,000,000 on the development of Diesel motors. "Working out little details," he explained.

In the final analysis, Mr. Ketterling believes, the future of all transportation and power hinges on the ability of science to capture the energy of the sun. He has for years been intensely interested in research on plant chloryphyl—the stuff leaves produce as a result of absorbing sun's rays. He called it "the most important research being conducted today," and averred that thus far science has failed to do little more than take what little sun energy plant life has already absorbed.

Fuels Products of Sun

"All our fuels are products of the sun.

"We dig coal from the ground and pump petroleum and use the energy it was given by the sun," he said.

"What we must do now is learn how to use today's sunshine rather than the sunshine of thousands of years ago. But we're so ignorant!"—*Los Angeles Times,* March 2, 1938.

Bread for Washington's Army.—Christopher Ludwig, a baker of gingerbread in Philadelphia, was the first man to be appointed by Congress as "Superintendent of Bakers and Director of Baking in the Grand Army of the United States." This appointment, together with a salry of $75 a month and two rations a day, was made in May, 1777, three years after the opening of the Revolutionary War.* For this amount, because of his patriotism, Ludwig gave up a thriving business and undertook to see that the soldiers were regularly supplied with good bread.

* Excerpt from Journal of Congress, Saturday, May 3, 1777: Resolved, That Christopher Ludwig be appointed superintendent of bakers, and director of baking, in the grand army of the United States; that he have power to license, with the approbation of the commander in chief, or officer commanding at any principal post, all persons to be employed in this business, and to regulate their pay, making proper report of his proceedings, and using his best endeavors to rectify all abuses in the article of bread: That no person be permitted to exercise the trade of baker in the said army without such license; and that he receive for his services herein, an allowance of 75 dollars a month and two rations a day.

minimizes scarring

A FEATURE OF

ANTI-PYREXOL

This most comfortable, and least troublesome dressing for burns may be depended upon to

1. Relieve pain promptly.
2. Protect denuded areas.

919 E. Pico Street **Los Angeles, Calif.**

NOT ADVERTISED TO LAITY

Before the Director of Bakers was chosen, bread making in the army had been a very haphazard proceeding. Instead of rations of bread, the men were given an allotment of flour daily. Sometimes they tried baking their own bread on hot stones, but because the "fire cakes" were so unsatisfactory it was more usual for them to pool their flour and have some comrade do the baking. This led to bad practices, because these chosen bakers returned one loaf of bread for a pound of flour, using as much water as they pleased and keeping for themselves the flour that was not needed for each loaf. This extra flour they used to trade with the civilians. There is a record of bakers who made such huge profits in this way from a regiment (about three hundred men) that they were able to lend the commissary one thousand flour rations for eight days.

All this changed when Ludwig took charge. In setting his salary, it was suggested that as a special plum he be allowed to deliver only eighty loaves of bread for every hundred pounds of flour supplied to him. This he flatly refused to do, saying that 100 pounds of flour should yield 135 loaves of good bread and that that was what he proposed to deliver.

The men preferred hard bread which in some ways made things easier, but one of the greatest difficulties was to get flour and another was to get the bread delivered to the men in fit condition because no one was designated by army or congressional orders to take charge of it after it left Ludwig's care. Sometimes it moulded and sometimes it crumbled beyond the point of any use, and everyone sidestepped responsibility.

However, after petitioning Congress, and getting results, it was arranged that the flour should be supplied by the commissaries of the different divisions and posts, that bakers could be hired from outside, and that transportation be provided. No provision was made, however, for the salaries of hired bakers, and so Ludwig sold his houses in Philadelphia and took his business savings, some 3,500 pounds, to pay the men from his own pocket. As the army spread, and shipping had to be done over longer distances,

When Steers Had Long Horns

THE medicinal value of the glands of internal secretion was not recognized.

But times have changed, as well as cattle. Now, the therapeutic value of certain gland products is definitely established and each year adds to our knowledge in this important field of therapeutics.

To the physician prescribing gland products we urge specification of "Wilson," because it connotes a product made at the source of supply from fresh glands, processed promptly, with the aim of conserving maximum hormone activity, in a laboratory devoted exclusively to the endocrine field.

locked wagons were supplied to deliver the bread to the camps, and money ($1,000) was appropriated by Congress to build brick ovens and hire workmen. Even with all this help of baking-posts, wagons, and men, the bread supply was seldom a week ahead of consumption, and sometimes less. Shortage of crops and dried watermills added to the troubles of poor Director Ludwig, as well as roads clogged with rain, grain speculators houding out for high prices, and grain-damaging rains. Bakers deserted, personal resources were nearly exhausted, rations were cut, and new baking centers were organized. Finally, in 1782, after Ludwig had kept hard at it in his central plant at West Point, the crisis was passed.

One interesting and strategic move was accomplished with the aid of the French bakers. Acting under orders, they began with a great stir to build ovens and make preparations for the establishment of a baking unit at Chatham, New Jersey. This completely misled the British commander, Sir Henry Clinton, into thinking that Washington intended to attack New York. In the meantime, Washington was pushing on to his real objective, Cornwallis, and by the time Clinton realized that a ruse had been accomplished the army was at Philadelphia and it was too late for the British to stop them.

Better Diets Main Factor in Preventing "Human Erosion."—If a raise of $100 a year in wages or salary comes to a family in a small city, the dining table will reflect the increase, but the previous income of the family will make a difference in how much more is spent for food. Those in the lower income groups with earnings of less than $1,500 a year probably will put about $20 of the raise into food. The families with incomes of from $1,500 to $3,000 probably will add $10 out of the $100 to food spendings, and the groups with incomes of more than $3,000 will average spending about $3 out of the added $100 for food.

Dr. Hazel K. Stiebeling of the Bureau of Home Economics contributed these figures to the symposium on con-

Authorities say: The value of Vichy Celestins as an adjuvant in hepatic and gastric affections, has long been acknowledged in medical literature. Its use is indicated both in their treatment and dietetic management.

THE POTTENGER SANATORIUM AND CLINIC

For Diseases of the Chest — Monrovia, California

AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

servation of human resources at the Washington Hotel on March 4 in an address in which she traced the connection between inadequate diet and "human erosion," and emphasized that an abundant supply of well-chosen foods can "raise health from levels generally accepted as average or usual to definitely superior planes. Fully adequate diets are a conservation measure in the finest sense of the word.

"The potential increase in the market for food is among the lower income groups. They are the ones who most need more and better food. They are the ones who would be most likely to spend more money for food if they had it. One possible way of insuring more food to low income groups is by increasing incomes without increasing food prices. An alternative is to lower food prices without cutting incomes." For rural families the most practical way of improving the diet in many cases is by increase in home production of fruits, vegetables, and milk.

Commenting that some short-time demonstrations tend to show that human beings respond to diets in much the same way as some of the laboratory animals, Doctor Stiebeling said: "Observations upon generation after generation of laboratory animals indicate that superior diets result in somewhat more rapid rate of growth in the young and somewhat larger size at all ages. They contribute to greater than average success in the rearing of young; and, more important, they make the body more able to resist and cope with infection, and also significantly prolong the prime of life."

Plenty of fruits and green vegetables and plenty of milk and milk products are the main features in which the good diets are likely to differ from the diets that are inadequate or poorly balanced. These are the items which nutrition specialists group as the "protective foods" supplying the

(Continued in back advertising section, page 35)

WHO contributes to medical progress? The chemist, the bacteriologist, the clinician, to be sure, and all other workers in the basic and medical sciences. A less manifest but no less essential part is played by the pharmaceutical manufacturer, who contributes to medical advancement by fundamental research and through adaptation of laboratory methods to economical, large-scale production.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS†

ANNUAL SESSION—PRE-CONVENTION BULLETIN SUPPLEMENT

April Supplement Should Be Read.—Members of the California Medical Association are urged to scan the pages of the Annual Session—Pre-Convention Bulletin Supplement to this April issue of CALIFORNIA AND WESTERN MEDICINE, in order to acquaint themselves, not only with the scientific work which their essayist colleagues have been pursuing during the last year, but also to learn somewhat more concerning some of the major organization problems to which the officers and committees of the Association have been giving careful study.

* * *

Scientific and Organization Programs.—An inspection of the pages of this Supplement will promptly indicate how large a constituent state unit in organized medicine is the California Medical Association, and how varied and important are the interests of its membership. The lists of papers on scientific topics offered by its twelve scientific sections (Anesthesiology, Dermatology and Syphilology, Eye, Ear, Nose and Throat, General Medicine, General Surgery, Industrial Medicine and Surgery, Neuropsychiatry, Obstetrics and Gynecology, Pathology and Bacteriology, Pediatrics, Radiology and Urology) are sufficiently attractive to lead every member to ask himself why he should not make an effort to attend this coming 1938 annual session? It will hold its first general meeting on Monday, May 9, in the beautiful Hotel Huntington at Pasadena, with succeeding meetings continuing through Thursday of the same week. The Committee on Scientific Program and the Section officers have made earnest efforts to present programs of sufficient worth to maintain real interest throughout the four-day session. Perusal of the synopses of the papers will prove convincing on these points.

* * *

Pre-Convention Bulletin "Reports."—Part II of the Supplement is given over to the Pre-Convention Bulletin, in which appear the reports of the general officers, councilors, standing and special committees. Here, also, a perusal of the text at once makes apparent that official position in

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

Association activities implies more than empty honor. The printed reports only scratch the surface of the work and problems discussed, some of which will no doubt receive extended consideration by the House of Delegates and its Reference Committees. It is to be hoped that all members of the Association will take the time to at least glance at the reports submitted, and if suggestions occur to them in such reading, that members will communicate with their delegates so that proper consideration may be given to their opinions. The House of Delegates will meet on Monday and Wednesday evenings, and its Reference Committees will be in session throughout most of Tuesday and Wednesday, to consider the printed reports and the suggestions of members who wish to make any comment. Every member has the right, and should feel free to appear before the Reference Committees and present any matters having to do with medical practice which he deems worthy of study by the Association's officers. The office hours of the Reference Committees will be posted on the bulletin boards.

* * *

Other Annual Session Activities.—Attendance at the annual session need not be limited to listening to papers by guest-speakers and members, since an excellent scientific exhibit can be visited. Also a commercial exhibit, which all members are urged to inspect inasmuch as it is these exhibitors who, through their advertising coöperation, make possible, in part, the official journal of the Association. The representatives of the drug and publishing houses, and other firms who will display their products, will appreciate your visits to their booths, and such interest will be a gracious return for their indirect financial coöperation.

* * *

Hotel Accommodations at Annual Session an Increasing Problem.—With a membership of almost six thousand physicians, the California Medical Association is finding it increasingly difficult to find hotels of size, ample to care for the activities that are a regular part of its annual session. Space must be provided not only for general meetings, and for gatherings of twelve scientific sections, but for the House of Delegates, the Council, the Scientific and Commercial Exhibits, and the Woman's Auxiliary. Even so large a hotel as the Huntington is lacking in space for all these, so that it has been necessary for the Association to erect a special pavilion for exhibit displays. The Woman's Auxiliary will have its registration headquarters and some of its activities at the Hotel Huntington, but certain other of its meetings will be held at the Hotel Vista del Arroyo.

* * *

Transportation and Other Items.—The Supplement also gives information concerning registration, transportation, and other facilities. Attention is called to the desirability of making early table reservations for the President's dinner, to be held on Tuesday evening. Finally, some words of advice are submitted for those who wish accommodations at the Hotel Huntington, they being requested to make their reservations at once, and secondly, for members of the House of Delegates, who are urged to finish dining before 8 p. m., the hour scheduled for calling the House to order on Monday and Wednesday evenings.

And last, but not least, you are requested not only to consider possible attendance at the 1938 annual session, but actually to be among those present to profit and enjoy the meetings. If you do so, you will have no reason for regrets.

KERN COUNTY HOSPITAL APPELLATE COURT DECISION: SOME LEGAL INTERPRETATIONS

Full Text of Kern County Hospital Decision Was Printed in the February Issue.—Every case that is presented to a court of law, with attorneys representing opposing sides, naturally implies a difference of opinion, either by the parties in interest or by their legal advisers. The Kern County Hospital case—the full text of which opinion (as handed down by the Fourth Appellate District of California) was printed on page 106 of the February, 1938 issue of California and Western Medicine—was no exception to this rule.

* * *

Misinterpretation of the Kern County Appellate Court Opinion.—With that opinion, as embodied in the injunction provisions, under its Subdivision 8, we have no quarrel. But with those officials of Los Angeles County, who in direct or indirect administration of that county's public institution for the sick—the Los Angeles County General Hospital—have claimed that this decision of the Appellate Court not only gave them the right, but made it mandatory for them to send bills for hospitalization services, we have and continue to take issue. It has been our opinion, and still is, and in preceding months we have so stated, that the Board of Supervisors of Los Angeles County have been erroneously advised concerning the Kern County Hospital decision, both as to its context and as to its applicability to the Los Angeles County General Hospital.

* * *

Contradictory Statements by Los Angeles County Officials.—Just who were or who are the parties responsible for this faulty advice, legal and otherwise, we do not know, nor have we been able to find out. The officials themselves do not seem to know, because the Superintendent of the County Hospital, Mr. E. J. Gray, in his letter of November 3, 1937, stated:

> The Kern County decision requires that the charges billed to patients . . .

And again:

> In billing under the Kern County decision . . . (see February California and Western Medicine, page 99);

whereas Mr. J. C. Greer, Director of Accounts and Statistics, in a letter dated December 2, 1937,

in reply to a letter mailed to him on November 10, 1937, stated:

The basis for claiming reimbursement from a county client is found in the previously cited section of the Welfare and Institutions Code, not in the Kern County decision. . . . (See February CALIFORNIA AND WESTERN MEDICINE, page 104.)

* * *

Legal Opinions Opposed to Los Angeles County Interpretations.—Again, at a conference held in the office of the Board of Supervisors on February 12, 1938, the first of five questions or topics* on which an opinion was rendered by County of Los Angeles officials (legal and hospital authorities) was as follows:

"The Appellate Court decision in the *Goodall* vs. *Brite* case in Kern County, defining the County's responsibility relative to the operation of county hospitals and the fixing and collecting of fees."

The statements then made by representatives of the County were out of line with Subdivision 8 of the Appellate Court decision, already referred to above.

At that conference, Mr. Howard Burrel, counsel for the Association of California Hospitals, in a written opinion there submitted to Supervisor G. L. McDonough, stated:

In regard to indigents [indigent patients] having no present property, we find no requirement in the statute that they should be billed. . . .

In a letter dated January 19, 1938, Hartley F. Peart, Esq., General Counsel of the California Medical Association, gave the following opinion:

The injunction in *Goodall* vs. *Brite,* which was very carefully prepared and which was approved by the District Court of Appeal after a lengthy and exhaustive hearing, leads one to believe that the District Court of Appeal assumed that persons admitted to county hospitals as indigent sick or dependent poor persons, *after due inquiry and investigation had established such to be the fact,* would never be called upon to pay the cost of hospitalization if they should in the future acquire resources. . . .

Also, Mr. Peart added,

if the court's decision is not followed, and no injury and investigation is made, the answer is, of course, that the board of supervisors must be considered to be acting in excess of its statutory authority.

Read also what another able member of the legal profession wrote concerning the Appellate Court opinion, as follows:

Certainly, nothing in the judgment of the court even suggests to a reasonable person any obligation on the part of the defendants to collect from indigent persons or dependent or partially dependent persons, anything whatsoever.

This legal friend continues:

. . . The court does not say power to compel payment, but power to provide for hospitalization of each individual patient should be "charged to the patient on his ability to pay." It clearly implies that if a patient has no ability to pay, nothing should be charged to him; that if he is able to pay, say $1 or so a week, only that amount should be charged to him and to the extent that such a patient is able to pay only less than the entire cost of hospitalization in his own particular case, the Board of Supervisors should in their rules of admission provide for payment of the balance. Of course, here I come back to a clause that I have stated above, which makes this reasoning dependent on the legal authority of the Board to use public funds to pay the cost of hospitalization of totally indigent persons and the balance of the cost of hospitalization of persons able to pay only in part for the services rendered. Such authority seems to be clearly implied in the opinion of the court. . . .

. . . The fact that they have elected to charge persons for services amounts that they knew such persons would never be able to pay, and the fact that they have under the pretended cover of a court order spent public money in efforts to collect accounts which they knew were uncollectible, without asking further instructions from the court, would seem to me, in view of the clarity of the court's decision and judgment, to come very near to exposing them to punishment for contempt of court.

* * *

General Counsel Peart's Discussion in This Issue.—Elsewhere in this number of CALIFORNIA AND WESTERN MEDICINE, on page 297, in the standing Medical Jurisprudence department, Mr. Peart, General Counsel of the California Medical Association, discusses legal phases of the Appellate Court decision in considerable detail. Mr. Peart's opinion, which is worthy of careful reading by every member of the California Medical Association, has especial value, not only because in his many years of service with the California Medical Association he has had occasion to give particular attention to the matters at issue, but also because, in the appeal to Appellate Court in the Kern County case, he appeared as one of the attorneys for the respondents, as did also Mr. Burrell, whose opinion was also quoted above. (See February issue, page 107.) It is fair to assume, therefore, that they know somewhat of the legal matters under discussion.

* * *

Evasion of These Fundamental Issues Will Be of No Avail.—Our reason for giving space to the above is that some newspaper articles containing interviews with county officials seem to avoid the basic matters involved in the criticisms of procedures in vogue at the Los Angeles County Hospital, while what one might term an almost studious attempt to show the costs to taxpayers if patients are not billed, is seemingly emphasized.

No such evasion or begging the question will suffice in the matters at issue, which must be settled on the basis of California law and fair play alike to patients, taxpayers, and the medical profession.

* * *

Evidence in February, March and April Issues Is Convincing.—The evidence presented in the February, March, and April issues of CALIFORNIA AND WESTERN MEDICINE possesses sufficient merit to warrant an impartial and thorough investigation, in order that illegal and improper procedures may be stopped. That is a responsibility which the Board of Supervisors must meet, even though the duty be unpleasant. The medical profession asks for no favors for its members, but feels that the past and present services of physicians who are on the attending staff of the institution warrant that much, no matter what the ultimate decision may be.

* See March CALIFORNIA AND WESTERN MEDICINE, page 217.

JOINT MEETINGS WITH THE LEGAL, DENTAL, AND PHARMACEUTICAL PROFESSIONS

A Joint Meeting Held Twenty-five Years Ago.—In the Twenty-five Years Ago department of this issue, the first item, taken from comments by Editor Jones in the official journal of April, 1913, concerned a joint meeting of the Monterey County Medical Society and the Monterey County Bar Association:

Why Not More Such Meetings?—On February 22 there was held, at Del Monte, the annual gathering of the Monterey County Medical Society and the Monterey County Bar Association. It was a good meeting, a good banquet, and a very good idea inspired it; anything that will get doctors to mix with other professions is unqualifiedly good.

In a number of counties there are good, live medical societies and bar associations; why not steal this idea from Monterey and get together once a year for a joint session of well-mixed wit and wisdom? Surely, we can each learn something from the other, even if it is only the fact that the other fellow is not so bad after all!

Since 1913 a number of such meetings have been held in California. The attention of the Program Committees of county societies is called thereto because such gatherings should be held not only here and there, and then only at spasmodic intervals, but rather, as a regular annual routine and not by one, but by each of the component county medical societies that constitute the California Medical Association.

* * *

Meeting of Los Angeles County Medical and Pharmaceutical Associations.—The Los Angeles County Medical Association, for example, on March 17, in its headquarters' auditorium, held such a joint meeting with the members of the pharmaceutical profession, that meeting to be followed in April by a joint gathering with the County Dental Society, and in May with the County Bar Association. The attendance at the first of these three joint conferences was excellent, the inspiriting program including the following:

PROGRAM

Humane Pound Law in Its Relation to Research in Medicine and Pharmacology.

(*a*) From the standpoint of the pharmacist—Hon. James Boyle, Assemblyman, Sixty-sixth District.

(*b*) From the standpoint of the physician—Dr. Clinton H. Thienes, Department of Pharmacology, University of Southern California.

Federal and State Narcotic Laws.

(*a*) Cautions from the standpoint of the pharmacist—Frank Homer, President, Southern California Retail Druggists' Association.

(*b*) Cautions from the standpoint of the physician—Dr. William R. Molony, Sr., President, State Board of Medical Examiners.

Prospective Legislation of Interest to Medicine and Pharmacy—Mr. Frank E. Mortensen, Secretary, Southern California Retail Druggists' Association; Dr. E. T. Remmen, member of the California Medical Association Committee on Public Policy.

* * *

High Points in the Recent Los Angeles Joint Session.—The short and to-the-point papers given in the program quoted above were of such merit that they are reprinted on pages 257 and 258 of the current issue. It was particularly interesting to hear from Pharmacist James Boyle—who during several terms has been a member of the Assembly of the California Legislature, and has been such a staunch and able friend in all public health matters—his reaction to the "State Humane Pound Law," as based on actual experience with the forbears of the present proposed Initiative Act, when these bills came before the last several legislatures. It is to be hoped that members of the Association will take the time to read what Mr. Boyle and Doctor Thienes had to say on medical research work, and how proposed laws would greatly handicap such studies.

Of almost equal interest were the talks on the Federal Harrison Narcotic Act and the California Narcotic laws. These also are printed in this number, on pages 261 and 262.

* * *

This Year: Important to Public Health Interests.—Druggist Frank E. Mortensen has represented the pharmaceutical profession during the last several years at Sacramento, when the legislature has been in session. His recital of experiences was both instructive and interesting, and emphasized the comments by Dr. E. T. Remmen, member of the California Medical Association Committee on Public Policy and Legislation, on the need of special alertness in this state election year, and particularly so before and at the primary elections.

Component county societies are again reminded that the kind of legislation affecting public health standards and medical practice will depend in good part upon the character of the Assemblymen and Senators who will gather at Sacramento in January, 1939. Also, that every legitimate effort should be made in every one of California's counties to support only those candidates to Assembly and Senate whose past careers and records indicate a broad and fair outlook on all legislation related to the public health.

* * *

Time Allotments and Topics in Joint Meetings.—The general nature and time allotments of this year's program plans of the Los Angeles County Medical Association were outlined on page 231 in the March, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, and the attention of program committeemen who failed to note the item is directed anew for such suggestive value as it may have for other county units.

CALIFORNIA MEDICAL ECONOMIC SURVEY

A Recent Review in the "Journal of the American Medical Association."—On page 289 appears an article, "California Medical Economic Survey," reprinted from the February issue of the *Journal of the American Medical Association*, in which some frank comments are made on the "Report on Factual Data" of that survey, as brought off the press by the California Medical Associ-

ation in November last, a copy having been sent at that time to each member of the California Medical Association.

* * *

"Journal of the American Medical Association" Criticisms of Deficiencies in Survey Directors' Tables.—The *Journal of the American Medical Association* criticisms call particular attention to the somewhat loose manner in which the director of the survey used the terms "adequate" and "inadequate" in compiling his tables. Exception is also taken with the phrases and comment dealing, "With regard to standards or definitions of illness and diagnosis" and "On the subject of medical treatment." Quoting further:

> There is a tendency throughout the published tables to exaggerate the lack of medical care, the cost of such services, and the implied defects of the medical profession, by the arrangement of the tables and the wording of the captions. . . .
>
> The Census Bureau of the United States Department of Commerce issues periodic estimates of the population of the states, but there appears no explanation of the use of a local estimate in preference to the Census Bureau estimate of the population. Likewise, the number of physicians in California in 1934 is less by 1,407 than the number given in the 1934 American Medical Directory. . . .
>
> If Figure 16 is used to represent the prevalence rate of specific disease, California is depicted as a very unhealthful place in which to live. . . .
>
> These complete figures for all the recorded physicians in California were available at the time the California Medical Economic Survey was conducted. The California survey figures give a grossly distorted picture of the percentage of general practitioners and specialists in that state. . . .
>
> The tables and figures in this report give the reader the impression that there has been an effort to arrange a build-up for sickness insurance. . . .

* * *

Survey Project Has Been Completed.—In these columns in former issues of California and Western Medicine, in order to avoid controversy, nothing more has been sought other than to place on printed record, in the Official Journal of the California Medical Association, the informative facts that this FERA-WPA project had been completed to the satisfaction of the Federal authorities, and that the final report as submitted by the survey director was the property of the State of California, to be used or reprinted only in such manner as the constituted State agency appointed by the Federal authorities—in this instance the California State Board of Public Health—deemed proper. It is gratifying to know that the Council of the Association will be in a position to report to the House of Delegates in May that this survey adventure, which was begun in 1934, is finally a completed task.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 274.

EDITORIAL COMMENT†

THE TREATMENT OF CHRONIC OCCLUSIVE PERIPHERAL ARTERIAL DISEASE

The sufferer from chronic peripheral occlusive arterial disease presents a problem which has only recently received the more serious attention of the profession. These affections take a heavy yearly toll in incapacity, suffering, loss of limb and, much too often, loss of life. It is imperative, therefore, that the sufferer be given every chance to preserve the integrity of his extremities and the loss of his activity.

The first duty of the physician is to establish, if possible, the nature of the effection. The vascular diagnostician must be fully conversant with the anatomy and physiology of the peripheral circulation, and the relationship of the autonomic nervous system to it. To the general examination, and examination of the vascular competency of the extremity, must be added an estimation of the part played by the sympathetic nervous system in the disability. This estimation of arterioconstriction should be quantitatively determined by utilizing an accepted method of vasomotor study. The treatment of the individual case will depend in a great measure upon the available vasodilatation.

The occlusion at hand may be due to arteriosclerosis, thrombo-angiitis obliterans, endarteritis obliterans, and other more rare affections. Whatever the nature of the occlusion, it is manifested by decreased flow of blood to the part; whatever its nature, the treatment aims to increase the circulation to the impoverished extremity. In many of these affections arteriospasm is an important factor in the early stages; by diminishing the blood supply and retarding the flow, it may be partially responsible for the onset of thrombosis and eventual tissue death.

If there is little or no vasoconstrictor element, it is illogical to consider an attack directed toward ablation of sympathetic influence. The usual conservative treatment must not be neglected. Suction-pressure therapy may be beneficial in some cases; in many it is of no avail.

Ligation of the main vein to the extremity may be considered in a small group of carefully-selected cases; despite opinions advising against this procedure, the writer has noted gratifying results in a small number of cases so treated. Drugs have been, without exception, disappointing.

When the element of vasoconstriction is considerable, the treatment is best directed toward releasing this factor. Diathermy, the administration of vasodilating drugs by iontophoresis and otherwise, suction-pressure therapy, artificial fever, and other methods have frequently given but temporary relief. Ganglionectomy will, without doubt, increase the total blood flow to the part by an amount equal to or greater than that indicated by preoperative vasomotor studies. Following opera-

tion the increased blood flow will be present day and night, and will be more marked and far more persistent than that obtained by any other means known to the writer. It may be the important factor in establishing a satisfactory collateral circulation to a failing extremity which might otherwise soon progress to ulceration or gangrene. It should be done early, before the vasoconstrictor element has decreased with the progress of the disease. The writer performed lumbar ganglionectomy on such a patient four years ago, the temperature of whose desympathectomized extremities is still maintained at the maximum level. Less satisfactory results are obtained in the upper extremities. The operation requires only about one week hospitalization and carries, in trained hands, practically no mortality. Although the circulation can thus be unequivocally increased, only about half the number of patients are relieved of severe claudication; yet the operation gives them more insurance against the serious complications of the disease than any other procedure.

STRABISMUS IN CHILDREN

Dr. S. A. Durr's paper,[1] read by him before the Eye Section of the California State Medical Association in 1936, again draws our attention to the problem of strabismus in children.

Samuel Butler, in Erewhon, described a civilization where medical knowledge is so advanced that sickness is a crime. When people are sick, instead of sending them to a hospital, they are sent to jail, because there is no excuse for ill health. The time will come when somebody will be imprisoned whenever there is a child who has strabismus. Whether the parents or the attending ophthalmologist will be incarcerated in the Bastille for such a heinous crime as the neglect of a child with strabismus, remains to be seen. Probably both the parents and the attending ophthalmologist will be condemned.

The reduction of the number of children seen with strabismus is best illustrated in the case of the school children of San Francisco. In 1929 I reported the summary of eye examinations, personally conducted, of over fifteen thousand children.[2] The number of children found with uncorrected strabismus of varying degrees was 2.4 per cent. Since that time the number of children with strabismus seen in the schools of San Francisco has been greatly reduced. It is now possible to examine the children in a large school and not find one uncorrected case of strabismus. It is my impression that the number of children with strabismus in San Francisco is now less than one per cent.

This has been accomplished through two factors:

1. The education of the school teachers and the follow-up work by the nurses of the San Francisco Department of Public Health of all cross-eyed children. Through them the parents have been educated to the necessity of early medical attention, which a child with strabismus needs. Indirectly the medical profession, especially the pediatrician, has become aware of the fact that children do not "outgrow a squint." The school nurse and the physician realize that if glasses do not promptly correct a squint, operation is indicated, and the age of the child is no contraindication to an eye operation.

2. The popularization of O'Connor's operation for squint makes it possible to operate on a child at any age. Doctor Durr has fully covered the advantages of O'Connor's operation. From the parents' point of view—and after all it is the parents who have to be persuaded as to the necessity of the operation—the fact that hospitalization can be reduced, if necessary, to only twenty-four hours, is one of the most important factors in obtaining permission to operate early on young children. Although I am not so old, I can still remember the time when, after doing an advancement, it was necessary to cover both eyes, use a starch bandage, and keep the child from ten to fourteen days in the hospital. The average age of the last forty strabismus cases operated on at the Stanford University Eye Clinic, with the O'Connor method, was nine and one-half years. Ten years ago the average age of a child operated on for a squint was around fourteen years. It is not necessary for me to emphasize the importance of early operative procedure in squint cases.

Doctor Durr's paper is of great importance in that it again draws the attention of the medical profession to the advantages of the O'Connor operation and its importance in the reduction of the number of uncorrected cases of strabismus.

CREEPING ANOXEMIA IN BRONCHOPNEUMONIA

A positive correlation has been noted by Stadie, Binger, Barach, Hill, Campbell, Poulton, and other investigators, between anoxemia and mortality in pneumonia. If anoxia is a contributory cause of death, it is so by its action on the vital centers—particularly myocardium, medullary and other nerve centers. The nervous system being particularly sensitive to oxygen want, symptoms usually appear when the oxygen unsaturation of the arterial blood drops to 15 per cent.

Evidence of anoxemia, manifested either by diffuse cyanosis, characterized by leaden pallor of the face or by nondiffuse cyanosis with bluish tint of fingernails, chin, lips, ear, cheek, may be apparent so late that valuable time has been lost before oxygen therapy becomes available.

Stadie has shown that O_2 unsaturation of the arterial blood, over 30 per cent, generally results fatally. A higher degree of unsaturation occurs in bronchopneumonia than in the lobar type.

In some of the bronchopneumonia patients in the recent epidemic, symptoms referable to the nervous system included: restlessness, sleeplessness, talkativeness, apprehension, and increased

2 Eye Examination of School Children, *Journal of the American Medical Association*, Vol. 93, pp. 911-916, September 21, 1929.

nervous tension, with spasticity of the voluntary muscles. The mind may be lucid, mental impressions being clear-cut and accompanied by actual euphoria. Tingling and hypoesthesia in the extremities were often pronounced, and should the anoxia continue unrelieved, are replaced by numbness and marked muscular weakness.

In adults the onset of either periodic, or shallow and rapid breathing is ominous. When there is no retention of CO_2 in the body, however, the patient may feel no distress and make no complaint, although in great danger from acute oxygen want. Because of the insidious development of the condition described, the term "creeping" anoxemia has been chosen.

Attempts to control the above symptoms by administration of barbiturates or opiates are contraindicated, as they tend to increase respiratory depression and the degree of anoxemia.

Although only a supportive measure in the management of the bronchopneumonia patient, on the other hand, early oxygen inhalation is invaluable.

Boothby's observation of a drop in temperature following a patient's admission to the oxygen chamber has been confirmed. It is noteworthy that, although oxygen often relieves restlessness, it may occasionally increase the restlessness of a patient, owing to recovery of the higher centers. To avoid this, the percentage of oxygen should be raised slowly, *e. g.,* from 3 to 6 liters per minute in one hour.

HEMORRHAGE AND SHOCK INCIDENT TO CESAREAN SECTION

Cesarean section is in great part responsible for the prevalence of a high maternal mortality in this country. The triumphs of modern surgery, and particularly the safety and success of the present-day laparotomy, have given the profession, as well as the laity, a false sense of security so far as cesarean section is concerned. It is not fully realized that cesarean section carries the risks of laparotomy in general, plus the hazards of a most unphysiologic method of delivery.

The dangers of hemorrhage, shock and infection, which are common to most laparotomies, are multiplied manifold in the case of abdominal delivery. In a recent review of nine hundred cesarean sections performed in Iowa, Plass[1] found that the maternal mortality was 7 per cent. Forty-nine and three-tenths per cent of these deaths were due to sepsis, 19 per cent to toxemia, and 20.7 per cent to hemorrhage and shock. Hemorrhage, also, undoubtedly plays an important part as a cause of death in the fatalities ordinarily attributed to toxemia. Dieckmann and Daily[2] recently made accurate measurements of the blood loss incident to cesarean section at the Chicago Lying-In Hospital. They found that the quantity of blood lost ranged between 170 cubic centimeters and 1,410 cubic centimeters, the average being 546.7 cubic centimeters. In the hands of the occasional operator, this blood loss must, of course, be much greater.

Hemorrhage in cesarean section is undoubtedly due to the disturbance of the physiology of labor. It is a well-known fact that the uterine muscle is relatively insensitive to stimulation until the end of pregnancy. With the onset of labor there is an abrupt rise in the susceptibility of the uterus to mechanical stimuli, and to the influence of oxytocic drugs; this irritability increases during the progress of labor, and reaches its height during the course of the second stage. It seems, then, that it is distinctly unphysiologic to precipitate the third stage of labor on a uterine muscle which is unprepared even for the first stage. Hemorrhage, consequently, is to be expected when labor is eliminated, or terminated early in its course.

The above remarks are not presented as an argument in favor of cesarean section late in labor. It is, however, intended to point out that the wisdom of elective cesarean section is open to question, and that the burden of proof must be assumed by those who maintain that the best results are obtained when cesarean section is done at an "appointed time," rather than at the onset of labor.

The abrupt termination of the third stage is another radical departure from the normal. The incision in the uterus frequently encroaches on the placental site, especially in the classical section. It is, therefore, necessary to remove the placenta promptly in an effort to control the profuse bleeding from the incision, and from the coincident partial detachment of the placenta. This interference with the natural course of the third stage tends to cause hemorrhage in cesarean section, just as it does in vaginal delivery.

Shock in cesarean section is chiefly due to the following factors: general anesthesia, celiotomy, the sudden release of the amniotic fluid, the immediate delivery of the fetus and placenta, and the coincident unavoidable hemorrhage. Commonly associated obstetrical factors which further predispose to shock are exhaustion from prolonged labor, toxemia, antepartum hemorrhage, and overdistention of the uterus due to multiple pregnancy or polyhydramnios.

The foregoing review emphasizes the facts that cesarean section is often complicated by serious hemorrhage and shock, and that the hazard due to these complications can be lessened by a careful selection of cases for section, and by a close adherence to well-established obstetrical and surgical principles. Abdominal delivery is, however, fundamentally an unphysiologic procedure, and no care and skill in its performance can fully compensate for the profound disturbance created in the mechanism of labor. Hemorrhage and shock, therefore, should be anticipated in all cases of cesarean section, and adequate preparations be made to meet these emergencies before surgery is undertaken.

HYPERPARATHYROIDISM: WITH SPECIAL REFERENCE TO PARATHYROID ADENOMA*

By William W. Washburn, M.D.
San Francisco

Discussion *by H. Lisser, M. D., San Francisco; Paul Michael, M. D., Oakland; Robertson Ward, M.D., San Francisco.*

CLINICALLY, hyperparathyroidism manifests itself in the presence of (1) parathyroid adenoma, or (2) generalized hyperplasia of the parathyroid bodies. Although a hypertrophy and hyperplasia of the parathyroid bodies may be found in conditions such as osteomalacia, osteitis deformans, multiple myeloma, metastatic carcinoma, rickets, scleroderma and nephritis, the enlargement in these conditions is of a secondary or compensatory nature. The principal condition in which hyperparathyroidism is noted is due to adenoma of the parathyroids, and gives rise to the disease described by von Recklinghausen in 1891. He outlined certain changes in the skeleton, to which he applied the term "osteoitis fibrosa." In 1925, Mandl [1] noted improvement in a case of osteitis fibrosa following the removal of a parathyroid tumor, and to him is usually given the credit for establishing a distinct relationship between the two conditions. However, Schlagenhaufer,[2] in 1915, demonstrated two autopsy specimens with enlarged parathyroid glands and marked skeletal changes. He stated that he believed that surgical removal of the tumor was indicated in advanced cases of bone change. Since that time numerous observers have contributed to our knowledge of the disorder. In 1930, Du Bois,[3] in the United States, published a case of osteitis fibrosa cystica associated with hyperactivity of the parathyroid bodies. The term "hyperparathyroidism" was first used in 1929 by Barr,[4] who reported the first proved case in the United States. Due to the increased interest in study of the parathyroids during the last decade, the number of reported cases has gradually been increased, though still comparatively small, as will be noted from the report of Wilder and Howell [5] as late as 1936. From their review of the literature, they were willing to accept 135 cases reported in the eleven years intervening since Mandl's publication. At the time of this publication, these authors had found but five proved cases from the Mayo Clinic, one of which was operated by Rankin in 1929, and which case was one of the first operations successfully performed for this condition in the United States. These authors note the relative scarcity of cases reported from different parts of this country, although surgeons may be alert to the condition. Barr has reported but four proved cases. The most remarkable series of cases has been those thirty-five or more cases reported by Churchill in Boston. Goldman and Smyth,[6] at the University of California, reported their two proved cases.

MAIN FEATURE OF HYPERPARATHYROIDISM

The main feature of hyperparathyroidism is a disturbance in the calcium and phosphorus metabolism, as evidenced by an increase in serum calcium, a decrease in serum phosphorus and an increased excretion of both of these elements in the urine. As a result of this excessive secretion of parathyroid hormone, characteristic changes take place, in most instances, in the bones. Inasmuch as the bones are the only storehouses of calcium and phosphorus in the body, this supply may become mobilized in a more or less rapid manner, according to the severity of the disease. In more or less early cases, upon x-ray examination there may be pronounced demineralization, whereas in the more advanced cases there are large irregular areas noted due to cystic formation (osteitis fibrosis cystica). In some instances there may be change in posture with rather marked kyphosis of the spine; bowing of the long bones and spontaneous fractures frequently occur.

Although the skeletal changes incident to hyperparathyroidism may be disabling, the real hazard of the disease is in the damage suffered by the kidneys, and it is noted that death, in most instances, is due to renal insufficiency or to complications of kidney stones. The patient usually shows rather marked loss of weight and loss of strength, and there is frequently a complaint of pain in the back, especially pronounced after exercising. There may also be generalized bony tenderness, especially in cystic areas—von Recklinghausen's disease.

If, at operation, one fails to find a tumor in the face of a well-established case of hyperparathyroidism, it may be possible that one is dealing with a generalized hyperplasia of all of the parathyroid bodies, a condition analogous to so-called Graves's disease of the thyroid. Though doubtful of the existence of such a condition at first, Bauer,[7] Churchill and Cope,[8] Castleman and Mallory,[9] and Albright [10] now recognize the condition of generalized hyperplasia of these bodies. This latter writer has reported several cases of patients with renal calculi which, when operated upon, showed enlarged hyperplastic parathyroid glands. These patients presented no skeletal changes or elevation of plasma phosphatase, but did show high serum calcium and low serum phosphorus readings. These patients were relieved by resection of approximately three-quarters of the total parathyroid tissue identified at operation.

REPORTS OF CASES

Case 1.—Von Recklinghausen's disease due to parathyroid adenoma. Patient: J. B., male, age forty-four. Employed for seventeen years by the Southern Pacific Company. Married. Born in Nebraska. Has lived in Colorado, Oregon, and Idaho. For the past eight years he has been living in Los Angeles.

Family History.—Negative. No history of any familial disease, nor had he any relatives that he knows of who ever suffered from any bone or joint disorders. The patient had had no previous operations. No accidents, injuries, nor broken bones. No previous hospital entrances during the past seventeen years of service.

* Read before the General Surgery Section of the California Medical Association at the sixty-fourth annual session, Del Monte, May 3–6, 1937.

Fig. 1.—X-ray, showing multiple kidney stones.

Present Illness.—States that he was perfectly well, as far as he knows, until approximately two years ago, at which time he first experienced some urinary frequency, polyuria, and pain in the low back region. There had been occasional attacks of abdominal pain associated with distention and passing of cloudy urine. During the past year or more he says that he passed gravel on some occasions, and states that the pain in the low back region was markedly aggravated by exertion. For the past few months he has experienced some dull aching pain, especially in the "shin bone." There has been a progressive sense of fatigue and muscular weakness more pronounced the last six months. His weight, which two years ago was 170 pounds, on entry to the hospital gradually has fallen to 135 pounds. Has noticed no change in his height, which has been 5 feet 9 inches for some years. Noticed no change in posture. He has not been constipated and uses no cathartics. The patient was admitted to genito-urinary service of the General Hospital on February 27, 1935, with diagnosis of renal calculi.

Physical Examination. — Showed fairly well-developed and well-nourished man, who looked to be about the stated age.

Head: Essentially negative, except for *slight swelling of the left jaw* in the temperomandibular region. Slightly tender on palpation. Opens and closes jaw fully. No remarkable infection about the mouth.

Heart and lungs: Negative.

Neck: There is moderate enlargement noted for both lobes of the thyroid, which gives the impression of containing adenoma of both lobes (thyroid adenoma).

Blood pressure: Normal, 140 systolic and 88 diastolic.

Back: Essentially negative. There was no pain noted on pressure over any of the bones, except along the crest of both tibiae, where the patient states there was some tenderness.

The abdomen: Is negative. There is no remarkable tenderness on palpation over both kidney regions. Liver and spleen were not enlarged to percussion and palpation.

Reflexes: Normal.

Laboratory Data.—X-rays of kidneys showed multiple stones in both kidneys, together with one stone in the left ureter, producing marked obstruction with dilatation of ureter (this stone was removed by simple dilatation). X-rays of skeletal system showed the following: Marked

Fig. 2.—Note x-ray appearance of cyst of inferior maxilla. Similar cystic areas were noted in the ribs and fibula.

demineralization of the skull and femur bones, cystic changes in the left jaw bone, multiple cysts and healed pathological fractures of one of the ribs on left side (in going back over the history, the patient stated that he had had a mild attack of "pleurisy" in this area three months prior to entry to the hospital relieved after two weeks by strapping). Left fibula showed cystic changes in the central portion of the shaft. Blood studies showed marked elevation of urea and nonprotein nitrogen. The urea nitrogen ranged from 38.4 to 26.4. The blood Wassermann test, reported positive upon entry was found subsequently to be negative.

Blood serum calcium was elevated to 19.3, and serum phosphorus was down to 2.9. Subsequent readings showed consistent high calcium and low phosphorus readings.

On the basis of the x-ray findings, together with laboratory findings of high calcium and low phosphorus reading, a preoperative diagnosis of parathyroid adenoma was made.

* * *

Case 2.—B. M., female, age forty-four years. Born in Nebraska. Moved to Oakland at age of four years and has lived in Oakland since that time, except for eight months in Seattle at age of twelve.

History.—This patient gives history of having passed "gravel" in her urine for the past three years. She has had periods of chills and fever with passing of cloudy urine on numerous occasions. Considerable discomfort and lameness in low back region on exertion. Noted no change in posture. No tenderness over any of the bones. No other complaints except urinary frequency and passing of gravel. X-ray studies show multiple stones in both kidneys.

On March 21, 1937, blood serum phosphorus reading was 13.5, serum phosphorus reading 2.4. Nonprotein nitrogen, 33.3. Urea nitrogen, 13.2. The urine was loaded with pus cells and numerous red blood cells. On April 23, the blood serum calcium again showed a reading of 12.5, serum phosphorus reading 2.6.

X-rays of the spine, skull, ribs, femur and tibia bones, showed no evidence whatsoever of decalcification or cyst formation.

Comment.—This patient has left the hospital to return in the next few days, when further investigation of her genito-urinary system will be made. It is felt, however, that this case may possibly be one of that rarity as reported by Albright,[10] namely, of renal calculi associated with high serum calcium, low serum phosphorus readings, with an absence of any skeletal changes as noted in the x-rays, but with multiple renal calculi. I feel that if further studies continue to show similar condition, operation is indicated for hyperparathyroid condition

Fig. 3.—Drawing made at time of operation. Note nodular appearance of both lobes of thyroid, which contained multiple thyroid adenomas as well as parathyroid adenomas.

due most likely to generalized hyperplasia of the parathyroids.

SURGICAL CONSIDERATIONS

Operation for hyperparathyroids should not be performed unless a definite preoperative diagnosis has been made. From the review of the literature and from my experience in the case presented herewith, it is apparent that technical difficulties are not infrequently encountered. It would seem superfluous to mention that the operating surgeon should be thoroughly familiar with surgical procedures on the thyroid gland itself. Furthermore, he should be familiar with the anatomy of the parathyroid bodies, and especially be mindful that they may be found in atypical locations.

It has been pointed out that atypical location of these bodies is not infrequently encountered, as emphasized by MacCallum [11] in 1906, and Halstead and Everett in 1907, as well as by Terry and Millzner [12] in 1927. These authors have shown that in 30 per cent of a series of their operative cases, one or more glands were found to be present on the lateral aspect of the thyroid, while in 10 per cent of their cases one or more glands were found to be present on the anterior surface of the gland.

As emphasized by Churchill and others, a parathyroid tumor is often found well concealed in the recess between the trachea and esophagus, or laterally about or outside of the capsule and areolar tissues surrounding the lateral lobes of the thyroid.

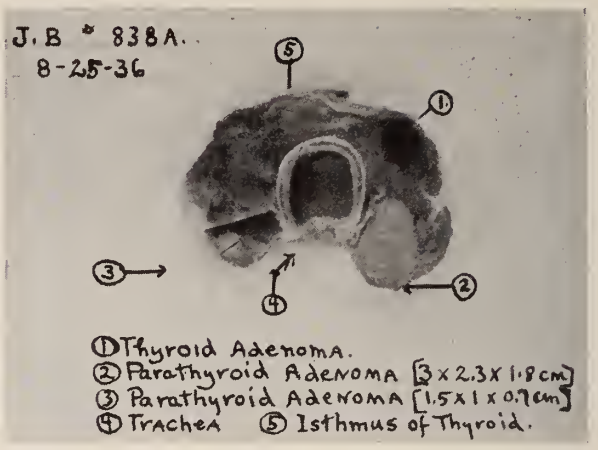

Fig. 4.—Cross section from postmortem examination. Note two remaining parathyroid adenomas buried beneath thyroid gland.

One must be prepared to extend the search deep into the mediastinum (as in the case reported by Churchill,[13]) or in some instances the tumor may be within the lobes of the thyroid gland (as noted by Lahey.[14]). It should be borne in mind that multiple tumors may be present (as noted in my own case). The presence of multiple tumors presents a serious consideration, and may call for secondary operation or partial resection on account of the danger of severe postoperative tetany due to the rapid lowering of blood calcium immediately following operation. Symptoms of tetany usually ensue from removal of a single parathyrloid adenoma.

If one fails to find a tumor or definite hyperplasia of all of the parathyroids at operation, normal glands should not be removed in an effort to reduce hyperparathyroidism, as emphasized by Churchill.[13] There is no known indication for removal of a normal parathyroid body. Such a procedure is futile and may present serious results at a later date, should the tumor be found and removed. Churchill reports a case in which normal glands had been removed at previous operation, the parathyroid tumor finally being found in the superior mediastinum and removed at secondary operation. Severe tetany ensued and the patient died.

DISCUSSION OF A CASE REPORTED

In the proved case herewith presented, a preoperative diagnosis of parathyroid adenoma was made. At operation the usual Kocher collar incision was made, as for thyroidectomy. The prethyroid muscles were divided transversally and retracted. Both lobes of the thyroid were found to be considerably enlarged and contained numerous small adenomas (see figures). A careful preliminary search about both lobes of the thyroid gland revealed no gross evidence of parathyroid tumor. By elevating the inferior pole of the thyroid on each side, and by careful exploration of the subclavicular and substernal regions, a mass was found which presented a smooth, rounded surface. It was discreet and freely movable. A definite vascular pedicle extended downward into what was apparently a parathyroid tumor in the sub-

clavicular region. When fully exposed, it was about 4 by 2 centimeters in size. It was yellowish-white and paler than the thyroid tissue, and lighter than the normal parathyroid. The tumor was removed with very little difficulty. Before closing, further search for other parathyroid bodies was made.

The pathological report by Dr. A. M. Moody showed parathyroid adenoma (benign). Weight 10.10 grams, size 3.8 by 2.5 by 1 centimeters.

Following operation, the patient was very carefully observed for any signs of tetany or parathyroid insufficiency. However, these signs failed to develop, and upon repeated examinations the patient showed no numbness or tingling of the extremities and a negative Trousseau and Chvostek sign. The day following operation the blood serum calcium reading was 16.1 milligrams, serum phosphorus 3.2 milligrams. Numerous determinations taken at frequent intervals continued to show high calcium and low phosphorus. While the serum calcium and phosphorus had not shown rapid changes, as was expected, it was felt at first that this might possibly be due (as pointed out by Albright and his associates) to the coexisting marked impairment of renal function. It was thought more likely that the patient still had other parathyroid tumors which had been overlooked at operation. Further surgery was deemed unwise at this time on account of the patient's advanced nephritis with kidney stones associated with fever and pyuria. X-ray treatment was instituted in the hope of diminishing the activity of any parathyroid bodies or tumors which might have remained following operation. Although a review of the literature discloses but few instances of the use of x-ray in the treatment of such a condition, Merritt and McPeak,[15] in 1934, reported what was apparently most satisfactory results from radiating the cervical region in six cases of cystic bone disease which, in their opinion, were due to hyperthyroidism. From my review of these cases it would appear that a definite tumor had not been proved by operation or necropsy. Furthermore, Aub, Albright, and Bauer[16] report one patient who had received massive doses of x-ray over the neck region before operation. They found no change in urinary excretion or blood calcium values, and the tumor removed at subsequent operation showed no definite changes whatsoever as the result of radiation. In the opinion of these authors there is no successful treatment of this condition other than surgery. However, our patient was given the advantage of any possible benefit by routine type of radiation, such as is used occasionally in hyperthyroidism; and there was no remarkable response to this treatment, and the blood serum calcium and phosphorus remained at the usual abnormal levels. The patient having been given leave of absence from the hospital at his own insistence, returned at a later date with severe kidney complications, from which he died. At autopsy it was of interest to note that the patient still had remaining two parathyroid adenomas, which were partially obscured by overlying thyroid tissue. The thyroid gland contained numerous adenomatous growths.

Histological examination of sections from these two tumors showed benign parathyroid adenomas. In comparing their histological appearance with that of the tumor removed at operation, Doctor Moody could note no remarkable changes as the result of x-ray therapy.

SUMMARY

1. Report of case of hyperparathyroidism, due to multiple parathyroid adenomas, is presented together with the clinical metabolic, and roentgenologic findings upon the basis of which a preoperative diagnosis was made.

2. With patients showing renal calculi or presenting clinical and x-ray findings of bony pathology simulating osteitis fibrosis cystica, a thorough investigation must be made, bearing in mind the possibility of hyperparathyroidism and parathyroid adenoma. By so doing, it is felt that many additional cases will be discovered which have heretofore been overlooked.

3. The treatment is essentially surgical. A definite diagnosis (based upon x-ray and blood chemistry findings) must be made before treatment is instituted.

DISCUSSION

H. Lisser, M.D. (384 Post Street, San Francisco).—Doctor Washburn has done well to report his experience with two cases of hyperparathyroidism. It would be highly desirable, for a few years longer, if other clinicians did likewise, since our understanding of hyperparathyroid syndromes is relatively recent, and probably not yet complete. It is altogether likely that the condition in its various manifestations is somewhat uncommon, but probably by no means as rare as some would think. Therefore, the publication of as many verified cases as possible will serve the

significant purpose of focusing greater attention on this interesting and important endocrinopathy.

Individual narratives, or case reports, have their value and teach varying lessons. For example: the extraordinary story of the sea captain (Bauer's case), suffering from osteitis fibrosa cystica, who insisted on repeated explorations until, at the seventh operation, the substernal adenoma was finally located, is not only dramatic but illustrates the necessity for the most painstaking search for oddly located parathyroid tumors. Similarly, Doctor Washburn's extirpation of a typical adenoma, without relief of the hyperparathyroidism because more than one such adenoma was responsible, adds another instructive point to the factors which must be considered in the treatment of this condition.

The recognition of Von Recklinghausen's disease as a definite endocrine entity constitutes an illuminating illustration of the scientific progress to be accomplished by intelligent utilization of preclinical or experimental research in the interpretation of clinical disorders. It is quite true, as Doctor Washburn notes, that Mandl, in 1925, happened to be the first to note improvement in a case of osteitis fibrosa, following the removal of a parathyroid tumor, but he did not have the acumen to interpret his fortunate experience adequately. This needed, quite naturally, the important investigations of Collip (1926) (and Hansen, independently), who first isolated a potent extract of the parathyroid glands, and convincingly demonstrated its influence on calcium metabolism. They were able to relieve the hypocalcemia of tetany (hypoparathyroidism) by injections of this parathyroid hormone, and also produced hypercalcemia in the experimental animal by injecting large amounts of this extract. David Barr, professor of medicine at Washington University, St. Louis, deserves the distinction of having been the first to postulate the syndrome of hyperparathyroidism as the cause of osteitis fibrosa cystica (1929) and, by removal of a parathyroid adenoma, reverse a negative calcium balance to the normal positive ratio. The Boston group, Churchill, Bauer, Aub, and Albright, extended these observations bountifully, and they have had by far the largest series of cases reported anywhere in the world. Their extensive experience added the clinical picture of parathyroid hyperplasia as a cause of renal stone, and emphasized the seriousness of the resultant nephritis. This contribution is so important that no internist or urologist should be guilty of failing to determine the blood serum calcium in every instance of renal lithiasis.

It is rather diverting now, in retrospect, to recall some of the peculiar maladies, such as paralysis agitans, which, theoretically, were formerly ascribed to an excessive parathyroid function.

It was assumed that, since a state of nerve muscle agitation was the opposite of muscular spasm (tetany), and since the latter was due to deficient parathyroid function, the former might be explained by parathyroid overactivity. It is a far cry from such armchair speculation to the sound scientific explanation of the metabolic osseous malady, Von Recklinghausen's disease, first described in 1891, shrouded in mystery for over thirty years, yet now understood with perfect clarity. The hyperfunctioning parathyroid adenoma robs the skeletal storehouse of calcium, demineralizing it and leaving cysts, accumulating excessive amounts of calcium in the blood, with resultant clogging of the renal tubules and calyces, so that calcium stones are formed, which ultimately impair renal function. Removal of overactive parathyroid tissue restores a positive calcium balance and permits calcium to be redeposited in the bones.

Paul Michael, M.D. (434 Thirtieth Street, Oakland). Doctor Washburn, in his paper, has brought out many points which are of pertinent interest to all students of this condition. It is likely that in the past many of these parathyroid adenomata were classed in the group of Paget's disease, and hence were denied relief by surgical removal. Although still comparatively rare, the subject of parathyroid adenomata is gaining in medical importance, and many remarkable cures have been reported. The realization of the importance of blood phosphatase and magnesium has added a great deal to our diagnostic armamentarium. It would have been of great interest to have subjected Doctor Washburn's patient to a calcium balance test to ascertain the degree of calcium loss. The presence of such high serum calcium, however, was sufficient corroborative evidence for the diagnosis. Among other important things, Doctor Washburn's case proved several points, among them (1) that these parathyroid tumors are frequently multiple; (2) that they very often are associated with thyroid adenomata; and (3) that many of these tumors are first brought to the attention of the patient by passing kidney stones.

It should be emphasized that the thymus is very often associated with calcium metabolism, hence failure to find a parathyroid adenoma may justify radiation to the thymus region as a therapeutic test. It must be mentioned, also, that all cases of parathyroid adenomata are not associated with fibrocystic diseases of the bones. Two cases recently seen by me were characterized by a simple demineralization without cyst formation, yet both had large parathyroid adenomata.

Robertson Ward, M.D. (384 Post Street, San Francisco).—Doctor Washburn's proved case of parathyroid adenoma brings out a number of extremely interesting points in the diagnosis and treatment of parathyroidism.

The first of these is the possibility of multiple adenomata and their unexpected locations. If the tumor, or tumors, can be localized preoperatively, their removal is much simplified. The use of a thick barium meal and visualization by x-ray should not be neglected, as occasionally an indentation of the esophagus offers an exact localization. At operation a meticulous search of the entire neck and upper mediastinum is required, and this is especially true where preoperative localization has not been possible. The surgeon who attempts such an operation, besides being familiar with the thyroid surgery, should know how to recognize parathyroid tissue by its chocolate color, its smooth fragile texture and its difference in appearance from thyroid, lymph node, fat and thymus tissues. He must be familiar with all possible nooks and crannies, including the thyroid gland itself in which the tumors could be tucked away. In order to make an adequate exploration he must have good exposure and perfect hemostasis. Anyone who has explored the upper mediastinum knows how difficult the attainment of these requirements are. It must be realized that the first operation is the time to obtain a cure. The temptation to remove normal parathyroid tissue must be avoided at all costs, and this dictum presupposes a thorough knowledge of the normal and abnormal locations of these bodies.

The second point of interest in Doctor Washburn's experience is the absence of a prompt drop in serum calcium after operation and its implication that the offending tumor had not been removed. Wilder and Howell found a calcium drop of 3 milligrams per 100 cubic centimeters so uniformly after operation that, when such a change did not take place, it threw doubt on the diagnosis and therapy. It would appear that a drop below normal is not necessary either for the proof of effective therapy or for the appearance of postoperative tetany. One case has been reported of severe tetany with a serum calcium reading 9 milligrams per 100 cubic centimeters, the level having been 14 milligrams before operation.

The third point of special interest in this paper, it seems to me, is the demonstration of the complete inefficacy of x-ray or medical treatment in this disease. The absence of any significant change in the appearance of the irradiated parathyroid tumors from the one originally removed speaks eloquently in this respect. This, however, is what one would expect from experience in the effect of x-ray on other benign tumors. With regard to medical treatment, Albright and his collaborators have demonstrated that demineralization of the bones can be prevented, to a large extent, by calcium and phosphorus therapy, but that this usually causes increased irritation to the already damaged kidneys. They have justifiably decided that surgical treatment is the only effective one.

Doctor Washburn is to be congratulated upon his presentation of a case which demonstrates so many interesting and instructive points as his first one.

ACUTE ANTERIOR POLIOMYELITIS

THE POSSIBILITY OF THE SPREAD AS A RESULT OF DIRECT PERSONAL CONTACT: A STUDY OF 385 CONTACTS

By J. C. Geiger, M.D.
San Francisco

Discussion *by Karl F. Meyer, Ph. D., San Francisco; George M. Stevens, M. D., Los Angeles; E. B. Shaw, M. D., San Francisco.*

CONTAGIOUSNESS, through direct personal contact in epidemic and nonepidemic periods of acute anterior poliomyelitis, is regarded by many departments of public health as a settled fact. The quarantine laws, however, as to the length of isolation applicable to contacts of this disease, vary in states, counties, and cities. For instance, the regulations of the California State Department of Public Health require quarantine of contacts for two weeks, and the San Francisco Department of Public Health three weeks. The student of epidemiology is frankly at a loss in interpreting quarantine laws except from a legal standpoint, and perhaps all such laws should be remodeled in order to meet modern epidemiologic methods and knowledge. The degree of contagiousness or, better termed, the infectivity rate, as determined by secondary cases, which are attributed to contact, varies in epidemic and nonepidemic periods of acute anterior poliomyelitis. Moreover, the epidemiologic and clinical evidence appears definite and almost conclusive that the infectivity rate due to contact is far less in acute anterior poliomyelitis than from any other communicable disease. Perhaps the fact that the inciting agent is a filterable virus, possessing no unusual degree of viability, and whose entry into the body is generally the nasopharynx, may be the determining factor in the limited contagiousness due to direct personal contact. Epidemiologists today discuss freely familial susceptibility, scan the weather reports in time of seasonal periodicity of the disease, and give guarded statements as to the effect of blocking the nasopharyngeal passages by the use of chemical sprays. Again, the health official in times of elevated epidemic indices is confronted with the closing of schools or delaying of the opening, and the closing of swimming pools, theaters, churches, etc., to children of susceptible age.

MERIT OF PREVENTIVE MEASURES

The beneficial effects of any one of these allegedly important quarantine or preventive measures, even when they are put into operation in their entirety, appear to be decidedly controversial. Other disputed subjects are the use of convalescent serum in the treatment of the case and its value as a preventive measure in contacts, and the ultimate result to the patient in the use of the mechanical respirator. The San Francisco Department of Public Health recently has reiterated its stand that convalescent serum for treatment is logical, but only if administered early in the disease. The public fears the disease because of its power to cripple, quite often for life. If the residual crippling can be limited to a small percentage of the cases, at least one per cent, then the fear complex of the public should be dissipated. Therefore, early diagnosis and treatment are essential, and again the San Francisco Department of Public Health has insisted upon the establishment of diagnostic centers and the instituting of early orthopedic procedures.

DIAGNOSTIC CENTERS IMPORTANT

The most important and valuable measure to be established by the thoughtful health officer, therefore, is the diagnostic center, in order that an early diagnosis be made and early treatment instituted. The control of contacts by quarantine does not offer insurmountable legal difficulties, but the value of this measure must not be weighed too heavily. In 1917, the author reported an incident in Mill Valley, California,[1] in which a child of four and one-half years appeared at a party with sixty-six other children, ranging in age from two to fourteen, the majority under ten. The child had many symptoms of acute anterior poliomyelitis at the party; was fondled more than usual because of the illness; danced with many; was kissed by a number; used the same utensils and drinking glass in several instances; and the room in which the party was given measured only 20 by 30 feet. Moreover, Mill Valley had been free of the disease for several years; so, undoubtedly, this exposure constituted the first for many children present. No case of the disease developed in any of the sixty-six contacts. This author drew the following conclusion[1] "Therefore, taking everything into consideration relative to the sixty-six close contacts of the above case, particularly their supposed susceptible ages with the subsequent negative clinical results, and especially since, for the majority, it undoubtedly constituted a first exposure to the disease, there seems to be sufficient reason to doubt the accepted present-day theory of the spread of acute anterior poliomyelitis by direct personal contact."

SAN FRANCISCO EXPERIENCES

In 1934, contrary to outbreaks of previous years, the incidence of acute anterior poliomyelitis rapidly increased in San Francisco in the latter half of May, 1934, reaching its peak in the latter part of June. In previous outbreaks, the duration with the distribution of cases in 1916 was from July through January; in 1921, June through November; in 1925, April through December; in 1927, April through December; in 1930, June through February; in 1934, May to July. The last outbreak, in 1934, was reported in detail by the author et al.[2] One phase of the outbreak was not sufficiently studied, and consequently was not commented upon in this paper, namely, the study of contacts of cases.

One hundred and eighty-one close personal contacts of sixty-eight proved cases were carefully studied. The one hundred and eighty-one contacts were followed for at least six weeks by epidemiologists and the public health nurse. Only two of the contacts developed the disease. Ten of the remaining contacts showed at various periods of the time elevations of temperature, sore throat, muscular

pains, and malaise; but careful clinical observation and laboratory examination eliminated all as a clinical case of acute anterior poliomyelitis.

In the entire outbreak of 1934 there were 122 cases, with 307 direct personal contacts (an average of less than three per case), of which six (or 2 per cent) developed the disease. In 1937, in eleven cases reported over a period of several months, there were seventy-eight contacts, an average of seven per case. These contacts were followed closely for three weeks by epidemiologists and the public health nurse, and no cases developed, nor were there any symptoms to indicate a suspicion of the disease. The conclusion of the author, published in 1917,[1] therefore, could be applied in the outbreaks of 1934, an epidemic period, and to the contacts of the cases that were reported in 1937, a nonepidemic period. The epidemiologic conclusion, that individual susceptibility among age groups, where the susceptibility to acute anterior poliomyelitis is considered greatest, is practically negligible as a result of contact, appears valid in the light of experience in San Francisco in 1934 and 1937.

IN CONCLUSION

The epidemiologist must seek a more definite answer as to the modes of spread of this disease or accept the evidence that the population immunity is not an inconsiderable factor, since acute anterior poliomyelitis affects very few persons in a community in comparison to other communicable diseases. Furthermore, it is unfortunate that the Department of Health possesses meager or no information as to the source or route of infection in the cases reported.

Finally, if the diagnosis is made and the treatment administered early, especially orthopedic, the reduction of the residual and crippling paralysis will be such that the disease will become relatively unimpressive.

DISCUSSION

Karl F. Meyer, Ph.D. (Hooper Foundation for Medical Research, University of California, San Francisco).—The experiences reported by Dr. J. C. Geiger coincide with those recorded in the international literature. In fact, the extreme rarity of sister infections, even in the vicinity of definite cases in a family, is so striking that the epidemiologist reluctantly accepts the concept of contagion for the disease poliomyelitis. Nobody will deny that the direct transfer of the virus from person to person is debatable, and for various reasons: (1) The infectiousness of the nasopharyngeal secretions of monkeys is fully proved, but well monkeys caged with poliomyelitic animals, or laboratory workers exposed to these apes, do not contract the disease. (2) In contrast to the droplet-borne infections—diphtheria and scarlet fever—the incidence of carriers is very low. An extensive spread of the specific disease agent in poliomyelitis has not as yet been proved. Lack of connection between cases of this disease is a constant epidemiologic feature; it is very difficult—usually impossible—to establish well-defined chain transmissions. This state of affairs is usually explained by the statement that the contacts are nonsusceptible. Would it not be better to separate clearly between susceptibility or disposition to infection, and susceptibility to disease? Seasonal incidence, lack of tendency to spread in congested centers, schools, etc., and the behavior of poliomyelitis in the tropics and in rural areas, are phenomena which do not harmonize with the concept of contact transfer, at least at the time the disease is clinically most prevalent. It is reasonable to suspect that the infective agent, perhaps a high molecular protein, enters the body many months before the clinical signs, induced by the intracellular parasitism, become evident. In the light of newer knowledge on viruses, the prevailing concepts of epidemiology may require radical revisions. The multiple cases reported by Bossert (Jahrb. d. Kinderheil K., 134:82, 1931) represent examples of exceptionally high genetic disposition to disease within two families, but this should not serve as proof that infantile paralysis spreads within the family.

Doctor Geiger feels keenly his inability to trace the sources or pathways of poliomyelitic infection. Everybody shares in this disappointment. An effective system of prevention cannot be instituted until the modes of transmission are established. The administrative measures in vogue are empirical and, consequently, ineffective.

*

George M. Stevens, M.D. (Los Angeles City Health Department, Los Angeles).—One of the present-day mysteries of poliomyelitis is its evolution from a sporadic disease to one of epidemic proportions. It is conceivable that the causative virus may be of a specific neurotropic strain.

The low infectivity rate, due to direct exposure, can undoubtedly be explained by the large number of carriers who have developed an immunity due to repeated subclinic infections, and individual maturation. We must, however, be aware that on account of the prevalence of widespread epidemics, the infectivity rate and the age incidence are on the increase.

In the Los Angeles epidemic of 1934 there were 1,434 cases. The outstanding fact during the outbreak was the unprecedented incidence of the disease among the personnel of the Los Angeles General Hospital. This institution accounted for 234 cases. I am of the opinion that this was due to the repeated daily opportunities for direct and often prolonged contact. I do not believe that one single exposure was responsible for a clinical case, but due rather to several or many exposures of subclinical dosages. This, together, with other factors, such as fatigue, loss of sleep, overwork, and the constitutional make-up of the exposed individuals, were the determining factors in the development of the clinical manifestations of the disease, or subclinical immunity.

The shifting hospital personnel during the outbreak was approximated at 4,522, and the gross attack rate was 4.8 per cent. The groups most severely attacked were the physicians and the nurses, with a gross rate each of 5.4 and 10.7 per cent, respectively. More striking was the fact that those nurses most closely associated with clinical cases had an attack rate of 11.4 per cent, while those physicians in such attendance had an attack rate of 6.2 per cent.

The disease first attacked and reached its greatest intensity among the newcomers of the hospital personnel, who gave no history of any previous exposure. Student nurses had the highest attack rate of 16.2 per cent, while the graduate nurses affected were 8.2 per cent. A much smaller attack rate was manifested among the attendants, with a rate of 1.9 per cent, and among the orderlies of only 1.6 per cent.

The attack rate among the hospital personnel, whose occupation never brought them into any intimate contact, was only 0.8 per cent. Residence on the hospital grounds also played a rôle. The attack rate among those residing on the grounds was 14.2 per cent, while those living outside the grounds was 2.3 per cent. All of the foregoing hospital statistics are quoted from the excellent study and report of Dr. A. G. Gilliam, past assistant surgeon of the United States Public Health Service. We trust that this excellent survey will soon be published for distribution.

Our analysis revealed that, of the total of 1,434 cases during the outbreak, there was a definite history of known exposure in 301 instances, or approximately 21 per cent. Secondary cases occurred in eighty-two households and were distributed as follows: two cases in each of seventy families; three cases in each of nine families; four cases

in each of two families; and in one household there were six cases. Multiple or secondary cases occurred in 6.21 per cent of the cases in the series. This rate compares closely with the attack rate of 6.1 per cent that occurred among the hospital personnel, who were more or less in close contact with the clinical cases.

Consequently, it is my opinion that direct contact, especially if associated with prolonged exposure, lack of opportunity to develop subclinical immunity by repeated small contact doses, fatigue, loss of sleep, and the constitutional make-up of the individual, all play a very important rôle as to whether an individual actually develops poliomyelitis or becomes subclinically immune. Surely, the spread can be controlled to some degree by the isolation of the patient and the restriction of the contacts. By so doing, we will help to prevent overwhelming exposure doses to many susceptible individuals, giving them a chance to build up protection by subclinical means.

Until confronted with more knowledge in regard to the spread of the disease, we are willing to accept the now prevailing opinion that it is spread by droplet infection from those ill with the disease, and often by carriers, who have themselves developed subclinical immunity.

I am in accord with Doctor Geiger's emphasis on the establishment of diagnostic centers for the early diagnosis and hospitalization of suspected cases. The use of nasal sprays can only be of limited usefulness. It has its drawbacks and dangers at the present time and, under these circumstances, cannot be of practical aid in the field of public health. I believe that the hope of the future for the control of poliomyelitis still lies in the development of a safe and efficient vaccine.

*

E. B. Shaw, M.D. (384 Post Street, San Francisco).—It must be admitted by any student of epidemiology that quarantine is frequently a process of closing the door after the horse is out, and is only justified by the argument that there may be other horses. In poliomyelitis, as in most infections, clinical diagnosis is established only after the patient has, in all probability, passed through his period of greatest communicability and, doubtless, thereafter continues to be a potential disseminator of virus but, due to the fact that he is then an ill child, the opportunities for dissemination are considerably cut down and he is not nearly so dangerous to the community as he was for a short time before the development of active symptoms. Doctor Geiger's observations indicate that, while the patient with poliomyelitis is not demonstrably a frequent source of other cases, the infection chain in this disease is, however, most obscure; and cases intermediate between a pure carrier state and outspoken paralytic forms of the disease are a likely agency for distributing the infection to the population. These disseminators of the infection are not readily detectable by ordinary methods, they are not clinically recognizable, and the virus cannot be demonstrated in their secretions with the ease with which diphtheria bacilli may be detected.

It is not altogether rare, however, as even Doctor Geiger's series demonstrates, to find the disease developing after contact with a known clinical case. Without completely reviewing the cases of poliomyelitis which I have seen, I can quickly recall several instances: (1) three children in one family developed the disease at intervals of four or five days; (2) a four-year-old child was exposed to a patient in another town, and developed the disease five days later; (3) at least three of the mothers who cared for small children during the early stage of the disease developed poliomyelitis within a week following their first exposure; (4) a child intimately exposed to her sister, who died of the bulbar form, developed poliomyelitis twelve days later with an almost identical clinical picture. I believe that these instances could be multiplied by a careful study of the intimate history of many cases. It has always been my belief that, although numerous individuals may be exposed to this disease without contracting it, intimate exposure is not necessary for the infection of the patient whose susceptibility is modified by constitutional and environmental factors which predispose him to infection. I suspect that the disease passes from one patient to another by means of an infection chain which includes the clinical case, the subclinical case, and perhaps even includes the healthy carrier.

Dissemination of the virus throughout the community is only a single factor in the production of epidemics; there are many reasons to suspect that numerous environmental factors must be propitious before an epidemic can develop. Until these environmental factors are more precisely known there is little which can be done from a public health standpoint, except to make an effort to reduce dissemination of the infectious agent, and this can only be partially secured through the isolation of cases and contacts. During seasons of increased epidemicity, when presumably environmental factors favor the disease, it is especially desirable to make every effort to avoid scattering infection, even though demonstrable case-to-case connections are not evident.

Doctor Geiger's observations emphasize simply the obscurity of our state of knowledge regarding the precise epidemiology of poliomyelitis. It might be relatively safe to enforce *no* isolation for the affected individual, but even a small degree of risk is incompatible with the nature of the disease, and the fear which it engenders in any community. St. Paul was responsible for the advice, "To abstain from the appearance of evil." This may not be valid epidemiology, but it is sound public health, from which I do not believe Doctor Geiger would propose any departure. There is no doubt that the study of epidemics from the standpoint of public health deserves the earnest coöperation of the clinician, who alone can supply a wealth of intimate detail regarding the individual patients helping to comprise the epidemic.

FUNCTIONAL INDIGESTION *

By Alfred E. Koehler, M.D.
Santa Barbara

Discussion *by William C. Boeck, M. D., Los Angeles; T. L. Althausen, M. D., San Francisco; Hugh Freidel, M. D., Santa Barbara.*

FUNCTIONAL indigestion may be defined as a disturbance of the digestive and assimilative functions in which no organic pathology can be demonstrated. Although many factors influence alimentation, in general well-masticated food undergoes proper digestion when (1) an adequate amount of the various digestive secretions is available; (2) when gastro-intestinal motility is neither excessively slow nor fast; and (3) when absorption of the products of digestion or of the simpler foodstuffs by the blood stream or by the lymphatics is adequate. By adequate in this respect, we mean that unabsorbed foodstuffs do not reach the colon or if so, only in relatively small amounts.

It is, of course, altogether probable that digestive disturbances due to organic causes, such as peptic ulcer or cholelithiasis, are related reflexly to these same factors. Removal of the organic lesion usually clears up the disturbance, and little thought is ordinarily given to the actual physiological mechanism involved.

In this study we have confined ourselves purely to those cases in which organic pathology has been ruled out as far as possible. The error is frequently made of assuming a functional diagnosis without eliminating such factors as ulcers, gall-bladder and liver disease, constriction, adhesions, diverticulae or congenital malformations. Failure of proper roentgenographical studies frequently is due to economic considerations, but experience teaches us that such economy is usually expensive in the end. We

TABLE 1.—*Limits of Variation Into Which 90 Per Cent of Normal Cases Fell*

Rate of flow	0.8 to 1.6 cubic centimeters per minute
Icteric index	25 to 60 times dilution
Amylase	200 to 500 milligrams sugar
Lipase	18 to 25 cubic centimeters 0.1 N NaOH
Protease	4.0 to 6.0 milligrams amino nitrogen

strongly urge that indigestion of any prolonged duration be not assumed as functional, but that every effort be made to rule out organic disease.

However, after such pathology is ruled out as far as possible, a considerable group remains that must be classified as functional disorders.

PLAN OF STUDY

Our approach to this problem, which too commonly is handled in a vague and purely symptomatic fashion, has been through channels of objective and quantitative diagnostic studies concerning digestive secretions, motility, and absorption. The latter two factors are, of course, intimately related, and dissociation, at least for the time being, has been difficult.

DIGESTIVE SECRETIONS

By means of a duodenal tube and a modified technique we have studied the duodenal secretions under basal conditions in 38 normal, 280 abnormal, but without digestive disturbances (malnutrition, adiposity, diabetes, allergy, etc.), and 710 cases of indigestion. Such studies have been reported previously by various workers, with the general conclusion that little value can be attributed to such findings. It is our belief that such failures have been due to: inadequate standardization of the drainage technique, poor methods of analysis, inconclusive data on the normal limits of variation, and failure to obtain more than one drainage in questionable cases.

The drainage material was analyzed immediately after it was obtained. The digestions were done at 37.5 degrees centigrade, in a special type of incubator in which a shaking platform kept the mixtures in constant gentle agitation. The digestions were all carried out in a phosphate buffered solution at pH 7.0 (the probable average pH of the contents of the small intestinal tract) and expressed in the following manner:

Rate of Secretion. Expressed as cc. collected per minute.

Icteric index (bile pigments). Dilution of drainage necessary to match colorimetrically 0.01 N potassium dichromate solution.

Amylase. Mg. sugar as maltose liberated from 1 cc. of 1 per cent starch solution by 1.0 cc. secretion in 10 minutes at 37.5° C.

Lipase. Cc. of 0.1 N NaOH required to neutralize the fatty acids formed from 2 cc. olive oil by 10 cc. secretion shaken (emulsified) in an incubator for three hours at 37.5° C.

Protease. Mg. of amino-acid + NH_3 nitrogen obtained from 250 mg. casein by 10 cc. secretion shaken in incubator for three hours at 37.5° C.

Table 1 shows the limits of variation of 90 per cent of the normal cases, while Table 2 shows the

TABLE 2.—*Incidence of Abnormal Findings in 305 Cases of Indigestion*

	Per Cent Below Lower Range of Normal Variations
Rate of flow	29
Icteric index	47
Amylase	26
Lipase	13
Protease	17

incidence of abnormal findings in the indigestion cases. We believe that the figures for decreased rate of flow, bile pigments and amylase in indigestion are significantly outside the values for normal variation, while those for lipase and protease are only questionably so. On the other hand, it is also well shown that a considerable percentage of the indigestion group have drainage values well within the normal variation limits, and that the cause for indigestion in these cases must be sought for in abnormalities other than digestive secretion deficiencies in the upper duodenum. Insufficiency of digestive secretions in the jejunum and ileum (succus entericus; erepsin, sucrase, lactase, etc.), has never been adequately studied.

STARCH INTOLERANCE

The high frequency of starch intolerance, as cited by patients in obtaining their histories, and the high percentage of amylase deficiency in the duodenal drainages made it desirable to devise a further quantitative test for this difficulty. This we accomplish by giving 1.5 gram of cornstarch suspended in water per kilo body weight in the same manner as for the glucose tolerance test and determining the glucose absorbed in the blood during hour intervals. In the normal person there is an excessive amount of amylase available, so that the rate of absorption of the sugar formed becomes the limiting factor and, consequently, the blood sugar curve after starch is similar to that after glucose. In many cases of indigestion, however, the blood glucose curve after starch is greatly flattened, frequently no elevation at all being noted. Commonly, such cases have nausea, flatus, distention, occasionally headaches and general malaise six to twelve hours after the starch ingestion, due probably to the undigested starch reaching the colon and undergoing rapid fermentation. Chart 1 shows the comparison of starch and glucose tolerance curves in a normal and a case of starch indigestion.

SIMPLE SUGAR INTOLERANCE

A considerable number of cases give the history of not tolerating simple sweets. Frequently, such small amounts of sugars (10 to 15 grams) caused upsets when administered in a test-meal, even when disguised, that the question of allergic intolerance was raised, but this was felt to be improbable because large amounts of these same sugars (sucrose, lactose, xylose and glucose) given intravenously to these patients produced no disturbances. In the case of glucose intolerance the factor of digestion

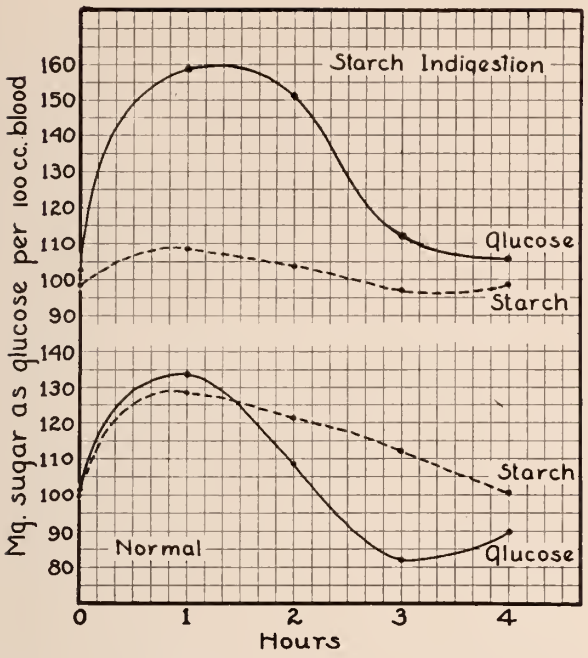

Chart 1.—Demonstration of failure of blood sugar rise after starch ingestion in a case of indigestion as compared with the normal rise in blood sugar after the same amount of glucose.

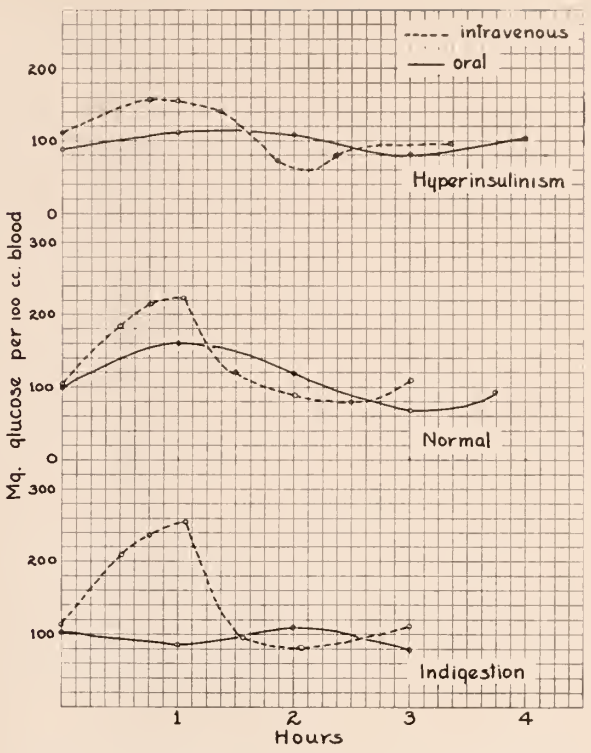

Chart 2.—Demonstration that the flat blood sugar curve after glucose ingestion may be due to failure of absorption. Such flat curves may be differentiated from those of hyperinsulinism by the intravenous administration of glucose.

can be eliminated, and consequently we turned our attention to its rate of absorption. Glucose tolerance tests by mouth in this type of a case frequently show only slight or no rise of the blood sugar afterward. Such a flat curve, of course, could be due either to faulty absorption from the intestinal lumen or to excessively rapid utilization of the sugar after absorption such as is obtained in cases of hyperinsulinism. That the latter was not always the case and that, consequently, the flat curve was due to poor absorption, was proved by demonstrating a normal or even poor utilization tolerance by continuous intravenous injection of glucose at a constant rate.

The distress that these people, with impaired glucose absorption, have after sugar ingestion is similar to that mentioned under starch indigestion.

Chart 2 gives examples of oral and intravenous glucose tolerance curves in normal, hyperinsulinism and sugar intolerance cases.

As to the type of disorder responsible for decreased sugar absorption, little is known. The possibility exists that decreased absorption is due to increased intestinal rate, and that there is a comparable decrease in the absorption of other substances such as amino-acids as well.

TREATMENT

It should be emphasized, of course, that many other factors exist that cause or are related to indigestion than those included in our discussion. Among these may be mentioned allergy and less specific food intolerance, such as that produced by cooked cabbage, lettuce, radishes, etc. We purposely avoid discussion of the vague term *nervous indigestion*; not that nervous disturbances are not important, in fact they are of fundamental importance, as has frequently been shown by various workers, but we prefer to think in terms of the type of alimentary disturbance caused by aberrant nervous activity.

Our experience leads us to believe that an excessively rapid, small intestinal rate is the most common cause of functional indigestion, and that distress is caused by an excessive amount of bacterial food reaching the colon. Treatment consists of the well-known methods, avoidance of foods mechanically or chemically irritating, and nervous stabilization. This latter aspect is a problem of such magnitude that no attempt can be made to review it here. One point in regard to nervous irritability we do wish to emphasize, namely, malnutrition, frequently a result of indigestion or imposed dietary restrictions. We emphasize, in this respect, a well-balanced dietary regimen, with particular attention paid to the mineral and vitamin requirement, frequently augmenting the diet with the pure forms, especially calcium and vitamins B^1 and C.

TREATMENT OF PATIENTS WITH DIGESTIVE SECRETION DEFICIENCY

Motility is, of course, closely related to secretory deficiency, inasmuch as a fast rate greatly decreases the time of action of the enzymes on the substrate.

In general, secretory deficiency can be treated in one of three ways or combinations of these procedures:

1. If the deficiency prevents proper utilization of one of the food groups, this group may be materially reduced in the diet. For example, cases frequently are low in amylase but have adequate lipase and protease, and consequently are given a diet

low in starch and higher in protein and fat. Similarly the avoidance of more than the minimum of sugars greatly benefits cases that have poor absorptive ability.

2. The deficiencies may be substituted for by enzyme concentrates such as diastase, malt, and pancreatic preparations. The difficulty seems to be that the activity of these preparations is so low and irregular that efficient concentrations in the intestinal tract are hard to obtain. We are convinced that unprotected pancreatic amylase is completely destroyed by the gastric acidity. We have not been able to alter low starch tolerance curves with the most active amylolytic preparations available, even when enteric coated. On the other hand, many patients report general digestive improvement with these preparations, but such criteria is frequently difficult to evaluate.

3. The low secretory activity of the digestive glands may be stimulated, at least in certain cases. Food itself is probably the best stimulus, and low secretory activity can frequently be related to long periods of partial starvation, frequently imposed to avoid digestive distress. Encouragement to eat adequately of the proper foodstuffs frequently is followed by improvement of the secretory functions with general improvement.

The secretory impairment is frequently related to low general metabolic activity, as in cases of hypothyroidism, and probably in anterior pituitary lobe deficiency of the lean type. Thyroid treatment is frequently effective.

Furthermore, evidence is accumulating that certain vitamin deficiencies, particularly B_1, result in impaired motor and secretory activity of the intestinal tract, and we believe that our data, although still in the experimental stage, indicates the usefulness of vitamin B^1 therapy in these types of cases.

Santa Barbara Cottage Hospital.

DISCUSSION

WILLIAM C. BOECK, M.D. (1919 Wilshire Boulevard, Los Angeles).—One must unhesitatingly commend Doctor Koehler for the industry which his research represents in the field of functional indigestion. It was motivated, no doubt, by a desire to learn whether or not there is some detectable physiological disturbance that may account for the digestive symptoms in that group of patients presenting no evidence of organic pathology.

The investigation seeks to show that in many of these patients the digestive disturbances may be based upon their inability to metabolize starch in a normal manner. The evidence that this exists is based upon the low or flat starch-tolerance curve obtained in many of such patients. This curve is interpreted to mean that much of the ingested starch is not digested and absorbed, but passes on into the colon, where it is acted upon by the bacteria; the fermentation produces gas, which results in the flatulence, distention, abdominal pain or distress, nervousness, etc., so commonly complained of by these persons.

I believe, however, that this finding, while it may prove to be a contributing factor, cannot be said to be established by this work, because this research only deals with pancreatic digestion, and the blood-sugar curve represents absorption over only four hours. This undoubtedly represents the maximum absorption from the digested starch, and that which probably occurs for the most part in the duodenum, jejunum, and upper ileum; but digestion and absorption may still continue on down in the ileum, and perhaps the colon, too. We would like to have evidence that undigested starch actually reaches the colon in large amounts. The intubation methods of Abbott, Karr and Miller of Philadelphia might be used to clarify this point.

As the author states, such important factors of malnutrition and undernutrition, and the nervous irritability so common in these patients must be considered in treating them. Too often these patients have practiced progressive food exclusion from their diet, with the result that a deficiency state may exist. The indigestion symptoms gradually disappear when the treatment is handled intelligently to include an adequate balanced diet and a proper evaluation of all other factors that may have had a part to play in the production of the digestive symptoms. This investigation deserves much credit as another step in the direction of explaining the probable origin of some of these symptoms.

*

T. L. ALTHAUSEN, M.D. (University of California Hospital, San Francisco).—The subject of deficient action of digestive enzymes in the body is decidedly in need of quantitative study, and Doctor Koehler's work is a valuable step in this direction. It is reasonable, as the author states, that diminution of amylase in the duodenal fluid does not necessarily mean failure of starch hydrolysis, because normally an excess of amylase is present. Doctor Koehler very properly advocates further studies in the nature of a starch meal, and if necessary a test of glucose tolerance by the intravenous method before the existence of improper splitting of starches is seriously considered. Even then it remains not entirely proved, because in a cornstarch test-meal the digestive action of the amylolytic ferment of saliva appears to be largely excluded.

The question of whether increased peristalsis has an adverse influence on absorption was brought up. We found that experimentally induced intestinal hyperperistalsis in animals reduced the hourly absorption of glucose from 1.7 gram to 1.4 gram per unit of body weight. We also found that starvation up to four days, hepatic injury due to phosphorus poisoning, fever, and dinitrophenol intoxication, all produced some diminution in absorption of glucose. However, the thyroid status of animals had the greatest influence on absorption. Thyroidectomy reduced the absorption of glucose in our animals to 0.9 gram, while administration of thyroxin increased it to 2.8 grams.

I agree with Doctor Koehler that, clinically, hyperperistalsis of the small intestine may cause intolerance to starches; but I also think that other factors which bring together unabsorbed carbohydrates and intestinal bacteria, such as excessive intake of starches or extension of the colonic flora into the small intestine, can produce the same effect.

Therapeutic administration of digestive enzymes is at present in such disrepute that the Council on Pharmacy and Chemistry of the American Medical Association does not accept any enzyme for oral administration. This state of affairs is due to the fact that digestive enzymes are almost universally given regardless of whether objective evidence of a deficiency exists, and that the amounts given are usually too small to be effective except as a form of psychotherapy. The clinical importance of the digestive enzymes will come into its own when we shall be able to prescribe them only in proved cases of deficiency and in amounts that are physiologically active. Doctor Koehler's work brings us a step nearer to this goal.

*

HUGH FREIDEL, M.D. (1515 State Street, Santa Barbara).—Doctor Koehler should be congratulated for presenting these studies to us. More and more worth while studies of the small intestine functions are being reported daily, chiefly biochemical in nature. They all add something valuable to our knowledge of the abnormalities of the intestinal mechanism, and are of increasing aid to us in the caring for the same. Further contributions will be continued by just such studies as Doctor Koehler has made, and we all look forward to the gradual clearing of those hazy and uncertain ideas that are so prevalent concerning this most important digestive organ, the small intestine. It is to be hoped that further studies of the intestinal motility will offer to our knowledge new and worth while contributions, for I feel the disturbances in the motility, and the factors influencing them, are of the utmost importance.

I have felt the evaluation of quantitative estimations of the secretory functions of the small bowel to be of some benefit in diagnosis, but very little in therapy. And this

was due to the definite variable influences on the secretion by psychic and emotional stimuli so prevalent in the group of emotionally unstable individuals encountered. Doctor Koehler has apparently disposed of these factors to his satisfaction in his presentation of this study. All have seen cases of starch intolerance with frothy, fermentative stools, and with definite clinical evidence of marked indigestion, who, when away from their family and business worries, have metabolized starch in an adequate and satisfactory manner. Functional deficiencies, as determined by such laboratory findings, should be more constant.

I agree with Doctor Koehler that substitution therapy, using the various enzyme and digestive concentrates, is very disappointing. In order to get any benefit, even in the most evident case, much larger doses than usually used are necessary, and then only with preparations of a proved potency. Good results have been reported by using a properly prepared potent preparation of pancreatic juice in proved cases of pancreatic insufficiency. Ivy reports good results with large doses of pancreatin of proved potency in similar cases. Therefore, it seems to me that if the deficiency is real and not transitory, preparations of these concentrates, properly prepared and of known potency, would be of a greater benefit to these functional indigestions.

When we have further studies of the small intestine physiology, and especially its motility, made available most probably by new and improved roentgen studies, with a more skillful guiding and helping of these individuals to adjust themselves to their handicaps and to live within their capabilities, then and only then will our therapeutic results with these various functional indigestions and disturbances in motility of the small bowel be satisfactory.

THE ENDOCRINES AND BEHAVIOR IN PUBERTY*

By Clara H. Spalding, M.D.
Richmond

Discussion *by Olga Bridgman, M. D., San Francisco; E. Kost Shelton, M. D., Los Angeles.*

THE child from eleven to sixteen is here discussed. The reasons for believing this group worthy of special consideration are threefold:

First: The universality of this critical time in every child's life.

Not every child will have broken bones or acute infection; but each child will, inevitably, have a period of puberty with its problems.

Second: Because of the importance of this period to the child himself, physically and emotionally.

Third: Because of the importance of the adjustment of the child toward society; the social economic value.

THE PHYSICAL CONSIDERATION

Pubescence interests us primarily because of its physiological changes, and the underlying anatomical changes, which means consideration of the endocrines.

The sum total of the child's previous life gradually brings to bud and blossom the gonadal system; the sex hormones of the pituitary gland, plus gonadal activity.

RÔLE OF THE PITUITARY

Regarding the pituitary as the keystone of the arch, we may pass lightly over the products of the posterior lobe, simply naming them for completeness:

1. That which affects the liver and so aids in fat metabolism.
2. That which aids the eye in mydriasis.
3. Three which affect the circulatory system:
 (*a*) Raises blood pressure.
 (*b*) Aids coagulability.
 (*c*) Controls capillary tone.
4. Two which bear upon the renal system:
 (*a*) Diuresis.
 (*b*) Antidiuresis.
5. Two which affect the uterus:
 (*a*) Alphahypophamin, the pressor.
 (*b*) Betahypophamin, the oxytocic principle.
6. Two which bear upon the digestive system:
 (*a*) One to the stomach, an inhibitor or gastric secretion.
 (*b*) One affecting the peristaltic action of the intestine.

One product of the pars intermedia:

1. Intermedia.

Then those of the anterior lobe, of whose eight products we mention seven briefly:

1. Parathyreotropic, parathormone.
2. Thyreotropic, thyrodin.
3. Suprarenalatropc, adrenalin or cortin.
4. One with galactagogue action.
5. Pancriaticotropic, insulin activator.
6. One affecting general growth.
7. One affecting skeletal growth, specifically.
8. The gonadotropic group, which we shall consider more closely.

GONADOTROPIC GROUP

Of the gonadotropic group, we have:

Prolan A, of which we have a male and a female entity:

1. That which affects the testicle, and whose specific function is the determination of spermatogenesis.
2. That which affects the follicle of the ovary—folliculin.

Prolan B, which, likewise, consists of a male and a female entity, as the case may be:

1. That which affects the testicle androtin.
2. That which affects the corpus luteum, progestin.

When the gonadotropic hormones mature and function normally, we have the group of secondary sex characteristics develop normally. If this physiological function be normal, we have the resultant normal emotional response on the part of the child, which predetermines that child's attitude toward life and society.

GROUPING OF CHILDREN

Children may, grossly, be divided into three groups:

First: The narrow top band of the precocious.

These children require great tact and understanding. Their ability to lead can be guided correctly, or they may easily develop their smart-aleck tendencies to be leaders of gangs.

Second: The bottom, much wider band of subnormals. The gradations range from:

1. The mildly retarded.

2. The feeble-minded—high-grade and low-grade morons. These are a definite menace to society because they are not adjusted, and are not capable of adjustment to the social economic system of today, with its complex problems.

The only hope for these two groups is early recognition, correct diagnosis, and adequate treatment of their endocrine dyscrasias.

* Read before the Pediatrics Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–5, 1937.

3. The twilight zone, the very low-grade mentals: the imbeciles and the idiots. Their only solution is institutionalization.

But many cretins and Mongolian idiots could have been spared this fate had their endocrine needs been recognized early. That would have been both humane and economical.

Third: That broad, middle band of good normals. Fortunately, these constitute the vast majority. From this group will always come our substantial citizens of the future.

They need no special medical attention, only understanding and sensible training.

EMOTIONAL REACTION OF THE PUBESCENT CHILD

With the pubescent child, bear in mind that he is undergoing an emotional crisis. He is confused, feels frustrated. He cannot understand himself, therefore he thinks nobody understands him. He is becoming an independent social unit with definite opinions. He is becoming an adult, so what he needs is someone to regard his problems as dignified and important, which is every adult's due.

SEX INSTRUCTION

Sex instruction should be provided. This may well be given by the parents, if they are intelligent, if they have the child's confidence, and if they are themselves instructed. It may be given by the family physician, if he is sufficiently close to the child to impress the child that he is really vitally interested in his welfare. Or it may be imparted at school, which can much better give sex-hygiene instruction than sex instruction.

Sex instruction, to be worth while, must be given not too early in life; it must not be too legendary nor romantic; it must be clear, and it must be scientifically sound.

IN CONCLUSION

The child who becomes maladjusted, in the majority of cases, follows this rationale:

First: Endocrinopathy.

Second: Development of undesirable traits and habits.

Third: Early juvenile delinquency.

Fourth: Criminality.

Endocrine disorders are amenable to treatment and are correctible, if diagnosed correctly, and treated early and adequately.

331 Eighth Street.

DISCUSSION

Olga Bridgman, M.D. (University of California Hospital, San Francisco).—For many years it has been the high desire of those of us concerned with various human problems to find some one basic cause which could be attacked in order, at one stroke, to eliminate such problems as feeblemindedness, crime, and mental disorder. Lombroso felt that he had hit upon such a fundamental cause in developing his theories of degeneracy. From time to time other panaceas have been advanced. Now endocrinology, still to a large extent in its very experimental stage, is perhaps a refuge for the very optimistic. What may be accomplished in the future by endocrine therapy can scarcely be predicted with any scientific accuracy, but some of us who have seen the complete failure of such treatment in scores of cases of mongolian imbecility, and have been disappointed in the use of thyroid therapy even in apparently clear cases of childhood myxedema, tend perhaps to be too pessimistic. It may be true that all maladjustment is primarily endocrine, but there are many other contributing causes of a social and psychological sort on which we must work, pending the discovery of any proved first cause.

❀

E. Kost Shelton, M.D. (921 Westwood Boulevard, Los Angeles).—Volumes could be written, in fact some have been written and very badly, on glands and personality. Suffice it to say, that those which I have read, including the article by Doctor Spalding, put too much emphasis on the glands of internal secretion as the direct cause of the personality pattern of the child.

Everyone will concede, in this day and age, that the pituitary is the regulator of numerous physiologic functions; but to predict just how many abnormal behavioristic leanings can be attributed to dysfunction of this organ *per se*, is a hazardous guess. It has always appeared strange to me that those suffering from demonstrable pituitary disorder, or whose pituitary dysfunction has been verified at autopsy, appeared to show the least change in personality pattern. To me the abnormal behaviorisms incident to tallness in girls, shortness in boys, genital hypoplasia, obesity, extreme thinness, etc., while real, are somatopsychic inferiorities, for which children compensate in various ways, mostly badly, rather than the result of hormonal imbalance *per se*. Some children compensate atrociously for these unsightly mechanisms, but I have never found a pill or a shot which would cure them without also some sensible psychologic readjustment. This treatment is frequently applied subconsciously by the physician during his course of physical rehabilitation.

Almost every day, when handling a large volume of work of this nature, one sees children with severe constitutional inferiorities, minor birth injuries, developmental cerebral defects, children with doting, foolish mothers or improvident fathers, who are being treated for their mental quirks with various endocrine products, especially new pituitary preparations that are sometimes in a very inadequate form and dosage.

Doctor Spalding's paper shows sincerity of purpose, and no doubt she knows all of these things, selects her patients carefully, and treats them well; but many busy practitioners whom this article will reach know little of the subject and thirst for knowledge. I am afraid that her article, interpreted dogmatically, would encourage rather than curtail the present indiscriminatory practice as regards the endocrine treatment of abnormal behaviorisms of the child.

ABDOMINAL ABSCESSES: THEIR TREATMENT

By Thomas O. Burger, M.D.
and
Harold C. Torbert, M.D.
San Diego

Discussion *by Robert A. Scarborough, M.D., San Francisco; Bon O. Adams, M.D., Riverside; Joseph J. O'Hara, M.D., San Diego.*

ANY method which promises to reduce the mortality from infections of the peritoneum deserves the attention of every surgeon. The purpose of this paper is to call attention to certain precautions in the treatment of abscesses in and adjacent to the abdominal cavity. The procedures to be described are not new,[1] but are so generally neglected, and in our hands have proved so potent in saving life, that it is felt worth while again to bring them to the attention of all surgeons.

TWO TYPES OF LOCALIZED ABSCESSES

Two general types of localized abscesses may be recognized: (1) Those following an inflammation

of the peritoneum, either local or general, and (2) those formed extraperitoneally. Examples of the first class are the ordinary appendiceal abscess, pericholecystic and pelvic abscesses, and those following slowly perforating peptic ulcers. Pancreatic, retrocecal and broad ligament abscesses are common examples of the second type.

PATHOLOGIC BACKGROUND

A knowledge of the pathologic processes involved is the first step in evolving proper methods of treating these lesions. The review given here is taken almost verbatim from Hertzler's monograph on surgical pathology of the peritoneum.[2] When infection begins in an organ covered by the peritoneum, the latter immediately initiates a series of defensive measures. The serosa becomes hyperemic for a considerable distance beyond the site of infection, and a fibrinous exudate appears on the surface. This is ready to adhere to adjacent surfaces, and usually with the aid of the omentum, which becomes plastered down over the site of the lesion, the infected area is walled off. Following the formation of this confining wall, the hyperemia beyond the immediate region of the abscess lessens; the exudate on the peritoneal surface and about the vessels is absorbed, and the peritoneum, except that part actually concerned in the formation of the abscess, returns to normal. In other words, that part of the peritoneum not concerned in the walling-off process is no longer in a state of defensive reaction.

If, now, the abscess is opened through the peritoneum either by the surgeon or by spontaneous rupture, pus flows over unprotected peritoneum. It is evident that the rational method of dealing with these lesions is to drain them extraperitoneally. In many abscesses, notably those occurring retrocecally and in the cul-de-sac, this can be done at once with comparative ease. In the remaining cases where the abscess is so located that it is impossible to avoid opening the peritoneum to get at it, a simple two-stage procedure will secure the same effect.

LOCALIZED ABSCESSES OF ABDOMEN

A large proportion of the localized abscesses of the abdomen occur following rupture of acutely inflamed appendices. This complication is particularly frequent following retrocecal appendicitis. The usual procedure is for the surgeon to make either a McBurney or right-rectus incision and tear away the adhesions. He then either removes the appendix and drains the abscess, or perhaps contents himself merely with draining the abscess. It really makes little difference, because in either event 20 to 50 per cent of his patients will die. Of course, he drained the abscess—and the drain cleared out a little channel not more than one centimeter in diameter surrounding the drain.

RETROCECAL ABSCESS

When for any reason the surgeon suspects the presence of a retrocecal abscess, the proper procedure is to begin the incision just over the crest of the ilium. The incision may then either be carried forward, close to the ilium anteriorly, or extended posteriorly, as for work on the lower ureter, as point-tenderness during palpation of the abdomen shall have indicated. Care should be taken to stay retroperitoneally until the abscess is approached. If there is any doubt that it has been reached, a large caliber needle may be used to demonstrate the pus cavity, which may then be opened by blunt dissection. If the appendix can be easily palpated, it should be ligated and removed. Otherwise, it is advisable to limit the operation to drainage of the abscess.

Occasionally one will suspect an abscess of this type but, on exploration, it will be found to be wholly within the peritoneal cavity. In such cases, the incision should be extended anteriorly, the peritoneum opened, and with one finger retroperitoneally and one finger in the abdomen, the abscess may be definitely located and retroperitoneal drainage instituted without soiling the peritoneum.

UNSUSPECTED ABSCESS

If, however, the surgeon has not suspected the presence of an abscess in advance and has made the usual gridiron or right-rectus incision, a somewhat different technique may be used. Every attempt should be made to avoid rupturing the abscess. The surgeon should content himself with placing a vaselin gauze drain down to the wall of the pus cavity, at the point nearest the surface. In a few days a protective wall of adhesions will be formed about the drain, constituting a pus-tight tube leading to the surface. The drain may then be withdrawn and the abscess opened with a hemostat or the finger. In many cases this will not be necessary: the drain will have adhered to the wall of the abscess cavity, which will rupture spontaneously into the drainage tract.

This two-stage technique is applicable to practically all abdominal cavity abscesses, the location of which makes one-stage extraperitoneal drainage impossible. We have used the method successfully to treat abscesses following rupture of intestinal diverticula, and those due to slow rupture of peptic ulcers. It also affords a fairly satisfactory method of dealing with abscesses which are completely retroperitoneal but which, because of their location, are difficult to drain extraperitoneally, such as those following infection of the pancreas.

The two-stage technique is particularly valuable in treating abscesses remaining after partial recovery from general peritonitis. Here the precarious condition of the patient, already weakened by a long and serious illness, makes a second infection of the general peritoneal cavity a matter of the gravest import. Seventy-five per cent of such patients will surely die if drainage is attempted transperitoneally. This mortality can be reduced to between 10 and 25 per cent if the draining is performed in two stages.

COMMENT

A final word of caution is perhaps necessary. Locate your abscess and place your drains without too much curiosity as to the original source of the infection.

In a series of thirty-seven cases of retrocecal appendiceal abscess in which either immediate extraperitoneal drainage or the two-stage operation was employed, we had no deaths. In five of the cases the appendix was found, ligated, and removed. Two of the remaining patients had to be operated upon a second time, one for a persisting fecal fistula through the stump of the unremoved appendix, and the other for a second abscess. Not only was the mortality zero in this series, but in practically all cases the postoperative course was smooth and convalescence rapid.

SUMMARY AND CONCLUSIONS

1. The pathology of localized abscesses in the abdominal cavity is briefly reviewed.

2. Extraperitoneal drainage of such abscesses is easy to do in some, but requires a two-stage procedure in others.

3. A two-stage operation is described for use in locations where primary extraperitoneal drainage is difficult or impossible. In the first stage, gauze drains are placed down to the wall of the abscess, with closure around the drain. Two to four days are then allowed for formation of a protecting wall of adhesions about the drain before the latter is removed and the abscess opened at the second stage.

4. In a series of thirty-seven cases of retrocecal appendiceal abscess drained by either the primary extraperitoneal or the two-stage method, there was no mortality. The postoperative course in all but two of these patients was entirely uneventful.

5. It is concluded that the mortality from localized abdominal abscesses can be materially reduced by the use of either primary extraperitoneal drainage or the two-stage method of forming an extraperitoneal drainage channel.

DISCUSSION

Robert A. Scarborough, M. D. (Stanford University Hospital, San Francisco).—Doctors Burger and Torbert are to be commended upon their presentation of a method for extraperitoneal drainage of abdominal abscesses which should be an efficient weapon in the armamentarium of the abdominal surgeon. Its application, however, to the appendiceal abscess, and in particular to the retrocecal appendiceal abscess, warrants critical analysis.

In order more competently to dissent from some of their statements, I have carefully reviewed the forty-four cases of appendicitis with rupture and local or generalized peritonitis that have been treated in the Lane Hospital clinic of the Stanford Medical School and in my own practice during the past eight years. In twenty of these cases the appendix was entirely retrocecal.

The general principle of treatment in this series of cases has been immediate operation through a McBurney incision, removal of the diseased appendix, if this could be readily accomplished, drainage to the site of localized abscess formation if the pus had a distinct odor; or, if a stained smear of the pus showed more than occasional bacteria, drainage of the wound to the peritoneum only in cases of diffuse peritonitis, and in cases in which the pus was odorless and showed only occasional or no bacteria in a stained smear. In no case was the authors' method of extraperitoneal or delayed two-stage drainage applied.

Careful comparison of this series with that of the authors does not convince me that the application of their method to cases of retrocecal appendiceal abscess is of great value, and it appears even to have certain disadvantages.

In the authors' series of twenty-eight cases there have been no deaths. In our series of twenty cases there have been no deaths, a contradiction of the authors' figures of an expected mortality of 20 to 50 per cent. In both series the "postoperative course was smooth and convalescence rapid." In the authors' series only five out of twenty-eight had the guilty appendix removed at the time of operation. The other twenty-three patients presumably should have returned for subsequent appendectomy. In our series seventeen out of twenty had the appendix removed at the time of operation. One patient returned for interval appendectomy five months later, one delayed eleven months, and returned during another attack of uncomplicated acute appendicitis for appendectomy, and the third patient has not yet returned.

Further analysis of our twenty cases shows that ten had appendiceal abscesses localized entirely extraperitoneally, and might conceivably have been drained by the authors' method. But in the other ten cases, although the appendix was entirely retrocecal, the infection, proved by culture, had spread to a greater or less extent into the general peritoneal cavity. Clinical differentiation of the two types could not be made.

The point to be stressed is not the placing of drains which we know cannot drain the general peritoneal cavity, but the immediate removal of the source of further gross contamination so that the peritoneum itself can cope with the already existing infection. Any delayed method of drainage fails to accomplish this object.

A word of comment seems justified also upon the twenty-four other cases of nonretrocecal appendicitis in our series, with rupture and varying degrees of extension of peritoneal infection. Three deaths have occurred, all in patients with a generalized peritonitis in whom there was found, at operation, no effort whatever on the part of the omentum or viscera to wall off the infection. One of these patients died on the sixty-second postoperative day, and at autopsy was found to have had a thrombosis of the splenic vein with a septic infarct of the spleen and pyelonephritis. The peritonitis had entirely subsided. One patient died very suddenly eight hours after operation, presumably from an embolus. The third patient was operated upon on the fourteenth day of illness, and died on the twelfth postoperative day. Autopsy revealed an acute generalized peritonitis.

The operative mortality in the forty-four cases of appendicitis with rupture and all degrees of spread of peritoneal infection was 7.5 per cent. I do not believe this figure is exceptionally low. It would seem to bear out the contention that the continued high death rate from appendicitis is attributable not nearly so much to any failure of surgical technique, but much more to delay on the part of the patient with abdominal pain in calling his doctor, and delay on the part of the doctor in diagnosis and instigation of surgical treatment. It is the latter that must concern us most deeply. If and when the recognition of acute appendicitis can be improved and immediate surgical intervention employed, then and then only will there occur an appreciable drop in the mortality rate of this disease. The important factor is not the mortality in cases of appendicitis with rupture, but the high percentage of cases of appendicitis which are allowed to rupture.

Bon O. Adams, M.D. (Mission Inn Rotunda, Riverside).—Doctors Burger and Torbert have given us a very valuable method of treating certain classes of abdominal abscesses of difficult approach. They have reviewed the classification of abdominal abscesses with relation to their probable origin; as to peritoneal covered viscera; and as to approachability. They have shown that nature very deftly blocks off subjacent areas when an abscess is forming. This blocking-off process she does by creating an inflammatory area with plastic exudate, both choking off by adhesions and by "water logging" lymphatics, thus protecting neighboring areas and distant parts.

The doctors have very cleverly come to nature's aid when the abscess is so situated as to make its direct drainage difficult or dangerous to the general peritoneal cavity, and so to life. They have taken their cue from nature and extended her process by using vaselin gauze to induce adhesions, and lymphatic blocking instead of the plastic exudate and lymphatic water-logging and omentum which nature so valiantly throws about abdominal abscesses of whatever origin to protect the organism.

The authors have made a very valuable contribution by indicating a method of extending the protective process of blocking off dangerous and easily susceptible tissues in these abscesses that are not readily accessible without danger of contaminating subjacent tissues.

My friend, Dr. W. E. Gardner of Riverside, uses 1-1000 acriflavin gauze in a two-stage suprapubic prostatectomy operation to block the lymphatics of all tissues along the drainage tract. This gauze is packed into the first-stage wound down to the bladder wall and left for two to three days, when the gauze is removed, and the second stage of opening the bladder and removal of the gland is completed.

These conservative procedures are the development of mature surgical judgment, and are based upon well-established laws of tissue autoprotectability. Their employment will lead to the reduction in mortality statistics in a very hazardous class of cases.

❦

Joseph J. O'Hara, M.D. (233 A Street, San Diego).—Only complete agreement with the authors is possible in their conclusions that the mortality in abdominal abscesses is greatly decreased if extraperitoneal drainage is used.

I wish to add that I am sure that if a careful follow-up of all patients who have survived drainage of abdominal abscesses were made, it would be found that those patients in whom well-planned extraperitoneal drainage was used have far less difficulty later with troublesome adhesions and intestinal obstruction. I feel that a great many of the mechanical postoperative obstructions that we are operating upon are due to previous general peritoneal drainage.

I think most of us dislike two-stage operations and procedures that may require two separate incisions, as well as a procedure that has not satisfied us as to the actual origin of pus; the authors have outlined a treatment that disregards these feelings, but from their report it has certainly been very beneficial for their patients.

CRITICAL DECISIONS IN CATARACT SURGERY*

By Harold F. Whalman, M.D.
Los Angeles

Discussion *by Dohrmann K. Pischel, M. D., San Francisco; Otto Barkan, M. D., San Francisco; Dewey R. Powell, M. D., Stockton; K. C. Brandenburg, M. D., Long Beach.*

THE colleagues who are most stimulating to us are those who disagree with us. It is they whose ideas we should ponder, not that we may be converted by them, but that, in the light of their certainties, we may search out the basis of our own. We dignify by the name of beliefs a jumble of traditions and superstitions which need to be subjected to the careful scrutiny of scientific methods. Spurred by some skeptic, we finally sort out the grain from the chaff.

With this thought in mind the essayist has the temerity to present some ideas regarding the decision to operate several types of cataract.

The subject does not lend itself to statistical study, so that no statistics will be presented; but certain specific examples will be cited.

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

CONGENITAL CATARACT

Early surgery in congenital cataract depends on whether the condition completely obscures the vision, or whether the opacity is limited to the poles or nucleus. When complete it is best to operate as early as possible, even in the third month because, if delay ensues, central fixation will not develop and an ocular nystagmus will result.

In the incomplete cases the operation may be postponed for a considerable period of time, even into childhood.

Whenever operation is considered during the first year of life, it is advisable to take an x-ray plate of the chest to determine the presence of a persistent thymus gland before a general anesthetic is administered. Although a small thymus gland may be hyperactive, just as in a case of hyperactive thyroid gland, nevertheless one can at least determine the presence of an enlarged gland and, furthermore, the taking of the x-ray picture is sufficient to have some therapeutic effect upon the thymus itself. The anesthesia required, of course, need be only very brief, as the operative procedure itself is short. Even a local anesthetic can be used in these tiny mites.

In congenital cataract, of course, the needling operation is the one of choice, as it can be swiftly done, and autolysis will result.

UNILATERAL CATARACT

In connection with senile cataract, the surgeon is frequently confronted with the decision of whether or not to operate a unilateral cataract which has reached maturity.

In the first place, it is generally agreed that there is an optimum time to operate a cataract, and that is when it is matured. It is not desirable to wait until it has gone into a state of hypermaturity, where the percentage of good results is reduced thereby.

Removal of unilateral cataract offers the advantage of increasing the field of vision on the operated side, which is very important in these days of heavy pedestrian and vehicular traffic. I have never seen a case so operated that could not become accustomed to the visual disturbance that at first results from the disparity of images received upon the retina, provided the eye is not fitted with a full correction.

Thirdly, should there be a beginning cataract in the opposite eye, it is highly desirable to remove the mature cataract before the fellow eye becomes mature; because, when a patient is allowed to become totally blind, he neglects himself and becomes a less favorable physical risk thereby.

He also becomes psychologically a poorer risk. When the matured cataract has been removed, and there is a beginning cataract on the other eye, the patient feels that it can take its time getting ripe without any concern on his part.

There is also the cosmetic standpoint to be considered. A stary white pupil can be a source of social embarrassment and an economic liability.

COMPLICATED CATARACT

What shall be done, then, with complicated cataract? When it is known that systemic disease,

such as arteriosclerotic retinitis, healed albuminuric retinitis or diabetic retinitis, or other forms of chorioretinitis pathology, exists, the patient is entitled to whatever vision can be offered by virtue of a cataract extraction, even though this be of a very low acuity. The ability to perceive form alone is not only encouraging, but is valuable to the patient. However, one must emphasize to patient and relatives the limited results to be anticipated.

Liquid vitreous need not deter one from performing cataract extraction, as the loss of liquid vitreous is a much less serious matter than loss of normal vitreous. Many of these patients will retain useful vision for years, and since most of them are aged or infirm their life expectancy is not great anyway.

GLAUCOMA AND CATARACT

One sees from time to time cases of glaucoma associated with cataract in which one cannot be sure which has occurred first. If the history is of failing vision of short duration, and the refraction has changed to indicate an increased refractive index of the lens, then the elevated intra-ocular tension is probably due to a swelling of the lens, and cataract extraction will be followed by a normal tension. In one such case the writer performed a preliminary trephine operation in one eye which proved to be unnecessary, as the tension came to normal in the second eye following cataract extraction.

TRAUMATIC CATARACT

When traumatic cataract is the result of a penetrating injury and the lens is extensively injured, it seems best to remove as much of the lens substance as possible immediately upon seeing the case provided not more than twenty-four hours have elapsed. After that time, and when a reaction has commenced in the eye, it is better to wait until the eye has quieted somewhat before attempting to remove lens substance.

Dr. Edward Jackson has stated, in an editorial in the *American Journal of Ophthalmology* for December, 1935, that the chief value of two eyes is the service that one can render when the other is lost and, therefore, we should make every effort to save as much vision as possible in an injured eye. On the other hand, 2 per cent of perforating injuries of the eye result in sympathetic ophthalmia. Fifty per cent of these will get well. Although the risk is considerable when one realizes that with sympathetic ophthalmia both eyes may be lost, yet one never can tell when an injured eye which has been salvaged may be the only eye that the patient may have some time in his life because of some unfortunate mishap to its fellow.

DINITROPHENOL CATARACT

Since within the past eighteen months we have been called upon to make decisions regarding a new type of cataract requiring special consideration, I wish to mention some points in connection with dinitrophenol cataract.

Dinitrophenol cataract should be observed as early as it is possible to see the patient, watching the eye closely for signs of increased intra-ocular tension and acting to remove the lens when this occurs. It is true that some of the swelling of the lens will subside, but it is too dangerous to wait until this occurs, as an acute glaucoma may develop as a result, and I have seen one eye entirely lost, requiring enucleation as a result of complications which set in because it became an acute emergency situation.

When intra-ocular tension remains approximately normal, there is no great hurry about surgical intervention; but one should be guided by the extent to which the patient is incapacitated and, if possible, wait until certain disintegrating changes have taken place within the lens. In most patients under forty-five years of age, the embryonic suture lines will eventually be seen to be split wide open, and at that time one can perform a linear extraction without difficulty. The closer the patient approaches the age of fifty the less this can be done with facility, and the remainder of the cases operated should be done by the extra-capsular method. Intracapsular extraction is never advisable, because the zonule is usually resistant, while the capsule in these cases is particularly fragile, and one will not be successful in a large percentage of attempts. Furthermore, in every instance of dinitrophenol cataract that the author has had the opportunity to see, there has been an increased posterior segment pressure which makes one feel the need of the protection offered by the barrier composed of zonule and posterior capsule of the lens.

727 West Seventh Street.

DISCUSSION

Dohrmann K. Pischel, M.D. (490 Post Street, San Francisco).—In regard to congenital cataract, I believe that we all agree it is advisable to operate early so that the macula will develop, but not all will want to operate as early as the third month. Some might want to wait until one year. It would not be wise to wait longer. There are several conditions favoring early operation. The youngster is so small that he is easily controlled, takes an anesthetic easily, and postoperatively lies quite still. These are all advantages.

As to the operation itself, some would prefer a linear extraction where a lens is entirely opaque. By this means practically all the lens matter can be removed at once, and the convalescence is short. The annoying iritis, which frequently accompanies needling as well as any possibility of secondary glaucoma, is avoided.

In regard to unilateral cataract, I believe we must all agree with Doctor Whalman that it should be operated upon when mature, to prevent its progressing to hypermaturity. I feel that the difficulty of a cataract extraction is so much increased by this condition that the probability of success is greatly lessened. Furthermore, hypermature lenses are apt to become dislocated with all bad consequences of this condition.

The annoying postoperative diplopia, mentioned in the textbooks, is very rare indeed, although when present may be very distressing. On the other hand, I have had a patient who was only satisfied when he was wearing full correction of the aphacic eye, together with proper glasses over the unoperated eye.

Aside from the complicated cataract with fundus lesions mentioned by the author, is the cataract with healed cyclitic changes. Here, with many posterior synechia and thickened capsule, the intracapsular operation is the one of choice. But just when to operate is the more difficult question to answer. If vision is so poor as not to be useful, one can operate after the eye has been quiet six or eight months. When there is still quite useful vision left, the question comes up of operating with the possibility of improving the vision, on the one hand, or of stirring up a

devastating inflammation on the other. Here each case will have to be settled on its own merits.

In glaucoma with cataract, one should keep in mind the glaucoma stirred up by the flaking off of the anterior lens capsule, the "glaucoma capsulaire" of Vogt.

Under traumatic cataract, Doctor Whalman gives a rather high percentage of sympathetic ophthalmia. I have always felt that it was very rare, and this seems to be also borne out by the literature. However, the statistics on this subject are very variable, because few authors have had a chance to see a large number of cases. While many men go through a life's practice without encountering this distressing disease, it is just as well to have it always in mind so that one will not be caught unawares when such a case appears.

In regard to cataracts resulting from the use of dinitrophenol, I merely wish to report that a few weeks ago at Stanford Eye Clinic a patient was operated upon for just such a cataract. Apparently, the era of dinitrophenol cataract has not as yet ended.

❦

Otto Barkan, M.D. (490 Post Street, San Francisco). Most of us are, I think, agreed that more or less complete congenital cataracts, when present in both eyes, should be operated within the first few months of life. The choice of operation is still an open question. I should be interested to know Doctor Whalman's opinion of the relative merit of linear extraction, making the incision well within the cornea and very oblique, after a subconjunctival injection of adrenalin. The exquisite friability of the infant iris should be born in mind, and that the pupil is often difficult to dilate in this type of case.

❦

Dewey R. Powell, M. D. (242 North Sutter Street, Stockton).—We are indebted to Doctor Whalman for bringing before us this ever interesting problem of what course to follow in certain types of cataract.

The title, "Critical Decisions in Cataract Surgery," is most apt, as both the fate of the eye and the peace of mind of both patient and surgeon depend on the wisdom of the course adopted. In his opening sentence, Doctor Whalman invites discussion through disagreement, but I find myself quite in accord with the procedures outlined and can only concur in the decisions arrived at, except in the question of the treatment of unilateral cataract. I am fully aware of the oft-quoted dictum of Knapp, "Get all the vision you can when you can," and I know that the usual advice given is to operate. If there is a beginning cataract in the other eye, there can be no question as to the advisability of operation, but if there is normal vision in the good eye, I am very hesitant about suggesting any removal of the cataractous lens.

I have had two patients who, in spite of correct postoperative vision of 20/30 and 20/20, respectively, had such confusion due to inability either to fuse the unlike images or suppress one of them that they only had comfort when one eye was covered. This was true with only a weak correction on the operated eye and even without a correction. This disparity of images was so annoying that I have since followed the custom of watchful waiting in cases of unilateral cataract with normal or nearly normal vision in the other eye. The situation is explained fully to the patient, who is asked to report for regular check-up examinations so that any new developments can be appropriately met. In all other decisions, I am in accord with the essayist.

❦

K. C. Brandenburg, M. D. (110 Pine Avenue, Long Beach).—We are indebted to Doctor Whalman for his presentation of the affirmative side of the question, when to operate. Most of us are aware of a number of reasons which may well decide us against operation in the cases which Doctor Whalman feels should be submitted to surgery. These considerations are not only of a purely ophthalmic nature, but are physiologic and economic as well.

The skill of the operator, as reflected in his results, must also be a determining factor in deciding whether the probable benefits will outweigh the risks which are an inevitable accompaniment of all surgery.

AS A PHARMACIST VIEWS THE PROPOSED CALIFORNIA HUMANE POUND LAW*

By James J. Boyle
Los Angeles

THE prejudices against animal vivisection remain one of the most serious obstacles to the progress of medicine, surgery, and pharmacology.

The Humane Pound Law being sponsored as an Initiative on the November, 1938, ballot will aid to intensify that prejudice.

To the general public the "Humane Pound Law" is a misnomer. The sponsors should come out in the open and call the Initiative by its proper name, "Antivivisection Act." The mothers and fathers of California must be warned of this deception of an apparently harmless title.

We pharmacists have witnessed before now many attempts to regulate, control and perhaps prevent the advancement of research in medicine. A similar proposal appeared on the ballot in 1922. It was defeated overwhelmingly. At each successive session of the California Legislature, except 1937, attempts were made to compel the Legislature to pass such a law. Every conceivable method known to modern lobbying was used; money was spent freely, threats and intimidations were employed, but the Legislature, in its wisdom, saw otherwise.

Should this proposed Initiative Act become the law of California, the education of pharmacists and of physicians and scientists would be superficial. Our knowledge of metabolism, the physiology of the digestive tract, came largely through animal experimentation and research on dogs.

Bacteriology, part of a pharmacist's education, is most essential to us if we are to continue to perform as the physician's right-hand man. The appreciation of the theory of immunology is essential in our daily work of dispensing serums and vaccines.

We are only too familiar with the noble results shown by public health records of the value of diphtheria, typhoid, scarlet fever, antitoxins, and antirabic inoculations, as well as the vaccines of smallpox and tuberculins. We are the guardians of biologics, kept under proper refrigeration, subject to emergency calls from physicians, night and day.

Antivivisectionists might well pause for a moment and give thanks that animal experimentation has saved the lives of thousands of children against infectious and contagious diseases. Yes, and also saving the lives of their pets as well.

We, as pharmacists, appreciate the economic saving to the nation that insulin has been the means of effecting. Since the discovery of insulin, men, women, and children are assured of a normal span of life. Diabetes is no longer the dreaded, incurable disease we formally knew. Insulin research has

* Read at a joint meeting of the Los Angeles County Medical Association and the Southern California Retail Druggists Association at Los Angeles on March 17, 1938.

See also editorial comment, on page 236.

played a dramatic part in this economic saving, due through experiments on dogs. Daily it is my pleasure to dispense insulin to many prominent and active citizens whose families would suffer not only an economic loss, but companionship and love for many years to come, did we not possess this beneficent research discovery.

Materia medica is a much different subject today than when I studied pharmacy. We pharmacists discuss many new potent drugs with our physicians. Without animal experimentation these new potent and specifics would not be available. Local anesthetics, digitalis derivatives, and heart problems are now fairly well controlled because of proper standardization. Chenopodium has done its part in the elimination of hookworm. Viosterol and our vitamins A, B, C, D, G, and K, are today household words given to parents by the pediatricians. Rickets, malnutrition, and dental problems are daily solved and, here again, largely because of animal standardization. Parents expect the pharmacist to guide them intelligently in their selection of vitamin products.

The pituitary extracts—Are we to be denied their continued use? For only through animal experimentation can the flow of such essential drugs pass from our great pharmaceutical laboratories, hospitals, and pharmacies to mothers, guaranteeing safe childbirth. I can well recall when the strengths of pituitary extract on the market varied from a ratio of one to eighty; what a sigh of relief, therefore, must come to every physician and pharmacist on dispensing potent drugs today, which, because of research on lower animals, standardization is much more exact.

Pharmacists look with optimism into the practically unknown field of endocrinology. Perhaps today we are facing a world of marvelous discoveries yet to be found. Our position in this field is comparable to chemistry about one hundred years ago. Only through animal experimentation can we continue to explore this most fascinating field of medicine that has given us the estrogenic products and the various glandular substances and extracts with which the pharmacist, as well as the physician, must now familiarize himself.

If we are to eradicate cancer, man's most perplexing disease, it will be accomplished, in part, through animal experimentation. Certainly it is not the intention of many of the most intelligent, but misguided citizens, to lend a hand at blocking this humane study. Surely, this group do not ask that cancer be eradicated only by experiments on their brothers and sisters.

We pharmacists have joined hands with the physician, research workers, and public health officials in spreading the gospel of health through constructive educational programs, based on facts of accomplishment. The lives of the pharmacist, Pasteur, and the physician, Jenner, still remain, and should continue, for all of us, guiding stars in overcoming disease in both human beings and the lower animals.

PROPOSED CALIFORNIA HUMANE POUND LAW: HOW IT WOULD AFFECT MEDICINE AND PHARMACOLOGY*

By Clinton H. Thienes, M.D.
Los Angeles

Discussion *by Fred B. Moor, M. D., Los Angeles.*

Sir William Osler makes the statement that, in the more than two thousand years from Hippocrates to Jenner, less was done to emancipate medicine from the routine and thraldom of tradition than was accomplished in the second half of the nineteenth century by experimental medicine.[1] The Hippocrates to Jenner era was one of observation of uncontrolled phenomena of disease. The era since has been characterized by the rise of the experimental method, so ably championed by Claude Bernard seventy-five years ago. What is the experimental method? It is the method of the controlled testing of scientific concepts. The experimental method in medicine requires living beings; that means animals or human beings. Surely, the life or liberty of neither animal nor human being may justifiably be placed in jeopardy unless, by so doing, many more animals and human beings are benefited, and to a great degree. Is this the case?

KNOWLEDGE OF LIVING TISSUE ESSENTIAL

First, let us consider the training of the student of medicine. As a practitioner, he must deal with living tissues. One of the best preparations for this is to learn what living tissue is. To this end he is trained by means of experience with living animals. And the student must learn the mechanisms of drug action. Such functions and mechanisms cannot be taught on the human being nor upon dead men or dead animals, but must be learned through analytical studies on living animals. Such analytical studies usually require operative or painful procedures. Hence, the animals are anesthetized to prevent such pain. If for no other reason than to create in the student a desire to relieve pain the teacher of medical science would see to it that the animal is spared unwarranted suffering. Medical education has advanced with great strides since, and largely because of, the introduction of the experimental method in the teaching laboratory. The use of animals, then, is of great importance for the training of the doctors of the future. But the most impressive value of the use of animals in relation to medicine is in the study and control of disease.

DIPHTHERIA'S DEATH TOLL, HAD THERE BEEN NO ANIMAL EXPERIMENTATION

As examples, I wish to select but a few of many that might be chosen. Let us consider, first, diphtheria. Diphtheria has been largely a disease of children and, in its fatal form, a very painful and terrifying malady, with death by slow suffocation.

In New York City, the average number of deaths per year from diphtheria during the seventeen years 1878 to 1894 was 144 per 100,000 popu-

* Read at a joint meeting of the Los Angeles County Medical Association and the Southern California Retail Druggists Association in Los Angeles on March 17, 1938.

See also editorial comment, on page 236.

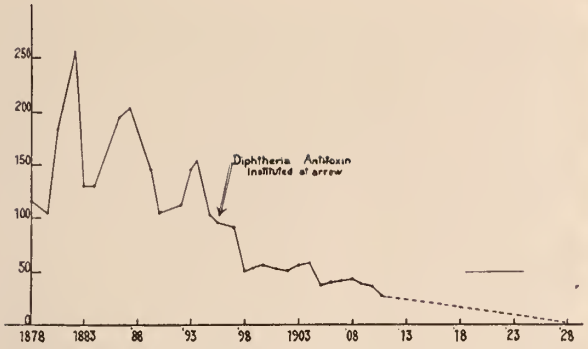

Fig. 1.—Diphtheria mortality 1,000,000 per year (by years).

lation. In 1894, the antitoxin laboratory was established in the city. From 1895 to 1911, which is the first seventeen years after the institution of antitoxin treatment, the yearly average number of deaths was but fifty-four.[2] Chart 1 indicates the trend during these years. Since 1911 the trend has continued downward, due to more widespread use of antitoxin, earlier diagnosis and immunization of school children; and, according to Park,[3] the figure for New York City not long ago was but four per 100,000. All writers consulted state that the mortality among cases treated during the first day of the disease is nil, and that for all treated cases it is less than 9 per cent, while of cases which do not receive antitoxin, over 30 per cent die.

This remarkable decrease in diphtheria mortality would have been impossible without animal experimentation which made the discovery of antitoxin possible, and, furthermore, the preparation of antitoxin today would be impossible without the use of the laboratory animal, which is the source of the antitoxin. All antitoxins and antisera are prepared by injecting the toxin or vaccine into the laboratory animal, usually the horse, and the subsequent bleeding of the animal to secure the serum which contains the antitoxin. Anyone seeing the sleek animals, living in animal luxury, from which blood is periodically drawn in the preparation of the antitoxin, must admit that the animal shows not the slightest evidence of torture.

RABIES: PASTEUR'S BENEFICENT SERVICE TO THE HUMAN RACE

Another infectious disease conquered by animal experimentation and by the use of animals for the preparation of the medicinal material, is rabies (hydrophobia). In all my medical career I have seen but one case of human rabies. This was a child of eighteen months, whose pitiful condition left its image ineradicably in my memory. Figures 2 and 3 show a young man in the terminal stages of rabies. In contrast to this is the instance of a medical colleague of mine who bears many scars from an encounter with a rabid dog, and who has escaped the horrible death by rabies because of the work of Pasteur. Before the institution of the Pasteur treatment, every medical student was familiar with the disease at first hand, because 15 per cent of the victims of rabid dogs succumbed to the disease. Now the Pasteur treatment has reduced the incidence of this universally fatal malady,

Fig. 2.*—Patient (rabies) in enclosed enclosure. Photograph taken in pause between two attacks. (Difficult breathing, complete exhaustion.)

so that of over five thousand persons in New York City who have been bitten by infected animals, only twenty (0.4 per cent) have died.[4]

Not only are thousands of human lives saved by antirabies treatment, but thousands of valuable or cherished dogs are yearly inoculated with the vaccine either as treatment or as an immunization against hydrophobia.

It is the lowly rabbit which supplies us with the Pasteur vaccine. The virus, which has been attenuated by passing through a series of rabbits, is inoculated into the final rabbit. After a certain time the rabbit is killed and its central nervous system is employed in the preparation of the therapeutic vaccine.

Who is there among you who would care to weigh the life of a child or of an adult person against that of a rabbit? And who among you can call it cruelty to sacrifice the animals for such purposes?

Fig. 3.*—Invalid during an attack of hydrophobia. Anxious, distressed expression of countenance, fixed gaze, divergent strabismus, laryngical spasm.

Fig. 6.

Fig. 6.—Group of diabetic children (after treatment with insulin). Photograph taken in 1927.

DIABETES: ITS MORTALITY RATES IN FORMER AND PRESENT DAYS

A third condition in which thousands of lives have been saved by animal experimentation is diabetes mellitus. Most of you remember the pre-insulin days. Diabetes was one of the dreaded diseases. In the young it was rapidly fatal. Few children lived more than a year after the onset of the disease, and the average length of life of a twenty-year-old patient was two years or less. What miserable folk they were: thin, weak, sallow, cold, hungry and thirsty, waiting for death (Figure 4). Today a diabetic can live a nearly normal life, except for the carefully adjusted diet and the daily injections of insulin. His life expectancy is almost that of a nondiabetic. This change in affairs has come about through animal experimentation and would have been impossible otherwise.

In Figure 5 we see the same child as in Figure 4, just thirty-four days after insulin treatment was begun. The photograph shown in Figure 6 is of a group of children at a local diabetic Children's Clinic in 1927. Today two of the girls are mothers, one of the boys is an assistant professor of chemistry and, except for a boy who died of bone sarcoma and a girl who died of lung abscess, all are living useful lives. Without insulin, none of these children would be alive today.*

The dog has been the only animal that could be transformed into a chronic diabetic for the careful study of the various factors in diabetes mellitus and for the study of the actions of insulin in the diabetic animal.

You may say that we have now gained so much knowledge of diabetes that further sacrifice of animals is unwarranted. But if the use of animals for scientific purposes were to cease, insulin standardization would be impossible, for we have no chemical criteria for its assay. Thousands of rabbits are necessary for the determination of the potency of the various batches of insulin prepared in this country. Insulin is a very potent material, and its dose must be accurately adjusted to the needs of the individual patient. Without standardization of potency, a patient might either be excreting large amounts of sugar, or be in a state of insulin shock. An overdose of insulin can be a very dangerous episode in the life of the diabetic patient. First judgment, then muscle control, then consciousness is lost, and convulsions supervene. Patients would not dare venture out of doors if they could not feel reasonably sure of a given volume of insulin solution producing a uniform effect. This uniformity of effect could not be without animal control of the insulin potency.

SMALLPOX, LOCKJAW, BUBONIC PLAGUE, SYPHILIS, AND OTHER DISEASES

I have mentioned but three of the triumphs of experimental medicine. I could tell you of the conquering of smallpox, lockjaw, plague, and syphilis; of great advances in our knowledge of infantile paralysis, tuberculosis, and pneumonia. I could relate recent experiments which seem to open wide the gate that has kept us in ignorance of the mechanism of high blood pressure. I could show how animals are indispensable for the establishment of the mechanisms of drug action and for the control of the potency of digitalis, ergot, pituitary extract, and many other potent drugs. How, also, the new anesthetics, ethylene and cyclopropane, were discovered through animal experiments; and how this marvelous new drug, sulfanilamid, which is doing such remarkable things in the treatment of childbed fever, streptococcus wound infections, and acute epidemic meningitis, was first brought to

* We are indebted to Drs. Bertnard Smith and Howard F. West, of Los Angeles, for these photographs.

light by tests on animals. But because neither my time nor your patience permits this, I must content myself with presenting a prophetic picture. Until we learned how to produce cancer in experimental animals, we learned but little about the characteristics of malignant tumors. Then it was learned that tar cancer could be produced in rabbits, that a tumorous growth could be initiated in fowl by the injection of a specific virus, and that spontaneous tumors could be transplanted from one animal to another. This led to the discovery of the carcinogenic sterols, to the discovery of genetic control of experimental cancer and, finally, to the rôle of the hypophysis and of the ovary, in the regulation of the growth and incidence of experimental malignant tumors. If one may forecast the future, on the basis of past experience, one may feel justified in believing that, before long, through animal experimentation, this disease of old age may be conquered. Having conquered many of the diseases of youth, we lengthen life into that era where cancer and circulatory disease take their toll. Most of those in this room will fall victim to one or the other. We are well on the way to understanding both through animal experimentation. We must not turn back. We must not even stand still. We must go forward.

Department of Pharmacology,

DISCUSSION

Fred B. Moor, M.D. (White Memorial Hospital, Los Angeles).—Doctor Thienes has presented to you a most convincing argument for the humane use of animals in the study of disease, the development of biological remedies, and the elucidation and standardization of drug action. It seems incredible that any but the most uninformed or wilfully ignorant would seek to impede medical progress in the life and death struggle with devastating diseases.

Although the past fifty years have witnessed wonderful progress in the control and treatment of disease by the aid of animal experimentation, medical frontiers are not yet abolished. New regions are constantly opening up, for example, the rapidly developing fields of nutrition and endocrinology, both of which require the use of animals in the solution of a multitude of unsolved problems. The discovery that nicotinic acid produces a most spectacular cure of pellagra arose from the observation that it relieved the black tongue disease of dogs. This discovery benefits both dogs and men, as do many of the results of animal experimentation. The control of pernicious anemia by the use of specific liver and stomach extracts had its foundation in the fundamental observation of Whipple that liver-feeding was especially effective in curing experimental anemia in dogs. As Doctor Thienes has intimated, one can continue indefinitely enumerating steps in medical progress which have been based directly or indirectly upon animal experimentation.

Let us suppose for a moment that the dreams and desires of certain well-meaning but misguided people could be realized, and that all animal experimentation could be abolished. Smallpox would again become epidemic as it has been in the past, and as it is occasionally still in some unvaccinated populations. Diphtheria would again become a prevalent disease and would exact a death toll of 30 per cent of its youthful victims. Typhoid fever and tetanus would again ravage our armies in time of war. Diabetics would again be consigned to their miserable state of preinsulin days. The mortality, which in nearly half of all lobar pneumonias can be reduced by specific serum to 10 to 20 per cent, would again rise to from 30 to 40 per cent. As Doctor Thienes has pointed out, we would be forced to use certain drugs of unstandardized potency. I was told recently that our local health department, most of the time, has under treatment several persons who have been bitten by rabid dogs. Without the Pasteur treatment these individuals would be waiting in awful suspense wondering if and when symptoms of rabies might appear, and when they did appear if nothing could be done about it. Our children would be exposed daily to attacks of rabid animals; and even the very animals which the proposed so-called Humane Pound Law seeks to protect would be in danger of much worse suffering than being painlessly put to sleep in an experimental laboratory with an anesthetic, to serve a merciful purpose in the study of means for relief of both animal and human disease.

Such would be the situation if we were denied the use of animals for experimental purposes. Surely, the people of California, if they knew the truth, would not desire even to take this first step in the abolition of the use of animals in experimental studies which will save the lives of their children.

FEDERAL AND STATE NARCOTIC LAWS: CAUTIONS FOR PHYSICIANS*

By William R. Molony, Sr., M.D.
Los Angeles

A BRIEF outline of major points on the narcotic laws include items such as follow:

The narcotic regulations that affect the physicians and surgeons of California come from two sources, namely, the Federal (Harrison Narcotic Law) and the State (Division of Narcotic Enforcement Government). It is quite important that each practicing licensed physician be familiar with the basic regulations of these laws.

At the present writing there are about one hundred licensed men under probation from the Board of Medical Examiners, and at least 75 per cent of these may trace their trouble to a violation of these narcotic laws.

Occasionally we find that a doctor gets into difficulty through carelessness or a misguided desire to help out an "addict" in his misery; but most of the cases develop from a deliberate violation of these laws, either in prescribing for a fee or the sale of narcotics to "addicts." No good ever comes from these practices, and the sooner our physicians stop writing for these habitual users the better off they will be.

A habitual user may be one who started with or still has a definite pathology; but no "pathology" requires 15 to 20 grains of morphin a day. The most severe type of pain is ordinarily controlled by a grain of morphin, and the balance of the daily dose is simply to satisfy the addiction.

The agents of the Federal and State narcotic enforcement divisions are anxious to coöperate with the medical profession. In most cases, after an investigation they settle the case with a word of caution, and an explanation of the law. It is only the doctor who is a "repeater" and one who is writing for "addicts" or selling narcotics who is arrested and punished.

* See also editorial comment, on page 236.

If a doctor has a bona fide patient under his care that requires morphin, he may order as much as in his judgment is needed; but he must have made his own independent diagnosis and thereafter notified in writing the proper enforcement office. If he follows this procedure, he has but little fear of being molested.

Ambulatory treatment of narcotic addiction is prohibited. "A physician cannot treat a case of narcotic addiction in a patient's home. The treatment must be given in a hospital or institution approved by the Board of Medical Examiners, or in city or county jails, where the patient is at *all times under restraint and control.*"

"That such addict is kept under restraint or control is the essential requirement for approval. Narcotics can *only* be administered to an addict under treatment in such an approved institution by a *licensed physician and surgeon* or a *registered nurse* acting under his direction."

"Narcotics may be prescribed in *good faith* for a *reasonable time* and in *reasonable amounts* by a duly licensed physician and surgeon to his patient for any disease, ailment, or injury, other than narcotic addiction. Such physician and surgeon must keep an office record, giving the name of the patient, the pathology for which each treatment is given, and the date thereof. This record is open to inspection by the officers of the law."

The first pages of the directory, issued yearly by the Board of Medical Examiners, a copy of which is sent to every California licentiate, is devoted to a full and clear explanation of the narcotic regulations.

1930 Wilshire Boulevard.

FEDERAL AND CALIFORNIA STATE NARCOTIC LAWS*

CAUTIONS FROM THE STANDPOINT OF A PHARMACIST

By Frank Homer
Beverly Hills

I will try to point out some of the differences in the new State Narcotic and the Federal Narcotic Acts. A new California law (Senate Bill 62) was enacted at the last session of the Legislature as an amendment to the State Narcotic Act. It strengthens the present Act, and imposes certain new restrictions not contained in the old measure. There are several new departures in this Act, some of which exceed the Federal statute in the things a doctor or druggist is required to do. It is extremely important that you fix these things in your mind to properly comply with both State and Federal Acts.

RECENT AMENDMENTS TO THE STATE NARCOTIC LAW

The first and most important change in the new Act is the entire elimination of any preparation containing any narcotic other than codein from the exempt narcotic list. This means that any preparation containing morphin, heroin, opium, or any of the salts or derivatives of these cannot be sold, even though the narcotic ingredient is present in the minutest quantity, except on a doctor's prescription; syrup of cocillana compound, elixir of copevine and a number of preparations containing ethyl morphin, hydrachlorid (or dionin) can only be dispensed on a doctor's prescription. In other words, codein is the only narcotic now permissible in exempt preparations in the State of California. And the quantity, one grain per ounce, still remains. Here are some of the essential differences in the present act:

The Federal law does not specify any time at which the prescription may be filled after it is written.

The new State law specifies that no prescription can be filled later than the seventh day after it has been written. And that no prescription can be postdated or antedated. The Federal law does not prevent the giving of a copy or duplicate of a narcotic prescription, the same marked across the face plainly, "copy." The new State law specifically makes it unlawful to give any copy or duplicate of any prescription except to an inspector of the Board of Pharmacy or to the chief inspector of the narcotic enforcement division. The Federal law permits a prescription to be dictated to another person or to be typed by an office assistant if it is properly signed by the doctor. The State law specifies that any narcotic prescription must be wholly written, signed, and dated by the person writing the prescription. These are the essential and principal differences. And where the State law is stronger than the Federal statute, the State law takes precedence.

All narcotic prescriptions must have the date, patient's full name, street address and city or town in which he lives; also, the doctor's full name, street address, city and registry number.

A narcotic prescription that has been altered or changed in any respect cannot be filled by the pharmacist.

Now, with reference to the writing of narcotic prescriptions calling for preparations which have previously been on the exempt narcotic list, the chief inspector of the narcotic enforcement division has stated that in the absence of any regulations yet received, the law will be enforced as written. And that means that a prescription, for instance, written for cocillana compound, would have to be wholly written in the doctor's own hand and presented in the same form as a narcotic prescription, nor could the prescription be refilled or a copy given. In other words, this prescription would take the same procedure as a prescription calling for morphin tablets.

In closing, I should like to see the doctors and druggists some day go on record condemning the practice of selling drugs and medicines through any other channels than the regularly licensed pharmacy. A proper law could go far in doing away with house-to-house peddling of drugs and medicines, and other forms of selling that lead to self-medication, and worse.

449 North Canon Drive.

THE LURE OF MEDICAL HISTORY†

HUGH HUGER TOLAND*

GREAT PIONEER SURGEON AND FOUNDER OF THE MEDICAL SCHOOL OF THE UNIVERSITY OF CALIFORNIA

VI

By Edgar Lorrington Gilcreest, M.D.
San Francisco

PART I**

IN this age of scientific achievement, it is well occasionally to look backward and take note of what some of the pioneers in medicine and surgery accomplished and gave to our craft. Hugh Huger Toland was one of these, and his contributions to surgery were far-reaching.

Born on a plantation at Guilders Creek, Newberry County, South Carolina, on April 16, 1806, in the cradle of Southern culture and chivalry, he was the fourth child in a family of ten. On his father's side he was of Irish descent, his ancestry being traced in a direct line to John Toland, a native of Londonderry, who, early in the eighteenth century, was the confidant of Harley, the Earl of Oxford, and was known to the world of letters and politics as an author and politician of repute. His father, John, a virile character, born in Newton Stuart in the north of Ireland, emigrated to America, where he became a wealthy planter and banker, and was highly respected in his community. His mother, Mary Boyd Toland, of Scot descent, was a remarkable woman—keen, alert, and an excellent manager of business and household affairs. She had considerable executive ability. The happy blending and influence of these two racial streams can be observed throughout Toland's long, vigorous, and productive career.

A PRECOCIOUS CHILD

A precocious child, Hugh was sent to school when but a little more than four years old, and at the age of six won first prize for reading in a class of forty children, many of whom were his seniors. Although educational opportunities were limited in that community, he acquired a good education and a knowledge of Latin and Greek, which proved of considerable benefit to him in his medical studies. He was in every respect an all-round, normal boy. He was very fond of athletics, and after many severely contested combats, became the best boy pugilist in Newberry County.

UNDERGRADUATE DAYS

Banking as a life work had no attraction for young Toland and, consistent with the custom in those days, at the age of sixteen he began his medical studies in the office of the most distinguished physician in South Carolina, Dr. George Ross. He remained under Doctor Ross's tutelage for eighteen months, and also helped in the Doctor's drug store, which was combined with his office.

MEDICAL EDUCATION

By this time Hugh's father, who had intended him for the study of law, became convinced that medicine was his son's calling. Accordingly, he was permitted to go to the University of Transylvania in Lexington, Kentucky, which had the distinction of having the first medical school to be organized west of the Alleghanies. There, in 1828, at the age of twenty-two, he was graduated in medicine at the head of a class of 160 students.

PRELIMINARY MEDICAL PRACTICE

The following year he began practice in Reeders, near Newberry, South Carolina. By nature bold, courageous, and resourceful, he soon successfully executed several important operations, and his reputation was immediately established in that community. His services were in great demand, and he often rode seventy or eighty miles a day on horseback in making his rounds of calls. His practice flourished, so that at the expiration of two years of country practice he had saved $2,700. He then returned to the medical school in Lexington, where he spent the winter in dissecting and in studying French.

EUROPEAN STUDY

With his tidy savings, and encouraged by his surgical achievements, he was then able to carry out his heart's desire—to go to Paris for further training. For the next two and one-half years he studied under such surgical and medical masters as Baron Guillaume Dupuytren, Jacques Lisfranc, Philibery Joseph Roux, Armand Trousseau, and others. There he met a notable group of American students, among them George Washington Bethune, Henry Ingersoll Bowditch, and Oliver Wendell Holmes, of Boston; and William Wood Gerhard, William Pepper and Joseph Peace, of Philadelphia. While in France he rendered valuable assistance during the epidemic of Asiatic cholera that decimated the country in 1833.

MEDICAL PRACTICE IN SOUTH CAROLINA

In 1833, Toland returned to Newberry County and resumed practice. One day, as he stood in the country drug store of his town, his mind on the teachings of Trousseau, a man staggered in, cyanotic, gasping, and eyes bulging. He was choking to death with quinsy. Toland, instantly recognizing the danger, put him in a chair, seized his instruments and was about to perform a tracheotomy when physicians who were present objected to such a radical procedure, and before Toland could convince them of its necessity the patient died.

Disgusted with the shortsightedness of his colleagues, Toland moved to Columbia, where he formed a partnership with Dr. Thomas H. Wells.

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* One of the papers given in Toland Hall, University of California Medical School, San Francisco, in the series on the history of the institution, arranged by the Division of the History of Medicine.

This is Paper VI of the series. For other articles in the symposium, see California and Western Medicine, November, 1937, page 321; December, page 405; January, page 27; February, page 114; March, page 186.

** This paper, on Hugh Huger Toland is printed in two parts—Part I in April issue; Part II in May number.

Fig. 1.—Hugh Huger Toland, 1806–1880. Founder of Toland Medical College, 1864. Toland Medical College became affiliated with University of California in 1873.

There he married Mary Goodwin, a direct descendant of Pocohontas, but she lived only a few years. In 1844 he married Mary Avery, who bore him two daughters. Toland became a dominant surgical leader in Columbia, and achieved both professional and financial success. He performed operations for the relief of club-foot and strabismus, and his method of using the lithotomy forceps soon spread beyond his state, and as early as 1841 arrested the attention of no less a surgical master than James Marion Sims of Montgomery, Alabama. It is reported that during this period Toland did as much work as all of the other doctors in Columbia combined, and that his annual income was $16,000.

LURE OF CALIFORNIA

Then came news of the discovery of gold in California. Although Toland was forty-six years of age, the spirit of adventure was still strong in him, and he could not resist the call of the West. So, in 1852, he left his lucrative practice, and he and his wife began to cross the plains with a party.

He entertained little doubt that success again awaited him in new fields. His confidence in this was based, first, on his knowledge that his reputation as a surgeon had preceded him and was known to many Carolinians then living in California; secondly, on his financial status, which made him economically secure for a long time; and thirdly, on the fact that he had shipped to California a quartz mill with which he hoped to make a fortune from the precious metal. This mill was one of the first to reach the State.

His party crossed from Independence, Missouri, to California in seventy-six days, breaking the record at that period. Three days after their arrival his wife died at Stockton. Immediately after arriving there he went to Calaveras County and bought the Gwin mine at Lower Rich Gulch, seven miles from Mokelumne Hill.

EARLY DAYS IN SAN FRANCISCO

After three months Toland realized that mining was neither to his taste nor his profit, and that a doctor should stick to his profession. So he sold his mine.* Saddened by the death of his wife and discouraged by the loss of a great part of his capital, but still resolute, he moved permanently to San Francisco in 1853 and gave himself over wholeheartedly to his profession. He soon attained wide popularity, and advanced steadily to fame and fortune. For twenty-seven years, even to the day of his death, he played a leading rôle in the practice of surgery, as one of the most distinguished surgeons in the West. He became widely known as "the great surgeon of the Pacific Coast." On October 6, 1860, he married Mrs. Mary B. (Morrison) Gridley of San Francisco, a woman of education, with a local reputation as a poetess and painter, who bore him one son.[1]

ACQUIRES A LARGE AND LUCRATIVE PRACTICE

His spacious offices, located at Montgomery and Merchant streets from the time he began practice in San Francisco until his death, were always filled with patients. The large number of persons waiting in his reception room gave it the appearance of a great out-patient clinic, and frequently it became so crowded that some had to wait outside on the steps. It is estimated that he saw about a hundred patients a day in his office, and made from forty to fifty visits in addition. Sunday afforded him little rest. He was a picturesque figure as he made his visits about San Francisco. This was the day when a physician was known for his equipage, and Toland rode in an old-fashioned buggy with a negro driving two handsome horses. Within two years of his arrival in San Francisco he is reported to have been making $20,000 annually from his practice. This shortly rose to $42,000. Soon after the Civil War began, however, California went on the Northern side and, because Toland was an ardent Southerner, his influence naturally became less and his income diminished. As there was no one with equal ability to take his place, however, he was soon as busy as before.

INTEREST IN ORGANIZED MEDICINE

This was the most productive period of his life. In 1855, two years after beginning his practice in San Francisco, he was appointed chief surgeon to the Marine Hospital, a position which he held for many years. Ten years later, he was appointed visiting surgeon to the City and County Hospital, and also a member of the first Board of Health of San Francisco, a connection he retained until his death. For ten years he was the proprietor of

* I am informed that since then over six million dollars in gold have been taken out of this mine, and that it is still not worked out.

the *Pacific Medical Journal,* which, in 1872, was renamed the *Western Lancet.*

A FAMOUS CONSULTANT

In 1856 he played a leading rôle as surgical consultant in the famous and fatal illness of James King of William of San Francisco, whose death. as the result of an assassin's bullet, so shocked and electrified the community, and so aroused public opinion, that the San Francisco Vigilantes took charge of affairs and caused the restoration of law and justice.[4] The question of whether or not a sponge,† which had been inserted in the wound after the shooting, should or should not have been removed became a great issue after King's death, not only in the medical societies but in the courts. It was truly the talk of the town. The controversy raged between Toland and Cole, and the newspapers made front-page news out of it. R. Beverly Cole, a medical leader as fiery and dynamic as might be expected from his Virginian birth and Kentucky rearing, testified in the trial "that the pressure of the sponge and the pressure of the tourniquet induced phlebitis and caused King's death." He also made remarks reflecting on Toland's reputation. Toland, however, in his testimony "confined his evidence strictly to the case in hand and made no personal remarks against Cole. He claimed he left the sponge in the wound because there was no left pulse and he feared the subclavian artery was severed or injured and would rupture or slough; that the wound caused a lesion of the vein and injury of the nerves in the vicinity; that, as a consequence, inflammation of the chest and inflammation of the vein followed and death ensued."

TOLAND MEDICAL COLLEGE

By 1864, near the close of the Civil War, Toland realized the fulfillment of a wish he had long cherished, which was the founding and erection of a medical school, known as the Toland Medical College.[2] At his personal expense a handsome brick and stone building was constructed on Stockton Street, between Chestnut and Francisco streets, and it was supplied with all the necessary appliances consistent with a thoroughly equipped medical school of that day. Toland was president of the faculty and professor of surgery. In spite of the bitter controversy between him and Cole eight years before, when he organized his medical school, Cole was made dean. At the beginning, the school was eminently successful and received the confidence of the public; but six years later, in 1870, a split occurred in the faculty which led to the formation of the Cooper Medical School. When several of the important members of his faculty left him, they took all the students but one. Failing in his efforts to get his colleagues or his students to return, three years later he unconditionally donated his school, with its furnishings and the land, valued at approximately $100,000, to the regents of the University of California, and it became an integral part of that university.[12] The faculty retained its membership, and Toland remained the professor of surgery until his death. His school had added a stimulus to the medical education of its day, and had given many men an opportunity which otherwise they would not have had.

† "The Sponge—Its Effect on the Martyrdom of James King of William, The Formation of the San Francisco Vigilance Committee of 1856, The Execution of Casey and Cora for Murder and the Trial of Edward McGowan for Complicity," was made the subject of an interesting article by Dr. George D. Lyman in 1928.

Fig. 2.—Toland Medical College, 1864.

A COMMANDING FIGURE

Toland was a commanding figure, well over six feet tall, erect, and dignified. Strength and forcefulness were evident in the straight, well-shaped nose, the prominent, determined lower jaw, the dark blue eyes, so discerning and keen, yet so kindly. His finely shaped head was covered with jet-black hair which fell almost to his collar, and his high forehead gave unmistakable evidence of the degree of his intellect. His carriage and every movement showed power and purpose. Delicate sensibility, a refined sense of honor and strict integrity were evident. Even his dress—the large, soft hat and the cloak or mantle typical of the Southern colonel of the old school—was impressive. Once seen, he was not easily forgotten. Though modest and unassuming in manner, few persons ever combined in one character more of the elements of success; in industry, perseverence and determination he resembled the great John Hunter.

HIS DRUG STORE AND HIS TWO FAVORITE PRESCRIPTIONS

It has been claimed that Toland's methods in his practice were not always ethical. Be that as it may, his reputation extended over all the central and northern coast, and when the miners and mountaineers came to San Francisco to seek advice, Toland was the man to whom they went, and he usually either cured them or greatly alleviated their symptoms. He had his own drug store and, it is

said, but two favorite prescriptions. One of these prescriptions consisted of various mixtures of iodid of potash, the other of mercury with nauseous drugs as adjuvants. Back of his office, in what he called his surgery, were two famous barrels, one labeled "anti-syph" and the other "anti-scrof." "He kept office hours in the morning for private patients; in the afternoon for clinic patients. No charge was made for the examination of these clinic patients nor for the prescriptions; but at the end of the corridor, next the stairs, was Doctor Toland's drug store, and none but his pharmacist could decipher the scrawls of the squeaking quill pen. Some idea of the volume of the business done by this drug store could be obtained from a glimpse at the row of scrapbooks on the top shelf which encircled the room—a veritable frieze of huge books of prescriptions."[12] Copies of the 581,000 prescriptions which he had given out in only fifteen years made twenty-three volumes. These he explained to his students in his lectures, and the ingredients were alleged to be a great boon to his patients. Prescriptions were renewed at $5 a bottle, but he never gave out their contents except as a contribution to his students. "This drug store was a real gold mine. It is interesting to note, too, that Doctor Toland did an enormous mail-order business. People in the mines of California and Nevada found it easier to write an account of their symptoms to Doctor Toland than to make the long journey by stage to see him. Medicine was forwarded by express, and Wells, Fargo & Company collected the fee."[12] One of his former students, who later became a great physician and a professor, said to me: "When my first medical work called me to Crescent City and it became known that Toland was my teacher, my reputation was made. Men flocked to me, and when it was known that I held the secret of 'anti-syph' and 'anti-scrof' they went no further. Well supplied with these mixtures, and carrying in my saddlebags a few simple remedies and an abundance of bread pills, I defied disease, for I soon found that good nursing with a few bitters, and my one specific, were sufficient to carry through all but mortal diseases."

A KEEN DIAGNOSTICIAN

Toland's method of diagnosis was impressive. He rarely asked a patient a question, nor did he allow any detailing of symptoms. Like Sherlock Holmes, he read the face and studied the physical aspects, and from these guessed the disease—not always difficult, considering the lives his patients had led. From his evident recognition and successful treatment of one of the most common, protean, and deadly diseases—syphilis—it is not surprising that he got results when others failed. Many years ago, as an interne, I heard one medical philosopher and great teacher talk to his students, and, in order to impress them, he intentionally exaggerated: "The diseases that the human flesh is heir to can be roughly, and for practical purposes, divided into two large groups—syphilitis and nonsyphilitic, the former comprising 95 per cent of the whole. If you can diagnose and treat syphilis in its various manifestations, you need have no doubt as to your success."

Until a few years ago syphilis was a taboo subject, to be mentioned only in a whisper behind closed doors. Now, almost sixty years after Toland's death, this ever prevalent scourge is at last being brought out from under cover and considered rationally. The people are being given public lectures by the medical profession, warning them that syphilis is a menace to our civilization. Indeed, one cannot but reflect that "knowledge comes, but wisdom lingers." This national campaign should have been started in Toland's day. There can be no doubt that it was just this idea, the education of the public and, thereby, the consequent preservation of the health of the community, that induced Levi Cooper Lane—a later confrère of Toland's and also a great medical leader in his day, to whom San Francisco medicine is much indebted—to inaugurate a series of medical lectures to the public. But, as nearly always, this innovation was frowned upon by his colleagues, and Lane was the brunt of their caustic remarks. Verily, if one would avoid the criticism of his day he must not be ahead of his time. Small minds cannot see the mountain near. However, one should take consolation in the thought that discussion of one's contemporaries is conversation, not criticism.

A DOMINANT PERSONALITY

He was master in the power of suggestion and in inspiring great confidence in his patients by his dominating personality, and he is said to have wrought marvelous cures in his day. It is little wonder that he soon had the largest practice on the Pacific Coast. This did not arise from a desire to outstrip his competitors, but because of the combination of native ability, splendid training, and a rare personality. He seemed to have a place that no one else could fill. Those who knew him best have written of his manifold generosities and of his lavish donations to charity, which often amounted to $100 a week.

384 Post Street.

(To Be Continued)

CLINICAL NOTES AND CASE REPORTS

EOSINOPHILIC BODIES IN MEASLES

By H. H. Parsons, M.D.*
Shreveport, Louisiana

IT is generally accepted that the virus of measles exists in the blood, nasal secretion, and the bronchial secretion.[1,2]

Several organisms have been described as having been found in the blood[3] and nasal secretion.[4] Both Gram-negative and Gram-positive cocci have been described, but none of them have been accepted as the etiological factor in measles.

Degkwitz[5] claims to have cultivated the virus.

* Member of the San Bernardino County Medical Society, California.

1 Anderson and Goldberger: (a) J. A. M. A., Vol. 23, No. 57, pp. 476, 971, 1911. (b) Am. J. Dis. Child., 4:20, 1912.
2 Blake and Trask: J. Exper. Med., 33:385, 1921.
3 Tunnicliff: J. Inf. Dis., 37:193, 1925.
4 Guardabassi: Pediatria, 1927.
5 Degkwitz: J. Inf. Dis., 41:304, 1927.

No reference having been found of anyone having made a daily examination of the blood of any virus disease from its inception to far into the convalescence, the author decided to carry out such examinations. On November 7, 1934, a pre-eruptive case of measles became available for study.[6] The eruption appeared on November 8, 1934.

Smears were taken daily from the blood and nasal secretion, and from the conjunctival sac, from November 7 to 17 inclusive, when the taking of smears was interrupted.

The smears were stained with a modified Fontana silver stain, and minute bodies were found in some of the red blood cells, free in the mucus of the nasal secretion and free in the smears from the conjunctival sac.

Since then eleven other cases of measles have been similarly examined, blood smears being taken from the day of the appearance of the rash up to and including the eighteenth day, and all have shown eosinophilic bodies in the red blood cells.

After trying many staining methods, it was found that these bodies are eosinophilic, that aldehyds intensify the staining, and that prolonged staining is necessary.

Wright's, Giemaa's, and other such stains have proved useless, as have basic stains.

STAINING METHOD

From the above data the following method of staining was evolved:

1. Make very thin smears. Dry in air.
2. Flood smear with absolute methyl alcohol and stand slide on end and allow to dry.
3. Place in Coplin jar containing a solution made as follows: water 90 cc., formalin 10 cc., and allow to remain for twelve hours.
4. Transfer slide, without washing, into another Coplin jar containing: eosin .3 gm., formalin 10 cc., water 100 cc. Stain for twelve hours.
5. Wash in running water, then blot or dry slide in the air.

All solutions should be filtered.

No counterstain is used for blood smears, but it is advisable to use a counterstain if mucus, pus, or other materials are to be examined. All smears are stained first as above; then, to counterstain, place the slide in another Coplin jar containing China blue .3 gm., formalin 10 cc., water 100 cc. Stain for from thirty seconds to thirty minutes (it will vary), or stain until the slide takes on a pale blue color. Do not stain deeply, as this will hide the eosinophilic bodies. Mucus, pus, etc., stain pale blue, the bodies an eosin color. Normal controls should be run on each slide or set of slides.

Normal blood contains some eosinophilic bodies in some of the red blood cells, but they are not numerous nor uniform. They are usually large and occur in the proportion of about one body to every eighty red cells. They may possibly be protected bodies.[7]

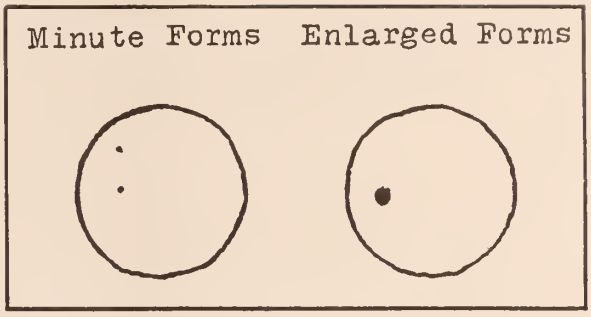

Fig. 1

BLOOD FINDINGS IN MEASLES

In measles blood the bodies are found in the red blood cells, rarely in a white cell or a platelet, or free in the plasma. They usually occupy the area between the periphery and the center of the red cell, and they generally occur in the proportion of one or two bodies to every sixth red cell. On the sixth to seventh day certain of these bodies seem to develop greatly in size, usually to about that of a coccus, and they make their maximum development from the ninth to the twelfth or fourteenth day. From the fourteenth to the seventeenth to eighteenth day they become pale, take the stain less readily, lose their outline, and by the eighteenth day have usually disappeared from the blood. They are eosinophilic, very refractile, both in the minute and larger forms, having a bright orange color. The red cells are stained a brilliant pink.

The color plate does not give an accurate conception of their appearance, as I have been unable to get the proper colors to show the refractility.

Both the minute and larger forms occur in the nasal mucus and in the smears from the lacrymal sac. However, it is not known how long they remain there.

Several cultural trials were made after the method of Goodpasture,[8] but the results were not conclusive.

There are certain points to be observed in examining these smears, chiefly to discard any slides that show large numbers of bubbles on the red cells, or slides that are not nearly perfect. Slides ground on one end on the flat are useless, as they are pitted all over from the abrasives used in grinding; these pits retain the stain and lead to endless confusion. Cells that are deformed, or that touch or overlap one another, should not be counted, as they often have bodies that lead to confusion. Unless one has had these bodies demonstrated to him, considerable difficulty will be experienced in identifying them.

Other eosinophilic bodies have been found in the blood of mumps, rubella, chicken-pox, poliomyelitis, arthritis, herpes influenza, the common cold—the descriptions of which I hope to publish.

I have termed these bodies "eosinia" for convenience.

These bodies were described and demonstrated before the Calhoun County Medical Society (Alabama) on November 5, 1935.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

WHAT IS TO BE EXPECTED OF BLOOD TRANSFUSIONS

I. INDICATIONS FOR BLOOD TRANSFUSIONS IN SURGICAL PATIENTS

LeRoy Brooks, M.D. (2000 Van Ness Avenue, San Francisco).—In the not too distant past, blood transfusions were used only in extreme emergencies. This idea still persists in the minds of many patients and their families. Too often, when a blood transfusion is mentioned, the impression is created that death is lurking around the corner. Indications for transfusions in surgical patients today are quite sharply defined, often prophylactic in nature, and may be grouped as follows:

1. Shock due to hemorrhage, accidental or operative trauma, or toxemia.
2. Acute infections.
3. Chronic infections.
4. Poor surgical risks.
5. Blood dyscrasias requiring surgery.

We now know, in shock, that a physiological state exists in which there is an insufficient amount of blood in circulation. The plasma migrates through the capillaries into the body tissues. In severe shock, if the volume of circulating fluid is furnished by saline, glucose or other crystaloid solution, this thin liquid rapidly passes through the capillaries, and will not sustain a satisfactory volume of circulating fluid. A colloidal type of solution must be used with molecules sufficiently large to prevent it from passing through the injured capillaries too readily. Gum acacia solution with glucose is preferable to the crystaloid solutions, but large volumes of whole blood must be given first place.

Transfusions offer the most dramatic results in patients in shock from the simple loss of blood without extensive tissue injury. Such incidences are not infrequent in maternity cases or in accidental hemorrhage from operations, when the source of the hemorrhage has been stopped. Patients unconscious from such hemorrhage, if blood is given immediately, will often regain consciousness during the transfusion. From 500 to 1,000 cubic centimeters quantities are usually needed and may have to be repeated.

In shocked patients from accidental or operative trauma, the response to transfusions is not always so satisfactory as in the cases of simple hemorrhage. This is due to the fact that the cause of the shock, tissue injury, is continuing to act. However, large transfusions repeated offers the best chance for recovery and, if given early, will prove successful in many cases which would otherwise terminate in a fatality.

Of great interest is the type of case in which there is a massive concealed hemorrhage—that is, a hemorrhage that cannot be definitely located so as to mechanically control the bleeding. Gastro-intestinal hemorrhages or lung hemorrhages offer good examples of this type. We have had many discussions with internists who, in such cases, feared the giving of blood on the basis that the increased volume would cause an aggravation of the hemorrhage. We agree fully that the circulating volume of fluid should not be increased by giving solutions such as glucose. Our experience, however, forces us to the conclusion that when a patient is approaching the state of shock from a concealed hemorrhage, the whole blood transfusion will replenish the volume of fluid and tend to stop the hemorrhage. The explanation which we offer for this is the increase in the coagulation of the blood following the transfusion. Whether this explanation is correct or not, clinically, transfusions do not cause an increase in the bleeding in such cases. In such cases, donors should be kept in readiness, and if the blood pressure falls below 80, a transfusion should be given immediately. A second donor should be kept in readiness, and even a third to keep the patient's blood pressure above 80, preferably above 100, and ward off destruction of the vital centers. We have given, with success, as many as six blood transfusions within one twenty-four hours, infusing altogether more than 3,000 cubic centimeters of blood. Care must be exercised that all donors and the patient are of the same type when such large quantities of blood are given. At times, in these desperate cases radical measures must be resorted to, and the element of time is extremely important.

If the patient is in shock from the absorption of toxins from an overwhelming infection, blood transfusions are of practically no value. It is encouraging to note that transfusions as a last resort, just to satisfy the family and friends when there is no chance of their having any beneficial effect, are not so often resorted to in these modern times as previously. The results of this type of practice accomplish nothing of good, and only serve to discredit one of our most effective methods of treatment.

Some of the severe surgical infections with or without definite localization, with high temperatures, evidence of lack of normal resistance against the given infection, even in the absence of anemia, blood transfusions in small doses, 200 to 300 cubic centimeters given daily or every second day, are of unquestionable value. We are definitely of the opinion that it is far more valuable than the use of the so-called antistreptococcic serum, "prontosils," magnesium sulphate, hydrochloric acid, and myriads of other solutions that are used on an empirical basis. A good example of this type of septicemia is seen particularly in children, from ear or mastoid

or lateral sinus infections. A blood transfusion increases the patient's resistance, furnishes needed food and, no doubt in many instances, makes it possible for the patient to localize or overcome the generalized infection.

Patients suffering from subacute or chronic suppurative processes present a group of people to whom transfusions offer much. Along with other supportive treatment, repeated small blood transfusions should be used once or twice a week to keep the hemoglobin above a minimum of sixty. It is not uncommon to see patients with prolonged suppurative processes, such as in bronchopneumonia, empyema, lung abscess, subdiaphragmatic abscess, liver abscess, protracted peritonitis, osteomyelitis and other types of prolonged surgical infections, develop a marked secondary anemia. Such patients, if transfused, will often recover; but if not transfused, not infrequently will not recover.

The bone marrow and blood-forming tissues must be adequately nourished and oxygenated, in order to meet the added call due to the additional destruction of the blood by the infection. Besides making recovery more certain, if the hemoglobin is kept up, these patients will develop fewer complications, have a shorter convalescence, and recover with greater certainty and less morbidity. It is our experience in chronic infections that repeated small blood transfusions, from 200 to 300 cubic centimeters, are preferable to the larger transfusions of 500 cubic centimeters or more. However, if the patient is anemic, with a hemoglobin below forty when first seen, at the first or even the second transfusion, a full 500 cubic centimeters may be preferable, and subsequent blood be given in small quantities. It is remarkable indeed to see pale, unhealthy, indolent type of surgical wounds, which are healing slowly with an excessive amount of production of scar tissue, change their color and develop normal, healthy-appearing granulation tissue, and the healing process proceed with greater rapidity. It is probably in this group of patients that blood transfusions, when judiciously used, are most useful. It is our experience that this group of patients now receives blood transfusions more often than in the past. However, truth forces the statement that in some quarters, as yet, there is considerable lethargy in giving transfusions as often as they are indicated.

A fourth group of patients to whom blood transfusions are of great value are the poor surgical risks. One doing any volume of general surgery quite infrequently encounters a patient who must be operated upon and is not a good risk. Time and space do not present an opportunity for full discussion of the broad use that can be made of blood transfusions in this group. Good examples are bowel resection, gastric resection, thoracoplasty, lung surgery, pyloric stenosis in starved infants, and numerous other necessary major surgical procedures that must be carried out, particularly in children and people past the middle age of life.

Here again it can be said without fear of contradiction that, in general, transfusions in these cases are not used as often as the good results obtained by the giving of blood warrants. There is no other single procedure which can be compared with the use of transfusions in the preoperative preparation and the postoperative convalescence in the poor surgical risk. A good working rule to adopt is, that when the surgeon begins to consider giving the patient a transfusion, that is the time to give the blood.

The fifth or final group of surgical patients requiring transfusions are those unfortunates suffering from blood dyscracias with a tendency to bleed. It is, fortunately, true that there are not many such cases. Occasionally, one is forced to operate upon such people, and the question of hemorrhage is a major one. For example, we might mention thrombocytopenic purpura and other less well-classified hemorrhagic dyscracias requiring surgery. It is even possible to do surgery on a hemophiliac, if the patient is given adequate transfusions.

The reader no doubt is struck by the enthusiasm expressed for transfusions. For this enthusiasm to be justified every care must be exercised in the selection of donors. Both grouping- and cross-agglutination tests must be a routine, and the possibility of transmitting syphilis and malaria must be conscientiously guarded against. We prefer whole blood when given with dispatch, but a citrate transfusion well done is preferable to a whole-blood transfusion poorly done.

* * *

II. INDICATIONS AND CONTRAINDICATIONS FOR THE USE OF TRANSFUSIONS IN CHILDHOOD DISEASES

Howard R. Cooder, M. D. (3875 Wilshire Boulevard, Los Angeles). — The following statements are an attempt to present the evidence for and against the transfusion of blood in the diseases of children. The experiences upon which these statements are based have been gathered almost entirely at the Los Angeles Children's Hospital. About two years ago, when transfusions were at their height of popularity in this hospital, a reaction of inquiry into the value of this therapy began. The results given here are the deductions and the beliefs of this writer, and not necessarily an agreement among all the physicians upon the staff of this hospital. Such beliefs have been derived partly by the statistical method, when it could be used, and in part have been built up as clinical impressions.

More than one thousand transfusions are covered by these observations. The method of transfusion used has been the direct syringe technique, and in no case has a citrated transfusion been given. This is an important difference because the citrate method is slower and does not produce the sudden load which is added to the blood stream when the direct syringe method is used. On the other hand, citrate reactions have been avoided.

CONDITIONS IN WHICH TRANSFUSION IS OF CERTAIN BENEFIT:

1. *Acute Loss of Blood, Such as Accidental Hemorrhage.*—Transfusion is necessary only when enough blood has been lost to cause physical embarrassment. Transfusion is not necessary for small

hemorrhages, because such small blood losses will be quickly made up by the blood-forming organs without assistance. The loss of fluid can be replaced by subcutaneous or intravenous saline administration.

2. *Severe Anemia.*—By this is meant a dangerous situation in which the hemoglobin has dropped to 30 or 20, or lower, and the blood cells have dropped to a like degree. Such an anemia might improve by other methods if given enough time; but the patient's general condition may be so threatening that he needs the quick assistance of a transfusion in order to add at least 10 to 20 per cent to his normal blood count and hemoglobin.

3. *Septicemia, With or Without Anemia.*—If one can be sure that the blood of the donor contains antibodies which are specific for the disease, and that there is a sufficient amount or titer of these antibodies in the blood of the donor to be really helpful, then a transfusion for this purpose is definitely indicated. If the patient's blood culture shows that he is suffering from septicemia due to certain streptococci—for instance, as a complication of scarlet fever or of otitis media—then the patient would better be given a transfusion of immune serum rather than the blood of a casual donor. It is possible to obtain from certain serum centers a well-prepared and well-tested serum whose antibody strength against the bacteria involved is known. The whole question of transfusion for septicemia is in dispute; it is usually a measure of last resort. The only way that its value can be stated is to know the antibody properties of the blood which is available from donors.

4. *Purpura, Primary or Secondary.*—Transfusion may be given when the patient's platelets are low and there is serious hemorrhage. By adding normal platelets, the hemorrhage will be stopped at least for a time. Repeated transfusions should not be given, because they will depress the platelet output of the hematopoietic system. Transfusion should be given only if the cellular elements are low. It is usually indicated in symptomatic purpura rather than in the essential type.

5. *Hemophilia.*—In this condition transfusion is clearly indicated, and may have to be frequently repeated as a life-saving measure. Transfusion furnishes normal platelets, which are able to break down quickly and assist in the formation of the clot required to stop bleeding. These normal platelets, of course, soon disappear, and transfusion will have to be repeated if the patient has another attack of bleeding which cannot be stopped by other methods.

6. *Leukemia.*—This is always a fatal disease in children. The patient may be kept alive for a certain time by transfusions which no other form of treatment will afford. Transfusions are given, time after time, when the patient's blood reaches a sufficiently low level in order to keep him alive for the sake of the family. More transfusions are given in this disease than in any other. The patient will sooner or later die, although the end may be deferred for months. In the case of a child, it is doubtful whether, for any other reasons than sentimental ones, it is worth while to prolong the patient's precarious and unsatisfactory life in this manner.

7. *Shock.*—In this condition, where a part of the blood of the body stagnates in a certain so-called "pool," fluid must be added to the blood volume of a kind that will remain in the vessels and restore the blood pressure. The transfusion of blood fulfills these needs and is of decided benefit.

CONDITIONS IN WHICH TRANSFUSION IS OF DOUBTFUL VALUE:

1. *Pneumonia.*—Transfusion is very much used in severe cases of pneumonia. The thought back of this usage is that normal blood or serum will furnish some kind of stimulus or antitoxic property to overcome the toxemia. In the observation of this writer, transfusion for the toxic type of pneumonia has seldom or never been of any help to a patient, and has sometimes done harm. If the blood shows severe anemia and depletion, transfusion may be called for just as it would be in any other severe blood loss. In severe toxemia with cyanosis and involvement of the nervous system, transfusion does no good. In collapse of the vasomotor system, transfusion is probably wrong, because the capillaries are engorged with blood due to reasons which have nothing to do with the blood itself, so that to add other blood at this time may only increase the undesirable condition. If the patient's poor condition is due to a failing heart, then it does not seem rational to put an additional amount of blood into the vessels, because we are not at all sure that the heart muscle will be stimulated by anything in this new blood, and to increase the blood volume will probably further embarrass the heart. If the heart is overworking and the pulse bounding, this is probably the time for venesection and the additional load of new blood is distinctly contra-indicated. Infants who are very ill with pneumonia frequently need intravenous saline solution to repair their dehydration, rather than the scanty fluid content of a small transfusion. Statistics, which deal with the value of any kind of treatment in relation to pneumonia, must be carefully gathered and interpreted. So far as observations in this hospital are concerned, transfusion for pneumonia in children has seemed to be associated with a higher death rate.

2. *Enterocolitis.*—This is a common and a serious condition in very young children, both in hospitals and in private practice. The patients lose more fluid than can be put into them, and rapidly become very ill and subject to complications. The death rate is high, and a large percentage die with pneumonia as a terminal complication. Consequently, enterocolitis and pneumonia have to be considered together, as it is often impossible to say which is the greater illness. The first and greatest requirement here is fluid replacement, and the most valuable recent addition to our methods of treatment is the intravenous drip of normal saline. Transfusion has been much used during the height of this disease and as a measure of last resort. The chief thought lying behind this therapy is that the fresh serum contains some restorative quality. It is the

opinion of this writer and of others on the staff of this hospital that transfusion has not helped in the mass of cases with enterocolitis. If severe anemia has been produced by the toxemia, a small blood transfusion may be given, but even then a transfusion of serum may be better. Blood cultures should frequently be made, and if positive for certain kinds of streptococci, serum which contains antibodies for these organisms may be given. Its use has apparently saved some lives.

3. *Postinfection, Depletion and Prostration.*—Transfusion is frequently used in the state of depression which follows a severe infection. The reasons given by those who employ it are not always clear. It is frequently referred to as a "boost." If the patient is severely anemic, a transfusion may be allowed; but it seems to be of value only to the exact extent of the amount of blood which is added, never more than 10 or 20 per cent of the patient's total blood volume. Many patients who have been severely ill will be depressed in various ways for weeks and months; children frequently show a persistent fatigue. It appears that what these patients need is chiefly rest, no matter how long it takes, and food, and an improvement in their mental and physical hygiene plus an iron tonic. Antibodies and the other restorative factors of fresh serum, which a transfusion is supposed to furnish in this condition, are extremely doubtful unless the donor's blood is tested. It is better to use a known immune serum. In certain convalescent conditions the patient's blood shows an increased tendency to clot, and to add new blood at this time will create a hazard of thrombosis. Patients have sometimes died during or soon after transfusions for reasons that are unexplainable, and seem to have something to do with a sudden coagulation and obstruction of capillaries.

4. *Leukopenia.*—This condition is found in children as a result of the use of arsenic preparation and a few other drugs, but most commonly as the result of chronic or acute infections. It is not very uncommon and it may become more common. These patients are very ill, and transfusions are given as emergency treatment. The question is always asked, is the patient ill because of a low white count or is the white count low because of the main illness? Transfusions depress the blood-forming system for a time and decrease the white count as a rule, although they may occasionally increase it. The reticulocytes are decreased. It is a common observation that blood counts done every day after a transfusion will show that the blood elements stand still. In leukemia a transfusion causes the white count to drop. If these things are so, then it is not rational to give a transfusion for leukopenia, because the white count is apt to drop still lower. In spite of the above contraindications, the patient may have to be transfused if necrosis of throat tissues threatens to occur.

5. *Surgical — Preoperative and Postoperative States.*—Transfusion is very popular with some surgeons, and is given as a routine measure by them. The reasons advanced are often not satisfactory, and are not founded on any known requirement, but seem to depend upon the empirical beliefs of these surgeons. The need of such transfusions is doubtful, and their value is impossible to measure. One nose and throat surgeon may give a transfusion before all of his mastoid operations, while another surgeon may never use it and the ultimate results in the two groups of patients will be the same. One example of irrational procedure may be cited—that of giving a transfusion before or after a brain operation. In this condition, with the many delicate ligatures of brain vessels and the danger of hemorrhage, it is not desirable to raise the blood pressure, and yet this is just what such a transfusion will do.

6. *Epidemic Disease Prevention.*—Whole-blood transfusion and serum by intramuscular injection are used to fortify the body against several specific ailments either before or after onset. An outstanding example is poliomyelitis. So far it has not been possible to show statistically that poliomyelitis immune serum has mitigated an epidemic or has prevented cases. The titer of immune bodies in any donor or in any pool of serum may be high; it may be low; it can be known only by determining its protective value for monkeys.

CONDITIONS IN WHICH TRANSFUSION IS CONTRAINDICATED:

1. *Uncomplicated Anemias Due to Lack of Iron.* This is a very common condition at all ages and particularly in infancy. Patients with a hemoglobin of 50 or 40 per cent, or even lower, do not need to be transfused. The administration of sufficient quantities of inorganic iron compounds by mouth for a moderate length of time will restore the hemoglobin of these patients to a normal condition. Of course, the main cause of the defect will have to be corrected.

2. *Pneumonia With Embarrassed Circulation.*—This has already been mentioned, and the reason stated why it is wrong to force more blood into an already overworking heart. The withdrawal of blood—that is, venesection—is probably better.

3. *Nephritis.*—Most patients with chronic nephritis look anemic, but are only moderately so. Patients with nephrosis have a surprisingly good blood count. Their white appearance is due to edema of the skin or perhaps to a capillary constriction. Plasma proteins are, of course, frequently abnormally low, and a transfusion of normal plasma has been used to combat edema, but without much success. The transfusion of whole blood does not help the condition of nephritis at all; in fact, it probably increases the load on the damaged kidneys to excrete the new substances which have been added. Transfusions in cases of nephritis sometimes have been followed by anuria.

4. *Recovery Stage of Infection.*—It has already been stated that here there are increased protein and platelets in the blood with increased tendency to coagulation, and that the addition of transfused blood at this time is somewhat dangerous. Sudden deaths have occurred for reasons difficult to explain. Transfusion is at least not necessary.

5. *Allergy.*—When transfusing a patient who is highly sensitive to certain proteins, it must be care-

fully ascertained that the blood of the donor does not offend by containing these proteins, which it may do at all times, and particularly after the donor has just eaten.

6. *Acidosis.*—A patient in this condition has abnormal substances in the blood which are excreted as organic acids. These substances are known to cause increased precipitation of hemoglobin; and, therefore, such a patient should have the acidosis corrected before transfusion of blood is given. Particularly should fluid be given to such a patient, and the acidosis and anhydremia corrected before the patient's blood is matched against donors, as the results may be different under these altered conditions.

* * *

III. METHODS OF TRANSFUSION

Clifford Sweet, M.D. (2940 Summit Avenue, Oakland).—Two methods of blood transfusion are in general use in the care of infants and children, namely, the transference of whole blood from the donor to recipient by the Lindemann multiple syringe method, and the indirect method by which the donor's blood is collected and mixed with sodium citrate solution, and then given after varying intervals of time to the patient by gravity or syringe, intravenously, intra-abdominally, or even subcutaneously.

The advantages of the multiple syringe method are not great, since there is no proof that the immediate transfer of undiluted blood from donor to patient is of any greater benefit than a corresponding amount of blood which has been citrated. On the other hand, the technical difficulties of this method are numerous when compared with the indirect, citrate method: (1) The multiple syringe method requires two skilled operators who can work together as a team, a nurse who can pass the syringes to both operators in a satisfactory manner, and a second nurse or orderly who can hold the patient if he is refractory, while a third unscrubbed nurse should also be present in case of need. When the citrate method is used, the blood can easily be collected by one operator with the assistance of one nurse, and can usually be given to the patient later by the same two persons. (2) In order to avoid any possibility of transferring infection from the patient to the donor, enough syringes must be provided so that each syringe is used only once; while if citrated blood is injected by the syringe method, only two syringes are needed—one to be filled by the nurse, while the other is being emptied into the patient's vein. (3) A much greater degree of skill is required to keep a needle in the lumen of a vein, while numerous syringes are being attached and disconnected, than when the needle is merely held in place while blood is flowing from the donor into a partial vacuum flask containing citrate, or when it is flowing into the vein of a patient (especially a small child) by gravity. (4) A transfusion of undiluted blood must be done quickly in order to avoid clotting, and in certain instances it may be undesirable, if not dangerous, to suddenly increase the volume of the circulating blood in a very young, acutely ill, or feeble patient, such as a child with pneumonia, a feeble or premature infant, or a child with a congenital heart disease, while a citrated blood transfusion can be given as slowly as need may dictate, even by the continuous intravenous drip method. Also the danger from reaction is reduced when the blood is introduced more slowly. (5) While it is possible to set up for a transfusion of undiluted blood in the patient's room when he cannot be taken to the operating room, it is much simpler to take citrated blood to the patient and give it as one would any other fluid by vein. (6) Citrated blood can be taken from the donor in sufficient amount at one time for two or more transfusions on successive days, provided it is kept in storage at low temperature.

Despite all the advantages of the citrate method, the writer prefers to use the multiple-syringe method of giving undiluted blood whenever possible.

However skillful the operator may be, he may fail if he does not give careful attention to the needles he uses. If the needle has a long, spear-type point, the danger of piercing the posterior wall of the vein is greatly increased. The bevel of the point should not exceed 60 degrees, and the needle should be sharpened to a razor-edge on a fine stone. The point should not only be sharp with cutting edges, but narrow enough to pick up and transfix the outer wall of the child's small, movable vein; the lumen of the needle should be as smooth as possible, and to insure this it should be thoroughly polished with fine dampened emery, or other abrasive material, carried upon the largest possible adapter. A short needle is much better than a long one since it is easier to aim accurately at short range than at long. Introducing the needle until the hilt is pushed firmly against the overlying skin assists greatly in keeping the needle in place. Since I learned several years ago, from Dr. A. H. Ziler of Los Angeles, to thus "lock" the needle in place, I have had very little difficulty in staying in the lumen of even very small veins. A Fordyce wing, which is readily attached to any needle after the manner of an adapter, gives one a firm handle for holding the needle in place, and I prefer to introduce the needle into the vein with only the wing attached, rather than to do so with the needle mounted on a syringe.

The skin is anesthetized with one per cent procain at the chosen site, the needle is introduced through the skin at an acute angle, and the vein is then fished for until the point engages the outer wall sufficiently for the vein to follow trial movements of the needle, after which the base of the needle is depressed until it is nearly parallel with the skin, and then moved forward in the lumen of the vein until the hilt brings the skin taut in the line of entrance. During the forward movement of the needle, the wing is held as one holds a pen or a scalpel, since any rigidity in the operator's hand greatly increases the probability of going through the vein rather than along the lumen.

If syringes are used, they should be held with the hand relaxed until connected to the needle, and then the connection made firm by clockwise rotation of the syringe. Detachment should be accomplished

by short counter clockwise rotations of the syringe, thus avoiding pushing or pulling on the needle.

The sites for transfusing infants and children are several, namely, the scalp veins, the jugular, the anterior cubital at the elbow, the internal saphenous, just anterior to the internal malleolus of the tibia, and the superior longitudinal sinus. The last-mentioned should not be used, but if one has the temerity to choose this route, he should use the citrate method and introduce the blood only under the lowest possible pressure of gravity.

The scalp veins in infants can often be used for the introduction of citrated blood under syringe pressure. The jugular vein is often the easiest one to use in infants, and even older children, provided the head is held firmly, fully extended over a sand bag or the end of the table, and at the same time strongly rotated laterally in order to prevent the jaw acting as an obstruction to a direct line of approach; and, most important of all, that the needle be introduced along the lumen of the vein for a great enough distance, preferably about an inch, so that the movements produced by the child's breathing and crying will not lift the vein off the needle.

The internal saphenous at the ankle must be exposed by cutting down upon it under local anesthesia in very young infants, nicking it with a knife-point or a small, sharp-pointed pair of scissors, and introducing a blunt needle or a fine canula into it, through which citrated blood can be readily given. This is the best site and method for transfusing new-born infants, and if faced with the necessity of cutting down on the vein of an older child, scarring at this point is least objectionable. A considerable number of older children who have very small arm veins, or whose arm veins are obscured by subcutaneous fat, present an ankle vein which can be readily entered by a needle puncture—provided the needle is very sharp. A few infants and most older children have arm veins which can readily be used for transfusion.

The proper use of a local anesthetic is important in order to reduce the struggles of the child and to prevent the operator from hurrying to get the needle well placed in the lumen of the vein. Haste at this point usually means failure. Also the child's arm *must not move* during the transfusion. I suppose the arm could be fastened to a splint, although I have not used this method. The child should be completely restrained, by firm wrapping in a blanket, leaving only his head and the arm to be used exposed. A small sand bag or folded towel should be placed under the child's elbow, in order to extend the arm fully. A nurse should then be seated on a stool beside the head of the table, and instructed (the best method of instruction is demonstration by the operator) to grasp the child's shoulder firmly in her hand with the fingers spread fanwise over the patient's scapula, and the thumb placed *emphatic,* exactly over the acromian process. With this hand the patient's shoulder is held firmly against the table; with the other hand she takes a firm grip on the patient's free hand from beneath with her thumb across his palm and the patient's thumb under her palm. She must not only fully extend the patient's elbow and prevent any flexion, but she must also prevent any rotation of the forearm. If the particulars of the above-described hand grip are not fully observed, rotation of the forearm, with dislodgement of the needle from the lumen of the vein, will almost certainly result. Proper placing of the nurse in a comfortable posture, with the elbow of her hand holding the arm well flexed and resting on her knee, or on a table or stool, will enable her to hold the child's arm motionless for a sufficient time, while she will be entirely out of the way of the operator, who is seated on the opposite side of the child's arm. I am indebted to Dr. Q. O. Gilbert of Oakland for this most excellent way of holding the patient's arm.

One other small detail of technique, attention to which raises the percentage of successful transfusion greatly, is the placing of the tourniquet just tight enough to fully distend the vein to be used, but without interfering with the continuance of circulation. Even though several readjustments must be made, time is eventually saved and failure will less often result.

Use of Benzedrine Sulfate in Seasickness.—Hill examined one hundred cases of seasickness. Except as conditions of hypertension, cardiac disease and unusual degrees of excitability contraindicate the use of benzedrine sulfate, these cases were taken consecutively as they presented themselves. The group comprised eighty-two women and eighteen men. Their average ages were 36.6 and 33.2, respectively. Satisfactory results were obtained in thirty-nine cases, in all of which the improvement was unequivocal, every likely fallacy having been carefully excluded. Those responding to benzedrine alone showed a mean pulse rate of 69 recumbent, increasing by 18 per cent on sitting up; in the group of failures the corresponding figures were 77 and 11 per cent; that is to say, a tendency to vagotonia predominated in the first group. It is doubtless in the vagotonic variety of seasickness that benzedrine finds its greatest usefulness. In its mode of onset this sickness reproduces in slow motion the prologue to an attack of syncope. The clinical signs point to a disturbance of the stabilizing control of the circulation whereby the effects of low arterial pressure are neutralized by tachycardia, and vice versa. Doubtful cases numbered forty. This group comprised not only those of whom it was doubtful whether they had improved, but also those concerning whom there was any room for doubt as to how improvement had been brought about. Psychologic factors were reckoned with. Analysis of the twenty-one cases which failed to respond to benzedrin shows that most cases of seasickness are amphotonic. In some cases of extreme vagotonia the dosage (usually from 10 to 20 milligrams) was apparently not adequate; insufficient attention was paid to the influence of constipation. A study of the data provided here described yields two generalizations regarding the action of benzedrin. (1) When euphoria has resulted, the subsequent depression is insignificant in degree and duration compared with the preceding exaltation; probably the reaction coincides with the period of sleep. (2) The effects appear rapidly but are long-continued, as if a succession of interdependent physiologic changes had been initiated by the action of the drug. The rapid effect on gastric spasm, suggesting a local action, is obviously of great value in seasickness. It is remarkable how seldom benzedrin is vomited, even by patients who have openly despaired of being able to retain it. Enthusiasm for a new drug must be tempered with sound skepticism and the results scrutinized with care. For the suppression of sympathetic activity, especially that associated with dread of seasickness, bromids rank high. Benzedrin sulfate has great possibilities of usefulness in certain cases of seasickness in which there are signs of excessive vagus activity.—*British Medical Journal.*

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

OFFICIAL BUSINESS

1. *Council Minutes, Two Hundred and Sixtieth Meeting, February 26, 1938.*

COUNCIL MINUTES

Minutes of the Two Hundred and Sixtieth Meeting of the Council of the California Medical Association*

Held in Room 302, Sir Francis Drake Hotel, San Francisco, Saturday, February 26, 1938, at 9:30 a. m.

1. **Call to Order.**—The meeting was called to order by the Chairman, Morton R. Gibbons, with the following members present: President Howard Morrow, President-elect William W. Roblee, Past President Edward M. Pallette, Speaker Lowell S. Goin, Chairman of the Council Morton R. Gibbons, Chairman of the Auditing Committee Karl L. Schaupp; Councilors Calvert L. Emmons, Carl R. Howson, Louis A. Packard, Axcel E. Anderson, Alfred L. Phillips, O. D. Hamlin, F. N. Scatena, T. H. Kelly, H. Rogers, Harry H. Wilson, J. B. Harris; Chairman of Public Relations Committee Charles A. Dukes, Secretary F. C. Warnshuis, Editor George H. Kress, General Counsel Hartley F. Peart and his associate, Mr. Howard Hassard.

Absent: Doctors Tanner and Kiger.

2. **County Hospitals.**—Louis A. Packard, Chairman of the Special Committee of the Council on County Hospitals, presented a report for the committee and submitted points agreed upon and those to be considered. Members of the Council then reported on conditions in the various counties throughout the State. The value of institutions commissions was discussed in detail. It was suggested that the situation be discussed with interested civic organizations.

On motion of Edward M. Pallette, seconded by Lowell S. Goin, the question of securing an institutions commission was submitted to an informal vote.

The Council members were unanimous in their disapproving the undertaking at this time of the enactment to provide an institutions commission.

On motion of Louis A. Packard, seconded by Axcel A. Anderson, the informal vote disapproving the sponsoring of an initiative for a state institutions commission was declared to be the formal vote of the Council.

Further discussion of the county hospital problem was deferred until the afternoon session of the Council, at which time a supplementary report was to be submitted by the Special Committee.

3. **Annual Session.**—Attendance at the annual session at Pasadena was discussed and it was decided to order 1,750 programs and badges for that meeting.

4. **Medical Survey by American Medical Association.** The Secretary read a letter from the American Medical Association outlining its plan for making a survey of the medical needs of each county through the coöperation of county and state medical organizations.

It was moved by Charles A. Dukes, seconded by Calvert Emmons, that the Secretary be instructed to coöperate with the American Medical Association in the consummation of its program. Carried.

5. **Contribution for Entertainment for American Medical Association.**—The Secretary reported that the mail vote of the Council approved the contribution of $1,000 from the Association's funds for the entertainment of the American Medical Association during its meeting in San Francisco.

It was moved by Harry H. Wilson, seconded by A. E. Anderson, that the mail vote be approved and made the official vote of the Council. Carried.

6. **County Society Affiliation.**—Discussion was had of affiliation of physicians residing in counties where no county societies existed on account of the small number of physicians located in such counties.

It was moved by Edward M. Pallette, seconded by Louis A. Packard, that a committee of two be appointed by the Chairman to work up recommendations governing the affiliation of physicians residing in sparsely settled districts where no county societies exist. Carried.

7. **Committee on Public Relations Report.**—The Committee on Public Relations reported that it had arranged a conference on February 27 with representatives of Oregon and Washington state medical associations.

8. **Projectors.**—Bids on projection lanterns for use at annual sessions were presented.

It was moved by Junius B. Harris, seconded by Edward Pallette, that the Secretary be empowered to arrange for reconditioning of the projection lanterns and to purchase aluminum screens. Carried.

9. **Membership Certificates.**—Letter from the Secretary of the Alameda County Medical Association regarding membership certificates and pocket membership cards was presented for the information of the Council. The communication was ordered filed.

10. **State Institutions.**—Correspondence regarding the complaint of a member relating to one of the state institutions was presented.

The Secretary was instructed to advise the member that such complaints should be filed with the Director of Institutions, State of California.

11. **Medical Economics Committee.**—Resignation of Percy T. Magan of the Committee on Medical Economics was presented and, on motion of Charles A. Dukes, seconded by Howard Morrow, the resignation was accepted with regret and deep appreciation of the work done on this committee. Carried.

It was moved by Howard Morrow, seconded by Junius Harris, that Edward M. Pallette be appointed member of the Committee on Medical Economics for the unexpired term of Doctor Magan, term expiring 1940. Carried.

12. **Luncheon.**—At this point adjournment was taken for luncheon.

13. **Call to Order.**—The meeting was called to order by the Chairman.

14. **Farm Security Administration.**—President Morrow presented a letter from the U. S. Department of Agriculture Farm Security Administration asking the cooperation of the county and state medical associations in furnishing medical and hospital care to migratory agricultural workers.

It was moved by Karl Schaupp, seconded by Charles A. Dukes, that the Council give its approval to the plan in principle and that the President of the California Medical Association appoint a committee to work out the details consistent with the general principles and policies of the California Medical Association. Carried.

15. **Exhibitors at Annual Session.**—The Secretary was instructed to inform all exhibitors at our annual session at

* The minutes of the two hundred and fifty-ninth meeting of the Council of the California Medical Association were printed in the February, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, page 125. Minutes in this series now printed are for the two hundred and sixtieth meeting.

Pasadena that we do not carry insurance on their exhibits covering loss by fire, theft or damage, and that they should carry such insurance.

16. **Mailing of "Journal."**—Discussion was had of the manner of mailing CALIFORNIA AND WESTERN MEDICINE. The Council felt that the present manner of mailing was satisfactory and the additional cost of mailing flat in envelopes was not justified.

17. **Hearing of Ross Carter and Roy Stevenson.**—The hour of 2 p. m. having arrived, the Council proceeded to hear the appeals of Ross Carter and H. Roy Stevenson of San Diego from the disciplinary action of the San Diego County Medical Society. The hearing was adjourned to a future date to be fixed by the Chairman.

18. **Proposed Amendment to Disciplinary Code.**—Lowell S. Goin submitted a report on proposed amendments to the By-Laws governing disciplinary procedures.

It was moved by Lowell S. Goin, seconded by Howard Morrow, that the Council recommend to the House of Delegates that Section 3, Chapter II, paragraph 7, be amended to correct a grammatical error by striking out the words "may be" in line 17 following the words "the answer or answers." Carried.

Doctor Goin then read the remainder of the report for the information of the Council.

It was moved by T. Henshaw Kelly, seconded by J. B. Harris, that copies of the report be submitted to each member of the Council for study and action at the first meeting of the Council at Pasadena. Carried.

18a. **Membership.**—It was moved by Lowell S. Goin, seconded by Howard Morrow, that the report of the Special Committee on retired and honorary membership be approved. Carried.

19. **Criminal Insane.**—It was moved by George H. Kress, seconded by J. B. Harris, that 1,000 reprints of the article on "Criminal Insane," by Ruggles Cushman, be made for future use. Carried.

20. **Resolutions.**—The Secretary of the Association was instructed to call the attention of component county societies to the inadvisability of having the language of resolutions so worded that members construe such resolutions to be by-laws.

21. **Legal Department.**—The General Counsel reported on the case of *Graun* vs. *Harder;* the Pacific Health Corporation and the Tator case.

The General Counsel, in accordance with previous action of the House of Delegates, was instructed to submit a report on malpractice at the annual session.

It was moved by Lowell S. Goin, seconded by Karl L. Schaupp, that the General Counsel assist in the Pacific Health Corporation case. Carried.

22. **Golden Gate Exposition.**—President Morrow presented a letter from the Executive Officer of the Golden Gate International Exposition and stated that $200,000 would be devoted to the health and science exhibit.

After discussion, on motion of Edward Pallette, seconded by Howard Morrow, Dr. Karl F. Myers was elected a member of the Association's Advisory Committee to the Golden Gate Exposition. Carried.

It was moved by Harry Wilson, seconded by T. Henshaw Kelly, that Doctor Kelly notify the Director of the Exposition that our Association's Committee which was appointed in response to their request, of which Doctors T. Henshaw Kelly, Edward Pallette, F. C. Warnshuis, and Hartley Peart are members, now includes Dr. Karl Myers and stands ready to coöperate with them. Carried.

23. **Ethics.**—It was moved by Lowell S. Goin, seconded by Alfred Phillips, that the Council recommend to the House of Delegates that it instruct its delegates to commence to move for an American Medical Association committee on the revision of the Code of Ethics. Carried.

24. **County Hospitals.**—It was moved by Louis Packard, seconded by Howard Morrow, that the Chairman of the Council arrange for representatives of the State Farm Bureau to confer with a committee of the California Medical Association, time and place to be arranged by the committee. Carried.

It was moved by Louis Packard, seconded by Lowell S. Goin, that the Chairman of the Council appoint a committee to represent the California Medical Association in conference with representatives of the State Supervisors Association. Carried.

25. **San Francisco Municipal Employees.**—T. Henshaw Kelly reported for the information of the Council on the plan of medical care for employees of the City and County of San Francisco.

26. **Council Meeting.**—The date of the next Council meeting was fixed as May 8, 1938, at 8 p. m., Hotel Huntington, Pasadena.

27. **Adjournment.**—There being no further business, the meeting adjourned.

PROGRAM, ANNUAL SESSION

This issue contains, in supplement form, the official program for the annual session in Pasadena, May 8 to 12. There will also be found in that supplement the annual reports of officers and committees.

Members are urged to read these reports. They summarize the year's activity and acquaint you with the work that is being carried on in behalf of every member. They reveal facts to you and with which you should be familiar. Know your Association. These reports make it possible for you to become reliably informed.

The program for the annual session is an outstanding one. The subjects are timely and will be presented by capable men. Attendance at these general and section meetings will be profitable and well worth the time of every member. Plan to be present. Write to the manager of the Hotel Huntington for your room reservations. A cordial invitation is extended to every member to attend this sixty-seventh annual session.

DELEGATES

A direct and important responsibility rests upon every delegate to read these annual reports. It is essential that he be informed as to their nature and contained recommendations. This information will enable delegates to adequately represent their respective county organizations in the deliberations of the House of Delegates. Delegates should discuss these reports with their county society members in order to gain the reaction and desires of local members. Delegates are expected to express the wishes of their county society and conform to the instructions expressed. A delegate is not an individualist, for he serves and acts for those whom he represents. To record that representation, the delegate must ascertain the desires and opinions of his constituents.

INVITED GUESTS

For each annual session four out-of-state distinguished clinicians are invited to participate in the scientific program. Our Association has been honored this year by the acceptance on the part of four well known and distinguished medical men of invitations to participate in the program of our sixty-seventh annual session, in Pasadena, May 8 to 12. The following invited guests constitute the group:

Udo J. Wile, M.D., Ann Arbor, Michigan, Professor of Dermatology and Syphilology, University of Michigan Medical Department.

Alfred Blalock, M.D., Nashville, Tennessee, Professor of Surgery, Vanderbilt University.

T. R. Harrison, M.D., Nashville, Tennessee, Professor of Medicine, Vanderbilt University.

Alexis F. Hartmann, M.D., Department of Pediatrics, Washington University, St. Louis, Missouri.

* All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

GENERAL MEETINGS

The opening general meeting on Monday at 10 a. m. will be addressed by President Howard Morrow and Dr. Udo J. Wile of the University of Michigan.

The general meeting on Tuesday will be devoted to a clinical pathological conference conducted by Drs. Alfred Blalock and T. R. Harrison of Vanderbilt University.

The third general meeting, on Wednesday morning, will be addressed by Dr. Alexis F. Hartmann of St. Louis, Missouri, and by Dr. C. Frederic Fluhmann of Stanford University (by invitation).

These three general meetings afford opportunities to hear six outstanding presentations that will be of extraordinary interest and value.

MEETING PLACE

All sessions of the California Medical Association will be held in the Huntington Hotel. Registration, scientific and commercial exhibits will be located in the Patio, which will be covered by a canvas. This will transform the Patio into a very excellent exhibition center. Hotel reservations may be secured through direct communication with the manager of the Huntington Hotel.

ATTENDANCE

With 2,300 members resident in Los Angeles County, it is anticipated that the registration and attendance will be the largest in the history of the Association. Every member able to do so should embrace this opportunity.

REDUCED RAILROAD RATES, ANNUAL SESSION

Those planning to go to the annual session in Pasadena by train are entitled to reduced fare. To obtain this reduction it is necessary to present an official certificate to the agent at the time when you purchase your round-trip ticket. This certificate may be obtained by sending a *stamped* self-addressed envelope to the office of the State Secretary. Remember, a certificate *is necessary*. Send for it today.

RAILROAD FARES

Following are examples of round-trip convention fares from points named below to Pasadena, California, available on presentation of this form of certificate:

Auburn	$15.05	Paso Robles	8.20
Bakersfield	5.55	Redding	19.05
Barstow	4.00	Sacramento	13.95
Calexico	7.50	Salinas	11.15
Chico	16.85	San Bernardino	1.80
El Centro	7.50	San Diego	4.10
Fresno	8.80	San Francisco	14.60
Los Angeles	.40	San Jose	13.20
Marysville	15.55	San Luis Obispo	7.15
Merced	10.45	Santa Barbara	3.55
Modesto	11.60	Stockton	12.50
Needles	9.05	Tulare	7.45
Oakland	14.45	Visalia	7.75
Oroville	16.35	Woodland	14.50

IS THERE A LACK OF MEDICAL CARE?

It is axiomatic that for a satisfactory solution of a problem there must be a clear understanding of the nature of the problem. Impinging facts and factors must be compiled and plans for remedying unsatisfactory conditions must be based upon dependable evidence.

For several years there has been much talk and many statements issued asserting that there was a widespread condition in which many people were without medical care. Some went so far as to state that from 30 to 40 per cent of the population of this country were being deprived of medical care. More lately certain governmental agents, economists and social workers have persistently repeated such statements, and as far as could be learned their statements were supported by few and questionable facts. To those who are earnestly concerned and interested, the instances cited were not convincing, nor were they felt to be dependable. In many of the statements it was apparent that these analyses and conclusions presented evidence that they had been formulated to conform to the preconceived opinions, ideas and purposes of certain individuals and probably distorted to serve personal quests.

A few years ago the American Medical Association made a limited inquiry. Contacts were made in different parts of the country with mayors, supervisors, welfare agents, commissioners and legislators. These public officials were asked if they knew of any person who had died or had been forced to go without medical care. Also, if they knew anyone or any group in their community that lacked medical care. This inquiry did not uncover any person or community that needed or couldn't obtain medical care and service.

In the last year or two there have been additional surveys by individuals or groups. As a result there has again arisen a number of statements reaffirming the existence of the lack of medical care for a large percentage of a given population. The manner in which these surveys were made, the incompetency of many of the investigators, and field workers, the manner in which data was compiled and the inaccuracies of the conclusions created lack of confidence. Trained, competent statisticians and economists were unwilling to accept the data that was presented. To them the findings did not warrant the facts claimed, and these experienced, competent authorities were unconvinced that the conditions were as they were represented.

More recently, and from several and varied sources, the declarations have been more widespread and persistent that many people were in want for medical care. Statements were and are being made that the medical profession through its several organizational units was stubbornly refusing to recognize the situation. That it was assuming a "stand pat" rôle. That is was acting as "obstructionist." That it declined to act. It was told to do something to correct conditions or that it would be done for them.

The traditions of the medical profession unfailingly demonstrate that medical men and accredited medical organizations have always held the health welfare of the people as their chief concern. The quest has always been to safeguard and enhance the health needs of the public individually as well as collectively. In true humanitarianism it has served in meeting and administering to the medical needs of mankind.

True to those traditions and earnestly desirous of ascertaining whether there does exist a lack of medical care for groups of people and to establish or disapprove that statement with accuracy and dependability, the American Medical Association, through its constituent state and county units, will undertake a study and survey as to the availability of medical care in this country.[1]

PLAN OF SURVEY[2]

As outlined in the article to which reference is given, complete survey blanks will be sent to every state organization. State organizations will perfect the details with their county units. County societies, through their members, will secure the local findings requested in these blanks. These will then be collected and returned to the American Medical Association Bureau of Economics. Definite instructions will be sent to each county secretary as soon as the Bureau of Economics forwards these supplies.

It can be confidently expected that the information obtained will be compiled, findings tabulated and conclusions formulated by the most competent, unbiased and experienced statisticians and analysts. Thus there will be made available, for the first time, a true picture of actual conditions and needs. Possessed of these facts, if the need is shown, the American Medical Association and its units will devise the means, as it alone is capable and competent to do, to remedy any untoward conditions and continue to make medical care available wherever it is needed.

Pending the presentation of these facts ill advised and unwarranted plans should be held in abeyance and discouraged.

PACIFIC COAST CONFERENCE

On Sunday, February 27, by invitation from our Association, representatives from the state medical organizations of Washington, Oregon and California met in conference in San Francisco. The following were present:

Elijah Clements Leach, M.D., Arlington, Washington.

Myron S. Jared, M.D., 1215 Fourth Avenue, Seattle, Washington.

Charles E. Hunt, M.D., 132 East Broadway, Eugene, Oregon.

Regner W. Kullberg, M.D., 9 Pacific Avenue, Astoria, Oregon.

[1] See p. 77b, *Journal of the American Medical Association*, February 12, 1938.

[2] *Ibid.*

Mr. Clyde Coley, Medico-Dental-Building, Portland, Oregon.
Charles Edwin Sears, M.D., 1020 South Taylor Street, Portland, Oregon.
Charles Sweeney, M.D., 35 North Central Avenue, Medford, Oregon.
John H. Fitzgibbons, M.D., 812 Southwest Washington Street, Portland, Oregon.
Morton R. Gibbons, M.D., 350 Post Street, San Francisco.
Vincent Askey, M.D., 1930 Wilshire Boulevard, Los Angeles.
Axcel E. Anderson, M.D., 1759 Fulton Street, Fresno.
Karl L. Schaupp, M.D., 490 Post Street, San Francisco.
T. Henshaw Kelly, M.D., 490 Post Street, San Francisco.
Louis A. Packard, M.D., 1412 Seventeenth Street, Bakersfield.
John Ruddock, M.D., 1930 Wilshire Boulevard, Los Angeles.
Henry S. Rogers, M.D., 159 Kentucky Street, Petaluma.
John H. Graves, M.D., 977 Valencia Street, San Francisco.
Howard Morrow, M.D., 384 Post Street, San Francisco.
Charles A. Dukes, M.D., 426 Seventeenth Street, Oakland.
F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco.

Medical, organizational, legislative, and economic subjects occupied the nine hours devoted to this conference.

Those in attendance were so impressed with the value of the conference that it was decided to hold a similar one in Portland, Oregon, early this fall.

COUNTY SOCIETY APPRAISAL

As yearly visits to county societies continue, facts become outstanding and impel certain conclusions. The county society becomes a county institution and a factor in community life when its members mingle with one another in harmony and clear understanding. There we find the nonexistence of individual or small coterie ambitions and selfish quests. The spirit of "the good of the whole" predominates. Public confidence is established and local agencies and officials seek, accept and are guided by the recommendations of the county society in matters related to public health welfare and wide problems of the care of the sick and the conservation of the health of well peoples. Such societies discharge their responsibilities to promote the science and art of medicine and the betterment of the public health. The members are friendly, happy and progressive. That county society is a going organization.

Now let us look at the county society where the opposite to these conditions predominates. The members are split into factions and strife and discord exist. Malpractice suits are numerous. Public confidence is wanting. Health standards are lower. Lay persons and public authorities handle health matters on a political program, ignoring the medical profession. The county society meetings end in discord. The society does not acquit itself of its responsibilities. The doctors lose out collectively and individually. They ignore their shortsightedness and moan unto themselves, but do nothing to rectify conditions.

To these latter it should be said that "medicine without ideals and without ethics ceases to be a profession." The light should dawn upon them that their future depends upon unity and solidarity. Cease bickering! Set about to place your county society house in order.

CALIFORNIA MEDICAL ASSOCIATION

6,008 Licensed Physicians and Surgeons

39 County Organizations

9 Councilor Districts

House of Delegates
(149 delegates chosen by the membership)

Council
(23 members)

Executive Committee
(8 members)

23 Standing and Special Committees

12 Scientific Sections

The foregoing reveals the democratic and representative plan of organization of your State Association. Work for it by loyal coöperation.

WHAT'S WRONG?

At Association Nights, when Association officers visit county societies and discuss organizational activities and professional problems and interests, there is always an "after-gathering" for personal discussions. At these "after-sessions" groups gather round and present personal questions or express individual opinions. At one of these sessions a member put the question—"What is wrong with our profession?" The answer given was "Nothing."

Centuries ago, one Hippocrates formulated certain principles that he condensed into a pledge or oath which medical students swore to and then some forgot. Let us quote certain sentences:

> I will prescribe regimen in order to benefit the sick, and not do to them injury or wrong. . . . In holiness and righteousness I will pass my life and practice my art. . . . Into whatever house I enter, my entrance shall be for the benefit of the sick, and shall be void of all intentional injustice or wrongdoing. . . . I will keep silence, judging such silence sacred.

Now turn to the history of the centuries that have gone before. Scan its pages carefully. There appears an ever-increasing galaxy of men of medicine who not only led, but also served the physical needs of the people of their day. And, serving, they met the problems of the hour and labored to refine and unfold the hidden mysteries of our medical science and perfected the art of its application. Thus, through their contributions and precepts, our profession, its theories and practices, its science and knowledge, reached the present standing and place in our social world.

And what a glorious record has been made for medicine and its practitioners! There is no greater romance than the romance of medicine. No emergency ever arose, no pestilence or calamity occurred, no war was ever waged and no community ever existed in which the practitioners of medicine failed to serve with their fullest ability and capacity to meet the medical needs of the people. They never failed to respond to the call of humanity. The record of service is truly one of honor and, shall we not say, righteousness and holiness.

This passing comment will not permit the citing of specific illustrative instances of which there are scores on scores of outstanding occasions. Whatever has been good for the health needs of the people has come forth from within the ranks of the profession, and never from outside agencies. Whatever progress has been made has been inspired and developed by our own students, men of research, investigators and members. Whatever were the medical needs of any emergency in any community, county, state or the nation, accredited representatives from within the profession formulated and applied the solution. When, a few years ago, there were some who asserted that people were in want of medical care the investigations and inquiries revealed that such assertions were unfounded and without warrant. True, there are those who prefer not to avail themselves of the ministrations of physicians, and, again, there are those whose intelligence is of such low grade that by reason of their ignorance they do not seek medical services that are available. That situation cannot be used as a criticism of our profession. The point is being made that none need to be without medical advice and care.

Then why the query that is being heard—"What is wrong?" The answer remains—"Nothing!"

If we enter into generalities the same query may be advanced for the social and governmental conditions that

confront us today. While the answer is apparent, many ignore and avoid it. It is not purposed to advance the answer other than to the query that relates to medicine, physicians and medical care.

The things that are wrong with medicine, if they can be designated as "wrongs"—it is preferable to refer to them as delay in readjustments—may be tabulated thus:

1. Jittery instability and nonobservance of fundamentals.
2. Quests on the part of ill-informed and unadvised, inexperienced individuals outside the ranks of medicine who seek to reform, reshape and direct our labors and our destiny.
3. Wavering on the part of physicians who seek to desert time-tried principles and ignoring them endeavor to follow self-constituted principles.
4. Nonobservance of the principles of ethics.
5. Financial greed.

There will be nothing wrong if men of medicine recall and observe Hippocrates' last exhort—"If, then, I fulfill this oath and do not violate it, may I enjoy my life and art and be held in honor among all men forever; but if I transgress and prove false to my oath, then may the contrary befall me."

There is nothing wrong, for, true to our traditions, chosen representatives in our organizational ranks will present and apply required solutions. May individuals conform to them!

PASSING COMMENT

In serious accidents, a consultant's note on the hospital record will refute and defeat many malpractice claims. Seek consultations often.

* * *

Settlement in malpractice claims stimulates additional claims. Demand trial and, when necessary, appeal to the highest courts. Observance of this policy will eventuate in lessening the number of claims and suits and also reduce premium rates.

* * *

Have you paid your dues for the current year? If not, remit them to your county secretary today. Failure to do so places your name on the suspension list and that means that this will be the last issue of your Journal that you will receive until you are reinstated. Pay your dues today.

* * *

Read the annual reports of the Supplement of this issue. They enlighten you upon organizational activity.

* * *

Suit was brought by a correspondence school to collect on a note given for a study course. Defendant filed a cross petition for damages for pain and anguish suffered by reason of a series of letters, notes and warnings sent to him. A $500 judgment was given. In another case the debtor sued for damages for mental pain, anguish and humiliation which she claimed to have suffered by reason of a series of letters written her. The court, in sustaining a verdict giving damages, stated that the letters were a willful intent to produce pain and mental anguish.

Hence the warning to be careful as to how you write debtors in demanding payment. Apparently there can be greater pain and anguish than that caused by having to pay one's bills.

* * *

We must deal collectively with the exploitation of our profession and the services it renders. Much depends upon how county societies and individual members act. Unity of purpose and action is the most effective method for safeguarding the future of our profession.

* * *

At one time in the history of organized medicine there was a certain group of members in almost every county unit who appeared to think their highest duties were performed when they succeeded in carrying the yearly elections through satisfactorily, and had the newly elected officers duly announced in all the daily papers. While this class of members is not entirely extinct, the vast majority of members appreciate the educational value of every meeting and regularly attend all meetings of their county and state associations. A member can obtain as much from his society as he desires. The greater his personal contribution, the greater his returns. Your society will be just what you help make it to be as an active medical organization.

* * *

"To whom shall be given the honor of a discovery? This question can never be answered fully; science is a continuous process; each investigator must of necessity build on the work of those who come before him. What we know, what we think we know, and what we think is a stream which flows by us and through us, fed by the far-off rivulets of long ago."—Sir Michael Foster.

* * *

Are you concerned with a problem? If so, write to your State Association headquarters. An earnest endeavor will be made to be of assistance to you and send you the information you desire to secure if it is at all possible to do so. It is your headquarters office and its services are at your disposal as one of the benefits of membership.

* * *

It would help a lot if every member would ask the detail men who call upon them whether his firm advertises in your state journal; if not, why not; and that you give preference to your advertising patrons. Please coöperate.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Developments in Hospital Insurance

The following is from the *Journal of the American Medical Association,* issue of February 26, 1938:

A statement issued by the trustees of the Intercoast Hospitalization Insurance Association of Sacramento, California, describes the changes in the five years of operation of this hospital insurance plan and affords a forecast of the developments in hospital insurance.

Based on a careful study by an actuarial specialist and an examination report by the state insurance commissioner, it was found that the association was financially sound, but that insufficient reserves were being accumulated to make the organization permanently stable. In order to increase reserves it was suggested that either the cost of the policy to the member be increased, the services allowed to be decreased or the two methods be combined. The trustees of the Intercoast Hospitalization Insurance Association felt that an increase in the policy premium, which is $1 monthly or $11 annually, would prevent a large group of persons from becoming members. Therefore, partly as a result of the necessity to improve the reserve status and partly because of the objection to the inclusion of x-ray and laboratory services in a hospitalization policy by the California Medical Association and the American Medical Association, the trustees of the Intercoast Hospitalization Insurance Association voted to eliminate both x-ray and laboratory services from future contracts. The amount of services provided for women and children was also reduced by 25 per cent, with the exception of employed women enrolled as a group by means of payroll deductions. In addition, the contracts of 350 members were canceled as poor risks, and special limiting riders will be attached to the contracts of other members who are considered doubtful risks. In 1936 all provisions for maternity care were discontinued, although this action caused 2,654 members to drop their policies.

These changes were deemed essential to the financial stability of the Intercoast Hospitalization Insurance Asso-

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

ciation and were made in accordance with the best experiences of this hospital insurance plan, which has been operating as long as any free choice group hospitalization plan in the United States.

It has long been contended by the medical profession that the inclusion of medical services in a group hospitalization contract is undesirable because of the disturbing effect on the practice of medical specialties in hospitals, such as anesthesia, pathology and radiology. It now appears that another good reason for excluding these medical services from hospital service contracts is presented by insurance actuaries, namely, that a proper premium to provide for medical services cannot be calculated in advance. Because of these two conditions, there are several indications that hospital service corporations are contemplating the exclusion of medical services from renewals of existing contracts and from all future contracts.

Contract Practice

It is apparent that there are members of our profession who are not informed as to the principles of medical ethics that relate to contract practice. For their information the following sections are quoted:

REVISED PRINCIPLES OF MEDICAL ETHICS OF THE AMERICAN MEDICAL ASSOCIATION—1937

Conditions of Medical Practice

Sec. 2. It is unprofessional for a physician to dispose of his services under conditions that make it impossible to render adequate service to his patient or which interfere with reasonable competition among the physicians of a community. To do this is detrimental to the public or to the individual physician, and lowers the dignity of the profession.

Contract Practice

Sec. 3. By the term "contract practice" as applied to medicine is meant the carrying out of an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, to furnish partial or full medical services to a group or class of individuals on the basis of a fee schedule, or for a salary or a fixed rate per capita.

Contract practice per se is not unethical. However, certain features or conditions if present make a contract unethical, among which are: 1. When there is solicitation of patients, directly or indirectly. 2. When there is underbidding to secure the contract. 3. When the compensation is inadequate to assure good medical service. 4. When there is interference with reasonable competition in a community. 5. When free choice of a physician is prevented. 6. When the conditions of employment make it impossible to render adequate service to the patients. 7. When the contract because of any of its provisions or practical results is contrary to sound public policy. The phrase "free choice of physician," as applied to contract practice, is defined to mean that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patient and physician when no third party has a valid interest or intervenes. The interjection of a third party who has a valid interest or who intervenes does not per se cause a contract to be unethical. A "valid interest" is one where, by law or necessity, a third party is legally responsible either for cost of care or for indemnity. "Intervention" is the voluntary assumption of partial or full financial responsibility for medical care. Intervention shall not proscribe endeavor by component or constituent medical societies to maintain high quality of service rendered by members serving under approved sickness service agreements between such societies and governmental boards or bureaus and approved by the respective societies.

Each contract should be considered on its own merits and in the light of surrounding conditions. Judgment should not be obscured by immediate, temporary or local results. The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole.

Direct Profit to Lay Groups

Sec. 5. It is unprofessional for a physician to dispose of his professional attainments to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him. Such procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people, and is against sound public policy.

County medical societies are the designated censors of their members. The responsibility rests with the county society to enforce observance of these principles.

COMPONENT COUNTY MEDICAL SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society met on the evening of March 3 at the General Hospital, with President Francis Stump presiding. Fifteen members were present, and two visitors—Dr. Charles Sweeney, President of the Oregon State Medical Society, and Dr. Charles Lemery, both of Medford, Oregon.

Doctor Sweeney spoke on *Salient Points of Abdominal Surgery*, and Doctor Lemery's topic was *Early Symptoms, Diagnosis, and Treatment of Glaucoma.* Both papers were very well presented.

After an enjoyable luncheon, the meeting adjourned.

LAWRENCE A. WING, *Secretary.*

KERN COUNTY

The Kern County Medical Society met at the Taft Hotel in Taft on Friday evening, February 18. President Harry Lange called the meeting to order.

On the motion of Dr. H. W. Jones, seconded by Dr. Seymour Strongin, it was voted that the minutes of the Board of Directors' meetings be read at the regular society meetings so that members may be better informed regarding transactions of the Society. It was also voted that a committee be appointed by the president to determine whether the physicians' telephone exchange service should be continued in Bakersfield. A committee, consisting of Doctors Garner, McAllister and Dykes, was appointed by the president to arrange special listing of the Taft members in the Taft telephone directory, as has been done in the Kern County telephone directory with other members.

The speaker of the evening was Dr. Clyde Emery, Chief of the Department of Roentgenology at Cedars of Lebanon Hospital in Los Angeles. Doctor Emery spoke on *Use of Radium and X-ray in Malignancy.*

An excellent dinner was enjoyed by the seventeen members present. Heavy rain prevented many members from attending this annual meeting in Taft.

C. S. COMPTON, *Secretary.*

MARIN COUNTY

At the regular February meeting of the Marin County Medical Society, held at the Marin Golf and Country Club, both the members of the Society and the Woman's Auxiliary enjoyed a very interesting discussion by Dr. Chauncey Leake of the University of California Department of Pharmacology, on *The Drugs Commonly Used in Medical Practice.*

CARL W. CLARK, *Secretary.*

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Dave Dozier, on January 18, at the Auditorium on Twenty-ninth and L streets. There were fifty-four members and guests present.

Dr. H. M. Kanner presented the paper of the evening. His subject was *The Treatment of Gonorrhea in Women.* Doctor Kanner stated that, on the whole, the treatment of this disease is unstandardized and unsatisfactory. The subject was taken up first as to the general measures used, such as bed rest, cleanliness, and abstinence; then the treatment of the points of infection in the child and the adult. Doctor Kanner stressed the treatment of the Bartholin glands by use of the electric needle early when these glands are affected, and to cauterize and pack the gland is better than attempting to enucleate in case of abscess formation. In treating the cervix, do not overtreat. Irrigations seem to be of most value, along with linear cauterization. Doctor Kanner stated that he did not use tampons, feeling that they are of no value and interfere with proper drainage. The value of the Elliott treatment or similar machine was stressed in treatment of pelvic inflammatory infections. Lantern slides showing some of the author's statistics, as well as pictures of the various types of machines used for heat therapy, were shown. The paper was very instructive,

and presented in an interesting manner. Discussion was opened by Dr. E. O. Brown, and continued by Doctors Beach, Turner, McDonnell, and Ed Babcock.

Under new business, Dr. C. Ankele presented a resolution regarding fee splitting to industrial accident insurance companies. A motion was made, and seconded, that the resolution be accepted. The motion was lost (17 for, 24 against). Doctor Turner then made a motion that we submit the resolution to Mr. Hartley Peart for revision, and that the revised resolution be read at the next meeting. The motion passed.

Doctor Dozier read the names of the members composing the committees for the year 1938.

G. E. Millar, *Secretary.*

SAN BERNARDINO COUNTY

The regular meeting of the San Bernardino County Medical Society was held at the San Bernardino County Charity Hospital on Tuesday, March 1. About seventy-five members and guests were present.

In the absence of Dr. W. W. Fenton, County Health Officer, the Secretary was called upon to outline the plans to date for the contemplated venereal clinic.

The house in the two hundred block on Fourth Street in San Bernardino was found suitable by Doctors Davey and Stoudt of the State Department of Public Health; the rental is $50, to be paid by the county, and the county's only expense for the clinic. The plans are to start the clinic about April 1, with Dr. J. W. Moreland in charge. Consultants have not been appointed, and are to serve without pay. Besides Doctor Moreland, the personnel will include a well-trained nurse, orderly, and secretary, who will be capable of doing the Social Service work. These are all to be Civil Service employees. The State will spend between $1,500 and $2,000 to equip the clinic. Follow-up nursing is to be aided by the Public Health nurses in the cities and county. The name of the clinic will probably be "The Health Center."

Doctor Hilliard asked about the minimum fee to be paid by those able to do so, and receive treatment my private physicians. The Secretary explained that this was to be determined by the Society.

Doctor Savage, Jr., asked about adequate social service. This is to be done by the Secretary, who it is hoped will be capable of doing this work in addition to her secretarial work.

Doctor Abbott made a plea for keeping the clinic at the hospital for adequate social service, consultation, etc. He asked the coöperation of the Society in the aid of the clinic's success.

The scientific program was given as follows: *Obesity*, Dr. E. Kost Shelton of Los Angeles. Discussion was opened by Dr. Justin Neighbor and Dr. C. A. Wylie, followed by questions and general discussion.

The venereal clinic was then discussed again, and Doctor Hilliard made a motion that the Society instruct a committee to investigate the matter further and to report to the Council to take such action as they saw fit to formulate a policy to be followed in this matter. The motion was seconded, and passed.

Doctor Abbott suggested that the Standing Committee on Public Relations and Public Policy be instructed to do the necessary work, in place of a new committee. This met with general approval, and Doctor Abbott was ordered by the President to call a meeting of this committee.

The meeting adjourned at 10 p. m., following which refreshments were served.

Arthur E. Varden, *Secretary.*

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was called to order by the president, Dr. A. C. Boehmer, at 8:15 p. m., in the Medico-Dental clubrooms, Stockton. The meeting was preceded by the customary supper meeting, held at the Hotel Wolf, at which twenty-five members and guests were present. The paper of the evening was presented by Dr. A. K. Merchant of Stockton, who talked on *Treatment of Gastric Malignancy by X-ray.*

The application of J. J. Seibel of Lodi for membership in the San Joaquin County Medical Society was reported on favorably by the Admissions Committee, and there being no objections from the floor Doctor Seibel was declared a member. Petition of affiliation to the San Joaquin County Medical Society of Dr. Curtis M. Galt of Manteca was received. This application was referred to the Admissions Committee for action.

Doctor Broaddus spoke on the Postgraduate Study group and presented certificates to those who had completed the course. Under miscellaneous business, President Boehmer urged all members of the San Joaquin County Medical Society to attend the memorial services for past president Thomas O'Conner, which are to be held at Bret Harte on Sunday, March 6, at 2:30 p.m.

The Secretary urged payment of dues by members who have not as yet paid their dues, advising them that they would be declared delinquent if the dues were not paid in time for transmittal to the California Medical Association on or before April 1.

The papers of the evening were presented by Dr. Carl Mathewson of San Francisco, Associate Professor of Surgery at Stanford, whose paper was on *Diagnosis and Treatment of Lymphogranuloma Venera.* Doctor Mathewson announced that he would furnish Frei antigen to those interested, for use and diagnosis in this condition if they communicated with him at the San Francisco County Hospital. This paper was profusely illustrated by slides. Dr. Robert Scarborough of San Francisco, Associate Professor of Surgery at Stanford, read a paper on *Cancer of the Rectum,* and suggested early diagnosis and treatment. Both papers were very well received and caused considerable discussion.

Mr. Hunter, special agent from the State Board of Medical Examiners for the northern part of the State, was introduced to the Society and stated that he would be glad to be of any help to the members. There being no further business to come before the Society the meeting was adjourned at 10:45 o'clock, and refreshments served.

G. H. Rohrbacher, *Secretary.*

SANTA BARBARA COUNTY

The month of February has been unusually active. A special meeting was held on February 7, attended jointly by the Santa Barbara and Ventura County Medical Societies. Officers of the California Medical Association were present and contributed to the program, the purpose of which was a relation of the Association's activities and the establishment of a rapport with the local societies. The speakers were Councilor Louis Packard, President-Elect Roblee, and Secretary Warnshuis.

On February 14 the regular monthly meeting was held. Prior to the business meeting, the Society members enjoyed dinner with the members of the Santa Barbara Bar Association. The speakers were: Mr. W. G. Gilbert, who spoke on *Some Aspects of Medical Jurisprudence,* and Dr. G. V. Hamilton, who spoke on *The Hypothetical Question.* At the business meeting a committee was formed to draw up resolutions regarding the death of Doctor Loveren. The Society voted that all members should join the Public Health League. New members elected were Dr. Clark Brown and Dr. Helen Hart.

The activities for the past month have in no way mitigated the Society's sorrow over the death of Dr. George Stillman Loveren. Kindly and self-sacrificing, he was respected and loved by all who knew him. His passing on the morning of February 3 seemed almost as though one had lost something out of one's own life. His buoyancy and humanity made even a casual "hello" stimulus to brighten one's day.

J. Jerome Rupp, *Secretary.*

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held on January 11 at the Ventura County Country Club at Saticoy.

There were seventeen members present. Doctors Witten, Moore, and Gilman, of the County Hospital, were guests.

A brief report of the progress being made by the Committee on Prepaid Medicine was given by Dr. Charles Smolt. After meeting with the Council of the California Medical Association, it was found that the plan which the

committee had previously presented to the Society would probably not be legal.

Following a discussion of this subject, Doctor Homer made a motion that the committee continue to investigate various plans in an attempt to present a suitable plan. Also that the members of the committee be reimbursed for their expenditures for tours. The motion was seconded by Doctor Shore. The motion carried.

Doctor Smolt asked for suggestions as to the best manner in which to draw up a fee schedule. It was suggested that the committee present some type of schedule and then let the members amend it.

Doctor Little cited a case in which a public health nurse had referred the patient directly to the County Clinic instead of his office. He was reassured by Doctor Wylie that an effort would be made to prevent a recurrence of this situation.

Doctor Wylie spoke briefly on the rabies quarantine which is now in effect in Ventura County, and gave the reasons for its necessity. Doctor Nielsen made a motion that the Society support Doctor Wylie in maintaining this quarantine and that this action be published in the various newspapers throughout the county. The motion was seconded by Doctor Homer, and was unanimously carried.

Doctor Shore made a motion, seconded by Doctor Smolt, that the Society endorse the plan for hospital insurance as offered by the Associated Hospitals of Southern California. The motion carried.

In accordance with the communication from Doctor Warnshuis asking if it would be possible for us to arrange a joint meeting with the Santa Barbara County Medical Society on February 7, Dr. Grant Clark made a motion that we meet with that society on that date. The motion was seconded by Doctor Strong, and carried.

After a short discussion on the value of the work accomplished by the Public Health League, Doctor Smolt made a motion that a special assessment of $5 be levied on each member, to meet the annual dues of this organization. The motion was seconded by Doctor Stoll, and was unanimously carried.

Dr. J. A. Mahan of Oxnard was unanimously elected to membership in this society.

Doctor Witten announced that the internes at the County Hospital were planning to have the Lederle film on the *Diagnosis and Treatment of Pneumonia* shown at the County Hospital on February 9. The members of this society were invited to see this film.

The following committees were appointed by Doctor Coffey:

Board of Censors—Doctors Mosher (chairman), Stoll, and Strong.

Program—Doctors Homer (chairman), Osborn, and Barker.

Public Health and Legislature—Doctors Wylie (chairman), Nielsen, and Gronhovd.

The president and the secretary ex officio.

* * *

In lieu of the regular meeting, a joint meeting was held with the Santa Barbara County Medical Society in the Cottage Hospital auditorium on February 7.

Doctor Lamb of Santa Barbara presided.

The following officers of the California Medical Association addressed the meeting: President-Elect Roblee of Riverside; F. C. Warnshuis, State Secretary; L. S. Goin, Speaker of the House of Delegates; and L. A. Packard of Bakersfield, Councilor of the Third District.

Doctor Henderson spoke briefly on the Postgraduate Conference which is to be held at Santa Barbara on March 12 and 13.

Doctor Profant spoke briefly on the Public Health League. A. A. Morrison, *Secretary*.

YOLO-COLUSA-GLENN COUNTY

The March 1 program of the Yolo-Colusa-Glenn County Medical Society was held at the Hotel Woodland. Ben H. Read, Executive Secretary of the Public Health League, gave a report on *Legislation*. Dr. Don King, Professor of Orthopedics at Stanford University, presented a paper on *Backache*. W. J. Blevins, Jr., *Secretary*.

✝

Smith, Frank Holmes. Died at San Bruno, February 19, 1938, age 59. Graduate of Cooper Medical College, San Francisco, 1905, and licensed in California the same year. Doctor Smith was a member of the San Mateo County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

Van Vorhis, James Harrison. Died at Corcoran, February 10, 1938, age 65. Graduate of Northwestern University Medical School, Chicago, 1901. Licensed in California in 1913. Doctor Van Vorhis was a member of Kings County Medical Society, the California Medical Association, and the American Medical Association.

OBITUARY

Milton Ellis Lando
1878–1938

Dr. Milton Ellis Lando, born on February 16, 1878, in San Francisco, died suddenly of a cerebral accident on January 31, 1938. He was a graduate of the Cooper Medical College, now Stanford University Medical School, in 1900. He entered the Army Medical Corps after interning at the Marine Hospital, San Francisco, and was assigned to duty in the Philippine Islands during the reconstruction period after the Spanish-American War, where he saw much active service far from the beaten track of our usual civilization.

He was chief surgeon of the Crocker Total Eclipse Expedition in 1908 to Flint Island in the mid-ocean of the South Pacific, led by Professor Campbell of Lick Observatory.

After this term of service, he entered the Navy Medical Corps until 1910, when his medical interest developed in the field of eye, ear, nose and throat. This led Doctor Lando to Vienna, which was the outstanding center of this specialty at the time. His main interest has always been in diseases of the eye, however, and as his practice developed, his attention was focussed on this particular field, which in later years was his exclusive specialty.

Doctor Lando was not a prolific writer, but had developed a particular knack of giving to lay audiences a comprehensive picture of diseases of the eye. He took much pleasure in, and was a frequent speaker before such groups, helping to publicize the right kind of medical approach toward these problems where there is so much loose thinking among the general public.

He was a member of the Alameda County Medical Society, the California Medical Association, and the American Medical Association. He was also a member of the American Board of Ophthalmology. He was chief of the Eye Clinic at the Children's Hospital of the East Bay. His interest in this work was not confined to the clinic alone, but many hours of his own office time were devoted to working out the problems of these children when the Clinic observations were not quite adequate.

He was a member of Aahmes Temple of the Shrine and other Masonic Orders; of the Moose Club, Oakland Lions Club, and Oakland Lodge of B'nai B'rith. He was chairman of the Committee for the Blind of the Oakland Lions Club, and has done much to alleviate the social conditions, as well as the medical problems arising in this group.

He was much interested in general community problems, and his passing will be a distinct loss to the medical profession as well as the entire community, which he had served so faithfully for these many years.

HAROLD GUYON TRIMBLE, M.D.

✝

Paul Eugene Bowers
1886–1938

Dr. Paul Eugene Bowers died at the Glendale Sanitarium, Glendale, California, on February 15, 1938. Doctor Bowers was graduated from the Indiana University in 1907

and was licensed in California in 1918. He was a member of the Los Angeles County and California Medical Associations, and of the American Psychiatric Association. For eight years he served as medical superintendent of the Indiana State Prison and Hospital for the Criminal Insane at Michigan City, Indiana. In his army service, he was at the Mexican border in 1916, with Indiana troops, and later at the Base Hospital No. 24 at Palo Alto, California. Recently, he was commissioned a senior surgeon in the Reserve Corps, U. S. P. H. S., with the rank of Colonel. He was the author of many articles, appearing in *International Clinics* and other medical journals, on topics related to prison, crime, and psychiatry.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. HOBART ROGERS.....President
MRS. FRED ZUMWALT.....Chairman on Publicity

News Letter

Dear Auxiliary Members:

Make your reservations now for the convention to be held in Pasadena, May 9 to 12. If I could just have the space to tell you of the interesting and delightful days that have been planned for you by Mrs. Newcomb—but that is written in detail for you in the *Courier*. Read the program carefully and then call your friends and *all come*.

Cordially yours,
MRS. FRED H. ZUMWALT.

Official Business

Report of the State Board Meeting.—A special session of the officers and Board of Directors of the Woman's Auxiliary to the California Medical Association was held at the Hotel Huntington, South Oak Knoll, Pasadena, on Wednesday morning, February 23, at nine o'clock.

The state president, Mrs. Hobart Rogers of Oakland, presided. The attendance was unusually large, all of the state officers—Mesdames Frederick N. Scatena, Elliot G. Colby, H. E. Henderson, Charles C. Hall, Harry O. Hund, as well as the councilors-at-large, Mesdames William W. Roblee, Arthur T. Newcomb, A. E. Anderson, and Fred H. Zumwalt—were present. The following district councilors attended: Mesdames Dexter R. Ball, Benjamin H. Sherman, Ed L. Markthaler, Lawrence Knox, Harold Trimble, and George A. Briggs. County presidents Mesdames Eliot Alden of Los Angeles, G. Wendell Olson of Orange, T. A. Card of Riverside, and W. J. Van Den Berg of Sacramento, were also present. Three members of the Board are, in addition, county presidents: they are Mrs. A. E. Anderson of Fresno, Lawrence Knox of Monterey, and Elliot G. Colby of San Diego.

President-Elect Mrs. Clifford Andrews Wright of Los Angeles was present. As in the past, our leaders have been women of exceptional ability and sane judgment; so, too, of the future we need have no fear with Mrs. Wright at the helm.

The most important business considered was the approaching convention of the California Medical Association to be held in Pasadena, May 9 to 12, with headquarters at the Hotel Huntington, South Oak Knoll, Pasadena. All meetings of the Auxiliary will be held at the Vista del Arroyo in Pasadena. Mrs. Arthur T. Newcomb, Convention Chairman, presented in detail the plans of her committee, which met with the hearty approval of the Board.

Mrs. Frederick N. Scatena, Chairman of Membership and Organization, reported the organization of Butte, Santa Cruz, and Tulare counties, the two former having sent in copies of their constitutions and by-laws.

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

The *Hygeia* chairman, Mrs. Harold G. Trimble, reported a total of 443 subscriptions, all but two of the counties having replied.

The other chairmen gave interesting reports of their activities, proving that the year has been an unusually profitable one.

Following the meeting the members of the Board and the county presidents were entertained at a delightful tea in the Vista del Arroyo Hotel. The hostesses were Mrs. Arthur T. Newcomb of Pasadena, Mrs. Benjamin H. Sherman of Hollywood, and Mesdames Eliot Alden and Mark Glaser of Los Angeles.

Component County Auxiliaries

Contra Costa County

Fifteen members were present at the last meeting of the Woman's Auxiliary to the Contra Costa County Medical Society. Renewed interest seems to be shown, and before long we hope to report a large enrollment.

MRS. MELVIN L. STAUFFER, *President.*

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association held its regular luncheon meeting on Tuesday, February 22, at the County Medical Building, with Mrs. Eliot Alden presiding. Ninety-three members were present.

Guests of honor of the occasion were visiting members of the State Board, including Mesdames Hobart Rogers, Fred H. Zumwalt, Elliott E. Colby, Charles C. Hall, and Harry O. Hund.

The guest speaker was Dr. Paul Perigord of the faculty of the University of California at Los Angeles, who talked on *The Triumphant Power of Ideals.*

On Wednesday, February 23, the State Auxiliary Board, the Convention Board, and the Los Angeles County Board were guests at a tea given by Mrs. Arthur T. Newcomb, Mrs. Benjamin H. Sherman, Mrs. Mark A. Glaser, and Mrs. Eliot Alden, at the Vista del Arroyo Hotel in Pasadena. Tea was served from a charmingly appointed table, decorated with a profusion of spring flowers in pastel shades.

MRS. ROBERT L. CARROLL, *Corresponding Secretary.*

Marin County

The February meeting of the Woman's Auxiliary was held, as usual, in the form of a dinner meeting at the Marin Golf and Country Club on Thursday, February 24. Our guest speaker was Dr. Chauncey Leake, Professor of Pharmacology at the University of California. Such an interesting meeting had been planned that we invited the medical society to join us. Briefly, the history of the physician, the surgeon, and the apothecary was outlined by Doctor Leake, who spoke on the subject planned for the evening, *Drugs and Society*. One of the important points stressed was that vitamins are drugs, and as such can be given, in some cases, in too large doses.

We were honored by having Mrs. Leake with us also.

Later in the evening the Auxiliary held a short business meeting. The secretary presided, as both the president and the vice-president were unable to be present.

MRS. B. J. CONROY, *Chairman of Publicity.*

Orange County

The Woman's Auxiliary to the Orange County Medical Society met on Monday, February 21, at the home of Mrs. John Wehrly of Santa Ana for their regular meeting and formal tea honoring our state president, Mrs. Hobart Rogers; corresponding secretary, Mrs. Charles Hall; Chairman of Program and Health Education, Mrs. Elliot G. Colby; and the First District Councilor, Mrs. Dexter Ball.

The president, Mrs. G. Wendell Olson, presided at the meeting. Mrs. Rogers, upon introduction, responded by outlining, in an interesting and inspiring manner, the aims and purposes of our organization and the importance of the Auxiliary to the county, state, and national organizations. Mrs. Charles Hall and Mrs. Elliot Colby responded also, upon introduction.

Mr. Calvin Flint, dean of men at Santa Ana Junior College, spoke on *Europe Awakens to Hygiene*. He was presented to the members by Mrs. K. H. Sutherland.

Tea was served at the close of the meeting. Hostesses assisting Mrs. Wehrly were Mesdames Thomas Rhone, E. L. Russell, and Fred Earel.

Mrs. G. Wendell Olson, *President.*

❦

Riverside County

Mrs. Hobart Rogers of Oakland, President of the Woman's Auxiliary to the California Medical Association, and Mrs. Charles Hall of Piedmont, State Corresponding Secretary, were honored guests of the Riverside County Auxiliary on Friday, February 18, at a luncheon meeting. Sixteen were present for the event, which was held at Ye Olde South Tea Room.

Corsages of spring flowers were presented to the guests, and other colorful blossoms adorned the table. Mrs. T. A. Card, President, presided over the business session.

Mrs. Rogers addressed the group on the work of the Auxiliaries throughout the state and nation.

Mrs. H. J. Wickman, *Corresponding Secretary.*

❦

Sacramento County

Legislation Pertaining to Medicine was the subject of the address given by Dr. J. B. Harris before the Woman's Auxiliary to the Sacramento Society for Medical Improvement at its evening meeting on February 15 in the home of Dr. and Mrs. A. M. Henderson.

Facts given by Doctor Harris were enlightening and interesting. He called attention to the important work which the Auxiliary members can do in helping to further the cause of proper medical legislation.

A business meeting followed, at which the Nominating Committee presented its report of nominees for 1938. The committee is composed of the following members: Mrs. Frank A. MacDonald (chairman), Mrs. Harry M. Kanner, and Mrs. John D. Lawson.

Hostesses who assisted Mrs. Henderson were: Mesdames John L. Fanning, F. F. Gundrum, C. B. McKee, Norris Jones, D. Schuyler Pulford, Herbert True, and C. E. von Geldern.

Mrs. Hugh Carmichael, *Chairman of Publicity.*

❦

San Diego County

The Woman's Auxiliary to the San Diego County Medical Society met on March 8 at the Men's University Club for its regular luncheon meeting. Mrs. T. S. Whitelock, Jr., and Mrs. J. G. Omelvena arranged very lovely flowers and decorations.

Dr. Lyell C. Kinney spoke on *Legislative Problems.* He brought to the attention of the Auxiliary three very important initiative measures to be brought up this coming November. These measures will undoubtedly greatly affect the practice of medicine. The first, the "Humane Pound Act," threatens the advancement of medical science through the prohibition of animal experimentation; the second, "County Hospital Act," will open hospitalization, medical attention, and dentistry to every one, irrespective of means, in the county; and third, the "Public Health Liability Act" will make a wrong diagnosis in surgery a crime punishable by $500 fine and six months' suspension of license. These serious problems will indeed need our support and study.

Mrs. R. E. Bond, *Secretary.*

❦

San Francisco County

Dr. William C. Voorsanger, President of the San Francisco County Medical Society, honored the Auxiliary with an address at the regular meeting on March 15 at 2180 Washington street. *The Medical Profession's Present-Day Problems,* was Doctor Voorsanger's subject for the afternoon. The president, Mrs. Hans Barkan, presided.

Following the program, a short business session was held, including a report from the Nominating Committee, as follows: Mrs. Thomas E. Gibson, president; Mrs. Edmund J. Morrissey, first vice-president; Mrs. A. Lincoln Brown, second vice-president; Mrs. Fred D. Fellows, recording secretary; Mrs. Wilber F. Swett, corresponding secretary; Mrs. John D. Humber, treasurer; Mrs. William C. Voorsanger, Mrs. E. S. Kilgore, and Mrs. Rea E. Ashley, directors.

There being no nominations from the floor, the report of the Nominating Committee was accepted in full, and a unanimous ballot was cast for the members' names so presented for office.

The Nominating Committee consisted of Mrs. Howard B. Dixon (chairman), Mrs. Philip H. Pierson, Mrs. Ernest C. Dickson, Mrs. John J. Sampson, and Mrs. A. G. Folte.

Honoring the sixty-two new members, from January 1 of this year, an informal reception followed the business period. Receiving with the president, Mrs. Hans Barkan, were the newly elected officers and directors for the ensuing year. Tea was served in the library, which commands a beautiful panorama of the Bay and the green-sloped hills beyond. Golden sunshine glimmered through the tall windows, seeming to welcome all to spring. A happy occasion to greet new members—new friends—interested in Auxiliary affairs; enthusiastic and eager to join us in our endeavor toward fulfilling the purposes of our organization.

Simplicity was the keynote of the decorations, with a soft pink predominating the color scheme. Mrs. Fred H. Zumwalt and Mrs. William C. Voorsanger presided at the tea table. Mrs. Edmund J. Morrissey, Membership Chairman, was in charge of arrangements, assisted by Mrs. William W. Newman.

The annual meeting is scheduled for Tuesday, April 19, at 1:30 p. m., 2180 Washington Street. The guest speaker of the afternoon will be Dr. J. C. Geiger, Public Health Officer for San Francisco.

Mrs. Harry R. Oliver, *Publicity Chairman.*

❦

San Joaquin County

The members of the Auxiliary to the San Joaquin County Medical Society held their last meeting at the home of Mrs. S. W. R. Langdon on the State Hospital grounds. The "Citadel," by Dr. A. J. Cronin, was reviewed. Mrs. G. K. Weaver presented Mrs. Robert Gordon, who sketched the story, an autobiography of a doctor who tried to live by professional ideals.

This group, which now meets monthly, entertained the state president, Mrs. Hobart Rogers of Oakland at the Christmas meeting in the home of Mrs. Dewey Powell. Mrs. Charles Hall, state corresponding secretary, was also a guest.

The San Joaquin County Welfare Department and its relation to other welfare agencies was explained in a talk by Ernest Stuart, county department head, who spoke at the February meeting of the Auxiliary. This meeting was held in the home of Mrs. C. D. Holliger, who was assisted by Mrs. P. R. Shumaker. Dainty refreshments were served at the conclusion.

Mrs. Paul Shumaker, *Chairman of Publicity.*

❦

Santa Barbara County

Santa Barbara held a business meeting on the morning of February 28 in the Board room of the Public Library. The object of this meeting was to make plans for March 14, when we are to have as our guests, Mrs. Hobart Rogers and Mrs. Charles C. Hall. This meeting will be in the form of a luncheon at the home of Mrs. Harry De Vigne. Dr. and Mrs. De Vigne occupy a well-known adobe home in Mission Canyon, and have furnished it with interesting and beautiful things collected during their many years of residence in Alaska. They have some fine old baskets and, among other things, two chairs which belonged to Diamond Lil of Sourdough fame. During many years of hospitality, Dr. and Mrs. De Vigne have acquired a reputation for pancake breakfasts which is enviable. In Mission Canyon, as in Alaska, these pancakes have been enjoyed by little-known travelers and noted people in all walks of life, who have only to pull the latch-string. In California they are cooked on the wide, flat top of a barbecue pit built close to the dining-room terrace, where they may be eaten inside in chilly weather, or outside under the shades of the oaks and ceanothus.

Mrs. H. E. Henderson, *Chairman of Publicity.*

❦

Tulare County

The Woman's Auxiliary to the Tulare County Medical Society was organized on January 27. The following officers were elected: Mrs. J. C. McClure, president; Mrs. F. R. Guido, first vice-president; Mrs. Forest Powell, second vice-president; Mrs. S. S. Ginsberg, recording secretary; Mrs. W. B. Parkinson, corresponding secretary; Mrs. P. S. Barber, treasurer; Mrs. P. D. Miller, auditor.

Mrs. J. C. McClure, *President.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M.D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena, May 9–12, 1938. F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco, Secretary.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of April is as follows:

Saturday, April 2—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 7,—KECA, 11:00 a. m., The Road to Health.
Saturday, April 9—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 14—KECA, 11:00 a. m., The Road to Health.
Saturday, April 16—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 21—KECA, 11:00 a.m., The Road to Health.
Saturday, April 23—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, April 28—KECA, 11:00 a. m., The Road to Health.
Saturday, April 30—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Group Hospitalization for Southern California.—The Associated Hospital Service of Southern California, which has been approved by the Los Angeles County Medical Association and the California Medical Association, is about to enroll subscribers. Mr. Harold B. Haas, of the Insurance Commissioner's office, at the banquet of the Association of Western Hospitals in San Francisco on March 2 announced that a permit would be issued. Twenty-eight hospitals in Southern California are now in the plan. It covers the territory from Santa Barbara to San Diego.

Who May Enroll

The Association plans to enroll employed groups and their families.

The individual rate will be 75 to 85 cents per month.

Husband and wife, $1.50 per month.

Family, regardless of the number of children under nineteen years of age, $2 per month.

Newspaper Comment

A great number of newspapers have given considerable space to the group hospitalization plan in Southern California. A recent editorial in the Los Angeles *Times* follows:

THE HOSPITAL GROUP PLAN

Announcement by a group of twenty-seven nonprofit Southern California hospitals of an insurance plan for hospital care is a big step forward. Fear of the cost of illness, one of the mental states which may be a contributing cause to illness itself, can now be removed by a plan within reach of the average family budget—ranging from three cents a day for an individual to seven cents a day for a family.

The plan appears to have all the advantages at which so-called "state medicine" aims, with none of the handicaps and disadvantages which state medicine and panel systems have been proved to have in practice.

The plan, which goes into effect on March 15, has been approved after careful study by the State Insurance Department, which considers it both sound and equitable. Features of all the various medical insurance plans in effect in this and other countries have been considered in drawing up the plan, and it is believed to be a combination of the best in all with avoidance of their serious defects.

It is designed to meet the hospitalization requirements of families with modest incomes, though wholly self-supporting—a group the needs of which have been largely neglected. There has been the best of hospital care available for those who do not have to count costs, and for the indigent, but those in between, the bulk of the population, have been little considered.

The plan is probably not perfect and will require adjustments as time goes on; but it is starting on a basis of solid experience elsewhere, and should develop into one of the most valuable contributions to popular well-being that has ever been made.

Stanford University "Popular Lectures."—The Stanford University School of Medicine announces the fifty-sixth course of Popular Medical Lectures (illustrated), to be given at Lane Hall on Friday evenings, April 1, April 22, May 6, and May 27, 1938, eight o'clock sharp.

The program follows:

Friday, April 1—Conditions of the Mouth in Relation to Disease," by Dr. Walter W. Boardman.

Friday, April 22—Backache: Causes and Treatments, by Dr. Donald E. King.

Friday, May 6—Forty, Fat, and Florid, and Heading for Circulatory Failure, by Dr. William J. Kerr.

Friday, May 27—Vitamin Facts and Fallacies, by Dr. Dwight L. Wilbur.

All interested are cordially invited to attend.

Association of Western Hospitals.—The Public Hospital Section of the convention of the Association of Western Hospitals and the Western Conference of the Catholic Hospital Association met in San Francisco, February 28 to March 4, inclusive.

The first session of the section convened on Tuesday, March 1, at 11 a. m. The postgraduate course for graduate and student nurses in psychiatric nursing was conducted by Dr. Margaret H. Smyth. Harry Lutgens, Director of the State Department of Institutions, was the discussant.

New legislation affecting institutions in this section were discussed by Dr. Leo W. Farrell, and Miss Mary Cronen gave a progress report on the study of hours of labor and wages of hospital employees of county hospitals.

On Wednesday, March 2, at the same hour, the second session opened with a discussion on the admission policies of state and county hospitals by A. M. Will. This was followed by a talk on "The Outlook of the Counties for the Disposition of Institutional Cases," by Dr. E. S. Loiseaux. "Alcoholic Colonies" was discussed by Dr. J. C. Geiger, and "Epileptic Colonies" by Dr. Thomas F. Joyce. Social security for county hospital employees was discussed by Dr. H. M. Ginsburg.

The cancer clinics were set for Thursday, March 3, with Dr. William B. Dorr, Superintendent of the Riverside County Hospital, Arlington, presiding. Talks were given on "Cancer Clinics," by Dr. Charles A. Dukes, Chairman of the Cancer Commission, California Medical Association; "Women's Place in Cancer Control," by Dr. J. M. Flude, western representative of the American Society for the Control of Cancer; "Cancer Control Today," by Dr. Alson Kilgore. A feature of this meeting was an address by Dr. Malcolm T. MacEachern, director of hospital activities for the American College of Surgeons, who spoke on the topic, "The Work of the American College of Surgeons."

*County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date, and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Krueger Is Given Grant by Medical Association.—Dr. Albert P. Krueger, Associate Professor of Bacteriology at the University of California, who recently announced that he had solved the mystery surrounding the identity of bacteriophage, has received a grant from the Committee on Scientific Research of the American Medical Association to aid him in continuing his work on the mysterious, bacteria-destroying protein.

Bacteriophage, one of the ranking enigmas of the medical world since its discovery by D'Herelle at the Pasteur Institute in 1917, thrives on a diet of bacteria. The name, "bacteriophage," given to the substance by D'Herelle when he found that it would destroy dysentery bacilli in the laboratory, means "bacteria-eater." Nevertheless, it has never been possible to use it as a cure for bacterial disease in human beings; this, despite the fact that in announcing his discovery D'Herelle predicted that bacteriophage would end all bacterial disease.

For many years bacteriophage was believed by most scientists, including D'Herelle, to be a mass of tiny parasites. However, Doctor Krueger, in experiments carried on at the University of California, proved conclusively that the mysterious bacteria-eater is really a solid, colorless germ-killing protein which thrives on a substance secreted by the bacteria. This evidence has now been accepted as definite proof by American scientists.

It is hoped that Krueger's discoveries concerning the identity and activity of bacteriophage, which is a simple virus, may lead to further discoveries concerning the more complex viruses which are believed to cause such diseases as infantile paralysis and encephalitis.

College of Medical Evangelists: Clinical Congress.—The Sixth Annual Clinical Congress of the College of Medical Evangelists, presented under the auspices of the Alumni Association, was held on Sunday, March 20, in Paulson Hall of the White Memorial Clinic, Los Angeles.

The program follows:

CLINICAL CONGRESS

Gadget, Hobby, and Art Display—Library
Pathological Museum—Basement Clinical Laboratory

Symposium at Paulson Hall

9:30 to 12:30

9:30—"Pre- and Postoperative Care of Heart, Nephritic, Hypertension and Diabetic Cases," Philip Corr, M.D.

9:50—"Prevention of Postoperative Pulmonary Complications," D. D. Comstock, M.D.

10:05—"The Choice of the Anesthesia," Charles F. McCuskey, M.D.

10:25—"The Treatment of Acute Cholecystitis," William H. Olds, M.D.

10:45—"Indications for the Use of Papaverin Hydrochlorid in Arterial Emboli," Donald C. Collins, M.D.

11:05—"Pre- and Postoperative Care of Thyroid Patients," Carl J. Baumgartner, M.D.

11:20—"Pre- and Postoperative Care of Fractures; Certain Helpful Suggestions in Prevention of Complications," H. Waldo Spiers, M.D.

11:35—"Complications that may develop in the Ear, Nose, and Throat following Surgery in that special field, and also those that may follow General Surgery," Benton N. Colver, M.D.

11:50—"Common Urological Complications following General Surgery; How to avoid them," Roger W. Barnes, M.D.

12:05—"Pre- and Postoperative Care in Anorectal Surgery," Malcolm R. Hill, M.D.

12:20—Welcome, Percy T. Magan, M.D.

12:30 to 1:30, Dinner

1:30 to 2:00, Medical Cadet Review—Tennis Courts

Clinical Demonstrations and Scientific Exhibits at the Dispensary

Continuously 2:00 to 4:30 p. m.

Cardiology

Roy Manning Clarke, M.D., and Donald E. Griggs, M.D., "Demonstration of Characteristic Lesions by Patients and Electrocardiographic Tracings."

Metabolic Diseases

Belle Wood-Comstock, M.D., "Demonstration by Patients and Charts of Weight Control."

Pediatrics

Albert L. Hill, M.D., "Differential Diagnosis of Mongolism, Cretinism, Achondroplastic Dwarf, and the Pituitary Dwarf," demonstrated with patients.

Neurological Surgery

Dorrell G. Dickerson, M.D., "Head Injuries, Brain Tumors, Spinal Cord Tumors," demonstrated by slides.

Diseases of the Chest

Marvin S. Harris, M.D.—"Bronchiectasis in Childhood," illustrated by x-rays.

Dermatology

Samuel Ayres, Jr., M.D., and Nelson P. Anderson, M.D., "Atypical Manifestations of Scabies," charts and photographs.

Paul D. Foster, M.D., "Allergic dermatoses," clinical and photographic demonstrations.

Allergy

Two-reel film, courtesy Mead Johnson Company, presented by Erving L. Rogers, M.D.

Roentgenology

Walter L. Stilson, M.D., "Typical Roentgenograms of Common Pathological Conditions."

Physical Therapy

Fred B. Moor, M.D., "Demonstration of Fever Therapy."

Orthopedic Surgery

Ernst Freund, M.D., "Surgical Treatment of Arthritis," patients showing end results.

David Kling, M.D., "The Practical Value of the Study of Synovial Membrane and the Synovial Fluid in Arthritis," illustrated by charts and slides.

Adolf Natzler, M.D., "Skeletons prepared after the Method of Virchow of Clubfeet, Flat Feet, Bunions, Hammer Toes, Plastic Amputations" (Stokes-Gritti, Pirigoff).

G. Mosser Taylor, M.D., "Manipulative Surgery," illustrated by motion pictures, charts, drawings, and demonstrations.

Ophthalmology

William A. Boyce, M.D., and Sidney Brownsberger, M.D., "Demonstration of Interesting Eye Cases."

Otolaryngology

H. James Hara, M.D., "Specimens of Foreign Bodies removed from Ear, Nose, and Lower Food and Air Passages."

Walter L. Stilson, M.D., "X-ray Films of Pathological Mastoids, Sinuses and Lungs."

Leland R. House, M.D., "Dissection of Head and Neck."

Merrill O. Dart, M.D., "Dissection of Temporal Bone."

Milo C. Schroeder, M.D., "Surgical Approach to Petrous Apex," demonstration by patients. Motion pictures: Instrumentation, Tonsillectomy, Mastoidectomy, Laryngo-Fissure, Tracheotomy, Peroral Endoscopy, Plastic on Rhinophynia, Surgery of Paranasal Sinuses.

Urology

Roger W. Barnes, M.D., Prostatic models, motion pictures, choice of: (1) Examination of Lower Urinary Tract (in sound and color); (2) Transurethral Prostatic Resection; (3) Suprapubic Enucleation of the Prostate; (4) Transperitoneal Nephrectomy; (5) Catheterization of the Urethra.

Proctology

Malcolm R. Hill, M.D., Roger W. Barnes, M.D., and Cyril B. Courville, M.D., "Vesical Dysfunction following Abdominal Perineal Resection for Carcinoma of the Rectum."

Malcolm R. Hill, M.D., motion pictures, choice of: (1) Examination and Diagnosis of the Anus, Rectum, and Sigmoid Colon (in sound); (2) One Stage Combined Abdominal Perineal Resection for Carcinoma of the Rectum (in color); (3) Rehabilitation of the Rectal Cancer Case (in color); (4) Vesical Dysfunction following Abdominal Perineal Resection for Carcinoma of the Rectum (lantern slides).

Obstetrics and Gynecology

Ralph Thompson, M.D., "Demonstration of Home Deliveries," motion picture; "Demonstration of Interesting Obstetrical and Gynecological Cases."

Medical Education

Walter E. Macpherson, M.D., Charts, Maps, and Statistical Information concerning Activities of the Medical School.

Visual Education

Herbert Childs, D.D.S., and Olov Blomquist, M.D.: (1) An Inexpensive Method of Producing Lantern Slides; (2) demonstration of these slides by projection on the screen.

Paulson Hall

4:30 to 6:30

4:30—"Diarrhea and Salt Metabolism," John E. Gregory, M.D.

4:50—"Surgical Treatment of Hypertension," Dorrell G. Dickerson, M.D.

5:10—Progress of the Association, Dee M. Rees, M.D., President.

5:20—Clinical Pathological Conference, Newton Evans, M.D.

6:10—News reels.

Registration fee $1.50. No registration fee will be required of students, interns or residents.

Brighter Children Tend to Grow Taller and Heavier. There is a slight tendency for brighter children to be taller and heavier than the average, according to intensive studies made over a period of several years by the Institute of Child Welfare of the University of California. The study was made on approximately two hundred Berkeley children by Dr. Marjorie Honzik, research associate, and Dr. Harold Ellis Jones, director of the Institute, and their findings included in the *Journal of Experimental Education.*

It was also noted that children who made above-average gains in mental growth, tended to show a more rapid course of physical development. There were many exceptions to this rule, however; enough to indicate that normal or above normal physical growth is not a necessary factor in normal mental growth. The children were tested and measured at regular intervals from twenty-one months to seven years of age. In one exceptional case a boy tested at two years was very markedly retarded in height, weight, and mental abilities. During the following five years he remained one of the smallest and lightest children in the group, but his mental gains were so rapid that by seven years he had achieved the mentality of a ten-year-old.

In concluding that physical and mental growth are associated, the investigators do not imply that an increase in rate of physical growth is a direct cause of an increase in rate of mental growth. It is more likely that they are both the result of underlying factors affecting in a number of ways the development of the individual.

University Enrollments in the United States: Fall Semester, 1937-1938.—The following figures have been compiled from the recent article in *School and Society,* by President Raymond Walters of the University of Cincinnati. The original statistics did not separate the University of California at Los Angeles from the total figures for the University of California.

California (Berkeley alone 14,694)	22,955
Columbia	14,683
Minnesota	13,691
Illinois	13,647
New York University	13,377
Ohio State	12,744

University of California: The Seventieth Charter Anniversary.—On March 21, 1868, the Legislature of the State of California gave its approval to a bill introduced by the Honorable John W. Dwinelle under the title, "An Act to Create and Organize the University of California." On March 23, 1868, this bill was made effective by the signature of Governor Henry H. Haight.

By this action the State of California laid down three fundamental principles which undoubtedly have had a favorable influence on its subsequent development. These principles were: that higher education should be available without tuition charge to all young men and women whose inherent endowments promised strength to the community; that whatever else might later be done to satisfy educational needs there should be a single state university as the culminating unit; and that the regents of the university should be left free to develop the institution in harmony with the needs of the people.

Under these principles, during the course of seventy years, the University of California has steadily broadened its service, has met the unique needs of the State by establishing additional campuses and research stations, and has attained a place of eminence among American universities. For these reasons the various divisions of the University, at Berkeley, Los Angeles, San Francisco, Davis, Mount Hamilton, Riverside, and La Jolla, joined in appropriate observance of the anniversary of the granting of the University Charter during Charter Week, March 19 to 26.

American Association for the Study of Goiter.—The American Association for the Study of Goiter, pursuant to its accepted invitation and to correspondence with the honorary presidents and attending members of the First and Second International Goiter Conferences, announces that the Third International Goiter Conference is to convene in the city of Washington, District of Columbia, September 12 to 14, 1938.

The subjects proposed for discussion are as indicated in the outlined tentative program.

Physicians and others in the United States and in other countries desirous of participating in the program are requested to submit titles at their earliest convenience. Since the time which it is possible to allocate on the program is obviously limited, it will be necessary for the Program Committee to exercise its best judgment in the selection of speakers and to insist, without exception, that the speakers conform to the time allocated.

Manuscripts of addresses, papers, and discussions delivered or read at the meetings are to be published *in extenso* in the form of transactions.

The official language of the Conference shall be English. Interpreters will be furnished for papers read in other languages.

For further information concerning the Conference, communicate with the officers of the American Association for the Study of Goiter or the chairman of the Program Committee.

OUTLINE OF TENTATIVE PROGRAM

First Day—Subject: Endemic Goiter, Cretinism, and Myxedema.

Etiology	Iodin
Pathology	Prophylaxis
Types	Thyroiditis
Geographic Distribution	Malignant Goiter

Second Day—Subject: The Thyroid in Relation to Metabolism, Nutrition and Endocrine Glands. Physiological and Pathological Interrelationship and Clinical Application.

Oxidation	Parathyroid
Sugar Metabolism	Pituitary
Water Balance	Adrenals

Third Day—Subject: Hyperthyroidism.

Basal Metabolism	Recurrences
Iodin	Goiter Heart
Complications	

Types: Diffuse toxic goiter; nodular toxic goiter.
Treatment: Nonsurgical; surgical.

The subdivisions under the subjects above are for illustrative purposes only and are not to be considered as all inclusive or exclusive.

California Academy of Sciences.—At an open meeting at the San Francisco Public Library on March 2, the California Academy of Sciences celebrated the centennary of the development of the cell theory by Schleiden and Schwann. Dr. Frank T. MacFarland, President of the Academy, surveyed the development of ideas relating to the cell theory and analyzed the significance of the contributions made by Matthias Schleiden (1804-1881) and Theodor Schwann (1810-1882).

Transatlantic Radio Conference on Rheumatic Heart Disease, May 2.—Leading British and American physicians, 6,000 miles apart, will confer via the radio on the greatest menace to child health, rheumatic heart disease. This conference, the first international broadcast on any health problem, will be heard over the National Broadcasting Company, WEAF and the Red Network, on Monday evening, May 2, at 7:30 o'clock, Eastern daylight saving time. Arranged by the American Heart Association, New York City, the conference-broadcast will observe National Child Health Day.

Lord Thomas Jeeves Horder, physician-in-ordinary to the King of England, will open the conference, speaking from London. Dr. Homer F. Swift of the Rockefeller Institute, New York City, and Dr. T. Duckett Jones of the House of the Good Samaritan, Boston, will then speak from Atlantic City, where they will be attending the convention of the American Society for Clinical Investigation. Dr. William J. Kerr, President of the American Heart Association, will take up the discussion from San Francisco.

Rheumatic heart disease is now recognized as the deadliest and most crippling affliction of children of school age. Its annual mortality rate is seven times that of dread infantile paralysis during an epidemic, while every year it invisibly cripples thousands more. Close to a million persons in the United States have hearts damaged by rheumatic fever.

Lord Horder's aerial report will dwell upon public health aspects of the disease, particularly in England. Doctor Kerr, from the West Coast, will tell of the work of the American Heart Association in this field. The radio audience will then be carried back to Atlantic City to hear Doctor Swifth describe the medical investigations being carried on to isolate the cause of the disease. Doctor Jones will follow with a discussion of the treatment of children with crippled hearts, emphasizing the need for long-continued sanatorial care.

This international conference-broadcast was conceived by a committee of Irvington House, sanatorium for the care of children with heart disease at Irvington-on-Hudson, New York, in an effort to stimulate greater public interest and action in this major child-health problem. It will acquaint doctors, and particularly parents and teachers, with the challenge of rheumatic heart disease, more dangerous because of the lack of knowledge of its nature and the difficulty in recognizing its early symptoms. Although no effective cure has yet been found, it is hoped that this broadcast will be a first step in the earlier recognition of the disease which, if unchecked, finally incapacitates the heart. A widespread realization of its prevalence should encourage increased support of scientific studies along these lines.

The present difficulty in arousing the attention of the public to rheumatic heart disease lies partly in its undramatic nature. Compared with the explosives and rapid pace of most childhood diseases, it plays the triumphant but unspectacular rôle of the tortoise in the fable of the tortoise and the hare. It is not easy, without specific education, to recognize the first slow manifestations of rheumatic heart disease as the onset of a systemic disease which may forever cripple the heart of a child.

On the Radio Committee of the American Heart Association responsible for arranging this conference-broadcast are: Doctors Arthur C. DeGraff (chairman), New York City; James G. Carr, Chicago; T. Duckett Jones, Boston; William J. Kerr, San Francisco; H. M. Marvin, New Haven; Edwin P. Maynard, Jr., Brooklyn; William D. Stroud, Philadelphia; also Miss Gertrude P. Wood of the American Heart Association and Mrs. Edwin H. Koehler of Irvington House.

American Board of Obstetrics and Gynecology: Examinations.—The oral, clinical, and pathological examinations for Group A and Group B applicants will be held in San Francisco on Monday and Tuesday, June 13 and 14, 1938.

An informal dinner for the diplomates of this Board, their wives and others interested in the work of the Board, will be held at the Palace Hotel on Wednesday evening, June 15, at seven o'clock. Dr. William D. Cutter, Secretary of the Council on Medical Education and Hospitals of the American Medical Association, will address the group, and the successful candidates of the preceding two days' examinations will be introduced in person. Tickets, at $2.25 each, may be obtained in advance from Dr. Joseph L. Baer, 104 South Michigan Avenue, Chicago, Illinois, or at the door. Reservations should be made in advance if possible.

Application for admission to the June, 1938, Group A examinations must be on file in the secretary's office before April 1, 1938.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

American Urological Association: Western Branch. The Western Branch, Society of the American Urological Association meets at Los Angeles on May 12 to 14, 1938.

On Thursday evening, May 12, at the headquarters of the Los Angeles County Medical Association, 1925 Wilshire Boulevard, Dr. Thomas Addis of Stanford will deliver a lecture on the physiology of the kidney, describing the enormous advances accomplished by the leading research groups during the last decade. He will deal with the subject from a practical clinical standpoint, and this lecture should be of greatest practical value and interest to every practitioner, no matter what his line of practice. He will be followed by Doctor Drury, Professor of Physiology at the University of Southern California, on a somewhat different phase of the same problem.

On Friday evening, May 13, Dr. Fred C. Koch, Professor of Biochemistry at the University of Chicago and President of the "Association for the Study of Internal Secretions," and Professor James B. Hamilton of Yale will lecture on the male sex hormones and male sex hormone therapy—an up-to-the-minute symposium.

Members of the California Medical Association are cordially invited to attend not only the lectures above set forth, but any or all daytime sessions held on Thursday and on Friday at the Los Angeles County Medical headquarters.

Los Angeles County Quarantined for Rabies.—An investigation having been made as required in Chapter 369, Statutes of 1913, of the State of California, and rabies having been found to exist among dogs living within certain portions of the county of Los Angeles, the California State Board of Public Health, on February 17, 1938, in accordance with the provisions of Chapter 369, Statutes of 1913, declared a quarantine against all dogs and cats within all but the northern portion of the county of Los Angeles, exclusive of Los Angeles, Pasadena, Long Beach, Santa Catalina Island, Avalon, Beverly Hills, Vernon, South Pasadena, and San Fernando.

Quarantine under this Act means the strict confinement upon the private premises of the owners under restraint by leash or closed cage or paddock, of all dogs and cats within the above described area.

It shall be the duty of all peace officers, all deputies of the county health officer, as well as the county health officer, to enforce the provisions of this order within the above quarantined area.

The county health officer, or other properly constituted officials, may make inspection or examination and enter upon all private premises for the enforcement of this quarantine.

Any owner, or other person in possession of any animal being held or maintained in violation of this quarantine, shall be subject to arrest on the charge of committing a misdemeanor.

Tuberculosis Christmas Seal: 1937 Sale.—Comparative returns for the first forty-five days of 1936 and 1937, together with the total Seal sale for 1936, for the local Tuberculosis Associations from whom reports have been received both years are listed below:

	1936 Gross	1936 45 Days	1937 45 Days

University of California Medical School Offers a Short Course in Diseases of the Digestive Tract, April 13 to 16, 1938.—The course is designed to meet the needs of physicians engaged in general practice. Through clinical presentations, detailed outlines of treatment and demonstrations of actual diagnosis and therapeutic procedures, every effort will be made to make the course applicable to the problems encountered in practice. At the end of each lecture, there will be an opportunity to ask questions. The meetings will be held in Toland Hall, west end, first floor, University Hospital.

On Thursday and Friday mornings from 8 to 9 and on Saturday from 9 to 12, there will be demonstrations of operative treatment of the various organs of digestion. These will be held in the operating rooms, second floor, University Hospital.

Luncheon will be served on Wednesday, Thursday, and Friday, from 12 to 1, and dinner on Wednesday and Friday, from 5:30 to 6:30 in the Faculty Club, basement floor, University Hospital. During the luncheons, trays prepared by Miss Ann T. Lamb, Chief Dietitian, University Hospital, and the members of her staff, will be shown. These will illustrate the various diets mentioned in the lectures.

On Friday evening, following dinner, a round-table meeting will be held in Toland Hall, during which, through the method of question and answer and free discussion, some clinical problems will be presented. A box will be provided in Toland Hall so that those having questions for this meeting may leave them.

The tuition fee for the course will be $20. This will include the meals, mimeographed diet lists, and a syllabus. Registration will be held in the students' lobby, first floor, University Hospital (opposite Toland Hall), from 8 to 9:30 a. m. on Wednesday, April 13. Although there will be ample accommodations for all who wish to take the course, it is desirable to notify the Dean's Office, University of California Medical School, Medical Center, San Francisco, of your intention to register. This will facilitate arrangements.

California State Nurses' Association, District Five.—The Nursing Bureau Committee of this Association announces the following approved schedule of fees effective April 1, 1938:

General Nursing

In hospitals: $6 for eight hours. 75 cents for each additional hour.

In homes: $6 for eight hours. $8 for twelve hours.

It is understood that a nurse employed on a schedule in excess of eight hours will receive her meals, and that actual nursing service over a 24-hour period will not exceed twelve hours.

Extra Charges

One dollar additional will be charged for the care of the baby in obstetrical cases, and $2 for each additional patient in the hospital and at home. Maximum fee not to exceed $10 for eight hours.

Alcoholics

Eight dollars for eight hours. One dollar for each additional hour. Maximum fee not to exceed $12.

Note: Transportation to out-of-town cases, and cab fares for calls after 11 p. m. are the responsibility of the person calling the nurse. When order for a nurse is canceled after arrival on a case, the nurse is entitled to one-half day's fee.

Hourly Nursing

One dollar and twenty-five cents per hour for the first hour or fraction thereof. Fifty cents for each succeeding one-half hour, not to exceed three hours. Beyond a radius of five miles from the Los Angeles City Hall, mileage at five cents per mile will be charged.

Early Tests Tell Little of Later Intelligence.—Results of intelligence tests taken during the first three years of a child's life offer little indication of what his intelligence may be as an adult, according to Dr. Nancy Bayley Reid, research assistant at the Institute of Child Welfare of the University of California.

Her statement is based on a study carried out with thirty girls and thirty-one boys born in hospitals at Berkeley, first observations being taken within three days after birth. This study brought Doctor Reid one of the five awards of the American Educational Research Association for the most important contributions to educational research in the United States in the past three years.

On the basis of the results of her study, Doctor Reid believes, "the behavior growth of ten early months of infant development has little predictive relation to the later development of intelligence." As a general factor, she believes, intelligence cannot be measured until nerve and muscular coördinations are sufficiently mature to make possible those reactions which are characteristic of intelligence. Even then it may be possible to predict intelligence only within a given period of development which would still limit the value of mental tests on infants as an indication of their probable intelligence as adults.

Doctor Reid found one good argument for the theory of heredity when her tests showed that the most intelligent parents had the most intelligent children at the age of three years. Strangely enough, however, these children when they were less than seven months old showed lower intelligence than the sons and daughters of less intelligent parents. Doctor Reid believes this may be due to their more complex mentalities, which needed a longer initial period of development before they reached an efficient stage. Thus, the intelligence of the child's parents would seem to be a better indicator of future intelligence than his own early intelligence ratings.

Full-Time Health Units in California.*—*Alameda*—All unincorporated area and all incorporated cities except Alameda, Berkeley, Oakland, Albany, Hayward, Livermore, Emeryville, and Pleasanton; 52,797 out of 474,883 population.

Contra Costa—All unincorporated territory and all incorporated towns except Antioch, El Cerrito, Pittsburg, and Richmond; 41,472 out of 78,608 population.

San Luis Obispo—All territory within the county; 29,613 population.

San Mateo—All unincorporated territory and all incorporated cities except Burlingame, Daly City, San Bruno, South San Francisco, Belmont, San Carlos, San Mateo, Menlo Park, Redwood City, and Atherton; 17,487 out of 77,405 population.

Santa Barbara—All unincorporated territory and all incorporated cities except Santa Barbara; 31,554 out of 65,167 population.

Santa Cruz—All unincorporated territory within the county; 7,032 out of 37,433 population.

Stanislaus—All unincorporated territory and all incorporated cities except Newman, Patterson, and Turlock; 50,191 out of 56,641 population.

Ventura—All territory within the county; 54,976 population.

Yolo—All territory within the county; 23,644 population.

Cities—Berkeley, Oakland, Palo Alto, Pasadena, Long Beach, Los Angeles, Sacramento, San Francisco, San Jose, Santa Barbara, and Fresno; 2,707,911 population.

Total population served by full-time health units; 4,527,554 out of 5,677,250, or 79.7 per cent.

Press Clippings.—Some news items from the lay press follow:

Ten Million Yearly California Alien Relief

Sacramento, March 15.—(INS)—Aliens in California are receiving nearly ten million dollars yearly in direct relief, medical care and for the cost of confinement in institutions.

This was the claim made today in a legislative memorial that was en route to Congress and President Roosevelt seeking federal assistance in the continually growing problem.

Data gathered by Assemblyman James D. Garland of Woodlake presented to the Legislature showed 24.3 per cent of the resident population of state hospitals was made up of those who were not citizens of this country and that $1,044,267, or 18 per cent, was spent for their care during the past year.

It was also shown in Garland's report that there were 1,252 admitted aliens in San Quentin and Folsom prisons. Garland said there were probably more aliens, but they would not admit they were citizens of other countries.

Los Angeles County, Garland declared, has 7,500 Mexican aliens on various forms of public relief and which cost citizens $4,500,000 yearly. Orange County had 8,000.

Officials of several counties, including those of San Bernardino, Siskiyou, Marin and Mono, have urged federal legislation to meet the alien problem.—Los Angeles *Evening Herald-Express,* March 15, 1938.

Menace to Hospitals Described

Trends endangering the existence of private hospitals yesterday were revealed to the joint convention of the Association of Western Hospitals and the Western Conference of the Catholic Hospital Association.

Dr. Junius B. Harris, addressing the general assembly in the Fairmont Hotel, pointed to county hospitals as a danger factor. Said he:

"The greatest menace to private hospitals in California is the trend towards opening county hospitals to all patients regardless of their ability to pay. This is the avenue through which state medicine will come if it comes."

He also viewed with alarm the trend towards allowing those without medical licenses to practice in certain county hospitals.

Earlier, the convention had discussed its most serious research problem: Cancer. Dr. Alson R. Kilgore pointed out that, treated in early stages, some types of cancer are being permanently cured in 80 per cent of all cases.

Dr. Z. E. Bolin added that the family doctor was the key man in early treatment.

"Therefore," he recommended, "it is advisable for all hospitals who find it possible to form cancer clinics which the family doctor may attend."—San Francisco *Examiner,* March 4, 1938.

New Hospital Charges

New charges against the Los Angeles County General Hospital and its administration were contained today in a second editorial by Dr. George H. Kress, president of the County Medical Association, appearing in the current issue of CALIFORNIA AND WESTERN MEDICINE, official organ of the State Medical Association, of which Doctor Kress is editor.

In his latest editorial, Doctor Kress renews previously aired allegations that payment of bills is pressed against indigent patients and that charges in the General Hospital are higher than at outside hospitals. Doctor Kress asserts that "hospital authorities, through the collection bureau of the Charities Department, are using methods so seemingly harsh that the indigent poor and their friends, about 500,000 persons, are driven to become in many instances more or less antigovernmental and bolshevistic."

Doctor Kress attached to his latest editorial numerous letters from other physicians and former General Hospital patients to support his claims, and quotes at length the results of an investigation already undertaken by order of the county supervisors into his originally printed charges.—Los Angeles *Evening Herald-Express,* March 9, 1938.

New Hospital Plan Adopted

State Permit Paves Way for Group Care Through Insurance

A group of twenty-seven leading hospitals of Southern California will inaugurate group hospitalization on March 15 as a result of the granting late yesterday by the State Insurance Commission of the first permit to be issued under Assembly Bill 1132, which makes it possible for individuals and families to pay their hospital bills like insurance, at a rate of a few cents a day.

The permit was presented last night at the closing meeting of the Western Hospital Association, in San Francisco, to Ritz E. Heerman, superintendent of the California Hospital and prime mover in the drive to obtain such legislation for California.

A nonprofit organization known as the Associated Hospital Service of Southern California has been formed among leading hospitals of the Southland, according to Dr. L. B. Rogers, exeeutive director of the group, which has opened offices in the Chamber of Commerce Building.

The group is headed by Mr. Heerman as president; Dr. William H. Kiger, vice-president; Leonard K. Brown, secretary; Dr. Edw. M. Pallette, treasurer, and Rt. Rev. Msgr. T. J. O'Dwyer, Dr. Glen E. Myers, Dr. Philip J. Edson, Dr. J. M. Burlew, Roland Maxwell, Anna K. Volger and G. Henniger, R.N., as directors.

Hospitals in the group are Alhambra, California, Cedars of Lebanon, Centinela, Collis P. and Howard Huntington Memorial, Foster Memorial, Good Samaritan, Jared Sidney Torrance Memorial, Las Campanas, Loma Linda, Long Beach Community, Mercy, Methodist, Mission, Physicians and Surgeons, Presbyterian-Olmsted Memorial (Hollywood), Riverside Community, San Pedro General, Santa Barbara Cottage, Santa Fe, Santa Monica, Scripps Memorial, Seaside Hospital, St. John's, St. Joseph's, St. Luke's and White Memorial.

Budgeting Planned

Group budgeting plans for hospitalization have been developed in fifty communities in the United States and have a total membership of over one million subscribers, according to President Heerman of the new California group. All these plans have been carefully studied and the enabling legislation for California drawn with the utmost public protection in mind.

No hospital is admitted to the group which does not hold a certificate from the California Board of Public Health, and groups formed under this law must be nonprofit and must have a permit from the Insurance Commissioner.

Designed as a service to persons of moderate means, the plan permits enrollment of employed groups of five or more at rates ranging from 3 cents a day for individuals to 7 cents a day for an entire family, regardless of size.

No physical examination is required, and service will include all items usually furnished in a hospital with the exception of fees of the medical practitioner. The subscriber will have free selection of physician and hospital, but he must pay for the physician. The plan covers all illnesses or accidents except those covered by compensation laws or diseases which are quarantinable or subject to isolation by the Board of Health.—Los Angeles *Times*.

Group Hospital Move Praised

Head of Association Says 1,500,000 Get Care at Low Cost

"Group hospitalization is spreading over the country and will be a bulwark against state medicine," Robert E. Neff, president of the American Hospital Association, said yesterday at the Biltmore.

Nominal Fees

By the plan, already established in seventy cities, the hospitals join in offering services for nominal fees paid like insurance. New York has a 3-cents-a-day plan that has worked out well, Neff says. Altogether in the country there are 1,500,000 persons protected by the group hospitalization.

"It is a boon to the wage-earning class," Neff says, "and by offering it protection at low cost removes one of the chief arguments for government medicine."

Plans Session

Neff is administrator of the State University of Iowa Hospitals, with headquarters at Iowa City. He comes from Dallas, where he made preliminary arrangements for the convention of the American Hospital Association to be held there in September. He is on his way to San Francisco to attend the Association of Western Hospitals convention there next week.—Los Angeles *Times*.

White House Given Measure to Curb Injurious Advertisements

Washington, March 14.—(AP)—Legislation increasing powers of the Federal Trade Commission over advertising of food, drugs and cosmetics won approval of the Senate today and went to the White House.

Senator Wheeler, Democrat, of Montana, said "this is one of the greatest steps toward the elimination of unfair practices that has ever been taken by Congress."

The Montanan said that previously the federal agency could act only when firms injured competitors, whereas the new bill covers injury to the public.

Senator Copeland, Democrat, of New York, criticized the measure as not broad enough. Consumers will suffer, Copeland said, because the bill stresses four articles—food, drugs, cosmetics and devices—instead of any commodity.

Wheeler insisted Copeland was misinformed. Any person who is injured by a product can demand action by the commission or the agency can act upon its own initiative, he said.

The commission can obtain an injunction to halt distribution of any injurious product, he added. Violations could mean penalties up to $5,000.—Los Angeles *Times*, March 15, 1938.

* * *

New York Passes Social Disease Test Law

Albany, March 9.—(INS)—By overwhelming vote, the New York State Assembly today passed a bill requiring that expectant mothers undergo medical tests for social disease. The vote was 116 to 4.—Los Angeles *Examiner*, March 10, 1938.

* * *

County-Wide Control of Tuberculosis Recommended

A survey of the tuberculosis control program in Los Angeles County, prepared by Dr. Robert E. Plunkett, general superintendent of tuberculosis hospitals of the New York State Department of Health, for the Department of Budget and Research of Los Angeles County, was submitted by the director of the department to the County Board of Supervisors on December 8.

The report of the survey, which was conducted under the auspices of the U. S. Public Health Service and the State Department of Public Health, has recently been made public, and mimeographed copies distributed.

A summary of recommendations states:

"In this survey of the administrative tuberculosis control program in Los Angeles County, the health of the community and the financial interests of the citizens have been the determining factors in the following recommendations:

"1. Organization of a county-wide department of health under a commissioner of health.

"2. Appointment of a director or comptroller of tuberculosis in the County Health Department.

"3. Clinicians in charge of existing health centers to serve under the supervision of the director of tuberculosis in the administration of the local tuberculosis programs.

Additional Beds Needed

"4. Construction of two new tuberculosis hospitals of 500-bed capacity each.

"5. The superintendent of each tuberculosis hospital (new and old) to function under the general supervision of the director of tuberculosis.

"6. The Health Department to be responsible for the ultimate decision as to the eligibility for hospital care in all cases on the basis of the best health interests of the public and the individual, without regard to the patient's ability to pay.

"7. Quantitative clinic services to be provided on the basis of district mortality and morbidity. All tuberculosis clinics to be operated by the medical staffs of the hospitals in the respective hospital districts. Tuberculosis clinics to be regarded as educational centers to which local physicians should be encouraged to come for instruction in diagnostic methods.

"8. Organization of a unified field nursing program under the director of public health nursing in the department of health, coöperating with director of tuberculosis.

"9. The development of an adequate medical social program."—*News Letter*, California Tuberculosis Association.

Single Health Unit Urged for County

Organization of a county-wide public health department to include the Los Angeles metropolitan area yesterday was recommended to the county government by Dr. F. M. Pottenger, head of the county's tuberculosis advisory board. At present the Los Angeles City Health Department is separate and independent of the County Health Department.—Los Angeles *Times*, March 3, 1938.

* * *

Supervisors Order Survey for Revision of Charter

Studies with a view of revamping the charter of Los Angeles County, effective since June 2, 1913, were ordered by the Board of Supervisors on motion of Supervisor McDonough.

Under the resolution a committee comprised of the County Counsel, County Auditor and director of the county Bureau of Budget and Research will be formed to start the survey looking toward revisions in the charter that could be placed before the voters in the coming November election.

Ask Recommendations

Each county governmental department head is instructed to make a study of his department to formulate recommendations to be submitted to the committee by May 1. The committee itself will make its report to the Board of Supervisors not later than August 1.

The action of the county officials is coincident with those in the city of Los Angeles who are making a study of the city charter with a view of revamping that document.

Approved in 1913

The county charter was approved by the State Legislature on January 29, 1913, and became effective June 2 that same year.

A special committee is now making a study of county civil service regulations. The findings will be laid before the charter committee, Supervisor McDonough said.—Los Angeles *Times*.

Medical Care Plan Outlined

Group Insurance Praised in Address to Hospital Leaders

San Francisco, March 1.—(AP)—Group insurance, "which helps the patient to help himself," was pictured to several hundred western physicians and hospital directors today as "a great bulwark against government medicine," in an address by Robert E. Neff of Iowa City, Iowa, president of the American Hospital Association.

Neff told the Association of Western Hospitals and the Western Conference Catholic Hospital Association that "it should be remembered there is no such thing as free hospital care—somebody has to pay. And with the public becoming more and more insistent that all persons have hospital care, that demand must be met in some way."—Los Angeles *Times*.

Los Angeles County Has 47,281 Old-Age Pensioners; Total Growing

Old-age pensioners are increasing rapidly in Los Angeles County.

By next June there will be approximately 62,300 old-age pensioners, blind and child-aid cases, as compared with 54,799 in November, 1937, and 35,481 in July, 1936, according to a report filed with the Board of Supervisors today by Rex Thomson, county superintendent of charities.

During the current fiscal year approximately $21,000,000 will be spent in this county on such cases, according to Thomson. Of this amount $7,119,587, or 34.1 per cent, will come from county tax funds. This amount will include the administrative costs, and comes almost entirely from county funds.

A breakdown of the types of assistance given shows 29,580 old-age pension cases in July, 1936, as against 47,281 today. Needy blind cases totaled 2,634 in July, 1936, and 2,800 today. Dependent children cases increased from 3,267 in July, 1936, to 4,574 at the present time.

Allowances for old-age pension cases in July, 1936, totaled $621,015, against $1,193,391 in November, 1937. Blind aid allowances were $84,926 in July, 1936, and $125,114 last November. Child aid costs were $88,840 in July, 1936, and $143,698 in November last. The cost of these cases, all of which are mandatory on the county by state law, is borne by the county, state and federal governments. —Los Angeles *Evening Herald-Express.*

Old-Age Pensions Paid 100,000 Californians

Sacramento, Feb. 28.—(Exclusive)—More than 100,000 elderly persons in California received old-age pension payments in January, Mrs. Florence L. Turner, State Director of Social Welfare, announced today.

A total pension payment of $3,326,191 was made to 100,834 persons for an average of $32.99 per case, Mrs. Turner said.

In Los Angeles, 37,258 persons received the pension, with the amount expended being $1,241,557. The average per case was $33.32.—Los Angeles *Times.*

* * *

Doctor Gives Life in Jungle Search for Paul Redfern

Georgetown (British Guiana), Feb. 17.—(AP)—The Colonial Secretary's office today announced that Dr. Frederick J. Fox of Boston, member of the Waldeck Expedition, had died on Devil's Hole Island, deep in the jungle, where the expedition had been marooned.

Word of the death was brought out of the jungle by James De Souza, leader of a party which had gone to the aid of the expedition. He said Doctor Fox already had been buried when the relief party reached the island. His message did not give details of Doctor Fox's death.

De Souza, returning to Bartica, reported the expedition, released from the island on which it had been trapped by high water and defection of its native bearers, had continued farther into the interior.

The expedition, under Theodore J. Waldeck, American explorer, has been searching for Paul Redfern, long missing American aviator.—Los Angeles *Times.*

* * *

Insulin Aids 100 Undernourished

Boston, March 5.—(AP)—The New England *Journal of Medicine* today reported 100 thin men and women, suffering from malnutrition, showed striking improvement through the use of insulin, gaining immediately in weight and appetite.

Most of the 100 persons studied "noted an improved general and mental condition, an increase in strength and efficiency, and better intestinal functioning," the report said.—San Francisco *Examiner,* March 6, 1938.

* * *

Plan for Cure of Alcoholics

Suggests Fund Be Provided from Liquor Tax Revenues; Proposes Two Institutions

Plans which may be the basis of a workable project for the solution of a growing problem—what to do about habitual drunkards—were presented in detail here last week before the meeting of the Association of Western Hospitals.

Author of the plans is Dr. J. C. Geiger, director of public health. Fundamental principle involved is this—"costs of care and treatment for drunkards should come from liquor taxes."

Major Social Problem

"Chronic alcoholism has become a major social problem," Doctor Geiger said. "Its victims require medical care in most cases and should be sent to special work farms where such care may be provided.

"Hopeful patients should not be treated in the same institutions with psychopathic and degenerate drunkards. This last group," Doctor Geiger explained, "are only secondarily alcoholic. Their alcoholism is merely one of the symptoms of a deeper and more fundamental disorder and they not only fail to be cured, but actually hinder the cure of more promising patients."

Two Institutions

Careful selection of cases for treatment, ample time periods for its accomplishment should be allowed, he said. Two special institutions, one in northern, one in southern California, could readily be established.

He quoted state financial reports which show that, in 1937, excise taxes on beverages totaled $1,889,079; license fees, $5,699,354; distilled spirits excise stamp tax sales, $8,248,599; fines, $85,871, and the sales tax intake, "another tremendous sum."—San Francisco *Examiner,* March 6, 1938.

$30,000 for Cancer Relief

As the result of the grant of $30,000 by the National Advisory Cancer Council of Washington to the University of California, great progress will be made in the treatment of cancer by radium and radio-active substances, it is believed here.

The money will be spent entirely in the laboratory of Dr. E. O. Lawrence, professor of physics and head of the university's radiation laboratory.

The grant came as the result of the latest achievements of Doctor Lawrence's cyclotron in the development of synthetic radium and radioactive substances.

In this cyclotron various substances are bombarded with electrical rays until their atoms are broken down and they form new substances. One of the latest of these experiments was the formation of synthetic radium.

With the $30,000 grant, a new and much larger laboratory will be built and a much larger cyclotron, to be known as a "medical cyclotron," will be installed for the production of purely radioactive substances for medical use and specially for the treatment of cancer.

To date, the old cyclotron has produced more than 200 radioactive substances, such as radiosodium, radiophosphorous and radioiron.

The present limited laboratory has produced these substances equal in radioactivity to one gram of radium. These amounts have been found adequate for hospital experimental use and at present can be produced at a cost comparable with that of radium.

However, as the cyclotron is only in the early stages of its technical development, Doctor Lawrence is convinced that its efficiency can be improved and that it can be made to produce the equivalent of ten grams or more of radium.

Great Expansion Seen

This would permit the most extensive use of radium and open up vast fields of experimentation with it in various diseases. It was for this purpose that the $30,000 grant was made.

One of the most important features of the newly created radioactive substances by the cyclotron is that they are not toxic. They can be taken into the digestive tract or administered intravenously without harmful consequences.

These substances also permit a close observation of their action on the blood and the body of the patient by the "tagging" of atomic content through radioactive properties. —San Mateo *Times,* March 14, 1938.

Expansion of Health Units in San Francisco

Rossi Given Proposal for Widening Activities in San Francisco at Cost of $86,000 a Year

A major expansion of the Health Department's activities, which would cost approximately $86,000 per year, was proposed to Mayor Rossi yesterday by Dr. J. C. Geiger, health director.

Suggested was establishment of a bureau of tuberculosis, concentration of efforts to combat the social disease plague under one executive, with establishment of new clinics, and increase of the present $20,000 fund supplying free milk to indigent and undernourished children to $30,000.

Increase Sought

Doctor Geiger also pointed out that the department's bureau of sanitary engineering was only a "skeleton" organization, and that the personnel should be increased.

Transfer of the bureau of plumbing from the Department of Public Health to the Department of Public Works was suggested. All city inspection services should be coordinated under a technically qualified director, Doctor Geiger declared.

"There should be established two additional infant welfare stations in strategic positions in the city where subnormal living conditions are present," the health director informed the mayor.

Hospital Proposed

Establishment of a new unit of the Emergency Hospital, at a site to be selected, also was proposed, as well as reorganization of the Health Department's building arrangements.

The improvement program was formulated with aid of University of California public health professors.—San Francisco *Examiner*, March 2, 1938.

Rabies in California

During the past fifteen years, 1922 to 1937, 12,926 cases of rabies in animals have been reported to the California State Department of Public Health. Their distribution, by animals, is as follows:

Dogs	12,105	Mules	10
Cats	256	Foxes	2
Cows	319	Monkeys	2
Horses	30	Rat	1
Coyotes	25	Squirrel	1
Goats	43	Raccoons	2
Hogs	12	Rabbits	2
Sheep	92	Unknown	19
Skunks	5		
			12,926

The distribution of these 12,926 cases of rabies in animals, by counties, is as follows:

Alameda	125	Plumas	38
Amador	2	Riverside	108
Butte	1	Sacramento	83
Calaveras	3	San Benito	24
Contra Costa	37	San Bernardino	277
El Dorado	6	San Diego	643
Fresno	226	San Francisco	5
Humboldt	11	San Joaquin	253
Imperial	244	San Luis Obispo	10
Inyo	6	San Mateo	11
Kern	92	Santa Barbara	20
Kings	101	Santa Clara	40
Lake	1	Santa Cruz	20
Lassen	30	Shasta	7
Los Angeles	9,377	Siskiyou	14
Madera	84	Solano	2
Marin	76	Sonoma	12
Mariposa	1	Stanislaus	193
Merced	54	Tehama	1
Modoc	95	Tulare	150
Mono	1	Tuolumne	2
Monterey	124	Ventura	35
Napa	7	Yolo	14
Nevada	7	Yuba	5
Orange	234	California *	2
Placer	12		
			12,926

* Dog brought into California from Denver, Colorado. Raccoon brought to Imperial County from Mexicali.

NOTE.—Only those counties that have reported cases are listed.

Human Cases

Since 1899, when rabies first appeared in California, eighty-six human beings have died of this disease. Of these, thirty had received the Pasteur treatment for the prevention of rabies. It must be remembered that this is a fatal disease, and that no one who has once shown symptoms of rabies has ever recovered. It is 100 per cent fatal.

The Pasteur treatment, in order to be effective, depends upon several factors, such as prompt administration following bite of an infected animal and location of bite, those near the larger nerve centers being much more serious. Cauterization of the wound with fuming nitric acid, which is the only reliable cauterizing agent, is also of prime importance n preventing the development of rabies.

Of the thirty fatal cases in which the Pasteur treatment was given, thirteen had received no cautery. In nine cases wounds were cauterized with nitric acid, four with iodine, two with carbolic acid, one with argyrol and one with silver nitrate. The records show that in only nine out of thirty cases were wounds cauterized with nitric acid. Of the remaining fifty-six cases out of the total that have occurred since 1899, only five had received cauterization with nitric acid.

Since the location of the wound is of great importance in rabies, it is interesting to note that in these thirty decedents, sixteen had been bitten on the head and face, seven on the hands, one on the wrist and face, two on the arm or wrist, one on the legs, one on the foot and wrist and in two cases the location of the bite was not recorded.

In three cases treatment was started the same day that the patient was bitten and in ten cases treatment was started five or more days after having been bitten.

Regardless of the location of the wound, 76 per cent of these cases, for which the incubation period is known, had incubation periods of sixty days or less. In no case was the incubation period less than ten days. In only three cases did it extend over a period longer than six months.

While the Pasteur treatment is ineffective in a small proportion of cases, particularly those involving severe bites about the head, face and arms, it is generally effective, and under improved methods of administration far better results are obtained now than were possible when the method was in its infancy. In the Pasteur L'Institut, Paris, where more than 500 patients receive the treatment each year, a fatality seldom occurs. In those cases where the lacerations occur on the head and face the infection sometimes develops more rapidly than immunity can develop through the Pasteur treatment.—*Weekly Bulletin, California Department of Public Health*, March 5, 1938.

Dog Bite Victim Dying, Report of Health Officer

Bitten by a cocker spaniel dog a month ago, according to health authorities, Rufus Bradley, 141 North Grand Avenue, was reported dying at General Hospital today from rabies, according to Dr. George Parrish, city health officer.

Bradley was one of nine persons the dog reportedly attacked when he ran from his home in Glendale to downtown Los Angeles.

Seven of the nine reported to the Health Department for Pasteur treatments, Parrish said, and they are now recovering. Stephen Wilson, who failed to take the Pasteur treatments, died several days ago. Bradley also had failed to take Pasteur treatments.—Los Angeles *Herald-Express*, March 24, 1938.

LETTERS

Concerning the Los Angeles County Hospital.

AMERICAN COLLEGE OF SURGEONS

Chicago, March 16, 1938.

To the Editor:—I wanted to see you while in Los Angeles several days ago, but my time was taken up with two or three meetings which I had to attend and, therefore, did not have an opportunity to discuss with you the Los Angeles County Hospital situation. . . .

Since receiving the Los Angeles County Hospital material you sent to me, I have reviewed it very carefully, and I am convinced that you worked up an excellent case which will surely have effect in changing the unfortunate policy which the Board of Supervisors have adopted in connection with the County Hospital.

I hope the time is not too far distant when the plan and set-up followed in Alameda County will be adopted in Los Angeles County. There is no question whatsoever but that the Alameda County plan is the best one under which any county hospital can be run. . . .

The county hospitals certainly should be kept exclusively for indigent cases and not for patients who are able to pay their way. . . . It is highly unfair to the taxpayer and to the physician to open the county hospitals to all people, regardless of their financial status, and I am sure that you will get lots of support in the investigation of the situation which you are now endeavoring to expose. Your premises are exceedingly well taken.

Rest assured of my deep interest in this matter and desire to give you any personal support I can in the issues mentioned in your letter and the material which you so kindly sent me.

Very sincerely yours,

MALCOLM T. MACEACHERN, M.D.,
Associate Director.

Concerning rabies quarantine in Ventura County.

STATE OF CALIFORNIA
DEPARTMENT OF PUBLIC HEALTH

Modification of order issued December 8, 1937, declaring a quarantine against all dogs and cats within the boundaries of the county of Ventura.

To the Editor:—Having received from Charles R. Wylie, M.D., Health Officer of Ventura County, a request for the modification of the order issued December 8, 1937, declaring a quarantine against all dogs and cats within the boundaries of the county of Ventura, the California State Board of Public Health having made an investigation in accordance with the provisions of Section 2, Chapter 369, Statutes

of 1913, hereby modifies the above-mentioned quarantine order as follows:

Quarantine shall be defined as the confinement of all dogs and cats within the designated area upon the private premises of the owners under restraint by leash or closed cage or paddock, except that persons over the age of fifteen years shall be permitted to take their dogs and/or cats on the public streets and highways when such animals are controlled by suitable leash not over five feet in length, and when so controlled may also take them on the highway in automobiles; *except* that those dogs and cats, quarantined as rabies contacts and confined to their premises or such other place as may be designated by the health officer or his representative, shall not be permitted to leave the designated premises upon which they are confined.

March 2, 1938.

W. M. Dickie, M.D.,
Director of Public Health and Executive Secretary, State Board of Public Health.

Concerning Portland meeting of American Public Health Association: Western Branch.

To the Editor:—May we ask you to call the attention of your readers to the fact that the Western Branch, American Public Health Association, will hold its ninth annual meeting in Portland, Oregon, June 6, 7, and 8, 1938. The program will be devoted to discussion of public health matters of special interest to the West, and will present speakers of national and western prominence.

Inquiries should be addressed to Dr. William Levin, State Department of Health, 816 Oregon Building, Portland, or to the undersigned.

Sincerely yours,
W. P. Shepard, M.D.,
Secretary.

Concerning Child Health Day, Sunday, May 1, 1938.

U. S. Department of Labor
Children's Bureau
Washington

To the Editor:—Dr. W. W. Bauer, Director, Bureau of Health and Public Instruction of the American Medical Association, has suggested that we send to you the enclosed Suggestions for the Observance of May Day—Child Health Day, 1938—with the request that you give some notice to it in your state medical journal. . . .

Sincerely yours,
Katharine F. Lenroot,
Chief, Children's Bureau.

* * *

(copy)

May Day—Child Health Day, 1938
Sunday, May 1
Supplementary Observance, April 30 and May 2

Suggestions for Observance

Child Health Day activities are sponsored by the Children's Bureau at the request of the State and Provincial Health Authorities of North America in accordance with the Congressional Resolution of May 18, 1928, which authorized the President to proclaim May Day as Child Health Day.

Slogan.—Speed children on the road to health.

Objective.—Every community to make full use of its resources in order to insure to children safe birth, normal growth, and protection against disease and accident in their progress from infancy to maturity.

Leadership.—State May Day chairmen appointed by State health officers arrange for the coöperation of State and local public agencies and private organizations in planning May Day activities that will contribute to year-round child-health activities. State departments of education cooperate in planning school Child Health Day programs.

Program.—For community groups: (1) Review of local child-health activities; (2) planning for the extension and improvement of child-health programs; and (3) presentation of special child-health needs requiring the attention of parents and others in the community.

By children: Exhibits, demonstrations, programs, plays, games, and festivals, illustrating the health needs of children, healthful activities, and progress made during the year in their knowledge concerning the protection of their own health and of the health of the community.

For the general public: News stories, radio talks, speeches, posters, exhibits.

For information on State programs, write to State May Day Chairman, State Department of Health.

Committee of Revision
of the
Pharmacopoeia of the United States of America
1930–1940

Announcement by the U. S. P. Anti-Anemia Products Advisory Board Concerning Liver Preparations Conforming to U. S. P. Standards

To the Editor:—When liver and stomach preparations were admitted to the U. S. Pharmacopœia, Eleventh Edition, it was recognized that these products presented a different problem, from the viewpoint of standardization, than any question previously before the Pharmacopœia.

As no ordinary methods for standardization or testing were available, an Advisory Board, made up of specialists in the treatment of anemia, was appointed. This Board established methods for determining the value of anti-anemia products, and the basis for a U. S. P. "unit of potency." They also issued forms for reporting evidence of clinical value and announced regulations for indicating the potency of U. S. P. products and for the wording of the labels.

On the invitation of the Board, a large number of clinical reports were submitted by manufacturers in evidence of the value of their products, and the Anti-Anemia Board, after reviewing these records, herewith submit their conclusions. This first report lists the products which have been approved up to this time as complying with the U. S. P. specifications and the firms authorized to sell or distribute them.

As is probably generally known, only a relatively small group of manufacturers have provided the necessary hospital facilities for checking the clinical value of anti-anemia products as required by the Board, and several of these distribute their products through the medium of other pharmaceutical firms.

Having been supplied with adequate clinical evidence of the efficiency of a manufacturer's product and having accepted it as of U. S. P. grade with a specific dose, the Anti-Anemia Board, on request, have also authorized the distribution of some of these approved products by other firms when the firms have given assurance that their handling of the products will in no way alter its quality or potency. No doubt the Board will later report additional approved preparations and firms.

Any assistance which you can give in extending publicity to this report will be appreciated.

Forty-third Street and Woodland Avenue,
Philadelphia, Pa.

Respectfully,
E. Fullerton Cook.

Concerning rehabilitation of mental defectives.

To the Editor:—Dr. Walter E. Fernald, one of the greatest pioneers in the treatment of the mentally deficient, once said:

"There is no panacea for feeble-mindedness. There will always be mentally defective persons in the population of every state and country. All of our experience in dealing with the feeble-minded indicates that if we are adequately to manage the individual defective, we must recognize his condition while he is a child, protect him from evil influences, train and educate him according to his capacity, make him industrially efficient, teach him to acquire correct

habits of living, and, when he has reached adult life, continue to give him the friendly help and guidance he needs."

How New York State is providing for the rehabilitation of its mental defectives who are capable of material improvement, and for the humane custodial care for persons of such a low grade of development that they cannot be restored to community life, are discussed in a newly published report of the survey of the methods of care, treatment, and training of the feeble-minded at Letchworth Village, Thiells Post Office, Rockland County, New York, one of the state's largest institutions for the mentally deficient. Upon request, we will be glad to send you a copy of the report.

Sincerely, yours,
F. B. Kirkbride,
President.

Concerning Coöperation of Major Disaster Emergency Council in recent Los Angeles floods.

Major Disaster Emergency Council
2224 West Sixth Street (Westlake Park)
Los Angeles California

March 22, 1938.

To Medical and Sanitation Committee:
George Parrish, M.D.
Edward M. Pallette, M.D.
George H. Kress, M.D.

Dear Doctors:—You will find enclosed a facsimile of a letter from the Mayor. This letter carried his appreciation to all members of the Emergency Council. Therefore, I felt I should pass it on to you.

You will also find enclosed a copy of my report on the activities of the Emergency Council.

Respectfully,
Basil E. Rice,
Director of Coördination.

* * *

(copy)
Office of the Mayor
City Hall
Los Angeles, California

March 11, 1938.

Mr. Basil E. Rice
Director of Coördination
Major Disaster Emergency Council
2224 West Sixth Street
Los Angeles, California

Dear Mr. Rice:

I feel that you and your associates in the administration of the Major Disaster Emergency Council are deserving of the highest commendation for the effective manner in which you responded to your first alarm on March 2, 1938, when our city was threatened with catastrophe. The efficient work of the several committees in maintaining communications, rescuing victims of the flood, providing prompt relief to those who had suffered loss, and allaying the fears of our citizens generally by frequent assurance of reliable information, gave a clear demonstration of the worth and the potential strength of the organization.

We are grateful that we were spared a major disaster, and out of the unfortunate crisis we have gained a new confidence and assurance that our Major Disaster Emergency Council is prepared to meet any call, no matter how great it may be or when it may come.

With kindest regards,

Sincerely yours,
Frank L. Shaw, *Mayor.*

* * *

(copy of coördinator's report)

March 10, 1938.

The Major Disaster Emergency Council got a real workout on March 2, 3, and 4. Even though this was not considered a real major disaster, it did give us an opportunity to test our plans.

In making a report of the activities of this Council it must be remembered what the Major Disaster Emergency Council is. It is all the departments of the City Government. The American Red Cross, our public utilities, privately owned corporations, our contractors, supply houses, our hospitals, physicians and surgeons, etc. In fact, everyone in the community who is expected to act in time of disaster has brought themselves together and formed a Major Disaster Emergency Council; a place where they have been able to formulate plans and correlate their efforts. Therefore, it can be readily understood how impossible any single report could be made to cover all the activities of the Emergency Council.

All of the various units of this Emergency Council have made individual reports which cover their particular phases of the program. We then will make our report along more general lines.

This was one of those disasters that developed slowly with no one being able to predict how far it would go. During the first hours it seemed that each problem we were called upon to solve would be the last, until suddenly we came to the realization that we had a tremendous problem before us, and it was a real source of satisfaction to note the promptness with which the various units and individual members of the Council responded.

Early on the morning of the 2nd, Frank L. Shaw, Mayor, and Chairman of the Emergency Council, came to Emergency Council headquarters and took personal charge. Practically every member of the Executive Committee reported either in person or by telephone, and reported that they were in constant touch with the members of their subcommittee and that the entire emergency set-up was standing by; that we might use all or any part of it as the need required.

The telephone communication in the city was excellent. Therefore, it was not necessary to call regular mobilization of all the members.

All departments of the City Government went into action doing their respective jobs, calling upon the Reserves as needed. There was a very close understanding between all departments. There was not a call for Reserves that was not answered promptly, proving that the great amount of planning which had been done was of untold value, and enabled them to locate outside facilities with the minimum of time.

The American Red Cross section was very busy, and began using boats for evacuating homes early. They established refugee camps in Venice, Canoga Park, Van Nuys, North Hollywood, and Tujunga. It was marvelous to see how the various units of this section coöperated one with the other. There was very little lost motion and never a question as to where to find supplies. All the plans of the supply committee proved their worth, as it enabled them to know exactly where to get everything that was needed, such as blankets, cots, food, etc.

An opportunity was given to try out the new committee, known as the Administrative Units, composed of Reserve Army officers working as representatives of the American Red Cross. They moved into five camps and even though the refugees were few they were able to test their plans. Each group made reports of their activities and recommendations for future planning which will enable us to perfect one of the most important groups of the Council.

This was typical of the entire program. We were able to check our planning and, in cost cases, found it good. We found the headquarters needs more telephone lines. This lack of sufficient phone service slowed up the program and caused us to lose a number of calls. This fault is already being corrected.

We found the need of a central intelligence group, where all information regarding the disaster would be assembled. There was need of regular half-hour bulletins and special bulletins, when the occasion required, from the Flood Control, Police Department, Sheriff's Office, Water Department, Public Utilities, American Red Cross, and others who gather information. These bulletins should have been made to a central intelligence group who in turn should release regular news bulletins and clear all rumors, and request for mobilization of various groups, etc. We feel that this would, to a great extent, correct one of our greatest evils in the recent flood, that of wild rumors being broadcast which caused much confusion.

All our people were cared for in a most efficient manner. There was no unnecessary suffering. There was splendid coöperation among all groups in both city and county. I am sure there is no doubt in anyone's mind that the Emergency Council has proved its worth.

BASIL E. RICE,
Director of Coördination.

Concerning California Attorney-General's Opinion on "Health Foundations."

BOARD OF MEDICAL EXAMINERS
STATE OF CALIFORNIA

Sacramento, California,
March 7, 1938.

To the Editor:—Enclosed please find copy of Attorney-General's Opinion No. NS869, dated February 18, 1938, regarding so-called "Health Foundations," which we thought might be of interest to the readers of CALIFORNIA AND WESTERN MEDICINE.

Very truly yours,
C. B. PINKHAM, M.D.,
Secretary-Treasurer.

(COPY)

STATE OF CALIFORNIA
LEGAL DEPARTMENT

San Francisco,
February 18, 1938.

Charles B. Pinkham, M.D.
Secretary-Treasurer
Board of Medical Examiners
450 McAllister Street
San Francisco, California

Dear Sir:

In your communication of the 21st ultimo you enclose a circular issued by a so-called health foundation and ask whether such foundation is violating any of the provisions of the Business and Professions Code.

In reply, please be advised that this office has examined the same and finds that such foundation purports to collect from its "members" a certain sum per month per family, representing that it entitles the member-family to anything the doctor can do in case of sickness or accident; that the member does not pay for surgery; that medical service for any disease whatsoever is purchased for members; that each member is entitled to a complete, free medical examination.

What purport to be facsimiles of letters received by the health foundation under discussion indicate that the health foundation took charge of a case and found three operations on one of the members were necessary; that another member received from the health foundation "the best of medical attention"; that another member received efficient medical service from such foundation.

Such literature indicates that a member thereof is not entitled to a choice of physicians; that the physician in effect is employed and paid by the foundation; that there is no professional relationship between the physician and the patient, and that the scheme of doing business is in accordance with that disapproved by the Supreme Court in the case entitled *Parker* vs. *Board of Dental Examiners*, 216 Cal. 285, and hence is violative of those provisions of the Business and Professions Code prohibiting the practice of medicine under a fictitious name and the aiding and abetting of unlicensed persons in the practice of medicine.

Very truly yours,
U. S. WEBB, *Attorney-General.*
By Lionel Browne (signed)
Deputy.

Concerning Malpractice Policies.

San Francisco,
March 26, 1938.

To the Editor:—Due to the fact that there are a great number of underwriters issuing Lloyd's of London malpractice policies and that these underwriters have, in the past, issued a large variety of policy forms, the following "broad form" of malpractice policy is submitted as the only form of Lloyd's malpractice policy approved as to legal scope of coverage by either the San Francisco County Medical Society or the undersigned. The approval just mentioned has been given *without prejudice* to the policies issued by any other insurance carriers and has reference only to Lloyd's of London, of which, in the past year, some thirty types of policy have been issued.

111 Sutter Street.

Very truly yours,
HARTLEY F. PEART.

(COPY)

A FORM OF POLICY: PHYSICIANS' AND SURGEONS' LIABILITY

In consideration of the statements and agreements in the application for this policy, subject to the conditions and limitations herein contained and in consideration of the payment of the premium, the underwriters hereby agree

A. To pay any damages against———hereinafter called the Assured, for professional services rendered, or which should have been rendered by him and/or any assistant to him, including any partner, physician, dentist, anesthetist, technician, nurse, or any other person, during the term of this policy, and resulting from any claim or suit based upon malpractice, error, negligence or mistake, breach of implied contract, loss of services, property damage, autopsies, inquests, personal restraint, the dispensing of drugs or medicine, assault, slander, libel, undue familiarity, anesthesia hallucination, malicious prosecution, replevin of property or arising from any counterclaims in suits brought by the Assured for the collection of fees provided such damages are claimed under any of the foregoing:

B. To defend the Assured without limit of cost in any suit within the foregoing specifications, filed at any time, and to furnish any bonds not exceeding in amount the minimum limit of this policy, which may be incidentally necessary to such suits, for appeals or the release of attachments or garnishments.

This agreement is subject to the following conditions:

1. The underwriter's liability for damages on account of any one claim or suit shall be limited to———dollars ($———) for each assured. Subject to the same limit for each claim or suit, the underwriter's total liability during one policy year shall be limited to———dollars ($———) for each assured. The cost of defending any suit will be paid in addition to, and irrespective of, the limit expressed above.

2. The underwriters shall not settle or compromise any claim or suit without the written consent of the Assured, and subject to his desire must defend any claim or suit until all legal remedies have been exhausted.

3. The protection under this policy shall include the estate of the Assured.

4. The insolvency or bankruptcy of the Assured shall not release the underwriters from the payment of damages for injuries sustained or loss suffered by any person or persons as the result of an act or omission covered by the policy and occurring while this policy is in full force and effect; and in case execution against the Assured is returned unsatisfied in an action brought by the injured person or his or her personal representative in case of death resulting from such act or omission, because of such insolvency or bankruptcy, then an action may be maintained by the injured person or his or her personal representative against the underwriters under the terms of the policy for the amount of judgment in said action, not exceeding the amount of the policy.

5. The Assured, in the event of receiving notice of claim or suit, shall advise the underwriters or———as soon as possible, and thereafter shall as soon as possible forward to the underwriters' representative any summons or process served, or any information received, and otherwise render the underwriters all assistance possible. All notices and communication to the underwriters and all documents, including summons or other process to be forwarded to the underwriters under the terms and provisions of this policy, shall be delivered to———, California, the underwriters' representative, and delivery of any such notice, communication or document to said representative at said address shall be conclusively deemed to constitute the receipt thereof by the underwriters.

6. The Assured agrees not to contract any expense in a claim or suit under this policy nor to make any settlement thereof without the written authorization of the underwriters and will attend and assist in the defense without charge to the underwriters.

7. The Assured agrees that this policy shall not pay damages awarded in suits based on criminal acts or on services rendered while under the influence of intoxicants or drugs.

8. In any case wherein the Assured has been in attendance or consultation he will endeavor to notify the underwriters before testifying at an inquest or public hearing.

9. Additional doctors engaged by the Assured shall be included hereunder, and an additional premium charged therefor unless insurance is carried in another company. Additional doctors employed during the policy term shall be included hereunder subject to the same conditions and notification to the underwriters and payment of pro rata additional premium.

10. It is agreed that in the event of dispute as to the validity of any claim made by the Assured under this policy of insurance or in the event of any suit instituted by the Assured against the underwriters, or any of them, upon this contract, the underwriters hereon shall submit to the jurisdiction of the courts of the state in which the principal office of the Assured is located and will comply with all legal requirements necessary to give such courts jurisdiction; and for this purpose said underwriters hereby appoint———, ———, California, their agent for the purpose of service of process; and in any suit instituted by Assured against the underwriters or any of them upon this contract, underwriters and each of them will abide by the final decision of the courts of said state and settle accordingly.

11. This policy shall be cancelled at any time at the written request of the Assured or by or on behalf of the underwriters by giving thirty (30) days' notice of such cancellation. If this policy shall be cancelled as hereinbefore provided or become void or cease, the premium having been actually paid to the writers or to the broker who effected the insurance the unearned portion shall be returned on surrender of this policy, the underwriters retaining the customary short rate; except that when this policy is cancelled by or on behalf of the underwriters by giving notice they shall retain only the pro rata premium.

12. The term of this policy begins at noon, Standard time, at the place where the Assured resides and from the——— day of———, 19—, to the———day of———, 19—.

Attached to and forming part of Certificate No.——— Lloyd's, London.

MEDICAL JURISPRUDENCE†

By Hartley F. Peart, Esq.
San Francisco

County Hospitals of California: Powers and Duties of Boards of Supervisors with Respect to Admission of Patients—A Review of Goodall vs. Brite

Recent events in various communities in the State have once again focused attention upon the subject of the extent of the powers and duties of boards of supervisors in the respective counties of the State with respect to the admission of patients to the county hospital and other county tax-supported institutions. In January, 1936, the District Court of Appeal for the Fourth Appellate District decided the case of *Goodall* vs. *Brite*, 11 Cal. App. (2d) 540, which directly involved the subject under discussion, and in which an exhaustive opinion was rendered. It was thought at that time that the court's opinion settled once and for all the seemingly controversial and frequently debated question: What members of the community may lawfully be admitted to tax-supported hospitals? And the further question: Must the decision with respect to eligibility for admission to the county hospital be made before admission, or may it be made at some subsequent time?

Unfortunately, there seems to be some misapprehension even now with respect to the proper legal answers to the questions just stated. Therefore, it is deemed proper to review again the rules of law laid down by the District Court of Appeal in *Goodall* vs. *Brite*.

The case originally arose in Kern County and was an action by individual taxpayers against the Board of Supervisors of Kern County to enjoin the supervisors from admitting to the county hospital as patients residents of the county who were financially able to pay the cost of hospitalization in private hospitals. The theory of the action was that the admission of patients able to pay the cost of private hospitalization constituted conduct on the part of the supervisors in excess of their statutory authority and resulted in an unjustifiable increase in the tax burden of the taxpayers in Kern County. The Superior Court in which the action was originally tried rendered judgment in favor of the taxpayers and against the supervisors and accordingly enjoined the supervisors from continuing to admit patients able to pay the cost of private hospitalization. The supervisors appealed to the District Court of Appeal and that court affirmed the judgment of the Superior Court although it modified the injunction in some respects.

The District Court of Appeal considered a number of questions in reaching its conclusion,* and its opinion on these questions may be summarized as follows:

1. Article IV, Section 31, of the California Constitution, forbids the making of gifts of public funds or the using of public funds for private purposes, and the hospitalization and medical care in the county hospital of residents of the county wholly able to pay for private hospitalization and private medical care constitutes in effect a gift of public funds to such persons.

Hence, Boards of Supervisors violate the California Constitution if they allow residents of the county able to pay for private medical and hospital care to enter the county hospitals. The Court summarizes its position with respect to this point, as follows:

> We, therefore, conclude that the admission and treatment of patients in the county hospital who, either themselves or through legally responsible relatives, can provide themselves with equally efficient care and treatment in private institutions does not promote the health and general welfare of the citizens of Kern County and is not a proper exercise of the police powers of that county and results in the use of public money for private purposes.

2. Residents of the County who are not paupers but who, on the other hand, possess insufficient means either themselves or through relatives legally liable for their support to bear the full cost of hospitalization in private institutions may be admitted to the county hospital as an humanitarian measure. However, with respect to persons who fall within this class, two distinct rules of law must be borne in mind:

(*a*) "Due inquiry and investigation" must be made either by the supervisors or someone on their behalf (*e. g.*, a social service agency) of each applicant for admission to determine whether or not such person is, or is not, able to pay either himself, or through some relative legally liable for his support, the cost of private hospitalization. (One ex-

† Editor's Note.—This department of California and Western Medicine, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

See also editorial comment, on page 234.

* The District Court of Appeal in its injunction provided for the admission of certain special classes of patients such as psychopaths, narcotic addicts, persons in the active stages of tuberculosis, etc., because of special legislative acts providing for the admission of such persons in county hospitals. The main portion of this comment will not include a discussion of these special cases, but in order that there may be no misunderstanding the portion of the court's injunction dealing with these special cases is quoted:

"The following should be admitted: (*a*) an indigent sick or dependent poor person; (*b*) a needy sick and dependent or partially dependent citizen in case of emergency; (*c*) a psychopath, narcotic addict or habitual inebriate temporarily in custody; (*d*) a physically defective and physically handicapped person under the age of eighteen years when the parents or guardian of such person are not financially able to secure proper care or treatment and when such person's admission and treatment has been duly authorized in the manner provided by law; (*e*) a person in the active stages of tuberculosis, in wards established for the treatment of such persons, who is able to pay for such treatment and who, when able to pay, is required to pay for such treatment; (*f*) a person to be quarantined or isolated in the county hospital with a contagious, communicable or infectious disease; (*g*) a prisoner confined to any city or county jail who requires medical or surgical treatment necessitating hospitalization where such treatment cannot be furnished or supplied at such jail when the Superior Court of the county shall have ordered the removal of such prisoner to the county hospital and said prisoner elects not to furnish such treatment at his own expense; (*h*) a county employee injured in the course of his employment by the county when hospitalization is reasonably required to cure and relieve the effects of such injury."

ception to this rule of law arises in cases of emergency or public disaster. This exception will be discussed later.)

(*b*) The supervisors, in administering public funds, are acting as trustees for the general public and, therefore, they are legally bound so to administer the funds as to lighten the tax supporters' burden as much as possible. Therefore, when an applicant seeking admission is found to be partially able to pay the cost of hospitalization, he must be charged an amount which is within his means. Of course, this in no instance can be an amount adequate to cover the full cost to the community of his hospitalization and treatment because if he is able to pay that amount, he should not have been admitted in the first place. On the other hand, if the applicant for admission is able to pay something toward the cost of hospitalization and treatment, he should be required so to pay in order that the taxpayers of the county will not be unduly burdened.

3. The California statutes dealing with powers and duties of Boards of Supervisors with respect to the admission of patients to county hospitals use the term "indigent." In order that this term may have a definite meaning, it is defined as follows:

> The word "indigent" when used in connection with admission to county hospitals includes an inhabitant of a county who possesses the required qualifications of residence, and who has insufficient means to pay for his maintenance in a private hospital after providing for those who legally claim his support. (11 Cal. App. (2d) 550.)

4. In cases of emergency or public disaster such as fire, earthquake, floods, storms or epidemics, people may be injured or rendered suddenly ill and immediate hospitalization may be necessary to save life. In such cases delays in admission to promote investigation of the final condition of the payment might cost loss of life. Therefore, in cases of emergency or public disaster, an exception is made to the requirement of due inquiry and investigation prior to admission, and it is held that:

> Such patients should be admitted promptly, investigation of their ability to pay should follow. Ordinary humanity could dictate no other course. In such cases boards of supervisors should not hesitate to collect the full cost of hospitalization from those able to pay, and from others not able to pay in full, a fair amount, to be determined after an investigation of their resources.

The foregoing summarizes the essential rules of law laid down by the District Court of Appeal in connection with the admission of patients to county hospitals. It is to be noted that the court distinctly and definitely held that the fact of indigency is to be determined upon due inquiry and investigation *prior* to admission to the county hospital except that in cases of emergency or public disaster investigation may be delayed until conditions have returned to normal. A charge may be made by the county in those situations where the applicant is found to be an indigent but is also found to have sufficient funds to pay a portion of the cost to the county of hospitalization and medical care. Only in emergency cases and in the event of a public disaster may patients be admitted without inquiry and investigation and the question of their ability to pay determined afterward.

It must also be borne in mind that the ability to pay of the applicant is to be determined at the time of application, not at some prior date or, on the other hand, at some later date. Moreover, it is indisputable that the State of California has authorized counties to maintain county hospitals for the sole purpose of promoting the public health and welfare of *all* citizens in the respective counties and that the State has limited admission therein to "indigents" because public policy must not countenance use of public funds for the benefit of private citizens who have no *need* for governmental aid. These principles caused the District Court of Appeal to forbid admission of patients wholly able to pay (either themselves or through relatives legally liable for their support) for private hospitalization. On the other hand, these principles likewise must forbid the various boards of supervisors from so administering their public trust that people unable to pay are forever oppressed rather than being protected. The general welfare certainly is not promoted by endeavors to collect from indigents if they later acquire some property. Their progress should be promoted, not impeded.

SPECIAL ARTICLES

CALIFORNIA MEDICAL ECONOMIC SURVEY*

A Statement by the Bureau of Medical Economics [of the American Medical Association]

The California Medical Association in 1934 was accepted by the Federal Emergency Relief Administration as the "Supporting Sponsor" of the California Medical Economic Survey. The published volume contains, as a foreword, the actions which led to the initiation of the report, addenda to the foreword, table of contents, financial reports, letters pertaining to the interpretation of Works Progress Administration regulations, and informal comments concerning possible interpretations and conclusions to be drawn from the factual data.

This survey adds 143 more tables and fifty-seven additional charts to the already large accumulation of figures which has been assembled from time to time under the auspices of various agencies and organizations in an attempt to analyze the need and receipt of medical care and the cost of the medical and hospital services rendered.

Many of the conclusions around which controversy over the distribution of medical services has arisen in recent years are in some way related to the use of the words "adequacy" and "inadequacy." These words are used frequently in the tables of the California Medical Economic Survey but, unfortunately, their use in this survey does not offer much help in a clarification of their application to medical, dental, and hospital care.

A definition of the medical and dental care that is apparently considered "adequate" appears on page 44 of Addendum X.

> The medical and dental care of a population and its members may be called "adequate" if all the following conditions are fulfilled:
>
> 1. In the opinion of qualified experts in public health service and sanitary engineering, preventive and sanitary services intended to diminish the incidence of disease and injury to the whole population are developed to the state of maximum efficiency, *i. e.*, to the point at which curative and other services to all individuals by private or other practitioners become more efficient in preventing damage and more economical of professional personnel and equipment than additional public preventive work.
> 2. In the opinion of qualified practitioners who have knowledge of the persons concerned, curative services and other individual treatment by private or other practitioners are available and obtainable to the whole population at need in the amounts and variety which are necessary or prudent in reducing prospective damage to the person of the patient.
> 3. Additional services for the comfort and convenience of patients—beyond those needed in the reduction of damage—are available and obtainable to the whole population in accordance with the medical and dental habits and customs of the people.

The definition gives one the impression that the first element is a counsel of perfection which, when reduced to a simple statement, seems to mean that medical and dental services, unless developed to a state of maximum efficiency, are unsatisfactory. Webster's New International Dictionary defines adequacy as "equal to or sufficient for some (specific) requirement" and gives as synonyms "proportionate, commensurate, competent, and suitable." The dictionary point of view, which may be supposed to reflect the idea commonly conveyed by the word "adequate," indicates that adequacy always refers to some comparison. In the California survey the purpose for which adequacy is urged is not defined, but the report continuously carries the assumption that adequacy means perfection. Once this assumption is fixed in the mind of the reader of the statistical tables, he is continuously confronted with the question of whether any of the medical services now available are adequate. If, however, the term "adequate" is interpreted as equal to or sufficient for some requirement, then it must have some relation to actualities and environment and to the "adequacy" of other elements which are essential to health, such as food, shelter, fuel, and clothing.

The same lack of definiteness is found with regard to standards or definitions of illness and diagnosis. It appears that the authority for the diagnosis in too large a per-

* Reprinted from *The Journal of the American Medical Association*, February 26, 1938, pp. 117B–119B.

See also editorial comment, on page 236.

centage of the cases was the report of a nonmedical investigator concerning the statement made by the person interviewed, and in many cases it seems that the patient must have made his own diagnosis. Moreover, the same vagueness prevails on the subject of medical treatment. Apparently, the investigators did not ask or were not instructed to inquire as to the length of time that had elapsed since treatment had been received. Nowhere is it apparent that these investigators inquired concerning the nature of the treatment received. This lack of reasonable definition of some of the basic terms used in the survey and the apparent failure to secure some of the basic data pertaining to medical care raise questions as to the value of many of the tables which purport to show "inadequacy" in all these fields.

There is a tendency throughout the published tables to exaggerate the lack of medical care, the cost of such services, and the implied defects of the medical profession, by the arrangement of the tables and the wording of captions. Figure 2 in Table 6 illustrates this point. The population of California used in the survey was based on "California Taxpayers' Association estimates based on average daily attendance in public schools." The Census Bureau of the United States Department of Commerce issues periodic estimates of the population of the states, but there appears no explanation of the use of a local estimate in preference to the Census Bureau estimate of the population. Likewise, the number of physicians in California in 1934 is less by 1,407 than the number given in the 1934 American Medical Directory. In several instances *The Journal of the American Medical Association* and the "Directory of the American Medical Association" are given as sources of information. However, the discrepancy cited is nowhere explained.

The reported need for dental care on date of family interview is shown in Table 25. The percentage of persons of all known incomes in all communities who were reported in need of dental care is given at 9.7. This figure is in sharp contrast with the estimates from a number of other studies which show that the number of persons requiring treatment for caries or other dental conditions seldom falls lower than 75 per cent of the whole population. The number of persons per thousand surveyed reporting specific diseases at time of family interview is shown in Figure 16. The wording of the caption of this chart indicates that these graphs represent the prevalence rates of disease. When compared with the prevalence rates of other studies, the California figures are from about three to more than ten times larger. It is possible that the charts in Figure 16 do not represent prevalence rates as stated in the caption, but are actually the incidence rates for a three-month period. However, if the incidence rate from other studies is compared wherever comparison can be made with the rates in Figure 16, there are still wide discrepancies. If Figure 16 is used to represent the prevalence rate of specific disease, California is depicted as a very unhealthful place in which to live.

The payment of medical bills is shown in Table 47, in which the ratio of expenditures to charges in different income groups is given. It is interesting to note that in a considerable number of instances in which the charges incurred were $40 or less, more than 100 per cent, and in one instance 265 per cent appear to have been paid. There are many who doubtless would be glad to know what device was used to induce patients to pay more than 100 per cent of the charges for medical services.

It is very difficult to reconcile Tables 48 and 116. Presumably, Table 48 represents the percentage balance of family medical debts and charges, and Table 116 represents the percentage of collections of charges for medical services made by physicians. Table 48 indicates that, for all known incomes in all communities, 22.9 per cent of the family debts and charges were unpaid. Table 116 indicates that physicians with all incomes collected 74.1 per cent of their charges for services. Three per cent of all medical charges are thus unaccounted for.

It appears that the sample of physicians on which Figure 31 is based, "Type of Practice of Physicians Reporting," must have been overweighted with specialists. An analysis of the types of practice of the physicians contained in the 1931 American Medical Directory shows that the number of physicians devoting their entire time to a specialty was 19.8 per cent instead of about 33.5 per cent, as shown in Figures 31 and 34. In the 1936 American Medical Directory, 21.9 per cent of California physicians are recorded as devoting their entire time to a specialty. These complete figures for all the recorded physicians in California were available at the time the California Medical Economic Survey was conducted. The California survey figures give a grossly distorted picture of the percentage of general practitioners and specialists in that state.

The relative importance of medical payments among family expenditures shown in Tables 60 and 61, and the average charge per person and family reporting medical charges of zero and over, shown in appendix B-11, give a false impression of the actual amount of medical services received in the various income groups. For example, a charge of $18.53 to an individual in the income group of zero to $499 may represent as much as or more medical care than a charge of $47.10 to an individual in the $3,000 to $4,999 income group. Furthermore, since it appears that a large percentage of the incurred medical bills in the low income groups remain unpaid, neither the size of the medical charges nor the amount actually paid for services by these low income groups can be taken as a dependable measure of the quantity or quality of the services received. Unfortunately, the tables in this survey are arranged in such a manner as to leave the impression that the amount of medical care received in each income group is directly proportionate to the amount of money paid for such care.

The tables and figures in this report give the reader the impression that there has been an effort to arrange a build-up for sickness insurance. If such were the case, scientific interest would have required the inclusion of facts easily available to show the distribution of physicians both as to specialties and as to population by small towns, rural districts, and so on, which is more distorted in any of the countries having sickness insurance than it is in California. The distribution of physicians according to population is no dependable measure of the quantity of medical services available to any specific community. Illness and the means for its relief bear no relation to state or political subdivision boundaries. The use of the population per physician measure of the availability of medical services in California is no more dependable than in any other section of the United States.

The question may well be raised as to the method of conducting the survey and the personnel used to collect the information. Inaccuracies and deficiencies in basic data, collected by persons who have little or no knowledge of medicine, will of necessity be reflected and oftentimes amplified in the finished tables. Perhaps the apparent distortions and discrepancies and the disagreements with other similar studies may be explained in the words of the director—

> In a word, even complacence or ignorance of facts cannot be considered as adequate grounds for maintaining that the picture here presented has been overexaggerated. Rather is the reader asked to put himself in the position of *looking from the viewpoint* of the standard of adequacy expressed above. It is hoped that he will then see, in the data, many of the main features of the real deficiencies in the health services exhibited in a suitable perspective. It is hoped, as indicated in the previous paragraph, that he will also realize he is looking at the picture through a reducing glass.

which seems to mean that the nature and amount of medical care provided by the medical facilities in California are entirely unsatisfactory when evaluated in terms of the definition of "adequacy," used in this survey.

RURAL COMMUNITY HOSPITALS: IS SUBJECT OF NEW FEDERAL BULLETIN*

The shortage of doctors, hospitals, and general medical facilities in certain rural areas is brought out in a bulletin on "Hospitals for Rural Communities" published by the United States Department of Agriculture. The study was made by the Bureau of Agricultural Economics. Blanche Halbert, formerly of the Bureau staff, is the author.

Noting that well-equipped rural hospitals will encourage doctors to enter country practice, the author says that the shortage of doctors in most small rural communities has become a serious problem. In a number of states where most of the people live in the country, there is only one doctor for every 1,000 to 1,500 persons. On the other hand,

* From the United States Department of Agriculture.

in other states which have a large percentage of urban population, there is one doctor to as few as 500 to 700 persons. The number of doctors in rural territory has been steadily decreasing. A great many small towns that had one or two doctors a few years ago have none at present.

As in the case of the doctors, the situation as to hospital facilities likewise places the rural communities at a great disadvantage. A survey made in 1934 showed that only about 1,700 of the 3,073 counties in the United States had any general hospital. This means that 1,300 counties had no hospitals. By allowing two hospital beds per thousand population and a distance of fifty miles from hospital centers, the study showed a need for 22,000 new hospital beds for the rural areas.

The hospital need is said to be greatest in the South, where more than a million persons living in eight states had less than one hospital bed for every 2,000 persons.

The bulletin discusses all the various considerations entering into the planning and building of a rural hospital—the needs of the community, the state laws that affect hospitals and hospital care, what it costs to build and operate a hospital, the financing, and the organization and administration. Numerous sketches show specific plans and specifications, and there are many illustrations of the building and work of rural hospitals in various parts of the country.

"Before agreements are made for a new rural hospital," the author points out that "some idea of the necessary size and expected occupancy should be obtained, for size affects the capital cost and occupancy affects the operating cost. . . . The expected occupancy of a hospital is dependent upon the proportion of beds to the population, the health education of the community and the attending physicians' habits of recommending hospital care."

The author concludes that "A good rural hospital does more than provide for those in the community who actually need hospital care. If it is well equipped and well organized, it may attract physicians to the country district where it is located, and it also may be the means of encouraging the doctors in the locality to stay in country practice. It enables these country doctors to see more patients and do better work. Its laboratories and facilities can be used for the diagnosis and treatment of all people. It may become the center of the entire county health program." A copy of the bulletin, No. 1792 in the Farmers' Bulletin series, may be obtained from the Office of Information, United States Department of Agriculture, Washington, D. C.

GENERAL HOSPITAL FINE INSTITUTION; LET US KEEP IT FINE

Reprint of an Editorial from the Los Angeles Daily News, March 2, 1938

It is to be regretted that at this time, when certain phases of local government are enveloped in a negative perfume, that General Hospital should be in any way open to criticism.

Los Angeles people have always been proud of their county hospital. They ought to be. It cost enough. It is recognized as the finest public institution of its kind in the world for organization, staff, and equipment.

Those who have benefited by treatment there—whose lives would have flickered out in painful misery and amid hopeless squalor if such a grand enterprise did not exist—praise loudly the attention they received; and many do their best to compensate the County, if ever able.

If anything is occurring there to destroy the faith of the people in this great institution—to lessen the pitiable confidence of the indigent, or cast a shadow of suspicion in the minds of the taxpayers—it is a situation that must be instantly remedied.

A county hospital, dealing in a Godly work, should be aloof from politics, venality, acrimony.

If General Hospital is hounding indigents for bills, the practice is cruelly vicious.

If General Hospital is charging, rich and poor alike, in excess of private hospital prices in its fear of being a victim of chiselers, then the County corporation of Los Angeles is a bigger chiseler than its people.

If the County is looking for chiselers, there are plenty of places to hunt for them before picking on the weak and disabled. Far better that one chiseler escape than the wretched lives of the destitute be made more horrible by unfeeling persecution.

* * *

General Hospital is an institution for the people.

In emergency, the doors must swing wide for rich and poor alike, for millionaires and paupers. They are all our people, and it is their hospital—their refuge in dire distress.

Primarily, of course, the hospital is for the poor. It is assumed they have nothing when admitted. But families with monthly incomes of $55 to $125—and there are many—are no more competent to arrange private hospitalization in emergencies than those wholly destitute.

They could, however, in the passage of time, try to diminish the charges at small monthly payments.

It would be reasonable for the hospital authorities to inform a discharged patient that his nominal expense to the County was, for instance, $87.50, and if he can ever pay any part of it, the sum will aid some future patient.

But to hammer at these persons regularly with the threatening tactics of a collection agency, as charged, when they probably are without heat or food, is a heartlessness which could only have been devised by prosperous politicians—who never attack the strong!

The "Kern County decision" of the Appellate Court is given as the excuse for the practice. This ruled that patients must be billed for treatment—but it did not say how often.

Kern County's population can be housed in a city block in Los Angeles. Its indigents can be known by first name to all officials. As a precedent for this county, it is the tail wagging the dog.

Only a leathern legal mind could interpret the Kern decision as it has been interpreted in Los Angeles—a great metropolitan center where destitution is bound to be at a vastly higher proportionate percentage than in a rural district. The interpretation, naturally, came from the office of the county counsel—the top job of which pays $10,000 a year, a fact that was recently emphasized.

Some appointed politicians, who do not need to run for election and have no financial worries, do not have the sympathy for patrons of charity hospitals so necessary for their operation.

* * *

Two hundred physicians are giving part of their time free each week to General Hospital. For the County to charge patients in excess of private hospitals is an affront and injustice to these fine and altruistic men and women.

The current charges were made by Dr. George H. Kress, President of the Los Angeles County Medical Association, which cannot risk its ethical dignity with idle accusations. There must be something there.

The Board of Supervisors will be making a grievous error if it does not press its inquiry to a satisfactory conclusion.

SYPHILIS: THE BARRIERS ARE DOWN—WHAT NEXT*

A Program for 1938

America's golden opportunity to conquer syphilis has been won by twenty years of patient work. At last the barriers are down. In the daily press, in national weeklies and monthlies, in radio broadcasts, in addresses and conversations, syphilis and gonorrhea are now discussed frankly and with optimism. The United States Public Health Service, under the vigorous leadership of Surgeon-General Thomas Parran and with the coöperation of the medical profession, has accelerated official action against these diseases throughout the country.

These are advances for which the American Social Hygiene Association has striven continuously—that the light of science might reveal to needlessly suffering men and women the hopeful facts regarding syphilis and gonorrhea; that the resources of local, state, and national governments might be mobilized against preventable disasters.

General interest, feelings of sympathy aroused by accounts of tragedies chargeable to syphilis and gonorrhea, are futile unless organized and directed in a program of specific action. No program for wiping out syphilis can succeed that fails to come to grips with the problems of individuals in shops, factories, offices and homes, in cities and on the farm. Infected persons must be treated, sources

* By Walter Clarke, M.D., Executive Director, American Social Hygiene Association.

of infection found, contacts examined, men and women instructed in the nature, methods of spread and means of prevention of syphilis and gonorrhea. For these purposes facilities and services available to all must be provided in cities and towns throughout the country. This program and these facilities must be provided under local medical and health agencies and to the extent necessary out of local tax funds. The people of the communities must appreciate the need for them and must wish to provide them. In a word, there must be organized citizen support based on enlightened citizen understanding.

For more than two decades the American Social Hygiene Association, guided by its General Director, Dr. William F. Snow [one-time Director, California State Board of Public Health], has gone about the business of creating and organizing this citizen interest and support. The time has now come to extend and intensify this work. Perhaps not for another generation will an equal opportunity be given America to conquer syphilis and mitigate the ravages of gonorrhea. The public will soon tire of a problem about which little is done; and the old inertia and hopelessness will return, unless popular awareness and concern are promptly capitalized. To capitalize this interest, we must organize it and put it to work.

The Association, aided by its National Anti-Syphilis Committee, of which General John J. Pershing is chairman, will redouble its efforts to create and organize support of the modern scientific program against syphilis and gonorrhea. The practical steps to be taken in cities, towns, and states are these:

1. Create committees of leading citizens to sponsor and guide appropriate action in coöperation with and support of the medical and public health forces of the community.
2. Instruct the public regarding syphilis and gonorrhea, the damage they cause, and how to prevent their spread.
3. Encourage sound official efforts to combat syphilis and gonorrhea.
4. Study local and state problems of syphilis and gonorrhea and social conditions favoring their spread, and plan to deal effectively with them.
5. Promote a well-rounded scientific program and obtain adequate facilities for combating syphilis and gonorrhea.

There is a place for every citizen, for every professional group, for all phases of interest in social hygiene, in such a program of state and local action. Both "the old guard, and the new recruit," as President Ray Lyman Wilbur calls them, are needed here. The Association will continue to work through existing state and local voluntary agencies, especially social hygiene societies, in organizing citizen support for the campaign against syphilis. In collaboration with these, the Association will provide the services of trained field workers as organizers, and of consultants for the technical features of the program. Where no social hygiene societies exist, the Association's representative will utilize the organization and contacts of appropriate existing agencies where these are made available, adding to them state and local committees for specific action against syphilis and gonorrhea. Failing such coöperation with existing health agencies, the Association may recommend new organizations of whatever type may seem to all concerned most satisfactory under the circumstances. As previously, the Association will continue as central clearing house of advice and information and will develop and disseminate educational material in appropriate variety and keyed to the current public interest.

This is our practical working policy and program for the immediate future. Along this highway let us make as rapid progress as possible, working in close harmony with health authorities, the medical profession, and social and educational organizations; not losing sight of nor abating activities related to the great ultimate objectives of the founders of the Association, but concentrating on the attainment of our first goal—the conquest of syphilis.

"In giving full approval to this emphasis on the medical aspects of social hygiene during 1938, and doubtless also for several years to come, the Association is not ignoring the importance of its long-range program of sex education and preparation for parenthood and family life," says Professor Maurice A. Bigelow, Chairman of the Executive Committee. "Nor is it overlooking the pressing problems of prostitution faced by many cities in a more acute form now than at any time in the last decade."

Constantly the Association points out that it is "combating syphilis and gonorrhea *and the conditions which favor their spread.*" Conditions which favor their spread include not only lack of facilities for diagnosis, treatment, epidemiology and popular health instruction, but also commercialized prostitution, sordid and degrading amusements, ignorance of parents and others responsible for the sex education of youth, handicaps of homes, schools, and churches in motivating boys and girls with high ideals of conduct.

The spear point of the social hygiene movement at present is the campaign against syphilis and gonorrhea. Behind the spear is the solid body of the whole broad social hygiene program giving weight and steadiness to the drive against these diseases. That will still remain after syphilis and gonorrhea have taken their places, along with smallpox, typhoid and yellow fever, cholera, and soon tuberculosis and diphtheria, among the vanquished enemies of man.

CALIFORNIA VENEREAL DISEASE CONTROL—PAST, PRESENT, AND FUTURE

The Venereal Disease Act of California was passed by the Legislature in May, 1937, was signed by the Governor on July 1, 1937, and became a law on August 27, 1937.

The Act appropriated $150,000 for the biennium. This is supplemented by $72,000 allocated to the state for venereal disease control by the United States Public Health Service for the fiscal year 1937-1938. In addition, approximately $200,000 has been appropriated by local governmental agencies for the present fiscal year for venereal disease control.

ADMINISTRATION OF THE ACT

Under the provisions of the law, the Bureau of Venereal Diseases was created as a separate bureau within the California State Department of Public Health. The state program is administered by the State Department of Health under the direction of Dr. Walter M. Dickie, director of the department. The Bureau was reëstablished (since such a bureau was in existence from 1917 to 1920) on February 1, 1937, and Dr. Malcolm H. Merrill was appointed as chief of the Bureau, using funds allotted to the state by the United States Public Health Service. (The Bureau was thus established prior to the passage of the state legislation.)

The Bureau of Venereal Diseases functions as an integral part of the State Department of Public Health just as does the Bureau of Epidemiology, Bureau of Tuberculosis, Bureau of Food and Drug Inspection, etc.

Accomplishments to date are difficult to evaluate. Some of the more evident developments may be mentioned.

1. *Reporting System.*—The system for reporting cases of venereal diseases has been simplified and modernized. A new report form has been prepared and issued. This new card was issued the latter part of June, at which time it was forwarded with a letter of explanation to the 12,500 medical practitioners in California.

Cases Reported.—The number of cases reported has increased by approximately 50 per cent since these cards went into use. The total number of cases reported to the end of the third week in December were 16,361 cases of gonorrhea and 16,540 cases of syphilis or a total of 32,901 cases. Twenty thousand of these cases have been reported since July 1, 1937. These figures may be compared with a total of 23,843 total cases in 1936 and 23,591 total cases in 1935. This does not indicate an increased prevalence, but better coöperation of the physicians in reporting. Surveys that have been carried on have indicated that prior to the present campaign less than 10 per cent of the cases treated by private physicians were rejected.

The epidemiological reports constitute a vital part of the reporting system. A card folder has been prepared and issued for this purpose. Each time a physician reports a case of venereal disease the local health department sends one of these card folders, together with literature for the patient, to the physician. On these folders the physician reports sources of infection, contacts and cases lapsing from treatment. The local health department then investigates these cases. Already many infections have been prevented as a result of these investigations. These cards have also been mailed to all physicians in the state. This entire reporting system, together with printing of cards, and instructions to physicians, have been developed in the past nine months.

2. *Clinics.*—When the Bureau was established, thirty-five venereal disease clinics were reporting at monthly intervals to the state department. The number has increased to seventy-seven. The records in many clinics were found to be poor and inadequate; wide variations existed. In order to improve the standard of the records and treatment, clinic record forms were prepared, printed and made available to any clinic desiring to use them.

Many clinics were treating only patients fulfilling the requirements of residency, and in many attendance of all patients was discouraged. Almost all clinics have now adopted the policies concerning admission laid down by the Bureau of Venereal Diseases, namely:

(a) Any patient for initial diagnosis and emergency treatment.

(b) Any case referred by a private physician for special tests and consultation.

(c) Any patient honestly unable to pay a private physician for treatment. Residency requirements completely abolished.

The next step has been to improve the general standard of medical care within the clinics. The Sacramento City Health Department Clinic was selected to determine the workability of various procedures of record keeping, treatment schedules, nursing procedures, etc. A medical officer of the Bureau has been assigned to that clinic for the past three months. A complete reorganization has been effected. As a result of the fine coöperation of the city of Sacramento, the clinic has been remodeled, all admission fees abolished, all residency requirements eliminated and any patient desiring advice is courteously received. After diagnosis is made, patients that can afford private medical care are referred to private physicians.

The same general plan is being inaugurated in the Fresno County Hospital Clinic beginning on January 3, and will be extended as rapidly as possible to all clinics in the state that will coöperate with the state department.

A unique plan of supplying physicians to these clinics has been worked out with the United States Public Health Service. Young physicians are employed by the state department as probationary public health workers and assigned to these clinics to devote their full time. As soon after employment as possible, these clinicians will be given a three months' intensive postgraduate course in the clinical management and public health control of venereal diseases. It is anticipated that each year to eighteen months, a new group of physicians will be employed to replace the trained physicians who go out into practice.

The State Department of Public Health is assisting these clinics by providing equipment, clinic record forms, in some instances, drugs and personnel.

Seventy-seven clinics now reporting to the state department are administering approximately 25,000 treatments per month to indigent patients of the State of California. The report for November indicated that 25,023 treatments were given to about 11,000 patients. In these clinics, 8,186 Wassermann tests were run, 4,453 microscopic examinations for gonococcus were made, and 134 darkfield examinations for treponema pallidum were made. On a yearly basis, this will indicate approximately 300,000 tests a year. Surveys have indicated that approximately 25 per cent of cases are being treated in clinics and 75 per cent by private physicians.

3. *Nursing Personnel.*—The addition of nursing personnel to the staff to take care of epidemiological work has had to await the Civil Service examinations. Within the next month it is anticipated that twelve to fifteen such nurses can be assigned to various districts throughout the state to develop this phase of the program. Two such nurses have already been assigned to the San Francisco Health Department. Heretofore this phase of the work has been almost entirely lacking throughout most of the state.

4. *Distribution of Drugs.*—Efforts are being made to render treatment of nonclinic patients easier to obtain. Private physicians are being provided with drugs for the treatment of indigent and part-pay patients. Since July 1, sufficient medication for approximately 50,000 treatments for syphilis has been dispensed by the Bureau of Venereal Diseases.

EDUCATIONAL ACTIVITIES

Physicians.—An addressograph list of all physicians in the state has been prepared. Thus far two circular letters have gone out to physicians with enclosed cards and pamphlets.

A number of lectures have been presented before county medical society groups and there have been several showings of the United States Public Health Service film, entitled "Syphilis of the Central Nervous System, a Preventable Disease."

Pamphlets.—A series of seven pamphlets have been issued. Thus far approximately 125,000 pamphlets have been sent out from the state department. Over one-half of these have been mailed directly to individuals as a result of requests.

Lectures.—Approximately fifty lectures have been delivered by various members of the department on Venereal Disease Control.

The United States Public Health Service film, "Syphilis: Its Nature, Prevention, and Treatment," has been shown to over fifty audiences.

Pamphlets have been mailed to all libraries in the state and all have been advised to obtain copies of Dr. Thomas Parran's book, entitled "Shadow on the Land, Syphilis."

Laboratory Activities.—The activities of the state and local health department laboratories have been extended. The number of tests being run have increased by approximately 100 per cent in the past year. This same increase is reported by private laboratories.

In an effort to improve the standards of laboratory service throughout the state a service is to be developed within the state laboratory in which specimens will be sent out to various laboratories for examination and check made upon the accuracy of these examinations. This is an extension of the general policy of the United States Public Health Service in which state laboratories are subjected periodically to such checks on the accuracy of their diagnostic tests.

PLANS FOR 1938

(a) *Continuation and Extension of Clinic Plans.*

(b) *Marked Extension of Epidemiological Services.*

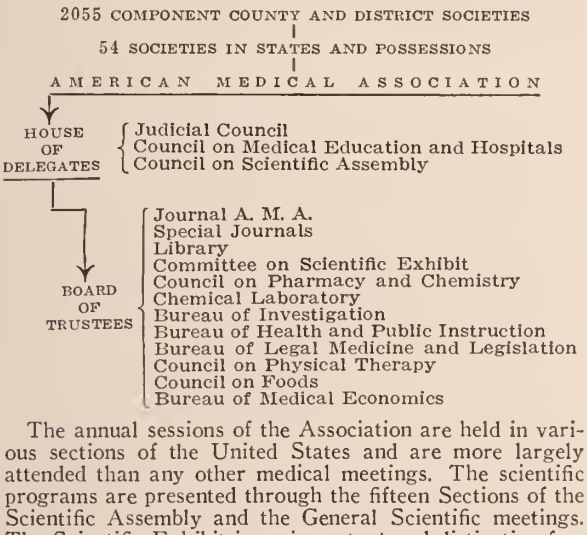
(c) *Development of Educational Centers.* Venereal disease training centers will be established and there will be an extension of training service offered to professional groups throughout the state. This applies particularly to the young physicians being added to the venereal disease bureau staff, who will receive three months of specialized training some time within the next year.

(d) *Marked Extension of Educational Program.* For the month of January an intensive educational program is being promoted throughout Southern California. A number of special posters are being prepared, particularly small enameled posters which will be distributed by the thousands throughout the state. These posters will be available for posting within the near future. There will be marked extension of lecture service, motion-picture showings and other types of educational activity.

(e) *Extension of Activities to More Rural Districts.* There will be marked extension of the program to the rural districts of the state, particularly with reference to the distribution of free drugs and arrangements for the care of indigent patients either through the establishment of clinics or through arrangements with local physicians to take care of these cases.

(f) *Seminars—County Medical Societies.* A series of seminars is already being planned for county medical society groups, to be carried on during the months of May and June. The services of Dr. Udo Wile, Professor of Dermatology and Syphilology of the University of Michigan Medical School, have been obtained for this purpose.

(g) *Surveys.* A number of surveys designed to determine the prevalence of venereal diseases have already been carried out in several counties of the state. These have indicated that there are between four and six cases per thousand of population constantly under treatment for these diseases. These services will be extended to include several of the larger cities of the state and to cover much of the rural districts of the state. They are designed to provide the department with more accurate information as to the extent of the problem and the points that can be most effectively attacked.



(h) *Personnel.* The present personnel of the Bureau is as follows: Chief of the Bureau, two medical officers, two investigators, an educational director, an addressograph operator and mail clerk, two nurses, two stenographers, and one venereal disease clinician. The personnel will be extended primarily by the addition of public health nurses and physicians. It is anticipated that some additional technicians will be employed to assist in the laboratory work.

THE INDIVIDUAL PHYSICIAN AND THE AMERICAN MEDICAL ASSOCIATION

Why a Fellow?—"Why should I be a Fellow of the American Medical Association?" "In what way do its activities affect me, the individual practitioner of medicine?"

These are fair questions. Those who have qualified for Fellowship have a right to ask for evidence that the Association is functioning actively in the interests of physicians. The following partial inventory of its activities is, therefore, presented. It shows in a brief way what the American Medical Association means to physicians individually and to the profession in general. Every physician who is a member in good standing of his county and state medical societies is a member of the American Medical Association and thus is eligible to apply for Fellowship. None but Fellows are eligible for election as officers of the Association or to participate in the work of its scientific sections.

How the American Medical Association Functions.—A large, nation-wide organization must necessarily delegate its activities to smaller bodies or to individuals. The House of Delegates of the Association determines its policies. The Board of Trustees is the governing body in the interval and is charged with the duty of administering the affairs of the Association. The various activities and the bodies responsible for each are shown in the following diagram.

The annual sessions of the Association are held in various sections of the United States and are more largely attended than any other medical meetings. The scientific programs are presented through the fifteen Sections of the Scientific Assembly and the General Scientific meetings. The Scientific Exhibit is an important and distinctive feature each year, averaging over two hundred individual and special exhibits dealing with advances in scientific medicine. The Technical Exhibit is always comprehensive and complete. Many enjoyable social functions are provided for Fellows and their wives.

The work of the American Medical Association is carried out largely through its executive officers, its various councils, its bureaus and its publications, which are described in detail in the following pages of this booklet.

The Judicial Council.—Jurisdiction on all questions of ethics and in the interpretation of the laws of the organization comes under the purview of the Judicial Council. It deals with questions involving Fellowship in the Scientific Assembly or the obligations, rights and privileges of Fellowship; controversies arising under the Constitution and By-Laws to which the Association is a party; controversies between two or more constituent associations, between a constituent association and a component society of another association, or a member or members of another constituent association; and controversies between members of different constituent associations. The Judicial Council is composed of five members, elected for five years.

Council on Medical Education and Hospitals.—This Council has brought the standards of medical education to a basis by which they are recognized throughout the world. Through its activities college entrance requirements have been raised to a reasonable point, college sessions have been lengthened, courses reorganized, better buildings and laboratories secured, better equipment provided, including libraries and museums, more and better teachers employed, better clinical material obtained and more improved methods of teaching adopted. Detailed information concerning all schools is maintained in the secretary's office. Undergraduate institutions are inspected and rated as "approved" or "not."

The Council informs physicians as to where they can secure satisfactory graduate medical courses in the various departments of medicine and surgery, whether in America or abroad.

The Council has also elaborate facilities through which detailed information in regard to all medical students and physicians is regularly collected, and kept on file. This makes it possible to recognize and support the legally and educationally qualified professional man and to expose quacks, healers, impostors, and incompetents. In short, the Council stands as a guard to keep the medical field from being overrun and discredited by entrance of the unfit. Its resources have been used with telling effect.

Another important phase of the work done by the Council on Medical Education and Hospitals is the collection and dissemination of information about hospitals. It maintains: (*a*) a list of hospitals registered by the American Medical Association; (*b*) a list of hospitals that are approved for internships; (*c*) a list of hospitals offering approved residencies in medicine, surgery, pediatrics, obstetrics, and the other specialties; and (*d*) lists of recognized schools for the training of occupational, physical therapy, and laboratory technicians. The Council also maintains standards for the approval of examining boards for the certification of specialists.

The Council will give you information about ratings of medical colleges, hospitals and other medical institutions; postgraduate courses; residencies; internships; licensure; reciprocity; information and statistics on medical education, licensure, hospitals, and technical schools.

The Council on Scientific Assembly.—This body is charged with the responsibility and duty of arranging the programs of the general meetings of the Scientific Assembly and securing coöperation between the sections. Other functions are to consider at first-hand applications for new sections or for changes in existing sections; to pass on questions of policy in relation to scientific work, and to investigate and report on scientific questions; and to appoint officers for meetings making up the section on miscellaneous topics, and for the first session of a newly established section. This Council consists of five members, each elected for five years.

Biographical Department.—Since 1905 this department has been collecting personal data regarding medical graduates and licensed physicians for a biographical card index of physicians of the United States and Canada. These records are available to all Fellows of the Association. They enable members of the profession to keep tab on location, society affiliations, specialty teaching connection and other personal data concerning colleagues. These data may be obtained either by writing to the Biographical Department or by consulting the American Medical Directory, which is issued every two years. It is a reliable, authentic register of the members of the profession.

Council on Pharmacy and Chemistry.—Through the Council on Pharmacy and Chemistry, the Association offers protection to physicians in choosing proprietary remedies. Seventeen scientific men, each an authority in his special field, make up the Council. Newly introduced medicinal preparations are considered in the light of cold, scientific evidence. The findings are reported in *The Journal of the American Medical Association* and in the book, "New and Nonofficial Remedies," issued annually. Here the physician can check up on claims made for medicinal preparations which he may be urged to use. In many cases, the Council finds that certain remedies marketed under proprietary names are no more efficacious than the established United States Pharmacopoeia products. Such products are sometimes sold at exorbitant prices, as compared with those of pharmacopoeial products. Many preparations are discovered to be irrational mixtures, many utterly inefficient for the purposes for which they were made. Fellows of the Association are privileged at any time to obtain information relative to medicinal preparations.

Council on Physical Therapy.—The Council on Physical Therapy was established with the primary purpose of gathering and disseminating such information as will assist

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 4, April, 1913

From Some Editorial Notes:

Why Not More Such Meetings?—On February 22 there was held, at Del Monte, the annual gathering of the Monterey County Medical Society and the Monterey County Bar Association. It was a good meeting, a good banquet and a very good idea inspired it; anything that will get doctors to mix with other professions, is unqualifiedly good.

In a number of counties there are good, live medical societies and bar associations; why not steal this idea from Monterey and get together once a year for a joint session of well mixed wit and wisdom? Surely we can each learn something from the other, even if it is only the fact that the other fellow is not so bad after all!

* * *

Lost Arts.—A rather interesting article, recently read, referred to the lost arts of our ancestors. No longer the housewife spins and weaves; no longer the family soap is made from the family grease and lye leached from the family ashes; no longer the candles are dipped by the hearth during the long evenings; no longer does autumn see the wonderful laying down of that immense quantity of mincemeat "like mother used to make." Passed are these things with the passing of the buffalo robe, the wild turkey and the prairie chicken. Has the art of prescription writing passed from us also? Has pharmacy taken the place of pharmacology? Have the patent office and the manufacturing pharmacologist taken the place of the thoughtfully put together prescription? Are the simple and valuable things of olden times buried out of sight by the flood of "discoveries"? For a simple "stiff neck" a quite new and wonderfully medically educated physician prescribed a new purgative, aspirin and a new lotion. Three dry cups, in ten minutes time, relieved the condition entirely. In what medical school does one find a knowledge of simple and valuable things properly expounded to the students? Is all this progress really advance?

* * *

Doctors and Lawyers.—Unfortunately, there is a very general impression in the public mind, and in the minds of a great many physicians as well, that the professions of law and medicine are very much alike, as they relate to the public in general and hence should be subjected to legislative control in quite similar ways. Even no less a person and so able a lawyer as Governor Johnson, in his message to the Legislature at its opening, voiced this thought and referred to the fact that a lawyer practicing in one state can go to another and practice with but little formality and no difficulty; he is not subjected to an examination before being permitted to practice law, so why should a physician be examined before being licensed to practice medicine? After a little thought, the fallacy of the argument in comparison becomes evident.

From an Article on "Rational Psychotherapy" by H. C. McClenahan, M.D., San Francisco.—The reasons for presenting this paper are threefold:

1. The necessity for a better and more scientific understanding generally of the principles, indications and application of psycho-therapeutic measures.

2. The disposition of many to regard attempts at such treatment as unscientific, irrational or even questionable.

3. The failure or refusal of some to use mental measures, as such, independently of, or in connection with, other treatment when indicated.

† This column strives to mirror the work and aims of colleagues who bore the brunt of Association work some twenty-five years ago. It is hoped that such presentation will be of interest to both old and new members.

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By Charles B. Pinkham, M.D.
Secretary-Treasurer

Board Proceedings

"Three reappointments and one new appointment to the State Board of Medical Examiners were announced today by the Governor's office. Named to succeed themselves for terms ending on January 15, 1942, were: Dr. Percival Dolman, San Francisco; Dr. George Thomason, Los Angeles; and Dr. C. L. Abbott, Oakland. Dr. John MacLean of Los Angeles replaces the late Dr. Harry V. Brown of Glendale. (San Francisco *News*, February 3, 1938.)

* * *

The Board of Medical Examiners held a regular meeting in Los Angeles, March 7 to 10, inclusive, 1938. Sixty-five applicants appeared for written examinations, including physicians and surgeons, chiropodists, and drugless practitioners. Twenty-one revoked licentiates applied for restoration. Three applied for modification of the terms of their probation.

Twenty-five cases were on the calendar for legal hearings. The following changes were made in the status of licentiates:

Licenses Restored

Harry Asher, chiropodist, license revoked on October 19, 1937, for practicing beyond the limitations of his certificate. Restored on March 8, 1938, and placed on probation for a period of five years. (Previous entry, December, 1937.)

James H. Beggs, M.D., license revoked on February 10, 1937, following conviction in the Pacific Coast abortion trials; restored on March 7, 1938, based upon the Supreme Court's setting aside the judgment of conviction and granting Doctor Beggs a new trial. (Previous entries, February, 1928; July, October, and December, 1936; February and June, 1937.)

Ralph A. Behrend, M.D., license revoked on October 19, 1937, based upon adjudication of insanity; restored March 8, 1938, and placed on probation for a period of five years, without narcotic privileges.

John V. Cocke, M.D., license revoked on July 10, 1935, narcotic dereliction; restored March 9, 1938, placed on probation for five years without narcotic privileges and prohibited from using intoxicating liquors. (Previous entry, October, 1934; August, 1935.)

Arthur Lee Davis, M.D., license revoked on July 11, 1933, for narcotic dereliction; restored on March 9, 1938; placed on probation for five years without narcotic privileges. (Previous entries July and August, 1933.)

Thomas Flint, Jr., M.D., license revoked on February 11, 1937, for narcotic dereliction; restored on March 9, 1938; placed on probation for a period of five years without narcotic privileges. (Previous entries, May, June, and October, 1936; February and March, 1937.)

George W. Fuller, M.D., license revoked on July 10, 1934; restored on March 8, 1938. Probation five years. (Previous entries, January, February, 1935; July, 1937.)

Darrington Weaver, M.D., license revoked on July 9, 1931 (narcotic conviction). Restored on March 9, 1938. Placed on probation for five years without narcotic privileges. (Previous entries September, 1937; July and August, 1931.)

Licenses Revoked

Sharon M. Atkins, M.D. (Medical-Chemical Laboratories, Robert Armstrong), charging of aiding and abetting an unlicensed practitioner; license revoked on March 9, 1938.

John Elmer Baker, M.D., convicted in Los Angeles insurance fraud; license revoked March 10, 1938. (Previous entries, July and September, 1927; April and December, 1928; September and December, 1937.)

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

B A X T E R ' S

INTRAVENOUS SOLUTIONS IN VACOLITERS

Here—solutions must be right

Solutions must be made sterile, yes . . . but they must *stay* sterile until your patient receives them. To assure purity and sterility in the intravenous solutions you use, Baxter's Laboratories developed the Vacoliter . . . a container specifically designed to protect its contents from the ever present hazards of contamination, deterioration and change in pH value.

A strong metal cap seals your solutions in a vacuum until you are ready to use them. No one can tamper with the closure without leaving unmistakable evidence. Once opened, a Vacoliter can never be resealed. This is an added protection against damaged fluids. This is one of the many reasons you can use Baxter's Dextrose and Saline Solutions with confidence in their dependability. They come to you after their sterility and purity have been thoroughly tested.

Only Baxter's Solutions are Vacoliter protected. Add economy to these satisfying advantages and the three basic advantages of Baxter's Solutions stand tall and obvious: They are sterile and pure; they are economical; they are *convenient to use* in the patented Vacoliter.

essential minerals and vitamins which may be lacking in less varied food supplies.

"When diets are largely made up, as is often the case in this country, of grain products, meats, fats, and sweets, they may satisfy the appetite and the traditional demand for variety, and yet fall far short of present-day specifications for satisfactory diets," said the speaker. "They may furnish plenty of protein and plenty of fat and carbohydrates in good proportions, but without liberal quantities of vegetables and fruits, and of milk in its various forms, they cannot furnish optimal quantities of some of the minerals and vitamins."

After discussing results of recent surveys of food consumption in typical groups of families in urban and rural communities, Doctor Stiebeling said that this analysis emphasizes three main points: "the need for greater purchasing power among the low income groups; the tendency of families to buy more of the protective foods and to secure better diets as the level of expenditure for food rises; and the wide difference in the nutritive quality of diets now purchased at any level of expenditure above a certain irreducible minimum."

For the country as a whole, she said, the findings of nutrition studies suggest "the allocation of a somewhat higher proportion of the income to food in view of greater appreciation of the long-time significance of dietary adequacy," and also "the more efficient use of money now devoted to food, through wider dissemination of knowledge regarding food values and nutritional needs."

Influenza.—Many are the years that have come and gone and many are the generations that have vanished since the first authentic account of an influenza epidemic was written. Mankind in that far-distant time lived in close touch with the supernatural, and old world science had no quarrel with angel or demon, so the good things of life came as reward, the evils as punishment.

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

ADAMS SPRINGS, LAKE COUNTY, CALIFORNIA

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

This belief, firmly and universally held as it was, should have tuned human behavior to an extremely high moral pitch, but history and experience show that the realization of good to follow certain actions, or even the fear of evil consequences following others, never materially changed man's way of living.

The first authentic account of an influenza epidemic was written in 1173 A. D. and since that time this, the greatest of humanity's epidemic scourges, has killed millions of helpless victims. It is estimated that in the pandemic which swept the world in 1918 and 1919 there were 200,000,000 cases and 10,000,000 deaths. In the United States alone there were more than 20,000,000 cases and 450,000 deaths. In India 4,933,132 deaths were reported from June to November, 1918.

Influenza is transmitted from person to person by the secretions of the mouth and nose by coughing, laughing,

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

(Continued from Preceding Page)

sneezing, and other means which make possible the transference of fresh virulent material from the infected person to the nasopharynx of the person with whom he is in contact.

The short period of incubation—twenty-four to forty-eight hours—and the almost universal susceptibility to the disease make the progress of an epidemic appear as an overwhelming explosive attack rather than one of communication, yet study of various epidemics has shown that the less intimate the contact and the more isolated the communities the more slowly does an epidemic travel.

Influenza spares neither age nor sex, class nor race; the rich and the poor are apparently equal in susceptibility. Practically everyone knows this and also just how it is transmitted, yet there remains a fundamental obstacle to all control measures, inasmuch as ordinarily people do little or nothing for their own protection and if precaution is taken at all it must be the affected person who exercises it. How carefully this is done may be seen by observing the run-of-mine individual with a cold. So influenza remains the one outstanding disease which proves that mass and group control can go only so far, and that, until a method of active immunization shall have been discovered, there is little chance of protection against its spread, because human nature will not change, and it is a very exceptional citizen indeed, who, when ill of the preliminary symptoms of influenza (even when he recognizes them as much), regards the safety of his neighbor as a personal responsibility. Many epidemic diseases, after sweeping through a community and temporarily exhausting the fuel that makes their progress possible, leave the victims who recover protected against future recurrence; not so with influenza; no previous epidemic prepares man to resist subsequent attack, and in fact there seems to have been an added susceptibility.

The symptoms of influenza range from those of a mild common cold to high fever, severe backache and sudden prostration, and its principal danger is the development of pneumonia as a complication. It is particularly dangerous at the extremes of life.

Precautions

Keep as far as possible from those who cough and sneeze.

Avoid unnecessary contact with those who have the disease.

Do not use drinking or eating utensils used by others unless such utensils have been thoroughly washed and rinsed in boiling water.

Avoid crowded places so far as possible.

Wash the hands frequently with soap and water.

Avoid unnecessary fatigue.

At the first sign of infection, go to bed.

Call a physician and obey orders.

Fatal Nicotine Poisoning.—The United States Department of Commerce, Bureau of the Census, records 288 cases of fatal nicotine poisoning in the United States Registration Area for the years 1930-1934, inclusive. In Portland, Oregon, over a ten-year period, according to Beeman and Hunter, there have been twenty-two deaths directly attributable to the ingestion of nicotine insecticides. The report also states that nicotine ranks fourth among the different poisons responsible for accidental, homicidal, and suicidal deaths over a ten-year period ended in September, 1936. The observations in eight necropsies are described. The essential lesions were of two types: those showing hemorrhagic gastritis, with or without the odor of nicotine, and often a brownish discoloration of the gastric mucosa, giving the picture of gastritis following the ingestion of a mild caustic; and those without gastritis, but showing an acute failure of the right side of the heart without any exact anatomic basis for death. In those cases in which an adequate history was obtained, it seemed that collapse occurred shortly after ingestion of the poison, death being deferred for from five to thirty minutes. Convulsive phenomena and a typical posture, however, were conspicuously absent. In an attempt to determine the effects of nicotine and Black Leaf 40 (a common insecticide), guinea pigs were utilized. The animals receiving Black

(Continued on Page 38)

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

II. THE BLANCH

● Previously, we have described the reasons for the thorough cleansing of raw food materials prior to canning and the methods by which such cleaning is effected. Another basic operation in the commercial canning procedures for many vegetables and some fruits, is known as the "blanch". (1)

In essence, the blanch is an operation in which raw food material is immersed in warm or hot water, or exposed to live steam. The blanch serves a multiple purpose.

First, blanching serves to soften fibrous plant tissue. By so doing, it contracts or expands these tissues and thus insures a proper final fill in the tin container. Second, during the blanch, respiratory gases contained in the plant cells are liberated. This release of gas prevents strain on the can during heat-processing and favors development of a higher vacuum in the finished product.

Third, the blanching operation inhibits enzymes naturally present in the raw foods and prevents further enzymatic action. Inhibition of enzymes—particularly those inducing oxidative reactions, yields products of superior quality and nutritive values. Fourth, the blanch may serve as an added cleansing measure and also remove "raw" flavors from certain foods. A final function of the blanching operation is to fix or set the natural color of specific products.

In commercial canning practice, blanching is usually accomplished in equipment especially designed for certain types of products. In general, the raw products after thorough washing are conveyed through water or steam by various mechanical devices capable of adjustment so as to subject the raw materials to a particular temperature for the proper period of time.

Such, in broad detail, are the purposes and mechanics of the blanch, a basic operation in many commercial canning procedures.

AMERICAN CAN COMPANY

(1) 1937 Appertizing or The Art of Canning,
A. W. Bitting,
The Trade Pressroom, San Francisco.

This is the thirty-fourth in a series of monthly articles, which will summarize, for your convenience, the conclusions about canned foods which authorities in nutritional research have reached. We want to make this series valuable to you, and so we ask your help. Will you tell us on a post card addressed to the American Can Company, New York, N. Y., what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles.

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association.

Leaf 40 exhibited a longer latent period before the onset of the convulsions, and the convulsions were of lesser intensity than in those animals receiving 40 per cent nicotine alkaloid. All died with fixation of the respiratory muscles, the heart continuing to beat. A dilute solution of sodium hydroxid adjusted to the total alkalinity of the Black Leaf 40 sample failed to produce the same severe gastric changes. It was concluded as a result of these studies that, because of the violent toxic action and ready accessibility of nicotin, commercial preparations such as Black Leaf 40 should be subject to the statutes covering the sale of poisons and their sale by nonpharmaceutical dealers prohibited. Observations of this nature should be given careful consideration in the formulation of any new food and drug acts that may be adopted.—*Journal of the American Medical Association.*

THE INDIVIDUAL PHYSICIAN AND THE AMERICAN MEDICAL ASSOCIATION

(Continued from Text Page 303)

the medical profession in determining the therapeutic value of certain devices and methods employed in the administration of physical therapy and of protecting both the public and the conscientious manufacturer against fraud and misrepresentation. The Council consists of clinicians, physicists, physiologists, pathologists, radiologists, and surgeons, each a specialist in his particular field.

Apparatus for physical therapy is considered and reported on in *The Journal.* A list of the devices that have been investigated and reported on in accordance with the Official Rules of the Council may be obtained from the office of the secretary at headquarters. A series of articles on physical therapy has been published in *The Journal.* It clearly sets forth the known merits of physical therapy and therapeutic agents. The most important articles of the series have been assembled in the "Handbook of Physical Therapy." Through these authoritative articles the Council has in a large measure divested physical therapy of the unwarranted therapeutic claims and the absurd theories with which it has been burdened.

The reports and recommendations of the Council are of great assistance to the physician in selecting efficient apparatus and methods of treatment.

Council on Foods.—The Council is authorized to utilize the influence and prestige of the American Medical Association for the establishment of truthful advertising of foods, and to act in the interest of the public on food matters. Voluntarily submitted foods, accompanied by complete advertising and information on formula of ingredients, analysis, microörganisms content, definition or specifications of raw materials used, description of manufacture, caloric value, vitamin content, and compliance with food laws, are scientifically passed upon and appraised. Foods which meet the Council's requirements as foods and which are properly advertised and promoted, are listed as "Accepted Foods." Manufacturers of "accepted" foods are privileged to display the seal of the Council on the package labels and in advertising, and are obligated to maintain their products and advertising in full accord with the Rules and Regulations of the Council.

The Council is effecting extensive changes in food advertising so that it will properly instruct the public on food values, nutrition and "health" through correct diet. The natural food values of certain foods are being protected. Decisions of the Council on its requirements for individual foods and on promotional advertising are being published to guide the food industry and advertising agencies.

From time to time the Council sponsors publication in *The Journal* of authoritative and informative monographs on various nutritional subjects.

The office of the Council receives many requests and inquiries from physicians, the food industry, and advertising agencies, and acts as a clearing house on matters pertaining to foods and food advertising. The advertising of foods in the Association's publications conform to Council decisions.

(Continued from Page 38)

Chemical Laboratory. — The American Medical Association Chemical Laboratory is a well-equipped department for the chemical investigation of newer remedies as presented to the medical profession and for various types of analyses. Much of its work is for the Council on Pharmacy and Chemistry in the evaluation and standardization of those medicinals which the Council has deemed worthy of consideration by the medical profession; in this work there is often coöperation with the manufacturer. For the Bureau of Investigation it supplies chemical data, which are incorporated in many of the "patent medicine" exposés. Original investigations along lines which will be of service to the profession at large are undertaken. It also aids *The Journal of the American Medical Association,* various organization committees, and replies to inquiries from physicians.

The Laboratory serves as a clearing house for information on the many new additions to materia medica, particularly the complex synthetics. Its value to organized medicine in America is clearly demonstrated when comparisons are made to the unscientific "chemistry" often presented to the profession in other countries which do not possess an impartial advisory laboratory. The Laboratory is so overwhelmed with requests for work that it confines its activities to those preparations which are widely advertised and to the investigation of the newer remedies for the Council on Pharmacy and Chemistry. It does no work for individual physicians and, of course, it does no commercial work. Members of the Association, however, are invited at any time to write for such chemical information as the Laboratory possesses in its extensive files.

Bureau of Investigation.—The Bureau of Investigation is a clearing house of information on "patent" and proprietary medicines, all forms of quackery, medical fads and fakes. The practical value of this material is proved by the thousands of letters of inquiry that are received annually by the Bureau of Investigation. These come from physicians and laymen in every state in the Union and from various foreign countries. Any physician desiring specific information on some preparation is urged to write to the Bureau asking for details and facts. Each letter of this kind is given careful answer, and in the majority of cases it is possible to send information on the subject of his inquiry.

Should a physician want to give a talk before a local club on some phase of the "patent medicine" evil or quackery, the Bureau of Investigation has a number of inexpensive pamphlets furnishing a wealth of material from which to prepare addresses. Also, the physician may rent lantern slides for a nominal fee that can be used effectively in illustrating talks on such subjects. In addition, there are a number of educational posters that have been prepared by the Bureau of Investigation and can be purchased at small cost. Physicians should not only take advantage of the service offered by the Bureau of Investigation, but should urge their patients who may inquire about certain "patent medicines" and quacks to write to the Bureau for information.

Bureau of Health and Public Instruction. — The Bureau of Health and Public Instruction divides its work into two principal functions: (1) service to the public through physicians and medical societies; (2) direct service to the public. The aim of both is health education of the public. Service to medical societies and physicians is rendered through personal attendance at state and county medical society meetings; reprints dealing with techniques and principles in health education; prepared radio talks available to the medical profession; loan of *Hygeia* clipping collections to aid physicians in preparing speeches, and liaison contacts with important governmental and voluntary agencies, both medical and lay, for the discussion of health policies bearing on medical practice. Service direct to the public consists in a correspondence answering 15,000 questions annually for lay inquirers; a radio network program forty weeks each year on a network of the

National Broadcasting Company; local and network radio broadcasts for special occasions; personal appearances and speeches before allied professional nonmedical groups, such as teachers; personal appearances and speeches before luncheon clubs, women's clubs and other community groups, especially high school assemblies; contributions on health topics to *Hygeia* and other reputable health magazines and lay magazines of general circulation; close coöperation with the Bureau of Exhibits, furnishing material for visual presentation; gathering and dissemination of information on public health, health education, protection of medical research, and promotion of the periodic health examination.

Bureau of Legal Medicine and Legislation.—This bureau keeps in touch with legislation and court decisions of interest to physicians. Information collected by the Bureau is available to all Fellows and members of the Association through their respective state medical societies.

The American Medical Association, however, cannot consistently with law and the ethics of the legal profession give legal advice concerning specific problems of purely personal import.

Bureau of Exhibits.—The Bureau of Exhibits has to do with the scientific and educational exhibits of the Association.

The Scientific Exhibit at the annual session of the American Medical Association covers all phases of scientific medicine, as well as the medical sciences. The exhibits are presented by leading physicians and research workers of the country, who personally demonstrate their work throughout the week of the meeting. Fellows of the Association attending the meeting may confer at length on those subjects in which they are interested.

Exhibits dealing with the activities of the various councils and bureaus of the Association have been prepared also for loan purposes to state and county medical societies or to groups approved by those societies. Some of the exhibits are strictly scientific and are intended only for medical meetings; other exhibits are of a popular nature and may be used at fairs, expositions and other places where

the public may gather. A list containing some forty subjects, with a description of each exhibit, may be had upon request.

Several motion pictures on scientific subjects are available for medical societies upon request. A list of sources of motion pictures, both for medical societies and for the public, is available.

Bureau of Medical Economics.—This Bureau was established to study all phases of general economics which have a bearing upon the practice of medicine. The Bureau is attempting to collect, tabulate, study, criticize, and to prepare for publication and distribution, data pertaining to the economics of the practice of medicine; to furnish both critical and constructive information and opinions by correspondence, conferences, and addresses on the several phases of medical economics; to encourage the adoption by individual physicians and medical societies of modern, sound, ethical business methods to urge medical schools to provide medical students with information concerning the economics of medical practice and an outline of essential business principles which should be incorporated early in individual practice.

The reports of studies conducted by the Bureau are published from time to time in the organization section of *The Journal*. Information concerning collection agencies, health and accident insurance companies, companies writing insurance against malpractice, corporations, coöperatives, associations and companies providing contract medical service, and such other data pertaining to the economics of medicine, is kept on file for answering inquiries.

American Medical Association Library.—The library of the American Medical Association is planned primarily as a reference library for the headquarters office and for rendering service to the medical profession. More than 1,300 medical journals, domestic and foreign, are regularly

(Continued on Page 46)

MATERNITY SUPPORTS

One author* writes: "A maternity corset not only aids in disguising the pregnancy figure but also is of great value in preventing a number of the complications of pregnancy. It should support the abdominal wall, the spinal column and the pelvic girdle. By supporting the abdominal wall, it holds the growing uterus in place. ... the contour of the abdomen wall will be better preserved... .With the back supported, the change in posture due to the forward displacement of the uterus is less fatiguing and many backaches are eliminated. Similarly, support of the pelvic girdle prevents sacroiliac strain with its accompanying pain and backache."

• • •

The sections of Camp prenatal supports are brought firmly about the pelvis by means of the over-strap with its buckle and lacing device. When the pelvis (the base of the body) is thus perfectly fitted, the upright sections of the support will function without undue pressure upon the abdomen or back.

The support shown is designed for all types of build: thin, intermediate and stocky.

RELIEVING THE NASAL CONGESTION DUE TO "COLDS"

The thickened, engorged nasal mucosa and the hypersecretion of the common cold account for symptoms which are most distressing to the patient.

The difficult breathing and nasal congestion can be promptly and effectively relieved by application of the synthetic vasoconstrictor—

NEO-SYNEPHRIN
HYDROCHLORIDE

(loeva-alpha-hydraxy-beta-methyl-omino-3 hydroxy-ethylbenzene hydrochloride)

Advantages of Neo-Synephrin as a nasal decongestant include:

1. No sting
2. More sustained action than epinephrine or ephedrine
3. Less toxic in therapeutic dosage than epinephrine or ephedrine
4. So stable that it may be sterilized by boiling
5. In dosage recommended Neo-Synephrin does not usually produce "nervousness" or insomnia

HOW SUPPLIED

Neo-Synephrin Hydrochloride Solution ¼% and 1% (*1-oz. bottles*)

Neo-Synephrin Hydrochloride Emulsion ¼% (*1-oz. bottles*)

Neo-Synephrin Hydrochloride Jelly ½% (*in collapsible tubes with nasal applicator*)

ACCEPTED AMERICAN MEDICAL ASSN Council on Pharmacy and Chemistry

When the Blood Pressure Falls

In acute hypotension due to shock, trauma, hemorrhage or anesthesia, especially spinal, administer

One Per Cent Solution of
NEO-SYNEPHRIN Hydrochloride

Supplied in 15-cc rubber-capped vials for subcutaneous administration.

received, many of them abstracted and indexed. The abstracts are made available to physicians through the columns of *The Journal.* An index of articles currently published, by both subject and author, is provided through the Quarterly Cumulative Index Medicus.

Reference Library Service. — Any member of the American Medical Association may use the facilities of the library, which will supply him on request with periodicals, package libraries or bibliographic service. Journals on file in the library may be borrowed for three days on request, accompanied by six cents to cover cost of postage. Through the package library service, members of the Association may secure, for temporary use, reprints of original articles on general medical subjects. A fee of 25 cents is made to cover postage.

Publishing Deparment.—By operating its own printing plant, the Association is able to furnish medical publications at a great saving. This department includes extensive type equipment, linotype machines, flatbed and rotary presses and necessary bindery machinery for producing medical journals, books, pamphlets, and supplies on a large scale, and at a reasonable cost. For example, the weekly issues of *The Journal of the American Medical Association* in one year make a total of more than 4,000 pages of reading matter attractively illustrated and well printed on good quality paper. The price is but $7, including Fellowship dues. *Hygeia,* the lay health journal, at $2.50 per year, is printed on the Association's presses and compares in typography, illustrations, and general attractiveness with other high-grade magazines. The printing department also makes possible several special journals—Archives of Internal Medicine, $5 per year; American Journal of Diseases of Children, $8 per year; Archives of Neurology and Psychiatry, $8 per year; Archives of Dermatology and Syphilology, $8 per year; Archives of Surgery, $8 per year; Archives of Otolaryngology, $6 per year; Archives of Pathology, $6 per year; and Archives of Ophthalmology, $8 per year. Journals such as these necessarily have a limited appeal and would have to carry a much higher subscription rate if printed by private concerns. This also applies to the Quarterly Cumulative Index Medicus, which gives the user a reference to practically all worth while articles currently published in the world's medical journals, yet is furnished at a price of $12 per year.

The American Medical Directory is another publication made possible by the facilities of the Association. This is issued every two years. It is a book of about 2,500 pages.

Good Reason

TO JOIN THE "CALL FOR PHILIP MORRIS"

Striking is the monthly increase in the consumption of Philip Morris Cigarettes.

Definite, tangible, proved advantages have made Philip Morris America's fastest growing cigarette.

Of no little consequence in making Philip Morris a superior cigarette is the decrease in throat irritation due to the use of diethylene glycol as hygroscopic agent.

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

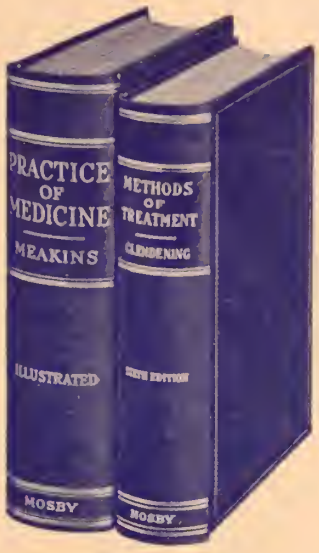
(Continued from Page 46)

and gives minute personal data on 95 per cent of the physicians in the United States and Canada and about 7,500 hospitals. It is furnished at a price of $18.

In addition to the regular periodicals issued by the Association, hundreds of thousands of circulars, reprints, leaflets, posters, etc., on medical and health topics are printed and distributed annually.

Coöperation with State Association and County Societies.—Through the office of its secretary and through its councils and bureaus, the Association endeavors to keep in touch and to coöperate with state and county medical societies for the promotion of the welfare of the individual physician.



Information Service.—The bureaus and departments of the Association reply to many thousands of letters each year, answering requests for information in which physicians are interested. Thus the various offices of the Association constitute a veritable service bureau for the benefit of its members.

Catalogue.—A catalogue and price list of the publications of the Association may be had for the asking.

Visitors Welcome.—Members and Fellows are urged to visit the offices of the Association and to look over its plant and its work.

In Conclusion.—Thus, in many ways, the Association is functioning in behalf of the individual physician. The benefits from its various councils, from its resources and its facilities are real and tangible. To take a full share in continuing and expanding its activities is the privilege of each physician who is a member, in good standing, of his county and state medical organizations. The annual dues for Fellows of the Association are $7. This includes subscription to *The Journal of the American Medical Association*. The subscribers to *The Journal* now total over 95,000. The number of physicians holding American Medical Association Fellowship cards exceeds 67,000.

WIDELY CONSULTED AUTHORITIES

POSSIBLY no medical volumes are so widely consulted by General Practitioners as Meakins "Practice of Medicine" and Clendening "Methods of Treatment." The continually mounting sales of these two books—the splendid reviews in important medical journals—their wide adoption in medical schools—the encouraging reports about them by physicians who consult them daily—is convincing proof that they are leaders in medical literature today. Both are new—Meakins was published in October, 1936—Clendening in October, 1937. Together these books make up a Library of medical information to be used daily by General Practitioners.

BOTH $3.00 A MONTH

$3.00 a month will bring you both these practical books. Use the coupon below to place your order right away. No down payment is necessary. Furthermore, the first $3.00 payment is not due until 30 days from the date of shipment.

Clendening

METHODS *of* TREATMENT

By LOGAN CLENDENING, M. D., Professor of Clinical Medicine, Medical Department of the University of Kansas. Sixth Edition. 879 pages, 103 illustrations. Price, $10.

Here is a book that gives you a different viewpoint on treatment. A book that instructs in the application of therapeutic measures and inspires greater faith in and greater respect for therapeutic means. Distinctly a book for the general practitioner, covering ALL forms of treatment . . . REST, DRUGS, DIET, HYDROTHERAPY, GYMNASTICS AND MASSAGE, ELECTROTHERAPEUTICS, RADIOTHERAPY, CLIMATE, AEROTHERAPY, HELIOTHERAPY AND PSYCHOTHERAPY.

In every case the author has kept in mind the problems of the general practitioner and encourages him to use methods and to adopt methods which he is likely to believe are effective only by what the world has come to call specialists. To make the book as practical as possible, illustrations are used to guide the physician. These illustrations are in themselves a course in therapeutics.

Texts on therapeutics and pharmacology are usually devoted exclusively to drugs. Here all therapeutic procedure is brought together within the compass of one volume. This book is primarily a comprehensive discussion, first of the many means of cure, as drugs, biologic therapy, exercise, heat, diet, cold, etc., and, second, a discussion of the treatment of specific diseases. In this discussion the why's, wherefore's, and why not's are considered and weighed in a way that shows the wide, wise and trained experience and excellent judgment of the author.

Meakins

PRACTICE *of* MEDICINE

By JONATHAN CAMPBELL MEAKINS, M. D., LL. D., Professor of Medicine and Director of the Department of Medicine, McGill University. 1,343 pages, 505 illustrations, 35 in colors. Price, $10.

With the help of this "Practice of Medicine" you can do much to improve the management and care of your patients. Throughout, the motive has been to "assist"—to help the practicing physician in solving the numerous puzzles and problems with which he is daily confronted. This "Practice of Medicine" approaches the subject from a physiological and biochemical standpoint rather than from a pathological and anatomical one. The latter, however, is not neglected. The smooth flowing style of the author, his tendency to talk "down to you," not over your head, is especially refreshing. Few books are so easily read. Pictures are an important part of this book. Meakins has diverted from the usual custom in textbooks on practice and has inserted many illustrations with the hope that these may be more informative than many words of description. This book thus becomes not only a guide to the practice of medicine, but a description of individual cases. There are 505 illustrations in the book, 35 of these being in color—A FEATURE FOUND IN FEW TEXTS ON PRACTICE.

Eliminate a "Daily Battle"!

Place: Any Doctor's Office.

Time: Any afternoon.

Scene: Mother talking to Doctor.

Mother: (in distressed tone of voice) "Billy simply refuses to take his cod liver oil—it's a daily battle, and I'm almost to the point of giving up!"

How many times has the above scene taken place in YOUR office?

By prescribing Special Morning Milk you may eliminate this "daily battle" because Special Morning Milk has no cod liver oil taste, and yet the natural Vitamin D added to each tall (13 fluid ounce) can is equivalent to that of 1¼ teaspoons of U.S.P. standard cod liver oil.

The Council on Foods of the American Medical Association has authorized the following statement: "The amount of Vitamin D added to Special Morning Milk is greater than that usually required for the prevention of rickets in normal infants and thus a margin of safety is offered when taken in the amounts customarily prescribed by the physicians." . . . therefore when "Billy," an average normal child, is placed on Special Morning Milk he unknowingly receives sufficient Vitamin D to provide a margin of safety—and thus another household "civil rebellion" is averted.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA AUTHORIZED BY THE AMERICAN MEDICAL ASSOCIATION TO MAKE THE CLAIM THAT THE AMOUNT OF VITAMIN D ADDED IS SUFFICIENT TO OFFER A MARGIN OF SAFETY AGAINST RICKETS IN THE NORMAL INFANT.
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.
- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA CONTAINING 400 U. S. P. UNITS OF ADDED VITAMIN D PER TALL (13 FLUID OUNCE) CAN OR ANY ADDED VITAMIN A. (2000 U. S. P. UNITS VITAMIN A ADDED TO EACH TALL CAN.)

No Cod Liver Oil taste in the Milk!

MORNING MILK COMPANY

STOCKTON, CALIFORNIA

Officers of the California Medical Association

General Officers

President—Howard Morrow 384 Post Street, San Francisco.
President-Elect—William W. Roblee, 202 Mission Inn Rotunda, Riverside.
Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.
Chairman of Council—Morton R. Gibbons, 350 Post Street, San Francisco.
Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.
Chairman of Executive Committee—Karl L. Schaupp, 530 Medico-Dental Building, 490 Post Street, San Francisco.
Chairman of the Committee on Public Relations—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.
Past President—Edward M. Pallette, 502 Wilshire Medical Building, Los Angeles.
Secretary-Treasurer—Frederick C. Warnshuis, 450 Sutter Street, Room 2004, San Francisco.
Editor—George H. Kress, 945 Roosevelt Building, 727 West Seventh Street, Los Angeles.
General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.
Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Morton R. Gibbons; Secretary, Frederick C. Warnshius.)

District Councilors

Lyell C. Kinney (Vice-Chairman)	San Diego	1940
Otto H. Pflueger (Secretary)	San Francisco	1940

Communications for the Cancer Commission should be addressed to the secretary, Otto H. Pflueger, M. D., Room 2004, 450 Sutter Street, San Francisco.

(Roster lists of officers of scientific section, component county societies, Woman's Auxiliary, A. M. A. delegates, special committees, etc., are continued on advertising pages 4 and 6.)

Every Product Exhaustively **TESTED!**

Physicians must have preparations the ingredients and efficacy of which are of unquestioned value. The steady growth of The Smith-Dorsey Company from 1908 is the best indication that our products measure up to these requirements.

PHARMACEUTICALS
YOU CAN PRESCRIBE WITH CONFIDENCE

Every Smith-Dorsey product is safeguarded in three ways:

1. We operate a control laboratory for the purpose of testing raw materials for purity.
2. Finished products are thoroughly tested for conformity to label statements.
3. No new products are released without subjecting them to physiological tests.

Our laboratory is modern and complete and is manned by competent university trained chemists. No expense is spared to make research complete. No preparations are ever offered the laity.

Such is the background of Smith-Dorsey products.

THE SMITH-DORSEY COMPANY, LINCOLN, NEBRASKA

ACOUSTICON
Acoustiscope

The Acoustiscope, by principle now being employed in television, gives visibility to sound and permits you to see what you hear.

We would be pleased to demonstrate this marvelous, new, scientific instrument to you, so that you may better understand the thoroughness with which we fit an Acousticon Hearing Aid to an individual person's needs.

Dictograph Products Company, Inc.

Offices in all principal cities

Summer Diarrhea in Babies.—Casec (calcium caseinate), which is almost wholly a combination of protein and calcium, offers a quickly effective method of treating all types of diarrhea, both in bottle-fed and breast-fed infants. For the former, the carbohydrate is temporarily omitted from the 24-hour formula and replaced with eight level tablespoonfuls of Casec. Within a day or two the diarrhea will usually be arrested, and carbohydrate in the form of Dextri-Maltose may safely be added to the formula and the Casec gradually eliminated. Three to six teaspoonfuls of a thin paste of Casec and water, given before each nursing, is well indicated for loose stools in breast-fed babies. Samples may be obtained from Johnson & Company, Evansville, Indiana.

Children are not born "bad"—they get that way—and the task is not to punish or discipline them, but to understand them and their problems and to direct them to a wholesome adjustment to their difficulties.

ISOPHRIN
TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

BROEMMEL LABORATORIES
FITZHUGH BUILDING
GArfield 4417 San Francisco, Calif.

ROSTER OF COUNTY MEDICAL SOCIETIES, CALIFORNIA MEDICAL ASSOCIATION

(County society secretaries are requested to promptly notify "California and Western Medicine" when changes are indicated in their roster information.)

Alameda County Medical Association
2404 Broadway, Oakland
President, Clarence A. DePuy, 230 Grand Avenue, Oakland.
Secretary, Gertrude Moore, 2404 Broadway, Oakland.
Meeting, *Third Monday, 8:15 p. m., Hunter Hall, Oakland.*

Butte County Medical Society
President, Raymond Kilduff, 322½ Meyers Street, Oroville.
Secretary, J. O. Chiapella, 131 Broadway, Chico.
Meeting, *Second Thursday.*

Contra Costa County Medical Society
President, Selby H. Marks, Grabstein Bldg., Pittsburg.
Secretary, Thomas J. Dozier, 202 G Street, Antioch.
Meeting, *Second Tuesday, 8 p. m.*

Fresno County Medical Society
President, Henry A. Randel, Box 2308, Fresno.
Secretary, Lester R. Nielson, 1006 Mattei Bldg., Fresno.
Meeting, *First Tuesday, University-Sequoia Club, Fresno.*

Humboldt County Medical Society
President, Francis M. Stump, Crescent City.
Secretary, Lawrence A. Wing, Fifth and F Streets, Eureka.
Meeting, *First Thursday.*

President, Charles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

(Roster lists continued on advertising page 6)

What have you to gain by prescribing S. M. A.?

In feeding infants deprived of breast milk, you have available a number of products capable of producing apparently satisfactory results. Why, then, should you choose S. M. A.?

Here are advantages thousands of physicians have found in prescribing S. M. A.—

- S. M. A. produces excellent nutritional results simply and quickly.
- S. M. A. is simple to prescribe and simple for the mother to prepare. You both save time and avoid exacting detail.
- S. M. A. is antirachitic and antispasmophilic. An ample quantity of cod liver oil has always been included in S. M. A. making it unnecessary to prescribe additional vitamin D activity.
- S. M. A. is produced from tuberculin-tested cows' milk, under laboratory control, by a firm of nutritional specialists.

Convince yourself. Prescribe S. M. A. and compare the results with your present methods. You will find, as have thousands of other physicians, that S. M. A. offers added advantages to you, to the mother, and to the infant.

S. M. A. is available at almost every drug store in the United States.

S. M. A. is a food for infants—derived from tuberculin-tested cows' milk, the fat of which is replaced by animal and vegetable fats including biologically tested cod liver oil; with the addition of milk sugar and potassium chloride; altogether forming an antirachitic food. When diluted according to directions, *it is essentially similar to human milk* in percentages of protein, fat, carbohydrates and ash, in chemical constants of the fat and in physical properties.

ACCEPTED AMERICAN MEDICAL ASSN.

S. M. A. CORPORATION - - CLEVELAND, OHIO

Get Acquainted with these MOSBY *Publications*

AT THE SAN FRANCISCO MEETING OF THE A. M. A., JUNE 13–17, 1938

We are looking forward to seeing YOU and your friends at the San Francisco session of the American Medical Association, June 13–17. Make the Mosby Booth—No. 93—your headquarters during this convention. For your convenience there will be comfortable chairs where you can rest—or browse through the new medical literature that will be on display. Courteous attendants will be on duty at all times to serve you.

THE C. V. MOSBY COMPANY

BOOKS . . .

The HEART *in* PREGNANCY

An inquiry into the relationship between the heart and pregnancy. By JULIUS JENSEN. 370 pages, 5 illustrations. Price, $5.50.

Symptoms of VISCERAL DISEASE

A study of the vegetative nervous system in its relationship to clinical medicine. By FRANCIS M. POTTENGER. New Fifth Edition. 442 pages, 87 illustrations, 10 color plates. Price, $5.00.

HEMORRHOIDS

Includes the details of the injection treatment — and accepted operations. By MARION C. PRUITT. 170 pages, 73 illustrations. Price, $4.00.

NEURO-OPHTHALMOLOGY

Bridges the gap between neurology and ophthalmology, showing the necessity for — and the benefits of — coöperation between the ophthalmic surgeon and the neurologist. By R. LINDSAY REA. 568 pages, 141 illustrations, 19 color plates. Price, $9.00.

WOMAN

An historical, gynecologic and anthropological compendium covering all that is known of feminine structure, function, and occupation, both normal and abnormal. By PLOSS AND BARTELS. In 3 volumes. 2018 pages, 1002 illustrations. Price, per set, $50.00. Terms: $5.00 with order, $5.00 per month.

OPERATIVE SURGERY

The experience and advice of men who meet surgical problems in the operating room and solve them with knife, ligature and clamp. By J. SHELTON HORSLEY and ISAAC A. BIGGER. In two volumes. 1387 pages, 1259 illustrations. Price, $15.00.

MACLEOD'S PHYSIOLOGY *in* MODERN MEDICINE

Brand new—and balanced in its discussion of pure physiology in its relation to clinical medicine and surgery. By PHILIP I. BARD. 8th edition. 1051 pages, 355 illustrations. Price, $8.50.

Diagnosis of ACUTE SURGICAL DISEASES *of the* ABDOMEN

Every proved means of diagnosis of the acute surgical diseases of the abdomen is arranged concisely and completely. By JOHN A. HARDY. In preparation. About 500 pages.

JOURNALS

SURGERY

SURGERY is characterized by independence of expression, authoritativeness, thoroughness, comprehensiveness and conciseness. Published monthly. $10.00 a year.

AMERICAN JOURNAL *of* SYPHILIS, GONORRHEA *and* VENEREAL DISEASES

The only American publication devoted exclusively to the study of the venereal diseases. Published bi-monthly. $7.50 a year.

JOURNAL *of* LABORATORY *and* CLINICAL MEDICINE

Edited for specialists in internal medicine, public health physicians, pathologists, laboratory technicians and general practitioners. Published monthly. $8.50 a year.

AMERICAN JOURNAL *of* OBSTETRICS & GYNECOLOGY

Offers complete coverage on all the developments constantly being made in these important fields in America. Published monthly. $10.00 a year

AMERICAN HEART JOURNAL

Recently expanded from a bi-monthly to a monthly publication this journal gives complete coverage on all diseases of the circulatory system. Published monthly. $8.50 a year.

JOURNAL *of* ALLERGY

Adequate coverage on allergy can be found only in this journal which records the new advances constantly being made in this field. Published bi-monthly. $7.50 a year.

JOURNAL *of* PEDIATRICS

Besides publishing many important original contributions to pediatrics every year, and hundreds of abstracts from the literature of all languages, the journal publishes the discussions of the American Academy of Pediatrics. Published monthly. $8.50 a year.

JOURNAL *of* THORACIC SURGERY

Presents full particulars of the diagnosis, surgical technic, and after-management of thoracic cases. Keeps you abreast of the developments being made in this field. Published bi-monthly. $7.50 a year.

. . . BOOKS

Management of the SICK INFANT & CHILD

This new edition is really a new book, entirely recast, printed from new type. Enlarged to include the Child as well as the Infant. By LANGLEY PORTER and W. E. CARTER. Fifth edition. 874 pages, 94 illustrations. Price, $10.00.

HERNIA

A complete treatise on hernia, its diagnosis and treatment. By LEIGH F. WATSON. 591 pages, 281 illustrations. Price, $7.50.

Textbook of HISTOLOGY *for* MEDICAL STUDENTS

In this book cells are considered first, then tissues, and lastly organs. By EVELYN E. HEWER. 365 pages, 340 illustrations. Price, $4.50.

Textbook of OPHTHALMOLOGY

Volume I covers development, form and function of visual apparatus. Volume II covers clinical methods of examination, congenital and developmental anomalies, general pathological and therapeutical considerations, diseases of the outer eye. By SIR W. STEWART DUKE-ELDER. Vol. I, 1124 pages, 1022 illustrations. Price, $15.00. Vol. II, 970 pages, 742 illustrations. Price, $15.00.

OPERATIVE GYNECOLOGY

Devoted exclusively to treatment, this book presents fully the technic of all operations. By H. S. CROSSEN and R. J. CROSSEN. Fifth edition. 1076 pages, 1264 illustrations. Price, $12.50.

PRACTICE *of* MEDICINE

The Practice that is illustrated. By J. C. MEAKINS. 1343 pages, 505 illustrations, 33 in colors. Price, $10.00.

MEDICAL BACTERIOLOGY

This text applies the fundamentals of bacteriology to the medical side of the subject. By R. W. FAIRBROTHER. 437 pages. Illustrated. Price, $4.50.

ALLERGY *of the* NOSE *and* PARANASAL SINUSES

A book of vital interest to the Otolaryngologist, Ophthalmologist, Internists, Pediatrist, Allergist and Gastroenterologist. By FRENCH K. HANSEL. 820 pages, 58 illustrations, 3 color plates. Price, $10.00.

The C. V. MOSBY COMPANY, 3525 Pine Boulevard, St. Louis, Mo.

$3.00 A MONTH

These publications may be purchased on the PAY-AS-YOU-READ plan. Under this arrangement you get the books and journals you need and pay for them at the rate of $3.00 a month. To take immediate advantage of this plan use the coupon at the right.

Gentlemen: Send me the following Mosby publications:

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers. and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

MEDICAL EXECUTIVE OFFICER — 345 West 50th Street, New York City

MULFORD COLLOID LABORATORIES

H. K. MULFORD, Founder

RHUS VENENATA ANTIGEN

(Poison Oak Antigen)

Williams and MacGregor report "The most striking feature was the rapid improvement, usually after a single dose . . ." In their series of twenty-six patients from the New York Skin and Cancer Hospital, only one patient failed to show improvement until the third dose was given. Williams concludes, "The results to be obtained by this method are nothing less than brilliant."

The Antigens reported by Strickler, Williams, MacGregor, and Bivings are made exclusively by The Mulford Colloid Laboratories, U. S. Government License No. 102, and are accepted by The Council on Pharmacy and Chemistry of The American Medical Association.

The Fly in History.—It was at the close of a summer day in the year 442, A. D. Lysippus, a battle-scarred old noble of the emperor's household, had just been condemned to die. This is the reason:

The emperor, Theodosius, had wed, one year ago this day, Eudocia, the learned and beautiful daughter of Leontius, the sophist, and the anniversary banquet had been in progress all the hot and sultry afternoon.

About the festal board were many guests. There were many attentive slaves, there were numerous watchfully waiting, active dogs, and there were flies! There were flies in myriads.

Fiery old Lysippus, whose head was thatched with practically nothing but the impalpable laurels he had won in the wars, finally driven to desperation by the buzzing pests, brought down a broad, weighty palm on his smooth and glistening dome, and three perfectly good flies passed to the great beyond.

Up 'rose Eudocia horrified; up 'rose Theodosius, dignified. Lysippus grinned; that finished him.

These people were good Christians; they did not worship flies, but it had been distinctly made known at Eudocia, greatly versed in the lore of Greece and Rome, in astronomy, in astrology, rhetoric, logic and what not, desired, and in fact demanded that flies be carefully protected throughout the empire. She knew flies.

She had proved by logic that the fly was the friend of man, because, where men most congregated, there were found most flies; where filth was most abundant, there were flies most busily active as scavengers in man's service, etc.

No one could outargue Eudocia. And, above all, there was the mysterious, magical origin of the fly which placed it as a creature apart. The fly suddenly popped forth fully developed into energetic existence apparently from nothing at all or perhaps from a little slime or mud by some sort of spontaneous generation, an origin accorded no other living thing except possibly the frog, toad, and snake. Eudocia had her doubts about these; they were not useful anyway. However, let us be sorry for old Lysippus; he lived and died too soon.

We now know there is nothing mysterious about the origin of flies. If flies are about, there is filth somewhere in the neighborhood because the eggs from which flies hatch are incubated in filth. Filthy places are the fly's habitat by preference, and filth provides his natural sustenance. If there is any reason for a fly's existence it is not known, unless it may be as Blinkowitz suggests in his treatise *The Friendly Fly*: "The fly's existence may be justified by the possibility that, as nature has so kindly fitted him out as an ideal germ carrier and distributor; man, having knowledge of this, may be led to clean his premises."

The fly's chief business activities are apparently propagation and the dissemination of the germs of typhoid fever, tuberculosis, summer diarrhea, diphtheria, erysipelas, anthrax, conjunctivitis, and gangrene. It might be mentioned, also, in the fly's favor: he is dipterous—two-winged; if he had more wings, he would get over more territory, be more filthy, and do more damage by carrying more germs.

The female fly carefully deposits about 150 eggs, and with an uncanny certainty places them just where they will best incubate—in decaying organic matter. There is an interval of but ten to twelve days from egg to adult fly, so the female fly of April may reasonably expect to have quite a few busy descendants by the time July and August roll around.

Look at the fly you are entertaining at lunch today, and ask yourself where he or she has previously dined, then calculate the number of undesirable germs and the varieties of unmentionable filth particles his or her descendants may carry to your family when summer days arrive.—*Ohio Health News.*

Coincident with the thoughts of preventing the demonstrated deficiency diseases through adjusted nutrition, it has been realized that the human organism in its highest state of nutritional fitness furnishes strong resistance against the attack of infectious diseases. Personal hygiene, also, in its various phases has been found to be a strong ally of nutrition in this respect, so that the two may be considered complementary.—The Health Officer.

For recurrent styes, boils and carbuncles—

STAPHYLOCOCCUS TOXOID

Lederle

AN EVER-INCREASING AMOUNT of clinical evidence confirms the efficacy of Staphylococcus Toxoid in the treatment of severe, recurrent styes, boils and carbuncles. Beneficial results with this antigen have been recorded in the treatment of pustular acne as well.

Staphylococcus Toxoid is a safe antigen. When doses are adjusted by skin tests as described in the package circular, immunity may be built up without eliciting severe reactions.

There is generally a prompt rise in the antitoxic titer, demonstrable and measurable by laboratory procedures.

Packages:

5 cc. vial (Dilution No. 1) 100 units per cc.
5 cc. vial (Dilution No. 2) 1000 units per cc.
Diluting fluid 4.5 cc. in vial (convenient for making 1:10 dilutions where very small doses are desired).

Handbook on Eye Hazards in Industry Available at Specially Reduced Price.—To secure wider distribution of its book on "Eye Hazards in Industrial Occupations" by Louis Resnick and Lewis H. Carris, the National Society for the Prevention of Blindness, Inc., 50 West Fiftieth Street, New York City, is now offering copies at the special price of fifty cents each as long as the supply lasts. This book, which sold formerly at the actual cost price of $1.50 was published in 1924. Although some of the photographs show safety devices which have since been improved upon, the contents remain a valuable guide to safe practices in industry.

The volume contains 247 pages, and includes fifty-nine illustrations dealing with the safeguarding of eyesight in factories, mines, shops, and offices. Orders or inquiries concerning this volume should be addressed to the National Society for the Prevention of Blindness, 50 West Fiftieth Street, New York City.

The inventors of the alphabet could not have foreseen the odd uses to which their signs and symbols would some day be put: how a man might read to take his mind off a mortgage, to make a journey seem shorter, to kill ennui, to rest the mind after an emotional storm, or to lull himself to sleep at night. If you would develop powers, read not often merely to pass the time, for listless reading breeds a poor memory.

3 Distinct Advantages

WITH THIS

THREE-VIAL PACKAGE

For the prophylaxis of Spring hay fever caused by grass pollens, the physician will find the 3-vial package—"Grasses Combined" Pollen Extract Squibb—a very desirable preparation.

IT IS CONVENIENT—no diluting nor mixing—just withdraw the required dosage from the vial and inject.

IT IS ECONOMICAL—there is enough solution in the 3-vial package for 19 doses for one patient—and it costs the physician only six dollars.

IT PERMITS FLEXIBILITY—which enables the physician to adjust the dosage in accordance with the patient's requirements.

The 3-vial package—"Grasses Combined"—supplies a total of 39,000 protein nitrogen units and contains equal parts of extracts from the pollens of Bermuda grass, June grass, orchard grass, red top, and timothy.

"Grasses Combined" Pollen Extracts Squibb are also available in 5-cc. vials and 15-dose Treatment Sets. The 5-cc. vials of "Grasses Combined" or of the individual extracts can be used with the Squibb Special Diluent Package (50% sterile glycerin solution) to prepare simple and stable solutions of pollen extracts as needed. A large assortment of Diagnostic Pollen Extracts is supplied in capillary tubes for skin-test purposes.

For literature giving concise and simplified dosage schedules, geographic pollen distribution, and information concerning the Squibb line of Pollen Extracts, address Professional Service Department, E. R. Squibb & Sons, 745 Fifth Avenue, New York City.

CLINICAL ALLERGY

Due to

Foods, Inhalants, Contactants, Fungi, Bacteria and Other Causes

MANIFESTATIONS, DIAGNOSIS AND TREATMENT

By ALBERT H. ROWE, M.S., M.D.
Lecturer in Medicine in the University of California Medical School, San Francisco, California, etc.

Octavo, 812 pages. Cloth, $8.50, net.

This book embraces the entire field of clinical allergy, considering every recognized cause of hypersensitiveness. It includes the material of the author's previous work on food allergy, revised in the light of his later experience. It shows the true nature of allergy, the tissues involved, and the best ways of diagnosing them and treating them. Symptoms are fully described and extended menus for adults and children at various ages, and new general menus are included in the appendix.

This is the drink that studied NUTRITION

look at its laboratory report card

	1 Ounce of Cocomalt adds	1 Glass of Milk (8 Liquid Ozs.) contains	Thus, 1 Glass of Cocomalt and milk contains
†IRON	0.005 GRAM	*TRACE	0.005 GRAM
†VITAMIN D	134 U.S.P. UNITS	*SMALL AMOUNT; VARIABLE	134 U.S.P. UNITS
†CALCIUM	0.15 GRAM	0.24 GRAM	0.39 GRAM
†PHOSPHORUS	0.16 "	0.17 "	0.33 "
PROTEIN	4.00 GRAMS	7.92 GRAMS	11.92 GRAMS
FAT	1.25 "	8.53 "	9.78 "
CARBOHYDRATES	21.50 "	10.97 "	32.47 "

★*Normally Iron and Vitamin D are present in Milk in only very small and variable amounts.*

† *Cocomalt, the protective food drink,* is fortified *with these amounts of Calcium, Phosphorus, Iron and Vitamin D.*

With a "report card" like this, it's no wonder that Cocomalt has won wide acceptance among Physicians and Hospitals as the *protective food drink.* Each ounce-serving provides vital food essentials commonly lacking in the normal diet. But more. Cocomalt goes two careful steps farther.

Insuring that the *extra* Calcium and Phosphorus in Cocomalt will be readily "available" to the patient it also provides a clinically measured quantity of Vitamin D, derived from natural oils and biologically tested for potency. And to make sure that the 5 milligrams of Iron present in each ounce-serving of Cocomalt is "effective", that Iron is biologically tested for assimilation.

3 TIMES A DAY WITH MEALS. Many Physicians have commented favorably on the "prescription" advantages of Cocomalt. With it, patients can *drink* the nutrition they need. As a beverage, Hot or Cold, Cocomalt has a distinctive flavor, appeals to young and old alike. It combines to add milk to the dietary.

Cocomalt is inexpensive. Obtainable in ½-lb., 1-lb., and the economical 5-lb. hospital size purity-sealed cans at grocery and drug stores.

Cocomalt is the registered trade-mark of R. B. Davis Co., Hoboken, N. J.

BOOK REVIEWS

Management of the Sick Infant and Child. By Langley Porter, M. D., and William E. Carter, M. D., both of the University of California Medical School. Fifth revised edition. Cloth, 874 pages. Price, $10. C. V. Mosby Company, St. Louis.

There is made available in this fifth revised edition of an appreciated text, modern principles related to the management and care of the sick infant and child. It is indeed a welcome addition to the literature. It will be welcomed also by many students and practitioners.

The authors have acknowledged the assistance rendered in writing the text by a distinguished group of associates of the University of California Medical School.

The field is covered thoroughly and in a manner that leaves little, if any room for disappointment. It is specific in discussion and advice. Extended comment on methods of treatment constitute a valuable feature. It should serve as a guide and reliable reference, and be of material assistance when confronted with complex problems encountered in the sick child.

Hernia. By Leigh F. Watson, M. D., Los Angeles, California. Second edition. Cloth, 591 pages. Price, $7.50. C. V. Mosby Company, St. Louis.

This text, and it is an excellent one, presents the important features of the anatomy, etiology, symptoms, diagnosis, differential diagnosis, prognosis and treatment of hernia. Mention should also be made of the concluding chapter, the medical legal aspects of hernia which is well to the point.

A well tempered, but nevertheless thorough chapter presents the indications and technique of treatment of certain types of hernia by the injection method.

Illustrations are well selected and are of a type that increases the value of the text. Subjects are well selected, impress by the clarity of the text, and emphasize basic important features.

All in all the author has furnished a text and guide that will be most helpful to surgeons and physicians. Unreserved recommendation is given for this book, is wholly consistent, and based on sound principles.

BOOK REVIEWS

(Continued from Page 16)

Workbook in Elementary Diagnosis. By Logan Clendening, M. D., University of Kansas. Cloth, 167 pages. C. V. Mosby Company, St. Louis, Mo.

This is a teaching guide for history recording and physical diagnosis. A satisfactory outline for students and clinic clerks.

Hemorrhoids. By Marion C. Pruitt, M. D., Atlanta, Ga. Cloth, 170 pages. Price, $4.00. C. V. Mosby Company, St. Louis, Mo.

An excellent monograph, well illustrated and comprehensive in text. Should be helpful to the general practitioner as a guide in treating this condition under sound principles. Merits general endorsement.

Symptoms of Visceral Disease. By Francis Marion Pottenger, M. D., F. A. C. P., Pottenger Sanitarium, Monrovia, California. Cloth, 442 pages, fifth edition. Price, $5.00. C. V. Mosby Company, St. Louis.

This author will arrest the attention of his many California as well as national friends and confreres who recognize him to be an authority of experience on any subject that he discusses.

In this monograph, the first edition appearing in 1919, there is presented a study of the vegetative nervous system in its relationship to clinical medicine. Pottenger presents interpretations in terms of visceral neurology of the symptoms which are found in visceral disease. He demonstrates how pathological changes in one organ affect other organs.

Little more need be said. Every earnest physician will find this monograph to be of great assistance to him. It merits a place in every medical library and should be consulted frequently.

Insure Your Health With the Sun

Smart men and women realize that good health is a blessing not to be taken for granted, know that an occasional week or two under a friendly sun at debonair Del Monte is the best health insurance of all. The premiums are modest, the returns many. Wander as you will over this 20,000 acre playground. Play four championship golf courses (including Pebble Beach!) ... discover the quiet beauty of bridle-pathed, pine-scented forests ... explore sea-sprayed rocks that front the Western shore ... wander Spanish Monterey's storied streets. Play hard or loaf long.

TWENTY-FIVE YEARS AGO

(Continued from Text Page 392)

stetrics) and Murphy (of *Murphy's Clinics*)—or should it be Murphy and Martin?—started the game and have skillfully encouraged the ambition to belong to something and decorate one's name with letters. How are the honored ones to be chosen? From the subscription lists of *Murphy Clinics* and *Surgery, Gynecology and Obstetrics*? Or shall the applicant merely have to attend and register at one of these huge surgical Martin-Murphy clinics?

* * *

Wassermanns and Wassermanns.—Judging from the circulars sent out by various laboratories, it would seem as if the price of Wassermann reactions had at last reached a sane level. The high prices asked by some serologists a couple of years ago have undoubtedly led to the sprouting up of a number of new laboratories. The reduction in price will permit far more frequent tests than heretofore.

* * *

Improving Medical Education in the United States.—At the time of writing, the state legislature has before it a number of bills, all destructive of the present medical law and not evidencing any proper compensatory constructive intent. Moreover, the administration itself is favorable to changes in the law which will lessen, in great measure, its value to the people. Finally, the people themselves, they who are the most interested in a proper medical law whether they acknowledge it or not, are quite indifferent to their own fate in the premises.

This puts, in a very few words, the *status præsens* in California and the prospect is not a satisfactory one. It is, then, a great relief to turn to the current annual report of the president of the Carnegie Foundation and to read his review of the general medical situation in the United States and in Canada, and see what has been gained and how much it is, and how really nothing has been lost in the wider field which must include the narrower.

Statistics are said to be just as truthful as facts, and so these statistical facts are quoted in full: "The total of 166 schools of all kinds existing in the United States and Canada in June, 1904, has in eight years decreased to 117 in 1912. Homeopathic schools, of which there were twenty-two in 1900, have now fallen to ten; eclectic schools from ten to six; the physiomedical schools have entirely disappeared. The total student enrollment, which reached 28,142 in 1904, has now declined to 18,412. As the student bodies of the higher grade schools have steadily advanced in numbers, this considerable decrease has taken place precisely where in the public interest it should take place, namely, in the weaker schools. It is thus obvious that the destruction of one inefficient school does not merely result in increasing the enrollment of another; it actually and absolutely keeps a certain number of unfit men out of the profession." The "negative character"—as it is called in the report—of these facts does not detract one whit from their having a positive value in indicating the trend of events. Leaving present forces undisturbed to continue this work and making "sure that standards are genuine rather than higher" in the immediate future will accomplish what is needed quite regardless of any vagaries of any state legislation.

From an Article on "On the Relation of the Academic Medical School to the Medical Community" by H. C. Moffitt, M. D., San Francisco.—It is unfortunate for us all that engagements of President Wheeler prevent his being here this evening—it is for you particularly unfortunate that I have been selected to speak in his place. We shall reach a better understanding if, at the start, it is determined what is meant by an "Academic Medical School." It is a question that has been discussed in detail by such men as R. M. Pearce, Cabot, Edsall, Huntington, Barker, Hewlett, and that is, in some of its aspects, familiar to you all. For some years it has been a fact generally accepted that the work of the first two years in medicine must be in the hands of men who could devote all their time to their special de-

(Continued on Next Page)

Oxygen Therapy in Cardiac Trouble

It may surprise you, as it did us, to know that about half of the oxygen tents we are furnishing are used in cardiac trouble.

This wider field for oxygen therapy makes our service of even greater value to you. As the largest independent manufacturer of oxygen in California, we have developed an unsurpassed service for hospitals and for private use.

From four cities where there are Stuart establishments —San Francisco, Oakland, Fresno, and Los Angeles— we furnish oxygen and the most approved type of tents.

This service never sleeps — not even on holidays. Trained men answer your call immediately. They install the equipment, check it to assure performance, and give your nurses the simple instructions that are necessary.

Recognizing our responsibility in offering this service, we have given it specialized supervision and training so as to maintain it on the highest professional standard.

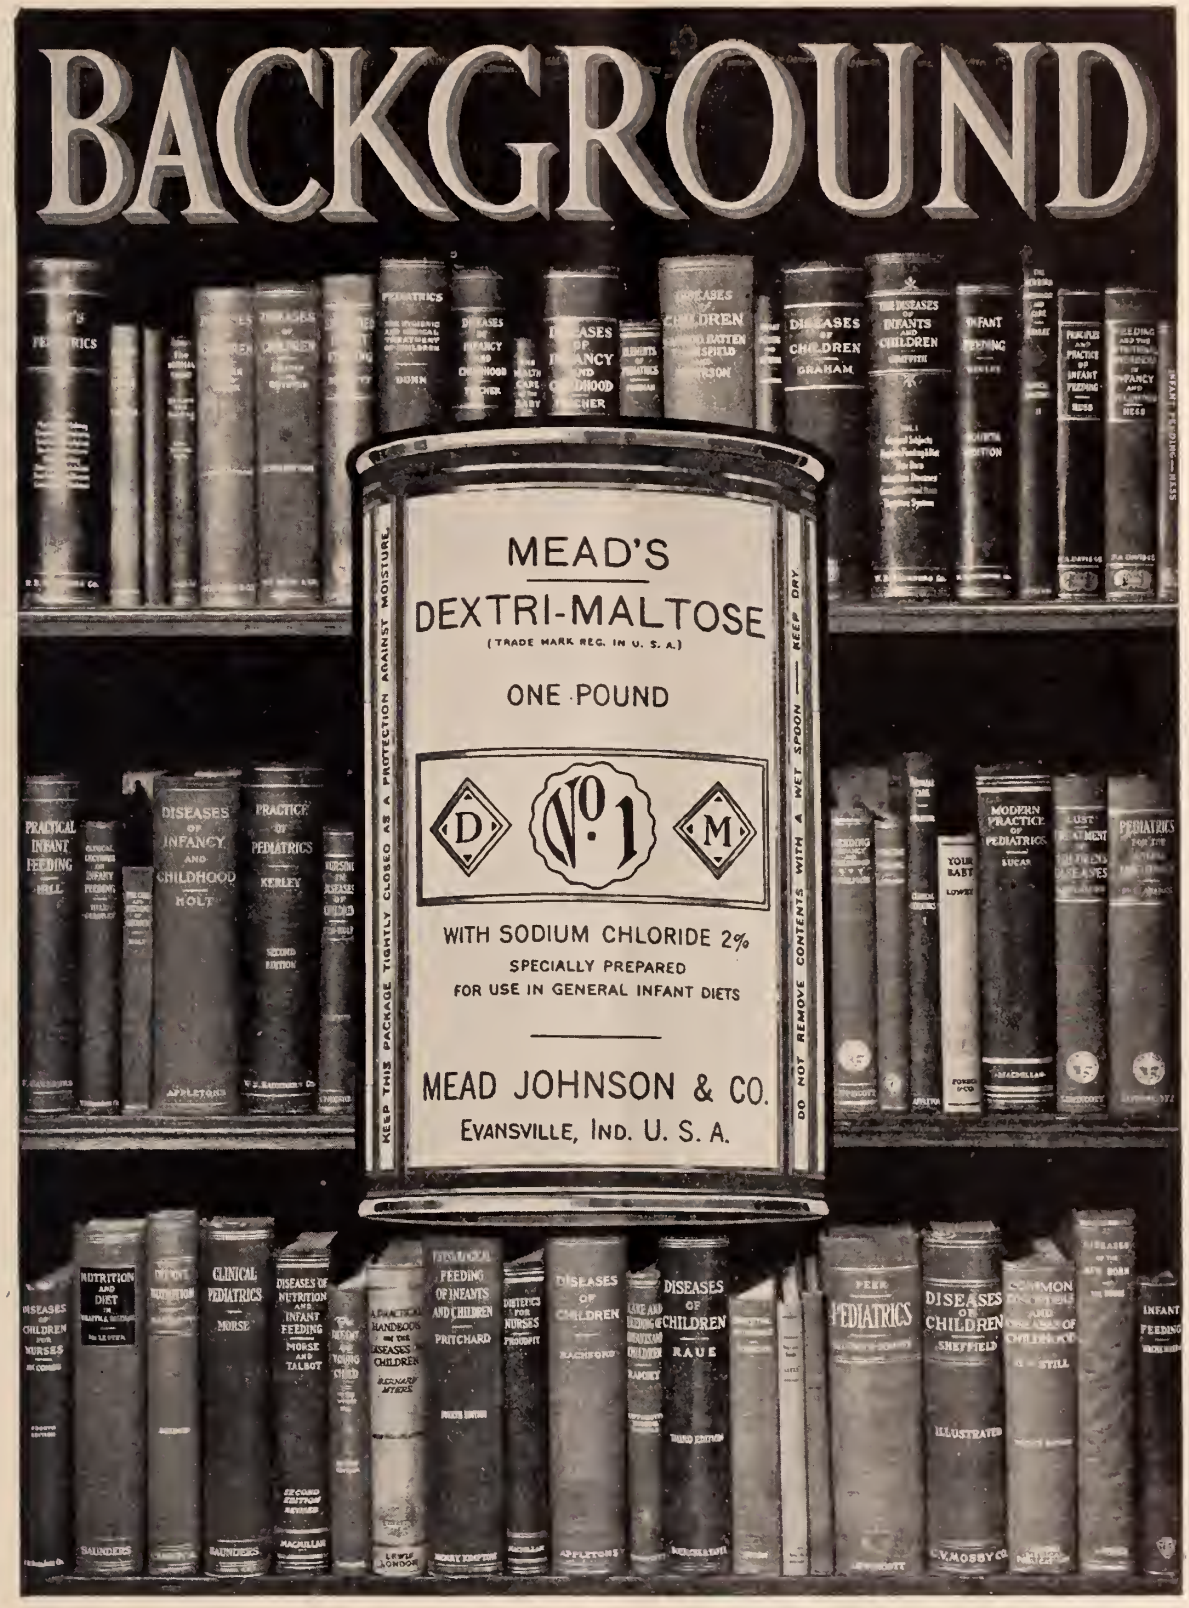
TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

partments—unhampered by the cares of practice—men who would be teachers but above all investigators, active in the advancement of medical development and knowledge. With the acceptance of this fact began the passing of the proprietary school; no institution dependent upon fees of students alone can long furnish the right men and proper equipment for the work and laboratories of the first two years. With the advances in student preparation and the standards of the first years in medicine, with the tremendous widening of the whole medical horizon, it soon became apparent that instruction in the so-called scientific branches was developing faster than the teaching of the clinical years, sometimes developing even at the expense of the clinical years. The gap widened between "scientific" and clinical departments, and it became necessary to find men with more time to devote to the development of the clinical years. It was realized that, as soon as practical, clinical teachers must be paid for part or for all their time, that the practicing physician could no longer cope unaided with the situation, that the last years of medicine needed the special teacher, organizer, investigator, even more than the first.

DISCUSSION

President Jordan: You understand, of course, that I am a medical impostor, so do not expect me to tell active physicians anything of medicine they do not already know. I took my medical degree with Harvey Wiley thirty-seven years ago, when bacteriology had not escaped from the Greek Lexicon, when germs and microbes were undreamed of, when pharmacology was a branch of metaphysics; and obstetrics and surgery had neither anesthetics nor antiseptics to aid in their successful work.



I am going to speak most of the time about something else, but I want to say first that I am in the fullest accord with everything that Doctor Moffitt has said. . . .

Dr. A. A. D'Ancona: The development of medicine and of medical education in California is illustrated by the appearance of President Jordan here tonight. I remember some years ago, when our medical school was merely allied to the University, I met a regent one day—Arthur Rodgers, now dead—who took pride in the statement that the Board of Regents had kept faith with the medical faculty and had never interfered in any medical affairs. . . .

Dr. R. L. Wilbur: I took it for granted that between Doctor Moffitt and President Jordan all of the essential features would be taken up, and now that Doctor D'Ancona has presented the more idealistic point of view there is very little left for me to say. It interested me very much to hear that Doctor Moffitt has come to believe that such a department as that of internal medicine must, in the University Medical School, be controlled by individuals who devote all their time to the development of medical teaching and research. . . .

Dr. D'Arcy Power: The only value of anything I can say is perhaps dependent upon the fact that for a long time I have had a reasonable opportunity of watching a large number of men who have been trained in the different medical schools and who have sought to pass our State Board examinations. Thus I know fairly well the ways in which medical education has failed. It is by noting the failures that we can make something like provision for better conditions in the future. It has been my privilege in the last three years to know fairly well the mental make-up and

(Continued on Page 22)

Not a baby food, but part of a flexible system of infant feeding

Mead's Dextri-Maltose owes its wide use and acceptance by physicians to its inherent merit as a carbohydrate well tolerated by infants, and to the fact that it is a part of a flexible system of infant feeding in which the art and science of the physician, rather than the artifices of any manufacturer, predominate.

TWENTY-FIVE YEARS AGO

(Continued from Page 20)

educational equipment of something like two hundred men from all kinds of colleges, from the worst to the best. Certain facts have come out so clearly that I am convinced that they are of primary importance.

Dr. Richard C. Cabot, Boston: The question is, I believe, of the rightful relation of an academic clinic to the medical profession and to the general public.

In the first place, what can the clinic do for the doctor? . . .

From an Article on "Treatment of Spiral Fractures of the Tibia" by Charles G. Levison, M. D., San Francisco.—The object of this paper is to lay down specific rules for the treatment of spiral fractures of the lower third of the tibia. The subject is of great importance, for the condition is one of the most difficult to treat in the category of fractures. . . .

From an Article on "A Physician's Vacation" by Douglass W. Montgomery, M. D., San Francisco.—It was urged recently in an editorial in this JOURNAL that every physician should take a holiday, else he might become a "stale" doctor: A stale medical man in these aseptic and bustling times would be a grave misfortune, especially to the "stale" one. Shortly before the appearance of the aforesaid editorial I, with my wife and daughter, went on a health-seeking expedition into the Sierra Nevadas, and behold some of the experiences that we underwent there. . . .

From an Article on "Acute Poliomyelitis in California" by F. F. Gundrum, M. D., Sacramento.—In a previous paper it was shown that acute poliomyelitis has been occurring in California for many years, both as sporadic cases and in occasional epidemics. These epidemics have been usually small, but within the past few years the numbers attacked have greatly increased. No further authentic ac-

THE members of the California Sales Organization of LUZIER'S, Inc., Makers of Fine Cosmetics, sincerely hope that you, the members of the California Medical Association, will visit the Luzier Booth at the coming national convention of the American Medical Association.

We will have a large display featuring all of the preparations manufactured by LUZIER'S, Inc. Our Service will be featured as **"Individually Nonallergenic,"** by which is meant simply this: In cases where the offending substances have been determined, and should they appear in our preparations, the chances are we can substitute other ingredients, thereby making our preparations nonallergenic so far as a particular person is concerned—in other words, **individually** nonallergenic. Our preparations do not contain the common offending substances, such as orris root, rice starch, etc.

It is our wish to coöperate with the medical profession to the full extent of our limited scope, and we sincerely hope through our appeal to your profession that we may enlist your coöperation in bringing to the public fine cosmetics that are safe to use.

LUZIER'S, INC. MAKERS OF FINE COSMETICS

KANSAS CITY, MISSOURI

counts have been obtained of past outbreaks except one group of two cases near Bodega Bay, Marin County, in April, 1888. It is the purpose of this communication to record the history of poliomyelitis in California during the past three years.

From an Article on "Impressions" by H. J. Kreutzmann, M. D., San Francisco.—The practice of medicine is certainly interesting and fascinating for many reasons; to myself the fact that we in our daily work can make the most interesting scientific observations and researches has always been especially attractive.

On the other side, no work of any kind taxes and racks the nerves of a person more than the practice of medicine. It is not only the great responsibility of our decisions, often involving life and death, health and happiness, which makes our position difficult; but what has always appealed most to me is the fact that in our daily work we are made not merely witnesses, but active participants, in the greatest tragedies of life. When priest or undertaker steps in, death has done its work, they stand before an accomplished fact; but we physicians are right in the battle line for life; we, if we have any heart at all, cannot entirely escape the anxiety, worry, disappointment and despair so often accompanying the struggle for life. . . .

From an Article on "Psychiatric Duties of Large Cities." The discussion brought out by this paper (which was read before the San Francisco County Medical Society in March and was printed in the April JOURNAL) seems to be sufficiently interesting and valuable to warrant its publication. It was not received in time to be printed with the paper, an early publication of which was urgently requested by the San Francisco Society.

Dr. W. F. Snow read the following letter from Dr. F. W. Hatch, who was unable to be present:

"It is evident that existing state hospitals do not fully answer the needs of the insane, owing to their distance from the centers of population and compulsory commitments. It is also apparent that existing measures for the care of the insane, previous to commitment, are not generally satisfactory and that neither the state hospital nor the quarters for the preliminary care of the insane afford the medical schools nor the medical profession the opportunities for the study of mental diseases that they should have.

"The state hospitals with their receiving and treatment buildings are doing advanced work in the care and treatment of acute cases, but this usefulness is limited by the necessity of legal commitment before their advantages and aid could be obtained. . . ."

From Railway Surgeons:

Report of a Case of Sarcomatosis by J. H. O'Connor, M. D., and W. T. Cummins, M. D., San Francisco.—History: Mr. C. H., aged 49, an engineman, was admitted to the Southern Pacific General Hospital on September 23, 1911. His father and mother died of pneumonia. Patient stated that his habits were temperate, and that he had had gonorrhea, but denied luetic infection. No other diseases were elicited. Present condition began three years before with a slight swelling in the left supraclavicular region. This gradually increased in size without pain or loss of weight.

Examination: Patient appeared well nourished. Pulse and respiration normal. No fever. Tongue clean. Thorax and abdomen negative. In the left supraclavicular region there was a firm, movable mass about the size of a hen's egg. Other superficial lymph nodes not palpable. . . .

A Filler Item:

The STATE JOURNAL is not a mindreader! If you move, send us your change of address at once!

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

From Association News:

Membership in the American Medical Association—The Proposed Change in Name—George H. Simmons, M. D., LL. D., Chicago.—The American Medical Association always has been a delegated body; only "delegates" ever had a right to take part in its proceedings. . . .

* * *

Membership in the American Medical Association: Today on the Same Basis as the Former "Members by Application."—Briefly, we have the following situation:

1. The voting membership of the organization is the combined membership of all the 2,000 (more or less) component county societies, amounting approximately to 70,000 members. These elect the delegates to the House of Delegates of the state associations; they in turn elect the delegates who form the House of Delegates of the American Medical Association. Before 1901 the delegates to the American Medical Association were elected, or appointed by the "affiliated" societies, which included local, district, and state societies.

From Some News Notes Taken from Newspapers:

The Long Beach Physicians' Club entertained Dr. Harvey W. Wiley when he was out this way on a lecturing tour.

* * *

Fresno is going to make a great effort to compel all dog owners to muzzle their pets this summer and put a stop to rabies.

* * *

Meningitis, of the acute epidemic type, has appeared in the vicinity of Bakersfield and also in the Sacramento Valley, though not a very large number of cases have as yet been noted.

The nurses of the state have been actively campaigning against the "eight-hour bill" as it applies to nurses, and for a bill to examine and register nurses and permit those registered to use the letters "R. N."

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 392)

Reports indicate that Carlyle A. Klein was arrested in Los Angeles, February 4, 1938, assertedly falsely claiming medical credentials. He is said to have associated himself with a licensed physician and surgeon in "a clinic at 4622 Wilshire Boulevard." Assertedly charged with forgery and issuing checks without sufficient funds, Klein failed to appear for trial in Los Angeles Superior Court, April 7, whereupon bail of $500 was forfeited and a bench warrant issued.

John Grusd, said to be a licensed chiropractor, was on February 24, 1938, found guilty of violation of the Business and Professions Code, arising out of his alleged practice of obstetrics, and was reported to have been sentenced to be confined in the county jail for five days, which sentence was suspended and he was placed on probation for a period of one year, on condition that he refrain from practicing obstetrics.

Reports indicate that Edward John Jones, reported former San Quentin inmate, and said to have purloined instruments from various hospitals where he worked as intern and orderly, was investigated by the Texas police recently. "As evidence of his qualifications, Jones presented a 'diploma,' attesting to his graduation from the 'United States Naval Pharmacistic (sic) Mates School of Medicine, Portsmouth, Virginia.'" He acknowledged having this diploma made by a printer in Oklahoma City.

(Continued on Page 26)

RY-KRISP
Whole Rye Wafers

The dinner shown above is typical of the substantial meals permitted with this new 1200-calorie diet planned by recognized authorities and used by thousands of physicians. Supplied in handy booklet form for distribution to your patients, it overcomes the usual objections to ordinary reducing diets because:

1. It provides for a safe average weight loss (about ¼ pound per day) without starvation methods, supplies adequate minerals and vitamins (with the possible exception of vitamin D).

2. It permits the use of the patient's favorite foods thus assuring adherence to the diet.

3. It simplifies food preparation. The patient can select from regular home or restaurant menus.

Ry-Krisp, so important in any reducing diet, contributes much to the success of this new low calorie diet. Made of whole rye, salt and water, double baked, it is safe, delicious and contains only 20 calories to the wafer. Its high bulk efficiency also helps protect against common constipation.

For free copies of Low Calorie Diet and samples of Ry-Krisp use coupon below.

RALSTON PURINA COMPANY, Dept. CW, 2338 Checkerboard Sq., St. Louis, Mo.

QUALITY CONTROL —

For absolute security, quality control must extend through every stage of manufacture of any product.

Quality control of Riggs prescription lenses begins with the selection of raw materials before they are made into glass in the glass plant of Bausch & Lomb. From then on, rigid specifications control each step of manufacture up to the completion and delivery of the finished prescription.

A pair of lenses in a Riggs R laboratory is not merely a job to be completed in the routine of a day's work—it represents a scientific instrument for the use and service of human eyes.

Reports of the Investigation Department indicate that on March 25 C. Young, alias Wong Yee, Chinese herbalist, was arrested in Pittsburg, California, on a charge of violation of the Business and Professions Code. On March 30 he pleaded guilty and was sentenced to sixty days in jail, suspended on condition that he refrain from further violation of the Business and Professions Code.

Investigation records indicate that on March 16 Charles Joseph Kribs, alias Dr. J. B. Kurtz, pleaded guilty in Los Angeles to a charge of violation of the Business and Professions Code, relating to the practice of medicine, and was sentenced to 180 days in the county jail, which was suspended. He is also reported to have been sentenced to serve 180 days for violation of the optometry provisions of the Business and Professions Code and committed to jail. "Two petty theft charges against this defendant were dismissed."

Arthur William Nord, on March 16, was reported sentenced in Bell, California, to serve ninety days in the county jail on a charge of violation of the Business and Professions Code and was committed.

"Dr. E. Blanche Ramer, San Diego physician, was convicted of performing an illegal operation by a Superior Court last night in Judge Arthur L. Mundo's Court." (San Diego Union, March 4, 1938.) (Previous entries, December, 1937; March, 1938.)

"Outright probation was today granted Dr. E. Blanche Ramer, fifty-one, prominent woman physician, who last month was found guilty of having performed an illegal

operation. . . . Superior Judge Arthur L. Mundo placed Doctor Ramer on probation for five years. . . . Her probation term prohibits her from practicing medicine. . . ." (San Diego *Tribune*, March 26, 1938.)

Records indicate that on March 28, 1938, a San Diego Superior Court dismissed the matter of E. Blanche Ramer vs. Board of Medical Examiners, wherein was sought to set aside the revocation of Blanche Ramer's license by the Board of Medical Examiners.

"Mrs. Ann Brown, alias Jane Wright, was arrested at 1304 Fillmore Street yesterday on a charge of having performed an illegal operation upon Mrs. Dorothy Marks, twenty-five, Oakland stenographer. The woman, police say, has a record of arrests in 1927 and 1937. . . ." (San Francisco *Chronicle*, March 14, 1938.)

"Dr. L. J. Giubbini, licensed chiropractor, and Marvin Raithel, once implicated in coast-wide illegal operation rings, were indicted by the Federal Grand Jury yesterday on charges of failure to file income tax returns in 1934 and 1935 and conspiracy to evade payments. Doctor Giubbini operated a bacteriological laboratory in San Jose. Raithel was indicted in Los Angeles last November as a member of an illegal ring, but the case was dismissed when he testified against others indicted." (San Francisco *Chronicle*, March 12, 1938.) (Previous entries, July, August, and September, 1936.) (Annual Report, 1936, Board of Medical Examiners.)

"Dr. Hjalmar Groneman, chiropractor, yesterday became $28,500 richer by a Superior Court order giving him half the estate of the woman he was once accused of slaying. An order was signed by Judge John J. Allen in Alameda County Superior Court and terminated litigation started by three relatives of Ella Mae Clemmons, 'Christ Angel of Chinatown.' . . ." (San Francisco *Chronicle*, March 11, 1938.) (Previous entries, September, 1932; March, 1936; February, 1937.)

"Lawrence P. Lorraine, forty-five, a male nurse of 2764 Riverside Boulevard, today was taken into custody under a grand jury indictment charging him with performing an illegal operation. He was placed in the county jail under $10,000 bail, set by Superior Judge Dal M. Lemon. Lorraine has faced similar charges twice previously. Last time, in 1935, he was acquitted after a trial prosecuted by the Attorney-General's office." (Sacramento *Bee*, March 15, 1938.) (Previous entries, January, February, 1935.)

" 'Dr.' Howard C. Woodward, thirty, will not be 'practicing' for thirty days at least. That was the jail sentence given him today by Police Judge Joseph A. Kennedy on a battery charge preferred by Mrs. Annie Morris, 3125 Elm Street. According to Police Inspectors L. M. Jewell and Thomas Duffy, Woodward has been posing as the son of Dr. B. W. Black, Alameda County Medical Directory. In this capacity inspectors say Woodward called on women, gave them physical examinations and instructed them in exercises purported to cure certain ailments. Oakland police have been looking for him about six months, but it was Woodward's own flair for publicity that led to his capture last Friday. Last Tuesday he broke into public print by offering an eye to the Rev. U. E. Harding, blind pastor of Portland, Oregon, who visited Oakland in search of a cornea section from a dead man's eye, to be transplanted to his own eye, in the hope of regaining his sight. The Reverend Harding declined Woodward's offer, but the story appeared and the police got on the trail. At that time Woodward said he was an unemployed cook. Police records show that Woodward once served a term in San Quentin Prison for forgery." (Oakland *Tribune*, March 19, 1937.)

Symptomatic control of Hay Fever and Asthma, with minimum toxic manifestations

Propadrine Hydrochloride is indicated in the control of allergic manifestations. It possesses pharmacologic effects similar to those of ephedrine, but seldom produces the undesirable side-effects of insomnia, nervousness, excitation or nausea which may accompany the administration of ephedrine. Thus, it usually obviates the necessity of simultaneously administering sedatives.

Propadrine Hydrochloride, S & D (phenyl-propanol-amine hydrochloride) is a bronchodilator and local vasoconstrictor. It is supplied in these convenient dosage forms in prescription packages with detachable labels:

Capsules Propadrine Hydrochloride: ⅜ gr., bottles of 25, 100 and 500.

Solution Propadrine Hydrochloride: 1%, one-ounce and pint bottles.

Nasal Jelly Propadrine Hydrochloride: 0.66%, in one-half-ounce collapsible tubes.

THE POTTENGER SANATORIUM AND CLINIC

For Diseases of the Chest — Monrovia, California

AN INSTITUTION FOR DIAGNOSIS AND THERAPY

CHOICE rooms and bungalows at rates ranging from $35 per week up, including medical service, general nursing, x-rays, routine laboratory examinations, ordinary medicines and therapeutic pneumothorax.

A few accommodations as low as $25 per week assigned on special application in selected cases.

In the foothills of the Sierra Madre Mountains, thirty-five miles from the ocean. Surrounded by beautiful gardens.

Close medical supervision. Aside from tuberculosis, special attention is given to asthma, bronchiectasis, lung abscess and kindred diseases.

For particulars address:

THE POTTENGER SANATORIUM AND CLINIC, Monrovia, California

Present-Day Status of Vitamins.—With a gradual acceleration of knowledge beginning less than a half-century ago, the whole subject of vitamins with its vast ramifications has been built up by means of chemical, biologic, and clinical studies, until it has practically attained the status of an exact science. Booth and Hansen point out that not only is the chemical structure of many vitamins known exactly, but recent investigators have developed chemical tests for determining quantitatively the amounts of various vitamins in the different tissues. Further developments along these lines may prove to be of far-reaching importance. Of greater importance than the presence of florid avitaminosis is the occurrence of subclinical states of vitamin deficiency. This is particularly significant because of the interrelationships between vitamins and certain clinical disorders. The fact that knowledge concerning the nature of these deficiency diseases has advanced so definitely necessitates a more specific nomenclature regarding these conditions. Their review includes a history of all the vitamins, their standardization, the resultant pathologic changes when their individual ingestion is lacking or deficient, the chief symptoms and laboratory diagnosis of the respective avitaminosis, their clinical application, daily requirements, and their natural sources.—*Journal-Lancet, Minneapolis.*

Maurice Chevassu Elected President of Académie de Chirurgie.—Prof. Maurice Chevassu, whose clinic at the Hôpital Cochin has been visited by many American urologists, was elected president of the Académie de Chirurgie of Paris for 1938. Professor Chevassu will succeed Professor Marion as head of the urologic department of the Paris Medical School in the fall of 1938.

Physicians are invited to specify Lilly Products on prescriptions because the Lilly trade-mark stands for:

1. Pure chemicals and high-grade basic materials.

2. The most improved methods of pharmaceutical and biological manufacture.

3. A policy of distribution and advertising that seeks to place emphasis on medical care where it belongs—the service of the physician.

'Merthiolate'(Sodium Ethyl Mercuri Thiosalicylate, Lilly) meets important surgical requirements. Antisepsis of the intact skin, mucous membranes, and exposed soft tissues can be accomplished with minimal cellular damage.

Tincture 'Merthiolate' and Solution 'Merthiolate' are supplied in four-ounce and in one-pint bottles.

HOWARD MORROW, M.D.
President, California Medical Association
1938

CALIFORNIA AND WESTERN MEDICINE

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 48 MAY, 1938 NO. 5

SALUTATION FROM PRESIDENT MORROW

To Members of the California Medical Association—

Greetings:

I salute you in the name of our profession and extend to you a very cordial invitation to attend the sixty-seventh annual session of your Association in Pasadena, May 9 to 12.

Our annual session affords the opportunity for every member to acquire information upon medical progress by hearing the presentations and discussions of competent clinicians and teachers. In addition, there are the inspiration and pleasure of meeting one's friends, forming new acquaintances, and engaging in the scheduled social functions. The personal benefits received more than compensate for the time spent in attending. A careful reading of the announcements, therefore, should induce you to plan to be present, and I sincerely trust that you will come.

At this time, I desire to officially extend expressions of appreciation to the section officers and speakers for their labor and contribution of time in preparing and taking part in the scheduled program. The success, the benefits, and the good that attend this session will be largely due to their efforts. We are grateful for their services and coöperation.

Lastly, may I emphasize anew that your membership affiliation is one of your most valuable possessions. Your loyalty to your county and state medical organizations will materially enhance the results accruing to you as a member. I bespeak your continued interest and sustained support, to the end that our Association and its constituent units may meet the problems of the times, and formulate well considered and directed solutions that will greatly help to secure public confidence and good will. We can lead, instead of being led.

Cordially,

HOWARD MORROW.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in length. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested that contributors to this Journal write to its office requesting a copy of this leaflet.

EDITORIALS†

LOS ANGELES CONGRESSMAN WOULD INVESTIGATE THE AMERICAN MEDICAL ASSOCIATION

California Newspapers Announce Another Possible Survey from Washington.—As stated in press dispatches from Washington to the *Los Angeles Times*, under date of April 10, Hon. Byron N. Scott of Long Beach, representing the Eighteenth Congressional District, introduced a resolution in Congress "calling for an investigation of American Medical Association opposition to group medicine." "He asked" (so the correspondent averred) "that a committee of five be appointed to investigate the local dispute [between the District of Columbia Medical Society; Home Owners Loan Corporation;* Group Health Association], and to cover the campaigns of the American Medical Association against group health organizations throughout the country." Comment of similar nature appeared in the Long Beach *Press-Telegram* of April 9, which quoted Congressman Scott concerning medical society activities in San Diego and San Francisco.

* * *

California Medical Association Members Should Read Congressman Scott's Resolution. We are able to print a copy of Congressman Scott's resolution, and suggest that all members take the time to read and study it—both its lines and between the lines. The language which this California Congressman used in framing his resolution does not indicate an impartial approach to the matters he would have the House Committee study; and, taking into account the powers it is proposed to rest in such a committee, as given in the last paragraph of the resolution, it is not difficult to forecast the kind of report that might be elaborated.

However, whether Congressman Scott of Long Beach will be able to persuade the House Rules Committee to place his resolution on the floor during the present session is not known, although the newspapers state that "he will seek a hearing before the House Rules Committee."

* * *

Implied Insinuations and Prejudgments.—It is hardly necessary to add that members of the California Medical Association take little stock in some of the insinuations and criticisms implied in Congressman Scott's resolution. The governing bodies of the California Medical Association and county medical societies in California know how little real warrant there is for an attitude and point of view such as that to which the Representative from the Eighteenth District has consciously or unconsciously given expression, and the same thought must come to the members of the compo-

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

* For items concerning this, see CALIFORNIA AND WESTERN MEDICINE, as follows: December, 1937, on page 433; January, 1938, on page 4; February, 1938, on pages 149 and 150.

nent county societies that make up the several constituent state medical organizations forming, collectively, our parent body, the federacy known as the American Medical Association.

* * *

Congressman Scott and the Metropolitan Water District.—In another investigation which Congressman Scott has taken up, concerning the Metropolitan Water District (which includes the cities and communities in Southern California that will bring the Colorado River water to the southern section of the State), the Los Angeles *Evening Herald-Express* of April 15 stated, among other things, in a prominently displayed article:

Charging Congressman Scott with prejudging the issues involved in the strike, the Board's reply pointed out that the Congressman, before he had given district officials an opportunity to answer his questions, proceeded, in the same letter, to accuse the district of not practicing collective bargaining.

Here is additional evidence that in Congressman Scott we have a member of the House of Representatives with a penchant for "prejudging issues." In any event, by these somewhat erratic activities, members of the medical profession in California are warranted in watching the career of the Hon. Byron N. Scott, who formerly taught school in Long Beach and who now, as a congressman, is engaged in tasks of quite a different nature.

* * *

Text of Congressman Scott's Resolution.*—This singular resolution, calling for congressional investigation by a committee "(1) to inquire into the activities of the American Medical Association, state and county medical societies"—(a provision broad enough to include, also, the California Medical Association and its many component county societies)—follows:

(COPY)

SEVENTY-FIFTH CONGRESS, THIRD SESSION

HOUSE RESOLUTION 452

In the House of Representatives, March 28, 1938

Mr. Scott submitted the following resolution, which was referred to the Committee on Rules and ordered to be printed:

RESOLUTION

WHEREAS, Group hospitalization and medical care on a periodical prepayment basis are successfully rendering valuable services throughout the United States; and

WHEREAS, The American Medical Association, various state and county medical societies, and the Medical Society of the District of Columbia have been actively opposing the plan and operation of Group Health Association, Incorporated, and other similar groups organized as voluntary, nonprofit associations for the purpose of protecting the health of their members; and

WHEREAS, It has been charged that such opposition by the Medical Society of the District of Columbia has recently jeopardized the health and even endangered the life of one or more employees of Federal agencies who are members of Group Health Association; and

WHEREAS, Members, officers, and employees of the American Medical Association and its affiliates, in correspondence, published articles, and statements, have misrepresented the activities, contractual relations, and policies of Group Health Association, Incorporated, with regard to its members, their physicians, and the public in a seemingly deliberate attempt to injure and destroy this association; and

WHEREAS, The Medical Society of the District of Columbia has directed its members to refuse to enter into consultation with physicians employed by members of Group Health Association for the purpose of treating or advising Federal employees and their dependents who are members of such association, even though the physicians employed by the association are duly licensed to practice medicine in the District of Columbia; and

WHEREAS, It has been charged that certain hospitals in the District of Columbia have denied the use of their facilities to duly qualified physicians employed by members of Group Health Association, not upon the ground of lack of professional qualifications but for the reasons that such physicians are not members of the Medical Society of the District of Columbia or are employed by a group not approved by said society; and

WHEREAS, Charges have also been made that certain hospitals in the District of Columbia have denied admission to persons, members of Group Health Association, for medical and surgical treatment by physicians of their own choosing, duly qualified and licensed, simply upon the ground that such physicians are not members of the Medical Society of the District of Columbia or are employed by a group not recognized by said society; and

WHEREAS, While a certain physician employed by members of Group Health Association has been expelled by the Medical Society of the District of Columbia from membership in said society upon the ground that he is engaged in the practice of medicine for members of Group Health Association, other members of said society in good standing are permitted to engage in the contract practice of medicine with similar groups without question, all of which indicates that said society, by reason of prejudice and hostility against Group Health Association, is unjustly and possibly unlawfully discriminating against highly qualified, reputable, and duly licensed physicians employed by members of Group Health Association; and

WHEREAS, The American Medical Association and its affiliates, local medical societies throughout the United States, are taking action to exclude or expel from membership in such societies licensed and reputable physicians who have become professionally associated with coöperative groups; and

WHEREAS, If such matters be true, the American Medical Association, its affiliates, and particularly the Medical Society of the District of Columbia are acting in contravention of their charters, in violation of law and contrary to medical ethics and sound public policy; and

WHEREAS, A preliminary study of the situation indicates that, through the prejudice and hostility of responsible groups within the American Medical Association, its affiliates, and the Medical Society of the District of Columbia, interference with reasonable competition among physicians in the United States is occasioned, and indicates that the free choice of physicians by patients in need of medical care and attention is being denied, a situation which jeopardizes the life and health, well-being, and general welfare of the public throughout the United States and the District of Columbia; therefore be it

Resolved, That the Speaker appoint a select committee of five members of the House and that such committee be authorized and directed (1) to inquire into the activities of the American Medical Association, state and county medical societies, the Medical Society of the District of Columbia, and of their officers and members against members of the medical profession, Group Health Association, Incorporated, and other coöperative or contractual groups using the services of hospitals and physicians; (2) to deter-

* Editor's Note.—While these editorial comments were in the hands of the printer, we received a copy of the *Bulletin of the San Diego County Medical Society* in which was given an article that appeared in the April 5 issue of a Washington, D. C., publication, *Labor*.

The information contained therein should be of interest to all members of the medical profession, and the item is printed in this issue of CALIFORNIA AND WESTERN MEDICINE, in its Special Articles department, on page 382. You are urged to read it.

mine whether the American Medical Association, its affiliates, the Medical Society of the District of Columbia, or any of them, are engaged in activities prejudicial and detrimental to the health, life, well-being, and general welfare of the public throughout the United States and the District of Columbia; (3) to ascertain whether the activities of such organizations against Group Health Association, Incorporated, or other groups having similar objectives and physicians employed in behalf of such groups, are in violation of law, in contravention of their charters, or contrary to medical ethics and sound public policy; and (4) to report to the House the results of its investigation, together with such recommendations as it deems advisable.

For the purposes of such investigation the committee, or any subcommittee thereof, is authorized to sit and act during the present Congress at such times and places, whether or not the House is in session, has recessed, or has adjourned; to hold such hearings; to require the attendance of such witnesses by subpoena and the production of such books, papers, and documents by subpoena *duces tecum*; and to take such testimony as it deems necessary. Subpoenas shall be issued under signature of the chairman of the committee or any member thereof designated by him and shall be served by any person designated by such chairman or member.

RABIES IN CALIFORNIA

Rabies in England and in California.—England is practically free of rabies. Its measures on the importation of dogs, designed to prevent the introduction of rabies into the United Kingdom, are strictly enforced. By contrast, in California, and more particularly in the southern part of the state, especially in Los Angeles County, the incidence of rabies, not only as a disease of animals, but of human beings, is astonishingly large. During the past year, several deaths of persons who were victims of rabid animals have been recorded in Los Angeles alone, a matter of more than tragic interest since all the particular victims of dog bites were unfortunate enough not to have taken the Pasteur treatment.

Rabies first appeared in California in 1899, and in the past thirty-eight years more than twice that number of persons—eighty-six in all—have died from the disease.

* * *

Incidence of Rabies in Some California Counties.—As regards rabies in dogs, Los Angeles leads the counties in the state with its record, during the past fifteen years, of 9,377 proved cases. Some of the other counties present the following figures: San Diego County, 643 cases; San Bernardino County, 277 cases; Imperial County, 244 cases; San Joaquin County, 253 cases; and Fresno County, 226 cases. Alameda County is credited with 125 cases, but, much to its credit, San Francisco has had only five cases.

The above statistics show that the disease is well established in the southern part of California, and that it is traveling northward.

* * *

Rabies Among Animals Other Than Dogs.—Not only dogs, but other animals contract and communicate the disease, and it may be of interest to note that just at the time of this writing we are in receipt of a memorandum from the State Board of Public Health giving the following interesting information:

Human death from rabies, Kings County, reported on April 9, 1938. Man was bitten by cow three weeks ago; started treatment, and died.

Cow's head was sent to Stanford University, and positive laboratory findings were reported on April 9, 1938.

In California, during the past fifteen years, rabies has been demonstrated in a total of 821 lower animals, other than dogs, and of such instances a total of 319 were cows. The human case, above recorded, proves that even from such bovine and other animals there is danger.

* * *

State Board of Public Health Has Declared Quarantines.—Recently the State Board of Public Health declared dog quarantines in Los Angeles City and Los Angeles County territories, and in Ventura County also. Concerning the California rabies quarantine laws (Section 2, Chapter 369, Statutes of 1913), the State Board, in its initial promulgations, has no latitude, the Act making it necessary to place all dogs and cats under quarantine restraint on the premises of owners. Fortunately, the statute permits the Health Board, in its judgment (as warranted by investigation or later information), to modify these stringent provisions. Thus, since only 256 cats have been shown to have had rabies in California during the past fifteen years, the modified quarantines exempt that animal, but make it necessary that all dogs be confined on the premises of owners, with provision that they may be taken off the same, by persons over the age of fifteen, when led on leash.

* * *

Large Stray Dog Population of Los Angeles Is a Public Health Menace.—Los Angeles City is credited with an unlicensed stray dog population of 20,000 animals! It is, therefore, understandable why Los Angeles County should lead other counties in the state as regards the prevalence of animal rabies (more than 1,700 proved cases of rabies in dogs during the past year), and this, not by hundreds, but by thousands of cases.

* * *

Improper Use of Dog License Fees in Los Angeles a Factor in the Incidence of Rabies in That County.—It is also of interest to know that Los Angeles City, during the past twenty years, has transferred about one million dollars from its dog license incomes to its general fund, for use on streets and other purposes! However, during the past year, the three human deaths reported from that metropolitan center, with all the resultant adverse publicity, may lead the city councilmen and organizations such as the Chamber of Commerce to pay more attention to this public health problem, and induce the city fathers to spend such money received from dog owners in more carefully planned and continuous efforts to stamp out rabies in Los Angeles. The matter is quite as important as good streets, both to the general public and especially to citizens so unfortunate as to contract this dread disease, rabies.*

* See CALIFORNIA AND WESTERN MEDICINE, April issue, on page 259, for other comments concerning rabies. Also in this issue, on page 391.

Every County Medical Society Should Be Interested in This Public Health Problem.—To this problem, the Los Angeles County Medical Association, through formal resolutions, some time ago called the attention of the Board of Supervisors, the City Council and the Chamber of Commerce; and, as a consequence, the health officers are now being given active support in their efforts to pick up the stray animals. The critical situation is one that is worthy of the attention of all health officers and county medical societies, not only in the southern, but in other parts of the state. Only by united, conjoint effort will it be possible to eradicate this distressing disease at this late day, and so prevent the spread of rabies to all parts of California and Pacific Slope states.†

ANNUAL PRINTED REPORTS OF COUNTY HOSPITALS

Original Purpose of County Hospitals.—County hospitals in California are institutions which originally were brought into being in order to provide hospitalization and medical care for indigent citizens who were sick or injured, such service being rendered without cost; because, as "indigent" citizens, the patients were practically "bankrupt" citizens. In the last several years, under the stress of adverse economic conditions prevalent here and throughout the Union, the stipulations for admission have been broadened to include "medically indigent" citizens; that is, to include a group also called "partly indigent" citizens, who, after providing themselves and their dependents with roof coverage, clothing and food, are not in possession of additional financial resources adequate to meet the hospitalization expenses of unforeseen sickness and injury. For such "partly indigent" or "medically indigent" citizens, it has been specified recently that "in proportion to their means," they shall repay to the counties a fair proportion of the cost of their care.‡

* * *

Attending Staffs Whose Members Give Gratuitous Professional Service.—In most of the county hospitals of California, members of the medical profession of the respective communities, acting jointly as attending staffs, give gratuitous service to patients. In the large Los Angeles County Hospital, for instance, with its more than 2,600 bed patients, the attending staff consists of more than 500 physicians, surgeons and specialists, nearly all of whom are members of the Los Angeles County Medical Association. It has been calculated that a conservative estimate of the money value of the professional services thus rendered by that group of physicians is in excess of two million dollars annually, a handsome sum, certainly, to donate to the taxpayers of Los Angeles County!

Gratuitous Service Has Never Been Recognized Through Printed Annual Reports.—In spite of this generous gift of services, the pecuniary value of which has only recently been emphasized, the County of Los Angeles has never deemed the work done by these members of the medical profession as warranting the expense of a printed report! Year after year the medical board of the staff has passed resolutions asking for such a report; but, up to the present time, these requests have seemingly been lost or otherwise nullified somewhere en route to the Board of Supervisors—which latter body, in compliance with law, must specify all expenditures in its annual budget. Through all these years the report of the Medical Director of the Los Angeles County Hospital on the professional activities of the institution's staff has consisted of some unbound mimeographed sheets containing limited information of far less amount and character than that which for years has been annually brought out by hospitals throughout the United States, many of these remoter institutions being of far lesser size and resources.

* * *

Reports of a Salaried County Department.—By contrast, the annual report of the Health Department of Los Angeles County for the year ending June 30, 1937, is a neatly bound volume of 115 mimeographed pages, although that department portrays therein only the activities of *salaried employees*. Which emphasizes, perhaps, the uncomplimentary fact that nonsalaried physicians are just foolish enough to expect such a public presentation as a proper report of their gratuitous professional services!

* * *

A Contrary Example: The Printed Report of The Queen's Hospital of Honolulu.—In this issue of California and Western Medicine is given a letter from the former assistant superintendent of the Los Angeles County Hospital, who is now superintendent of The Queen's Hospital in Honolulu. He sent us a copy of the seventy-eighth annual report of that institution, a book of sixty-two pages, and called attention to the fact that even in these recent years of depression The Queen's Hospital has published annually its report on the year's activities.

* * *

A Printed Report on Los Angeles County Hospital Has Been Promised.—At a recent conference with the chairman of the Board of Supervisors of Los Angeles County, when his attention was called to the need of such a printed report, and the treatment accorded to former requests, he assured us the desired provision would be made in this year's budget. So now, it would seem that the effort kept up for years to have a yearly printed report is about to be crowned with success. Once started, then, in good time, a report really representative of the work of the attending staff may be regularly forthcoming in future years.

† For comments concerning the incidence of "Rabies in Wild Animals in California," see in this issue, article in back advertising section, page 35.

‡ See California and Western Medicine, February, 1938, on page 108, for Item 8 of the Appellate Court decision in Kern County Hospital case.

Every County Hospital in California Should Print a Yearly Report.—Mention is made of this Los Angeles County Hospital experience because it is typical of what attending staffs in other county hospitals of California also face; on which account we would stress the thought: If the physicians of a county are generous enough to provide an attending staff for their county hospital, and to give to the indigent sick professional services of a value running into thousands of dollars, then the least that the boards of supervisors should do—as an expression of appreciation on the part of the taxpayers—would be to provide in their budgets (now, by the way, in the making for the next fiscal year) for printed reports on the professional work done. That, surely, is not too much to ask as a kindly return token of services willingly and generously rendered.

* * *

County Medical Societies Should Join with Attending Staffs in Petitions for Yearly Printed Reports.—If, then, every county hospital in California brought off the press, each year, such a report, the cause of the public health in California would be materially helped; because detailed reports of that nature must shed much light on methods and problems of mutual interest, especially to Californians. Every county medical society in California may well give this subject its early attention, coöperating with members who are on attending staffs in petitions requesting its boards of supervisors to place this item on their county's budget for the next fiscal year. The time, however, to act on this matter is now—while the budgets are being prepared!

CALIFORNIA MEDICAL ASSOCIATION ANNUAL SESSION: MAY 9–12

On Monday, May 9, the California Medical Association will convene at the Hotel Huntington in Pasadena to begin a series of meetings extending over four days. These meetings and conferences will mark the sixty-seventh annual session of the Association.

The April supplement of California and Western Medicine gave the complete programs of General Meetings, Scientific Sections and House of Delegates; and printed also the "Pre-Convention Bulletin," which contained the reports of officers and committees that will come up for consideration by the House of Delegates. That body meets on Monday and Wednesday evenings and members of the House should be in their seats by 8 o'clock, in order that the business may be promptly taken up.

Transportation information concerning rail, motor and local car line routes to the Hotel Huntington appeared on page 30. Members who arrive on southbound trains and who have not made other arrangements to leave the train at Glendale will probably find it much more convenient to detrain at the Southern Pacific station at Fifth and Central avenues, Los Angeles. Then, by way of street car or taxi, go to the Pacific Electric station at Sixth and Main streets, where "Pasadena via Oak Knoll" cars may be boarded. All cars on this route have a regular stop at the Hotel Huntington grounds.

A last thought: It is the hope of the officers of the Association that you will be among those who will register as "present." You are urged to attend, if only for a part of the session.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 362.

EDITORIAL COMMENT†

THE MECHANISM OF INSULIN THERAPY IN SCHIZOPHRENIA

Insulin therapy in schizophrenia promises to negate the previous markedly pessimistic outlook in dementia praecox. Yet there is almost no knowledge of the mechanisms involved. A number of theories have been suggested by Sakel himself, and by others, but little or no corroborative evidence is advanced for the different views. Because of this uncertainty, an investigation of the physiologic effects of insulin in relation to the therapeutic outcome appeals to us as being particularly pertinent.

The physiologic aspects might be classified as follows: (1) primary functions, namely, glycogen storage and increased tissue oxidation; (2) low blood sugar, with its resultant deprivation of nourishment of the brain—here might also be considered the effects of the compensatory epinephrin secretion said to occur in hypoglycemia; (3) "shock effects" from prolonged aglycemia; and (4) secondary effects from increased caloric intake, and improved intestinal absorption and assimilation, such as fat deposition. We shall concern ourselves at present chiefly with the first consideration.

Clinically, one thinks of the action of insulin largely in terms of reduction of the blood sugar, since hypoglycemia is the outstanding effect in the normal person. However, the hypoglycemia is a secondary rather than primary physiologic feature. The primary actions of insulin in the nonpathologic state are not absolutely established. Authorities state that insulin leads to the storage of glycogen in the liver and possibly in the muscles. There is some question of enhancement of oxidation in the peripheral tissues. These primary activities deplete the blood stream of its sugar. Presumably, the initial functions are not abolished when hypoglycemia is prevented by increased carbohydrate administration.

The question comes to mind as to whether or not these primary functions are significant in insulin

† This department of California and Western Medicine presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

therapy: will insulin, in the absence of hypoglycemia, yield the same response as in its presence? This query has a practical implication. Treatment with the pancreatic hormone is at present very expensive and, therefore, available to a comparatively small number, and it is also not without danger. If it could be shown that the hypoglycemia is not essential, the limitations of the treatment would be removed by the simultaneous administration of insulin with glucose or food. This problem is being investigated at the present time.

One feature stressed in the literature discourages the supposition that there may be an extrahypoglycemic factor of therapeutic potency in insulin treatment. It is stated that the results are best when the hypoglycemic coma is permitted to persist from three to five hours, instead of being terminated early. The accuracy of this observation is of extreme importance, but until definitely established under controlled conditions, should not be accepted with finality. We recall that when, prior to the days of shock therapy, small doses of insulin were administered to secure weight increase in psychotic patients, favorable effects on the mental state occurred at times. May not the more potent effects of shock therapy be due to the larger dosage of insulin utilized, rather than to "shock" or prolongation of the hypoglycemia? In the investigation of the rôle of insulin in the treatment of schizophrenia, extrahypoglycemic factors are worthy of consideration.

CONVALESCENT HOMES

It is interesting to observe, after studying the problem of convalescent home facilities in Los Angeles County, that probably the chief reason why such facilities are not available, in sufficient number, is the fact that medical men are unaware of the value of such service and, consequently, have not made demands which would have produced the supply needed in their communities.

The problem of convalescent care has been very thoroughly studied by the Councils of Social Agencies in various large cities in the United States, and a similar excellent study was made by the Commission under President Hoover, which studied especially the problems of children. In all of these surveys it has been the constant opinion of the investigators that convalescent care, in a properly-equipped convalescent home, could be maintained at less than half the cost of a hospital bed. They were also consistent in finding that convalescent homes could be built for one-half the cost, per bed, compared to hospital beds.

In a period when the care of the indigent sick has been such a tremendous burden to the states and society generally, it is remarkable that more attention has not been paid to the important savings which might be made through convalescent home care. The same fact is true in the private practice of medicine. Very often a patient who does not have adequate care at home can be cared for to great advantage in the convalescent home, both from the point of view of physical and mental well-being, at much less cost than in hospital. The need for such facilities is, of course, probably more apparent to the orthopedic surgeon because of the long convalescence required in many of his cases. But the fact remains that many patients in the general practice of medicine and surgery would be much happier if they could be in a well-equipped and well-run convalescent home, rather than having to serve the long period of convalescence in the more expensive hospital bed.

A satisfactory convalescent home requires, of necessity, proper consideration of sanitation, easy mobilization of patients in case of fire, and recreation and occupation facilities, while it should have, if possible, physiotherapy available in the institution without requiring the patients' return to some outside establishment for their follow-up treatment.

The long convalescence required after fractures, especially in elderly people, is a thing which comes to mind particularly in considering what great advantage might be served by convalescent home care. These people are often very depressed by the fact of being disabled in their latter years, and the noises and outcries, which will be heard in any hospital, add greatly to the mental depression of such patients; whereas, a convalescent home, in which all the inmates have passed the point of suffering pain and where no acutely-ill person is met, either in the wards or in the recreation halls, is much more conducive to a happy frame of mind during the long months of recovery. These same months are much freer from worry if the cost to the patient can be reduced, which is, of course, the one most important thing the convalescent home can accomplish for the patient.

The ideal convalescent home would be one in which the fire hazards were so low, and the possibility of moving bed and wheelchair patients so facile that care could be given where patients were confined to bed or wheelchair by plaster of Paris or other portable fracture apparatus. This mobility permits of change of scene and a chance of recreation for patients during their confinement, and social activities for both the ambulatory and bed patient.

As medical men we should all be interested in the establishment of convalescent-home care.

Orthopaedic Hospital.

Harold E. Crowe,
Los Angeles.

"Concentration of population and the vicissitudes of modern life demand the continuous development and perpetuation of scientific medicine. We must be adequately prepared not only to render individual professional service to individual patients, but to help solve the problems of the still undiscovered causes of many diseases. In a broad sense organized society perforce depends upon us for the preservation of public health, physical virility and mental power. This then is our burden in a chaotic era of changing social philosophy."—*Cummer.*

SELECTIVE COLLAPSE BY PARTIAL THORACOPLASTY*

RECENT ADVANCES IN THE SURGICAL TREATMENT OF PULMONARY TUBERCULOSIS

By EMILE HOLMAN, M.D.
AND
PHILIP PIERSON, M.D.
San Francisco

DISCUSSION *by Robert A. Peers, M.D., Colfax; Hans Schiffbauer, M.D., Los Angeles; F. M. Pottenger, M.D., Monrovia.*

IN the care of unilateral tuberculosis, therapeutic collapse of the lung by pneumothorax, phrenic interruption and thoracoplasty is an accepted procedure which no longer needs defense. The problem is not, shall collapse be employed, but what form of collapse is indicated. Each type, beginning with pneumothorax, will often fall short of the expected result, and when the radical thoracoplasty has finally failed, the patient is usually abandoned to the tender mercies of God and to the medical phthisiotherapist. Such failures bring the radical measures into disrepute, and yet a closer scrutiny of these unsuccessful cases will occasionally reveal the possibility that other measures, or the same measures differently performed, would have effected a cure. Particularly is this true in the cases characterized by a large apical abscess. The routine thoracoplasty will frequently fail to obliterate such an abscess, and the ultimate death of the patient is recorded as an operative failure. It may be categorically stated, however, that unless every available measure to collapse a cavity has been utilized, an unsuccessful thoracoplasty must be considered a failure, not of the underlying principle, but of the manner of its application.

* From the Departments of Surgery and Medicine, Stanford University Medical School.

Read before the General Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

RESISTANCE OF APICAL ABSCESSES TO TREATMENT

Several factors combine to make the apical abscess particularly resistant to all forms of therapy, medical and surgical. Destruction of the apical pulmonary tissue results in the formation of a "dead" space surrounded superiorly and laterally by the rigid thoracic cage and inferiorly by the floor of the abscess, which, made rigid by successive deposits of fibrous tissue, is moored to the chest wall by unyielding adhesions. Expansion of healthy lung, which is the only tissue available for filling the dead space, is impossible against this rigid floor of the abscess; and inasmuch as the lateral walls are formed by an unyielding rib cage, some external aid must be provided if the cavity is to be obliterated. In selected cases "plombiering" has had its day of vogue, but additional experiences bring less, not more, confidence in its use. Moreover, its application is limited, and usually quite inappropriate for the type of abscess under discussion. Furthermore, a foreign body remains forever "foreign," and nature attempts in every way to make its prolonged tenure within the body impossible—hence the difficulties of infection, of local extrusion, and of evacuation through a bronchus.

INADEQUATE OPERATIVE PROCEDURES

In the obliteration of such cavities the complete paravertebral thoracoplasty, now "old-fashioned," failed in a number of instances because of its tendency to displace an apical abscess downward into the paravertebral gutter. Here, protected anteriorly by overhanging stumps of the first three ribs, it continued to be a source of trouble. The obvious correction was the complete removal of the upper three ribs from transverse process in back to costal cartilage in front. This, too, proved inadequate in some instances, primarily because the cavity was protected posteriorly along the vertebral bodies by the overhanging rib stumps and transverse processes. The logical development was, therefore, a far more radical procedure, including as part of the primary collapsing procedures, resection of the

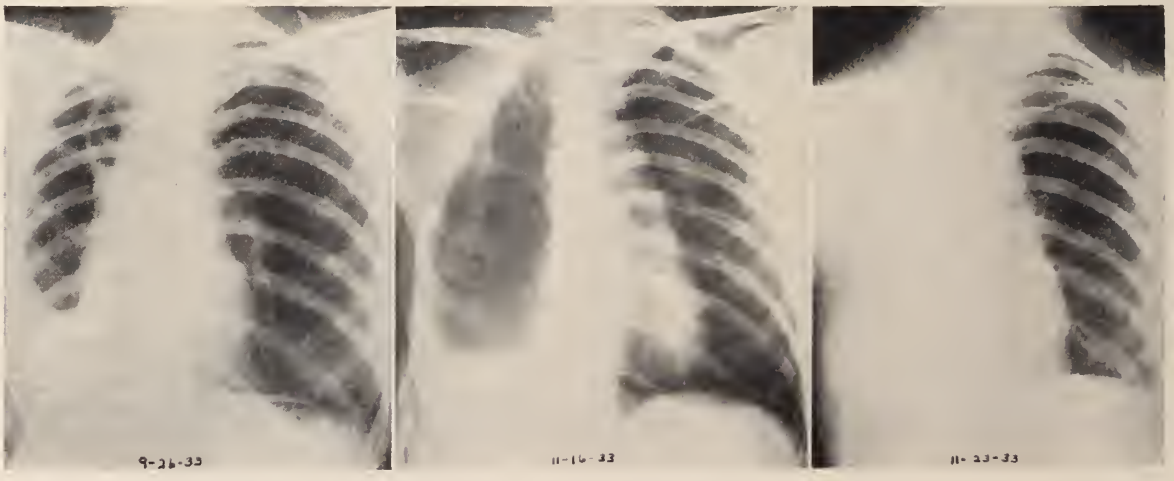

Fig. 1.—Large thick-walled abscess incompletely closed by pneumothorax, is subsequently closed by resection of eleven ribs and eight transverse processes. Patient is an arrested case.

Fig. 2.—Large thick-walled abscess closed by resection of nine ribs and of four transverse processes at the site of the abscess. Patient is well.

transverse processes of the second, third, fourth, fifth, and possibly sixth vertebrae, the number depending upon the size of the cavity. Each candidate for surgical collapse is studied with particular reference to where the apical or peripherally placed abscess will lie after the thoracoplasty has been performed. Resection of the appropriate transverse processes over a large enough area to extend well above and below the compressed abscess in its new location is carefully determined and carried out (Figs. 1 and 2). This additional procedure adds somewhat to the operative trauma; but if care is taken to divide ligaments and periosteum flush with the bony process by scalpel and sharp periosteal elevator, bleeding from injured vessels and shock from traumatized nerves are minimal.

The resection of the transverse processes is of particular importance also in the revision of an inadequate or ineffective thoracoplasty. In such a revision, it is not sufficient to repeat an operation already proved inadequate. The cause for failure should be discovered and corrected. In one instance following two complete and one partial thoracoplasty in five stages, the paravertebrally situated abscess was still well protected by the overhanging transverse processes, resection of which led to complete collapse of the cavity and a cure of the disease (Fig. 3). Fortunately, despite the five previously ineffectual thoracoplasties,

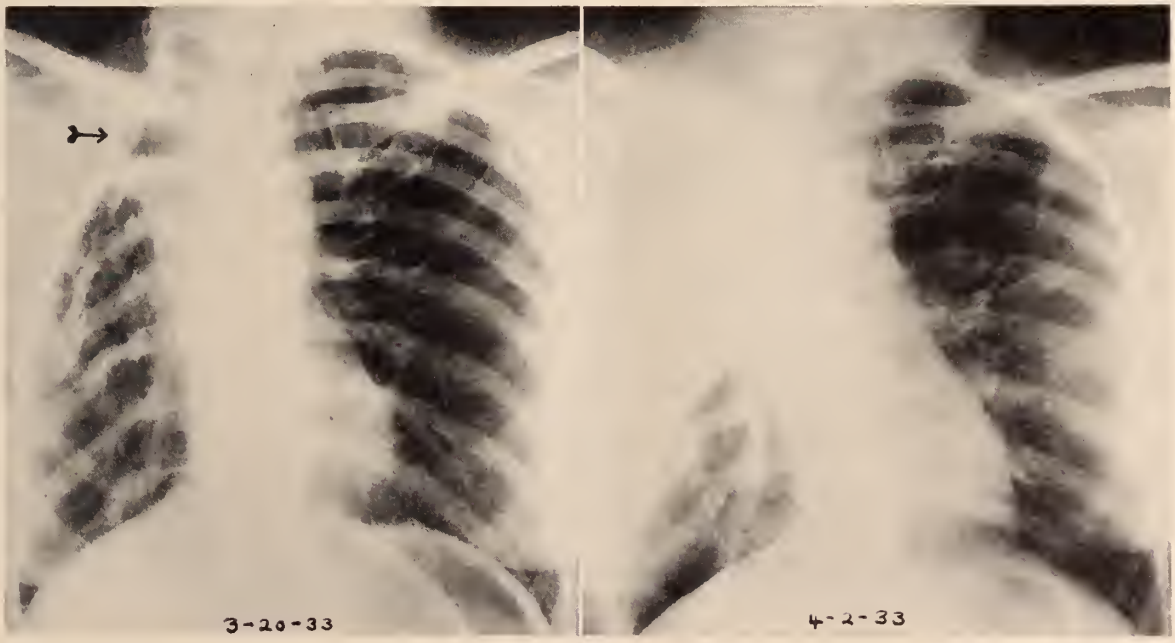

Fig. 3.—Two complete thoracoplasties and one partial thoracoplasty failed to collapse the cavity designated by arrow. This intractable focus was completely closed by resection of transverse processes and regenerated rib. Patient is well.

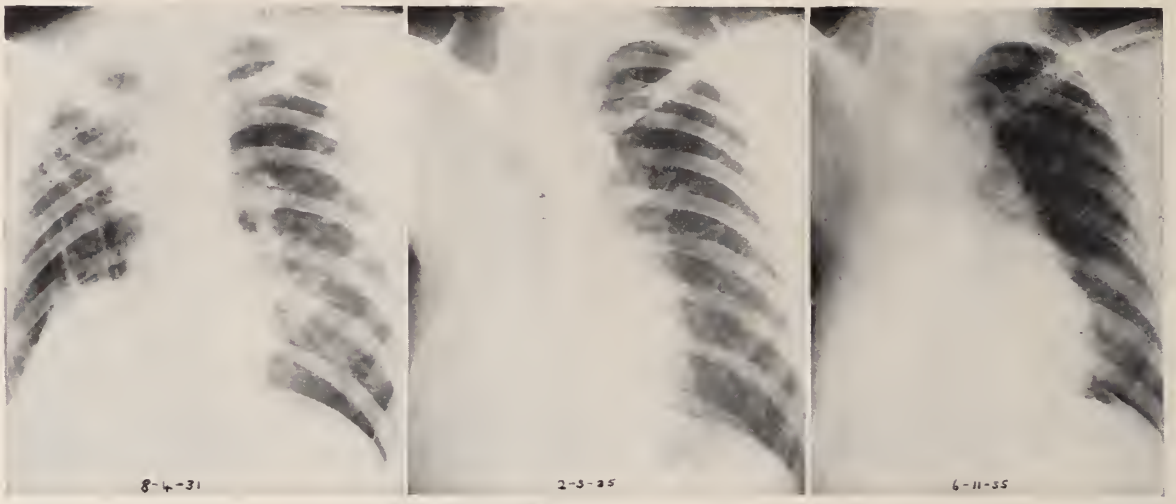

Fig. 4.—Three thoracoplastic procedures failed to close a large cavity, remains of which can be seen just below the clavicle protected by transverse processes, by regenerated ribs and by stumps of ribs anteriorly. Resection of these elements led to closure of the cavity. Elimination of cough and sputum, and apparent cure.

this intelligent patient was convinced that collapse of the cavity was necessary for cure.

In another instance the revision of a thoracoplasty, previously performed elsewhere in three stages, necessitated not only the resection of transverse processes, but also resection of the anterior stumps of the first, second, and third ribs to obliterate the cavity (Fig. 4).

SPECIAL INDICATIONS

Not infrequently, a localized apical abscess, though constituting the most intractable focus, is only part of a more generalized process involving ipsilateral and contralateral lobes. Under such circumstances it is highly important to conserve as much as possible of the uninvolved lung and of the already greatly reduced vital capacity. A complete unilateral thoracoplasty may be definitely contraindicated because of bilateral disease and because too much healthy pulmonary tissue would be sacrificed thereby. Since surgical collapse of the apical abscess or dead space is absolutely imperative if cure is to be effected, some form of partial thoracoplasty is indicated. This may involve, in certain instances, only a single operation (Fig. 5), consisting of complete resection of the upper three ribs from vertebral to sternal attachments. In other instances it may be necessary to perform, in addition, a partial resection of the fourth, fifth, and possibly sixth ribs, including also resection of the

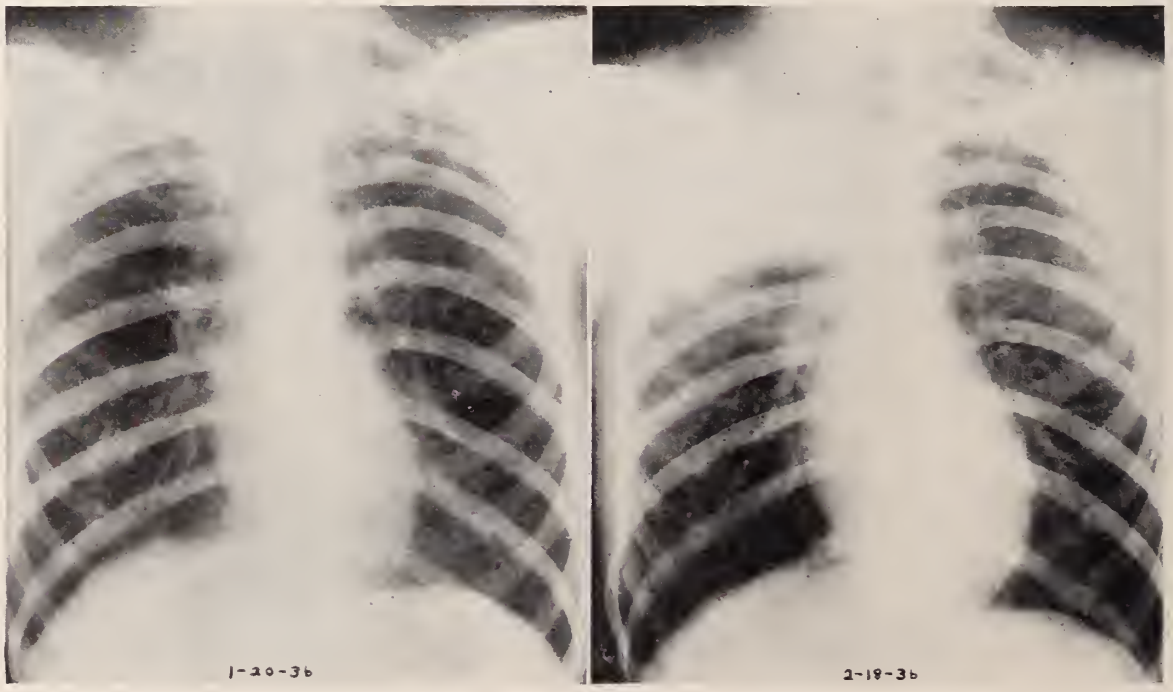

Fig. 5.—Bilateral apical abscesses with displacement of trachea and mediastinum to right. Resection of upper three ribs resulted in closure of the right abscess and marked diminution of cavity on left by restoration of mediastinum to normal position with relaxation of apical tissues on left.

Fig. 6.—Large apical abscess, unsuccessfully treated by pneumothorax and incompletely closed by resection of upper three ribs, is completely closed by the partial resection of additional four ribs, and pushing in of the scapula. The patient is well.

transverse processes of the third, fourth, and fifth vertebrae (Fig. 6).

Occasionally the greatest obstacle to the maximum benefit from such a partial thoracoplasty is the scapula. If only five ribs are resected, the scapula effectively prevents the complete falling in of the posterior thoracic wall. If only six ribs are removed, the lower angle of the scapula rides on the seventh rib, causing localized pain and elevation of the shoulder. The resection of seven ribs may be too formidable for patients with the type of general involvement under discussion, and the additional sacrifice of good lung and of vital capacity is unwarranted when the sole object is obliteration of an apical cavity.

OPERATION: PARTIAL RESECTION OF THE SCAPULA

Such reasoning led to the resection of the lower third of the scapula as an alternative procedure to resection of the sixth and seventh ribs (Fig. 7). This resection is easily performed, with a minimum of bleeding, by an incision around the angle of the scapula, elevation of the periosteum and of the attached muscles by a broad sharp elevator, and excision of the bone by rongeurs. Enough bone is removed to permit the scapula to fall easily into the space provided by resection of the upper five ribs.

This operation of partial resection of the scapula for the collapse of an apical cavity may be done in one or two stages (Fig. 8). Following the complete resection of the upper three ribs and portions of the fourth and fifth, the menace of paradoxical respiration is always great, depending upon the thickness and rigidity of the parietal pleura. Accordingly, if removal of the upper three ribs causes active paradoxical movement of the mobilized chest wall, the operation is terminated, and at the second stage, ten to fourteen days later, the fourth and fifth ribs, and occasionally the sixth, are partially resected together with the lower third or half of the scapula. If the paradoxical movements are only moderate, due to fibrous rigidity of the visceral and parietal pleurae, the operation may be completed in one stage (Fig. 9). In fact, the falling in of the small, partially resected scapula may effectually prevent paradoxical respiration and may, therefore, permit completion of the operation in

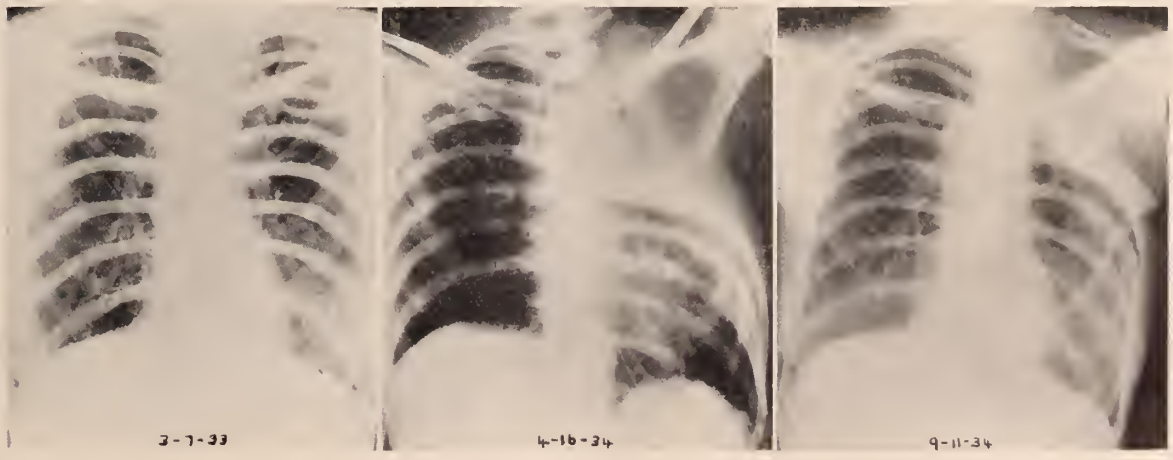

Fig. 7.—Bilateral tuberculosis with large left apical abscess completely closed by resection of five ribs and partial resection of scapula. Patient much improved, but still has tubercle bacilli in sputum.

Fig. 8.—Large apical abscess, incompletely closed by pneumothorax, closed by complete resection of upper three ribs, partial resection of fourth, fifth, and sixth ribs, and resection of lower third of scapula. Patient apparently cured.

one stage. Further experience with the operation will be necessary to determine this point.

SUMMARY

Pulmonary tuberculosis is frequently characterized by a large apical abscess, which forms the most intractable focus of the disease. Such an abscess must be closed, either by reëxpansion of good lung or by compression. There is no alternative—healing will not occur unless closure of the cavity is effected.

For such an abscess, localized selective collapse is preferable to the usual complete paravertebral thoracoplasty. A limited thoracoplasty may be necessary because of (1) bilateral involvement of lungs; (2) necessity for conserving good lung at the base; and (3) the abscess may be displaced rather than compressed by the old-fashioned paravertebral procedure.

Aids in effecting complete collapse of apical abscesses are:

1. Complete resection of the upper three ribs from transverse process in back to costal cartilage in front.

2. Resection of transverse processes over the site of the abscess. When thoracoplasty threatens to displace peripherally situated abscesses into the paravertebral gutter, resection of the transverse processes over the area likely to be occupied by the abscess in its new position is indicated.

3. Resection of the lower third of the scapula, which permits more complete compression of the involved lung by the falling in of a scapula greatly reduced in size, and obviates the need for sacrificing good lung at the base.

Revision of inadequate thoracoplasties for incompletely collapsed cavities should not be a repetition of previously ineffectual procedures, but should include resection of the transverse processes over the site of the abscess and, when necessary, resection of the anterior stumps of ribs through an anterior incision.

In the presence of bilateral apical abscesses, a unilateral upper thoracoplasty may be effective in relaxing the opposite apex, thus providing better conditions for healing of both abscesses by one operative procedure.

Thoracoplasty as a therapeutic measure should not be condemned or abandoned until the offending cavity has been effectually and completely collapsed.

Stanford University Hospital.

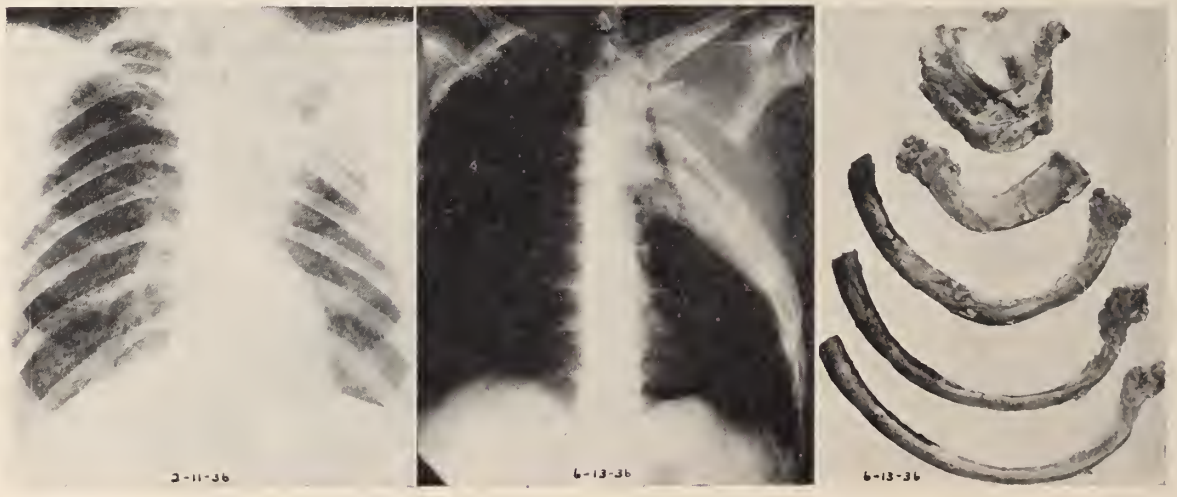

Fig. 9.—Bilateral tuberculosis with large apical abscess closed by resection of four ribs and partial resection of scapula. Patient much improved, but still under sanatorium care.

DISCUSSION

Robert A. Peers, M.D. (Colfax).—Someone has said, "It was a brave man who first ate an oyster." It was a braver man who first performed extrapleural thoracoplasty for the closure of cavities resistant to pneumothorax or other measures. That thoracoplasty has survived, and has become a recognized and important method of treatment where pneumothorax and other measures fail, is due, perhaps, as much to good fortune as to skillful surgery. Fortunately, in spite of what we know now to have been insufficient removal of the proper constituents of the lung cage and what we realize was, at the time, too extensive surgery in the removal of parts of too many ribs, enough patients recovered from the shock of operation and a sufficient percentage recovered their health to encourage surgeons to improve their technique and their surgical judgment. Had the mortality been higher and the percentage of recoveries smaller, what is now a very valuable adjunct to antituberculosis treatment might have been lost forever or at least postponed for a long period. Herein, as noted, fortune played a hand.

Experience showed that what often was needed was a multistage operation instead of a shock-producing one-stage attack. Experience also showed that the removal completely of a few of the upper ribs, together with the transverse processes, together with partial removal of two or more lower ribs, would result in success where failure was common when parts of many more ribs were removed. Doctors Holman and Pierson have explained why this is so. They have still further improved on the method by removal of part of the scapula where conditions indicate the advisability of this measure. As the authors have pointed out, the plan of attack as outlined by them enables them to save much useful healthy pulmonary tissue.

The author of this discussion can, from personal experience, heartily endorse all that has been said by Doctors Holman and Pierson. With carefully selected cases, operated on as outlined with individual surgical resources adapted to individual cases, we now have in thoracoplasty a means of saving many lives which were hopelessly doomed before the advent of this additional procedure of thoracic surgery.

❦

Hans Schiffbauer, M.D. (520 West Seventh Street, Los Angeles).—I quite agree with the contents of Doctor Holman's paper. More ill-advised and inadequate thoracoplasty operations are being done than ever before, and many of these patients will have residual cavities which produce positive sputum.

Many surgeons have felt that when a complete posterior thoracoplasty has been supplemented by some form of anterolateral resection of the remaining sections of ribs with their costal cartilage, and after months of careful sanatorium treatment, a cavity still persists with a positive sputum, nothing more can be done.

Doctor Holman has beautifully shown that these cases can be successfully reoperated, removing the bony plate with the transverse process over the existing cavity in the diseased lung, producing complete obliteration of the existing cavity.

After the removal of the transverse processes there is a greater tendency to scoliosis, especially in children. So, instead of removing the transverse processes, I have disarticulated the neck of the ribs from the transverse process, also disarticulated the head from the vertebrae with its periosteum, and using caution not to leave more than a minimum of denuded bone in the operated field. After three to five such stumps are removed, with sharp and blunt dissection, the parietal pleura can be separated from the lateral vertebral column, which allows the diseased lung to shrink up, leaving the transverse processes undisturbed.

Doctor Holman brought out the necessity of removal of the lower portion of the scapula. This is very necessary in partial selective thoracoplasty where larger sections of the sixth and seventh rib are not removed. At times it may be advisable to remove six to eight centimeters of the entire vertebral border of the scapula in order not to have the scapula interfere with adequate collapse over the operated area.

In all of the more recent thoracoplasty after section of the rib at transverse process, I remove the neck and head by disarticulation with its periosteum, beginning with the third rib. I am certain, in so doing, that I have obtained greater collapse of the diseased lung without damaging the transverse process, which is an advantage to the patient.

❦

F. M. Pottenger, M.D. (Pottenger Sanatorium, Monrovia).—In recent years surgery of the chest has developed quite rapidly. It has offered hope to a certain group of patients who could not possibly have gotten well without it.

While the healing of tuberculosis is brought about through the patient's own physiologic reactions, the mechanical conditions must be favorable or such healing cannot occur. Loss of tissue causes shrinking of the lung volume, and unless the remaining portion of pulmonary tissue is able to enlarge and fill in the thoracic cage, cavity walls remain apart, tension is put upon the pulmonary structures, and healing is interfered with.

The proper form of chest surgery suited to the individual case acts by improving the mechanical condition, thus allowing physiologic healing to take place.

One of the problems which has baffled clinicians since attempts were first made to treat tuberculosis has been the apical cavity. While now and then such a cavity would epithelize and become dry, as a rule it continues suppurating as long as the patient lives and frequently is the focus from which the disease spreads to other parts of the lung. Operation of such cavities in the past have not been very successful in bringing about closure. Doctors Holman and Pierson discuss in a very satisfactory manner certain reasons for this failure.

Inasmuch as surgery alone offers hope for the patient suffering from a large apical cavity, clinicians have been free to recommend them for surgery, only to be disappointed in the result obtained.

The authors discuss two measures which will make this operation more satisfactory: first, the resection of the transverse processes of the second, third, fourth, fifth, and possibly sixth vertebrae, depending upon the size of the cavity; and second, the resection of the lower third of the scapula, so as to allow the chest wall to fall in and complete the approximation of the cavity walls.

While it is very fortunate that patients with tuberculosis should, in such large numbers, be permitted to go on to the formation of large apical cavities, it is gratifying that surgeons are able to devise a technique which offers them hope of relief.

ABDOMINAL HERNIAS*

THE USE OF AUTOGENOUS STRIPS OF FASCIA LATA IN THE REPAIR OF THE MORE DIFFICULT ABDOMINAL HERNIAS

By Donald C. Collins, M.D.
Los Angeles

Discussion *by Hall G. Holder, M.D., San Diego; C. Latimer Callander, M.D., San Francisco; E. Eric Larson, M.D., Los Angeles.*

FOR clinical purposes, abdominal hernias may be grouped into two classes: First, those of a simple character in which a very large number of cures result from operative measures; and, second, that smaller group where ordinary standard surgical procedures usually lead to failure and recurrence. Members of this second group are: direct inguinal, sliding, postoperative, diaphragmatic, recurrent, and the large indirect inguinal hernias—so frequently observed in the elderly, debilitated patient.

* Read before the General Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

In this second group surgeons have recognized these facts. They have used various kinds of nonabsorbable sutures as various types of wire, linen, silk, and silkworm gut. Of the absorbable materials employed, catgut and ox or kangaroo tendon are still the most popular sutures. The enthusiastic advocation of multiple techniques and suture materials to be used in a successful hernioplasty is sufficient proof of the inadequacy of present methods of repair. We are seeing an increasingly greater number of unsuccessful attempts at cure in this group by the injection of various sclerosing solutions in the vain hope of closing the hernial defect by the formation of inflammatory scar tissue.

AUTOPLASTIC SUTURES

Lewis Linn McArthur,[7] in 1904, published his final report on the use of autoplastic sutures in the repair of hernia and other diastases. This was a report of the use, in his clinic, since the year 1896, of autoplastic strips of the external oblique aponeurosis instead of foreign suture material in inguinal hernioplasties.[9] Few surgeons paid much attention to McArthur's method, or to the underlying principles of the use of autoplastic fibrous tissue in the place of absorbable foreign sutures. Subsequent reports in the surgical literature upon the use of McArthur's technique have shown excellent results, with a negligible percentage of recurrences. Postmortems done on individuals who had had such a repair done previously, and then had later died from causes unrelated to their hernioplasty, demonstrate that the transplanted sutures of aponeurosis had lived and were firmly united to the tissues through which they passed. Active proliferation of connective tissue could be seen originating from such sutures. Dr. C. W. Mayo[8] in recent years has successfully used this method in the cure of inguinal hernias. In hundreds of his patients that have now been followed for two or more years, there has been less than one-half of one per cent of recurrence.

LIVING AUTOGENOUS STRIPS OF FASCIA LATA

Between the years of 1921 to 1930, Gallie and LeMesurier[2,3,4,5] firmly established the value of living autogenous strips of fascia lata derived from the individual patient. They have popularized the use of this material not only in inguinal hernias, but also in the largest and most difficult varieties of this second group. These authors conclusively demonstrated that either pedunculated or free strips of fascia lata will continue to live indefinitely so long as they are able to receive an adequate supply of lymph and tissue plasma. The tensile strength of fascia lata has been estimated to be 750 pounds in a straight pull before rupture will occur. This, of course, far exceeds the tensile strength of any absorbable foreign suture that we may employ. They also found that this amazing tensile strength was unchanged and was not lost in the free transplanted strips of the patient's own fascia lata. However, this method had a major objection to its universal use by surgeons, because it necessitated the making of a long incision along the lateral surface of the thigh so that the tendon of the tensor fascia lata muscle could be exposed, from which the fascia lata strips could be obtained. This difficulty was removed by the perfection of a fascia lata stripper by Dr. J. C. Masson,[10] during the year 1933. In 1935, Masson[11,12] did much to popularize this method of treating these more difficult abdominal hernias by the presentation of two timely articles, which were widely read by the surgical profession.

REPORT ON HERNIAS AMONG STEEL WORKERS

The recent report of Foster[1] on 101 unselected cases of hernias occurring among steel-mill workers, in which autogenous sutures of fascia lata was used, is of great interest. His patients returned to full duty within six months following their hernioplasty. Many of these individuals were elderly, possessing atrophic tissues together with huge hernias. The end-results proved to be far superior to former methods employed. In only two of the seven recurrences was faulty operative technique to blame. Most important of all, these seven were again repaired with additional strips of autogenous fascia lata, and they have had no further recurrences.

MASSON FASCIA LATA STRIPPER

The Masson fascia lata stripper consists of two steel tubes that telescope one over the other. The outer tube is shorter and has a knife edge on its distal end. The inner tube forms the handle of the instrument and has an eyelet at its distal end. The outside tube is threaded at its upper end so that it can be screwed onto the inner tube just below the handle. With the instrument thus assembled, the cutting-knife edge is well above the eyelet of the inner tube and can do no damage to neighboring tissues. The skin of the lateral aspect of the thigh, over the proximal portion of the tendon of the tensor fascia lata muscle is incised for a distance of 5 centimeters, and the tendinous portion is exposed. A strip is then dissected out of the tendon, about 2 centimeters in width, and then the strip is lengthened for a distance of 5 centimeters. Then the fascia strip is threaded through the eyelet of the stripper and securely grasped by several hemostats. The stripper is forced down the thigh until it lodges in the neighborhood of the external condyle of the femur. The outer tube is then unscrewed and, with several twisting motions, the knife-edge cuts off a strip of fascia lata the length of the subcutaneous extent of the stripper. Additional strips can easily be obtained in a similar manner. These strips are then split longitudinally in the direction of their fibers, into narrower strips of about half a centimeter in width. The individual strips thus obtained are threaded onto thick, heavy short needles that are securely tied on by ligatures of black silk. The other end of the strip is also securely tied by a similar ligature. After taking the first two stitches, the needle is passed back through the strip close to its ligated end, thus forming a slip-knot which will firmly secure it. Fascia lata can only be fastened in this manner because of its inability to remain tied in a square knot. After this

first strip has been used up, another is similarly prepared and fastened to the first strip by a similar use of a slip-knot. The needle is removed from the first strip, making certain that a secure ligature of black silk has been tied there to prevent the fraying out of the end of the strip. Thus, each strip is fastened onto the preceding one for the purposes of security. As additional measures of security, the sutures are allowed to pass through one another as a basket-weave suture wherever possible. The last suture is ended by suturing the free end down with black silk to neighboring strong tissues and doubly tying it there. Chromic catgut has been found unsatisfactory as ligature material and will easily slip off of the fascia strips, thus endangering the entire hernioplasty.

OTHER PROCEDURES

One can usually obtain enough fascia lata strips from one thigh to repair even the largest of hernias. These hernial defects are closed without tension. If the edges cannot be reapproximated with ease, then the defect is closed by weaving in a basket-weave closure of strips. The resultant defect in the tensor fascia lata muscle causes no discomfort, but I warn my patients that such a muscle hernia will follow their hernioplasty, but that it is of no consequence. Most surgeons make the mistake of attempting to obtain fascia lata from the more anterior and medial portions of the thigh, with the usually dismal failure as their reward. It is only in the fibers of the tendon of the tensor fascia lata muscle that the fascia lata can be easily stripped off for any appreciable distance, and done safely. The thigh incision is closed tightly in layers with the use of one retention-suture of silkworm gut for supportive measures, as the thigh receives considerable active motion in bed postoperatively. All of my hernioplasties remain in bed for at least three weeks or longer, depending on the character of their postoperative convalescence. All hernioplasty incisions are drained dependently for the first seventy-two hours following surgery, in an effort to prevent the formation of incisional hematomas or the collections of serum which do so much toward lengthening the postoperative convalescence of your patient. Every effort is made to prevent the formation of dead spaces in the incision. I pay very little attention to whether the patient is obese, because, with the use of living sutures, the problem of excessive intra-abdominal pressure tearing down the hernioplasty can be disregarded, since you are suturing structures with a suture that has a tensile strength of 750 pounds to the square inch of pull. As a consequence, bites with the fascia needle are deeper and include more tissue than would be done if foreign sutures were used. No particular effort is made to clean off the adipose tissue from muscles or fascial structures before suturing them together, inasmuch we are dealing with a living suture which, as time goes on, will become increasingly stronger and will actually proliferate fibrous tissues from its fibers. The obtaining of the fascia lata strips and the resuture of the thigh incision should not take more than five to seven minutes to complete, when the Masson fascia lata stripper is employed. All of my patients wear an adequate Scultetus abdominal binder while in bed and an efficient abdominal supportive belt for one year following their dismissal from the hospital. Whenever possible, I insist on the use of a spinal anesthesia to obviate abdominal straining and to insure maximum relaxation of the abdominal wall.

INDIRECT INGUINAL HERNIAS

I have been using a modified McArthur technique in the surgical treatment of indirect inguinal hernias, with one recurrence, so far, in a group of eighty-three patients so treated, and followed for at least two years since the time of their operation. After the reduction of the hernial contents and a high ligation of the hernial sac with its transposition up behind the conjoined tendon, two strips of external oblique aponeurosis one centimeter in width are cut. One strip is left attached to the spine of the pubis while the other is left attached to the cephalic end of the external oblique muscle. A modified Bassini hernioplasty is then done, using these two strips of aponeurosis as running mattress sutures to close the inguinal canal, by suturing the conjoined tendon down to Poupart's ligament and particularly strengthening the internal ring. The external oblique is also sutured beneath the cord for additional strength. If the conjoined tendon is found to be weak and of little value in the lower portion of the inguinal canal, strips of autogenous fascia lata are taken and the resultant defect is filled by a basket-weave type of suture that very easily closes the opening without tension.

VENTRAL OR INCISIONAL POSTOPERATIVE HERNIAS

In instances of ventral or incisional postoperative hernias, particular attention is paid to overlapping the edges of the hernial opening. Often valuable tissue can be salvaged from the hernial walls for this purpose. This scar tissue is sutured to the muscle tissue of the opposite side, and vice versa. Thus, a double layer of tissue is first used in the preliminary closure of the peritoneal cavity, which is secured by ordinary absorbable sutures. To prevent the recurrence of the hernia following some sudden increase of intra-abdominal pressure, such as may follow coughing, sneezing, or straining at stool, additional support is provided by the use of autogenous fascia lata sutures either as mattress sutures or in the form of a basket-weave to strengthen the former hernial site. These sutures take bites into the imbricated repair and deep bites out into neighboring normal tissues. Never should an attempt be made to draw muscles together under excessive pressure, as this will only lead to eventual necrosis of the sutured muscle and the repair will break down due to faulty operative technique, and not due to any fault of the fascia sutures. Interrupted mattress retention sutures of silkworm gut are used to obliterate dead spaces in the incision, and thus discourage hematoma formation or the collections of serum which may lead to secondary wound infections. If such a complication does

occur, the fascia repair will usually hold, but the incision will not heal until all of the silk knots have been removed. Thus, particular care is taken to have the preoperative preparation as thorough as possible, which includes a sterile preparation of the skin of the operative site the day preceding surgery. Interestingly, most of these patients show a fever of only 99.0 or 99.5 degrees Fahrenheit for the first two days postoperatively. Postoperative morbidity and complications are far less when autoplastic fascia sutures are used.

UMBILICAL HERNIAS

In umbilical hernias the hernial opening is enlarged to expose the edges of the recti muscles. The Mayo overlapping closure is performed, suturing the cleaned peritoneal portion of the upper flap to the anterior rectus sheaths of the lower flap, using forty-day chromic catgut. The imbrications are further strengthened by the use of autogenous fascia lata sutures. Interrupted retention sutures of silkworm gut are used to obliterate dead spaces in the incision. The superficial portions of the incision are closed by layers. The dependent portion of the incision is drained for the first seventy-two hours following operation.

FEMORAL HERNIAS

In femoral hernias in which there is a large femoral canal, I use strips of fascia lata to firmly close the hernial defect. Following the reduction of the hernia and the high ligation of the sac, the femoral canal is blocked by mattress fascia lata sutures taken through the upper portion of the pectineus muscle and thence passed up the canal and through the external oblique just cephalad to Poupart's ligament. This simple procedure works very well and is quickly done. In five cases so treated there have been no recurrences to date.

DIAPHRAGMATIC HERNIAS

In large diaphragmatic hernias the defect is first closed by overlapping the margins of the hernial opening for a distance of 3 centimeters by the use of interrupted mattress sutures of linen. This suture line is then further strengthened by running mattress sutures of autogenous fascia lata strips. This makes the strongest possible closure obtainable. If there has been considerable loss of diaphragmatic muscle or its attachment to the thoracic wall has been torn, fascia lata strips are invaluable and will give a strong permanent closure.[6]

REPORT ON FORTY-FOUR CASES

I wish to briefly report my experiences with forty-four patients in whom the Masson-Gallie technique was closely followed, using autoplastic fascia lata strips. There were no deaths either in the hospital nor during their convalescence. Twenty-six were males. In only one individual is there some doubt as to whether there might be a newly developed weakness in the inguinal region lateral to the site of the repair of a huge postoperative ventral hernia following the removal and drainage of a gangrenous perforated appendix. The hernia of this patient was repaired less than one year following the appendectomy, and promptly developed an acute wound infection in a supposedly clean case. The thigh incisions healed *per primum*. It is highly probable that latent infection existed in the tissues of the anterior abdominal wall from the first operation. It was necessary, in this instance, to secondarily open the incision superficially and remove all the silk knots. This was followed by prompt healing of the incision. Four individuals had gangrenous incarcerated ventral incisional hernias in which portions of the small intestine, varying from 16 to 74 centimeters, were resected. Gastro-intestinal continuity was restored by the performance of aseptic end-to-end anastomoses, without a fatality. In eight instances the fascia repair was done in the presence of gross contamination, and all of these hernioplasties have held and are well healed today. There was only one wound infection in a supposedly clean case in this series, and the details of that case are given above. Table 1 summarizes the data of this group of patients and records the salient facts.

IN CONCLUSION

1. The use of autogenous fascia lata sutures has given a higher percentage of cures in the more difficult types of abdominal hernias than was formerly possible.

2. The Masson fascia stripper affords an easy and rapid means of obtaining an adequate supply of fascia lata without resorting to large incisions in the thigh.

3. Spinal anesthesia is the anesthesia of choice in these cases.

4. Obesity is no longer a contraindication to a prompt hernioplasty.

5. Forty-four cases of the more difficult types of abdominal hernias are reported in which the Masson-Gallie technique was closely followed. There were no deaths and only one questionable slight recurrence.

6. Eighty-three additional cases are included of indirect inguinal hernia in which the McArthur technique was followed. There was one recurrence. There were no deaths.

TABLE 1.—*Summary on Report of Forty-four Patients: Masson-Gallie Technique*

Number of patients reported upon	44
Sex:	
Males	26
Females	18
Deaths	None
Recurrences (questionable)	1
Clean cases	36
a. Wound infections	1
Dirty cases	8
a. Secondary operations to remove silk knots	3
Obese individuals	31
Age:	
a. Average age	47.8 years
b. Youngest individual	38 years
c. Oldest individual	71 years
Average number of fascia lata strips used per patient	5.2
Average time per operation (minutes)	98
Anesthetics used:	
a. Spinal	35
1. Procain	28
2. Combined	7
b. Ether	3
c. Ethylene	3
d. Cyclopropane	3

Types of Hernia:

1. Inguinal	15
a. Direct	9
b. Huge indirect	6
2. Incisional	15
a. Previous mid-right rectus incision	8
1. Upper abdomen	3
2. Lower abdomen	5
b. Previous mid-line incision	7
1. Upper abdomen	2
2. Lower abdomen	5
3. Umbilical	6
4. Femoral	5
a. Women	4
5. Diaphragmatic	2
a. Side of diaphragm: Left side	2
6. Epigastric	1

DISCUSSION

Hall G. Holder, M.D. (1107 Medico-Dental Building, San Diego).—Doctor Collins' presentation is timely, as little improvement in end-results has occurred in herniorrhaphy since Bassini introduced his method of radical repair in 1899. In the repair of inguinal hernias three general principles are universally agreed upon following the advent of the radical operation, namely, (1) complete dissection of the inguinal canal, with particular attention to the removal of all areolar tissue, so that firm union may be had between either muscle and fascia, or between fascia and fascia; (2) high ligation of the sac, preferably with transplantation high under the internal oblique muscle; and (3) plastic reconstruction of the inguinal canal.

The different types of reconstruction can be classified simply into three main groups: (1) Bassini's original description of the transplantation of the cord; (2) Non-transplantation of the cord, as advocated by Ferguson; and (3) Extra-apponeurotic transplantation of the cord, as typified by Halstead, Andrews, and others. The tremendous advantage of the use of fascia lata over ordinary suture materials in the repair of hernias, particularly difficult types of hernias as related by Doctor Collins, is further emphasized by reviewing the recent literature on the subject. Using only the best sources, I find reported 3,275 cases of indirect inguinal hernia repaired without fascia, giving an average recurrence rate of 5.5 per cent as against 188 reported cases in this same condition in which fascia was used with a recurrence rate of only 2.6 per cent. Still more striking, the average recurrence rate using foreign suture material in 804 direct hernias reported in the literature was 16 per cent, as against a recurrence of only 3.5 in 252 cases repaired with fascia. No definite information could be obtained regarding the recurrence rate of recurrent hernia, but it is only fair to believe that this would be much higher than the 16 per cent for the direct hernia. I find only forty-five cases of recurrent hernia repaired with fascia with a recurrence rate of 6.6 per cent reported, which undoubtedly is far below that of the ordinary suture material.

Until the year 1935 my records show that I performed forty-five Galli fascial repairs with a recurrence rate of 2.2 per cent, and twenty-seven McArthur herniorrhaphies with a recurrence rate of 3.7 per cent. At the same time I reviewed 103 cases of indirect inguinal hernia which had been repaired with the ordinary suture materials in which I had a recurrence rate of 6.7 per cent. Therefore, in my own hands, using identical technique with the only variable suture material, I obtained one-third less recurrences in the more difficult cases using fascia over other suture materials.

Points in technique which I think are important, and which I repeat for emphasis, as Doctor Collins has mentioned most of them, are: extra-aponeurotic transplantation of the cord, high ligation of the sac with transplantation, closure of the transversalis fascia, careful cleaning away of all of areolar tissue from fascial and muscle structures, so as to allow a two or more layer repair of the inguinal canal beneath the cord with the fascial sutures.

As Doctor Collins has indicated, I believe that the fascial stripper simplifies the obtaining of the fascial sutures which can usually be done by an assistant with no loss of operating time. In the placement of the sutures, I prefer to employ a fascial suture clamp which I devised, instead of the Galli needle, as it permits of more rapid suturing with much less traumatization of tissue. This latter is a very important point, I believe, in obtaining the best results in this type of repair, as most failures come from excessive traumatization from the large Galli needle with sewn-in fascial suture.

C. Latimer Callander, M.D. (450 Sutter Street, San Francisco).—Doctor Collins has given us, in a clear-cut and painstaking manner, the case for the use of autoplastic fascia lata in the repair of all varieties of rupture. So many able surgeons now employ fascia lata transplants in hernial repair as a matter of routine that I am convinced of the general utility of this suture material. Antagonists of the method cannot overlook the manifest fact that a fascia lata suture holds opposed surfaces over a broader area than does any other material, and, in addition, unites with the opposed tissues. No other material can be woven into a living overlay over a gross tissue defect. Masson's stripper has made collection of the sutures a simple step in the operation.

It was well to call attention to the pioneer work of McArthur in this field. His method of using attached strips of the external oblique aponeurosis from the edges of the inguinal hernia incision can be utilized in all indirect inguinal hernias and in most direct ones. This method, however, only allows sufficient suture material to unite the incision in the external oblique aponeurosis, and to approximate the conjoined muscle and tendon to the shelving edge of the inguinal ligament. Gallie and Le Mesurier have carried their investigative work and clinical applications in autoplastic suture material far further than did McArthur, and soundly established their method of tissue approximation.

With the contention, however, that aponeurosis will not unite firmly to muscle when held in place by either catgut or silk ligature, I am heartily out of accord. Anyone who has had occasion to repair many recurrent ruptures cannot fail to recall instance after instance in which sharp-knife dissection was required to separate the lower margin of the internal oblique and transversus abdominis muscles from the inguinal ligament. The failure of the hernia operation often is not a faulty new wall, formed in front of or behind the cord, but is a result of not ligating the hernial sac sufficiently high.

E. Eric Larson, M.D. (1930 Wilshire Boulevard, Los Angeles).—Until recent years much confusion as to the best procedure for repair of large ventral, recurrent direct and inguinal hernias, has existed. Tabulated statistics of data have shown that recurrences existed in surprising proportions. Past military activity and the advent of rigid physical examinations of all employees, especially in the heavy industries, have placed a burden on the successful surgical attack of hernias.

For these reasons, and for the added fact that there must be progress in surgical technique, the essayist has today brought to our attention the use of autogenous fascia for more successful repair.

Doctor Masson's method of obtaining strips of fascia lata is a distinct contribution. Experimental studies have revealed that transplanted fascia becomes incorporated as living tissue in about one year. Therefore, the strength and permanence of this tissue, which neither stretches nor contracts, adds to the permanence of closure and successful treatment of these defects.

This is especially true in large ventral hernias where much tissue may be lacking. A basket-weave type of fascia stripping, much like darning a hole in a sock, has been a most salutary and welcomed procedure. Where there is enough tissue, strips of adjacent fascia are woven into the suture lines. The result of this added suture has given excellent and permanent support to the sutured edges. Harrington's use of fascia in the repair of large diaphragmatic hernias has added an amazing permanence to this type of repair, since very few recurrences are reported when fascia is used.

I have used fascia strips for fourteen years, and in the obese patient or those over forty years of age with inguinal hernia I incorporate strips of the aponeurosis of the external oblique into the sutures, as first described by L. L. McArthur in 1901.

The intelligent use of fascia is becoming world-wide, and will no doubt afford us better statistics in a short time.

TONSILLECTOMY: A PLANNED, COMPLETE OPERATION*

By William Remfry Hunt, M.D.
Santa Barbara

Discussion *by Frank S. Baxter, M. D., Oakland; W. H. Johnston, M. D., Santa Barbara.*

THE purpose of this paper is to discuss, and demonstrate with slides of removed tonsils, a planned complete removal of the palatine tonsil and its lymphoid appendages, with particular emphasis on the latter. It may seem strange to take time to discuss the most commonly operated tissue, the tonsil; however, the surgical technique of this important structure cannot be overemphasized. As we all know, the two main methods are: (1) with the various types of tonsillotomes or guillotine instruments, (2) with the variable dissection and snare method.

ANATOMY

The palatine tonsils lie in the oropharynx. The arterial supply to the tonsils from branches of the external carotid are the ascending palatine and anterior tonsillar of the external maxillary (facial), ascending pharyngeal, the dorsum linguae branches of the lingual, and the descending palatine branch of the internal maxillary. The venous drainage through the tonsillar and pharyngeal plexes enters the facial veins. The nerve supply comes through the lingual branch of the fifth, and from the ninth, tenth, and sympathetics. Over the upper pole, the capsule is separated from deeper structures by loose areolar tissue (the most common site of peritonsillar abscess). Below this the capsule is intimately blended with the muscles, namely, the palatopharyngeus or posterior pillar, the palatoglossus or anterior pillar, and laterally partly by the superior constrictors of the pharynx. The plica semilunaris is a fold of mucous membrane joining that of the pillars medial to the upper pole of the tonsil. The plica triangularis is a fold of mucous membrane which extends medially and downward from the margin of the anterior pillar, surrounding the lower pole like a sling. This appendage contains masses of lymphoid tissue. It extends to the pharyngeal border of the tongue. Here the lymphoid masses may be termed lateral lingual tonsil. Below the lower pole of the tonsil proper is a subtonsillar lymphoid chain of varying amounts of lymphoid tissue, lying against the muscles and covered by mucous membrane. This subtonsillar lymphoid tissue may extend downward as far as the pharyngo-epiglottic fold.

It is my opinion that all this lymphoid tissue should be removed in every tonsillectomy. Some laryngologists have advocated removing the tonsil and not disturbing these lymphoid appendages routinely; but doing so at a second operation if subsequent examinations indicate that they are a septic focus of infection. However, few, if any, patients would return to the original surgeon for a second operation. As there is no objection to their removal, and they are frequently definitely septic, and they are a common site of recurrent acute inflammation, it seems well worth while to give the patient the maximum benefit of an initial complete tonsillectomy.

While it does not come directly within the subject of this paper, I may mention the lymphoid tissue, especially the lateral lymphoid bands on the pharyngeal wall. This tissue is present in a large percentage of people in every age group, especially preadolescents. It is more abundant in the so-called lymphoid types. Why some people have more lymphoid tissue on the pharynx than others is not known. The writer has observed it more often in the allergics and hypothyroids. That its presence is due to posterior sinus infection, alone, is contrary to my experience. That, if present, it becomes readily inflamed with any inflammation of the upper respiratory tract is an almost daily clinical observation. If someone has not already done so, may I suggest the term "lymphoid pharyngitis," as preferable to "granular pharyngitis" for this condition. As a rule, I remove these pharyngeal lymphoid masses, if of consequential size, when doing a tonsillectomy. If present, they are the most common site of sore throats, when an otherwise successful tonsillectomy has been accomplished.

TECHNIQUE

The writer has attempted to rationalize his surgical technique to strict anatomical detail.

In tonsil surgery, good lighting, making for good vision, is vital. Direct reflection from a head mirror over the eye is best. The Klaar lamp or similar

* Read before the Eye, Ear, Nose, and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

reflection may be satisfactory. The ordinary head lamp, with indirect light reflected from the forehead, is inadequate, and accounts for many remnants being overlooked that can be seen with good lighting. When a tenaculum such as the Tydings grasps the tonsil, the plica and anterior pillar become tense. Initial sharp incision is made through the mucous membrane exactly at the border of the anterior pillar, near its upper limit. This incision, exposing the capsule, is carried down to the tongue, thus removing the plica from the border of the anterior pillar. A Seiler's knife, similar to the Dean, except that the former has a slight curve, is used to begin the operation after the initial sharp incision, and for much of the subsequent dissection. Returning toward the upper pole, muscle fibers are pushed off or incised from the capsule under direct vision, as a curved incision through the mucous membrane extends upward and medially. With the knife over part of the upper pole, the tonsil may be pushed down, releasing that portion from the loose areolar tissue at the extreme apex of the fossa. Now, curved scissors are used to make an accurate incision close to the tonsil in the upper medial portion through the plica semilunaris. This is more certain than tearing the upper medial portion of the tonsil from the posterior pillar. Carelessness at this point results in a raised palate on that side, due to the injury to muscle fibers of the palatopharyngeus which blend with those at the base of the uvula, and the action of the levator veli palatini muscle on the injured palate. With the upper pole partially free, the tenaculum is placed in the upper pole, including its capsule, and the dissection continued downward under direct vision. With the Hurd dissector or Seiler's knife, depending upon the amount of adhesions, the posterior pillar is completely freed from the capsule of the tonsil, likewise the anterior pillar. It may not be necessary to free the entire lateral wall to the level of the tongue, but I always do so. The tonsil now lies loose in the fossa attached only at the lowest anterior and lateral portion of the lower pole, and by its subtonsillar lymphoid appendage.

The tenaculum is now carefully placed so that the lower pole, particularly, is included in the grasp. The snare is placed over the tonsil and drawn up loosely to a smaller loop. The tongue depressor is removed, allowing the tongue, especially the lateral portion, to be free to rise. The loop of the snare is almost parallel to the lateral wall of the pharynx. As the lower pole is pulled up, the snare wire is pushed down, and the snaring is completed. When the tonsil is examined, it will be found present in capsule, with all or most of the lymphoid appendages: plica, lateral linguals, etc., attached. A thorough inspection is now made of the subtonsillar area, and any additional lymphoid masses are removed with the Allis and snare. The most difficult area to be sure of is the extreme posterior lateral border of the tongue. This may be examined with the Allis forceps, gently feeling for and grasping any lymphoid masses, not readily apparent when using the pillar retractor and tongue depressor alone. Careful inspection of the fossa frequently reveals a few small extracapsular lymphoid masses at the apex, or behind the anterior pillar. These may be pulled off with an Allis, if small, or snared off, if large.

If there is actual or threatened bleeding, particularly from the upper pole, the vessel is grasped superficially with an Allis forcep, and a superficial suture, using "0" or "00" catgut, is placed. When the fossa is clean and "dry," it is lightly swabbed with 2 per cent mercurochrome, or with 3 per cent tincture of iodin, which must be handled more carefully.

The other tonsil is removed in a similar manner.

Under local anesthesia, the procedure is almost bloodless. Under general anesthesia any free bleeding, particularly from the upper pole, is stopped with a superficial suture during the dissection. The upper pole of the tonsil being pressed down with the tongue depressor, and the edge of the fossa raised with a retractor, any bleeding area here is readily seen. By controlling this type of bleeding, the remaining dissection and snaring offers only a slight ooze. In this way blood loss is maintained at a minimum; tracheal aspiration and other hazards are reduced. Postoperative bleeding, either primary or secondary, rarely occurs. Under local anesthesia the tongue depressor may be dispensed with most of the time, as the view over the angular tenaculum is adequate. This adds greatly to the comfort of the patient.

COMMENT

Some statistics on so-called tonsillectomized children given in the general literature, have little, if any, value. The assumption that any patient who has undergone a tonsil operation by any physician, so often untrained and unskilled, is always tonsillectomized, is contrary to clinical observation.

Infected tonsil remnants, like infected dental remnants, may be a serious menace to good health, and should receive meticulous surgical attention.

Tonsils operated with the various tonsillotomes should have the plica, lateral lingual, and subtonsillar areas cleaned up at the time. Plical remnants on the anterior pillar should be excised with knife or scissors. Other remnants may be removed with the Allis and snare, or a similar procedure, as none of these instruments, alone, include all the lymphoid appendages of the tonsil.

Younger physicians should be taught a less casual and more respectful attitude toward tonsillectomies.

Results of successful surgery on previously incompletely operated tonsils, particularly with rheumatic conditions, such as acute iritis, arthritis, etc., are thoroughly convincing.

IN CONCLUSION

Accurate smooth dissection under direct vision leaves clean fossae, minimizes trauma, promotes easy convalescence, gives a good cosmetic result, and obtains for the patient maximum benefit from the planned complete tonsillectomy.

1421 Chapala Street.

DISCUSSION

Frank S. Baxter, M.D. (1624 Franklin Street, Oakland).—We all know that tonsillectomies are done by surgeons of varying ability and dexterity. It follows, as a

natural course, that those tonsils which are removed with a full understanding of the immediate anatomy are entirely removed. Careful inspection of the fossae, and particularly the plica triangularis and the adjacent lymphoid tissue, is vitally important. The instruments used in a tonsillectomy are a matter of individual preference, but the fundamental thing of importance is a painstaking, nontraumatic, complete removal of the tonsils. A focus of infection is thereby eliminated, which is the real reason for removing the tonsils.

W. H. Johnston, M.D. (1515 State Street, Santa Barbara).—We all acquire a technique for this operation after we have been in practice a few years, and I believe that we should continue to use the method which, in our hands, has given us the best results. Most of us try to do the complete operation described by Doctor Hunt, but I fear that we are not all getting the ideal end-results in 100 per cent of our cases. I have had the experience, many times, of completing what I thought was a perfect job, only to find a few months later a mass of lymphoid tissue at the lower part of the tonsillar fossae. I have also had the experience of doing a somewhat hasty operation and later finding that the end-result was perfect. We are overlooking something in the patient's make-up, and must remember that there are cases which we might call of the lymphatic type in which it seems impossible to do any type of operation that will insure against regrowth of lymphoid tissue at the lower pole. In this class we must look for some etiological factor, the discussion of which might go on indefinitely and does not belong under the heading of this paper. Some years ago French described an operation which he called "extended tonsillectomy"; it was quite similar to the one described by Doctor Hunt in reference to the lymphoid extension to the base of the tongue.

I agree with the essayist that many quoted statistics mean very little, because a considerable number of the operated cases retain remnants of infected lymphoid tissue in the tonsillar fossae. Most of us agree, I believe, that a piece of infected lymphoid tissue hemmed in with scars is much more harmful than was the original tonsil in many instances before an incomplete operation was performed.

I believe that we should all have a less casual attitude toward the tonsil operation, which now seems to come into the field of so many branches of the medical profession.

DRUG ERUPTIONS DUE TO THE BARBITURATES*

By Frederick G. Novy, Jr., M.D.
Oakland

Discussion *by Harry E. Alderson, M.D., San Francisco; Stanley O. Chambers, M.D., Los Angeles; Philip K. Allen, M.D., San Diego.*

THE purpose of this paper is to discuss briefly the different types of cutaneous manifestations that may follow the use of the barbiturates.

Today the barbituric acid derivatives, of which there are a large number, have a widespread use in medicine for their sedative and hypnotic effects. Since these drugs were first introduced, eruptions of different types have been reported. Toxic skin reactions appear frequently following their administration, and should be constantly watched for. Menninger[1] states that about 2 per cent of the patients taking phenobarbital (luminal) develop some form of cutaneous intolerance. All of the barbiturates have been responsible for reactions, and there is no one form which is less likely to produce trouble. Phenobarbital and barbital (veronal), however, are the ones most frequently mentioned in the literature. This, I believe, is because of their more widespread use rather than that they are more toxic.

Why certain individuals react to these drugs is not fully understood. Undoubtedly the patient's general condition plays an important rôle. We see patients in good health who tolerate a drug, and later, when their general health has been impaired, a reaction to the same drug takes place. In these instances interference with the elimination of the drug could be a factor. A disturbance of the cardiorenal system would lead to retention of fluids and storage of the drug in the tissues. Other patients, probably the majority, have an idiosyncrasy to the drugs. This hypersensitivity can be explained in some patients who, having taken the drug some time in the past, have apparently become sensitized. Then later, upon administration of the same drug, a reaction occurs. This would account for the clinical fact that urticaria, a type of response that one would expect with hypersensitivity, is extremely common. Wise and Sulzberger[2] feel that nearly all drug eruptions fall into this category of sensitization reactions.

Dosage does not appear to play a great part, as exceedingly small amounts will produce eruptions in sensitive individuals. Babington[3] reported a patient who developel a toxic eruption the second day after having taken only two one-quarter grain doses of phenobarbital. Other cases have been reported in which large doses, over a considerable length of time, had been given before any cutaneous reaction was noticed.

CUTANEOUS MANIFESTATIONS

The types of cutaneous manifestations seen are: (1) urticarial; (2) erythematous; (3) bullous; (4) eczematous; and (5) fixed.

Urticarial Type.—This is probably the most frequent. The eruption appears immediately, or a few hours after administration of the offending drug. The reaction may be mild, with a few scattered wheals, or may take on the more serious form of angioneurotic edema, with extreme swelling of the affected part. This reaction must be differentiated from urticaria due to some other cause. Stopping of the medication should be followed by a clearing of the condition in a short time, if that is the causative factor.

Erythematous Type.—This form usually appears on the chest and face as brilliant, light-red macules, which may become diffuse if medication is not stopped. If the reaction is severe, the eruption may become universal. This may be followed by a generalized exfoliative dermatitis. Lancaster[4] reported such a case following the taking of phenobarbital. There is nearly always a great deal of pruritus. Edema, particularly about the eyes, is usually part of the picture, and there is an associated conjunctivitis. The mucous membrane of the mouth and the throat may become involved. The mucosa of the rectum and genitalia may also be affected. Frequently there is a slight rise in tem-

Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

perature. Temperatures of 103 and 104 degrees have been reported. In these cases gastro-intestinal symptoms are usually present. A moderate leukocytosis is present with an increase in eosinophils. These may be as high as 22 per cent. A differential diagnosis must sometimes be made between this type of eruption and scarlet fever or measles. At times this is extremely difficult. A careful history is of importance. The absence of pain and marked injection of the throat would be against scarlet fever. Ordinarily there is not a marked adenopathy with the drug eruption. The tendency of barbiturate eruptions to clear promptly upon withdrawal of the drug is of help. The blanching test for scarlet fever is an aid in distinguishing the two conditions. The absence of Koplik's spots, and the prodromal coryza, would differentiate the drug dermatitis from that of measles.

Bullous Type.—This type is not seen frequently. It is usually associated with the severe erythematous type. The vesicles may vary from miliary size, which are usually transient, to that of large bullae and blebs, simulating pemphigus. The mucous membranes are frequently involved. Weber [5] has reported a case in which there was jaundice along with the bullous eruption. Hemorrhagic bullae also have been described. Following the formation of blebs, extensive ulceration and necrosis have occurred. Mailer [6] reports an interesting case of this kind, in which the reaction was due to nembutal (sodium ethyl—one methyl-butyl—barbiturate). In this case large wheals first appeared on the thighs, followed by vesicles which coalesced into bullae. Necrosis rapidly followed, involving one-half of the anterior portion of the thigh. Similar cases have been seen by Coste and Bolgert,[7] following the use of barbital. The necrotic areas occurred at the sites of pressure appearing as acute decubiti.

Eczematous Type.—Bering [8] recently described a group of five cases in which the clinical picture was that of a papulovesicular eczema. Three of the patients had a primary dermatitis, following the long use of barbiturates. In the other two the eruption was secondary to a chronic pruritic eruption.

Fixed Type.—A fixed eruption is one characterized by recurrences in exactly the same locations. The affected areas usually become pigmented, and at the time of exacerbation are pruritic. This type of reaction, due to several of the barbiturates, has been observed, but is not widely recognized. Wise and Parkhurst,[9] Goldenberg and Rosen,[10] and Fowlkes [11] make mention of this condition caused by these drugs. Loveman [12] published the description of a case following the use of allonal which contains alurate (allylisopropyl-barbituric acid). Langenbach,[13] reporting four cases of dermatitis following the use of sodium amytal (sodium iso-amylethyl barbiturate), states that there was some pigmentation, and that in one case, upon repeating the drug, the eruption did occur in the same areas. From his description, however, one cannot be sure that he was dealing with a fixed eruption. I have seen one case in which this type of reaction was found to be due to amytal.

REPORT OF CASE

N. F., female, age thirty, was referred to me for consultation by Dr. C. Cocks. Her chief complaint was recurrent itching patches on the right wrist and left buttock. Examination revealed two circular, sharply circumscribed, hyperpigmented areas of a purple-red hue. The one situated on the dorsum of the right wrist was of dollar-size. The other, on the left buttock, was of palm-size. The rest of the skin was clear. A clinical diagnosis of fixed eruption was made.

The eruption had been present for the past four or five months. It came on suddenly and there was a marked pruritus of the affected areas which lasted several days. The symptoms then cleared. Exacerbations have since occurred at irregular intervals. After each attack the patient noticed that the pigmentation gradually became deeper. Her general health had been good, except for some nervousness and insomnia. For this she had been taking different medicines, including allonal.

The patient was asked to take several tablets of allonal, but no exacerbation took place. Further questioning revealed the fact that, in addition to the allonal she had, on occasion, been taking sleeping capsules that were prescribed for her mother. These were found to be amytal (iso-amyl-ethyl barbituric acid). A few hours after taking one of these capsules, there was a severe exacerbation, with pruritus and deepening of the color of the lesions.

From this observation it was apparent that the exciting factor of this patient's eruption was due to the amytal.

FURTHER OBSERVATIONS

Effect of Other Drugs Producing Fixed Eruptions.—The patient was then instructed to take aspirin and phenolphthalein. Both drugs are known to produce fixed eruptions. There was no reaction. This again confirms similar experiments by Abramowitz [14] and the author [15] on phenolphthalein, and by Loveman [12] on allonal, in which it was shown that an individual with a fixed eruption is not susceptible to all the drugs that cause this type of lesion.

Effect of Taking Other Barbiturates.—She had previously taken allonal with negative results. One-half grain of phenobarbital (phenylethyl-barbituric acid) was given, and there was a definite flare-up of the eruption. Later, when the condition had subsubsided, she was given barbital (diethyl-barbituric acid). Again there was a severe exacerbation, appearing in about twelve hours. As amytal, barbital, and phenobarbital, all contain ethyl-barbituric acid, it was thought that the eruption might be due to this radical. She had not reacted to allonal (allyl-iso-propyl barbituric acid), which does not contain ethylbarbituric acid. Loveman [12] found in his case which reacted to allonal that there was no reaction to the other barbiturates.

Effect of Split Products.—Several split products of barbituric acid were kindly furnished by the Eli Lilly and Company. They were iso-amyl-ethyl malonamid; iso-amyl-ethyl malonic acid; iso-amyl-ethyl acetyl urea; iso-amyl-ethyl acetic acid; iso-amyl-ethyl acetamid. One-half grain doses were administered without reaction. This shows that the eruption was not due to some split product of barbituric acid, which could have been formed in the body.

Patch Tests.—Patch tests were performed in the usual manner with amytal and the split products named above. All were negative. This has been

the usual finding with fixed eruptions. This observation would support the idea that hypersensitiveness in these cases is not in the epidermis and superficial part of the cutis, but is in the deeper layers of the skin.

TREATMENT

These eruptions usually involute rapidly on withdrawal of the offending drug, and no treatment is necessary other than a mild antipruritic, as calamin zinc lotion. Occasionally, in the more severe forms, active treatment is necessary. Johnson [16] and Sanderson [17] have reported good results with the intravenous injection of large amounts of 5 or 10 per cent glucose. A 4 per cent solution of sodium bicarbonate has also been used intravenously when large doses of the barbiturates have been taken.

SUMMARY

Skin eruptions due to the barbiturates are common. Any barbituric acid derivative is capable of producing the different cutaneous reactions which have been described. These reactions are urticarial, erythematous, bullous, eczematous, and fixed.

A case is reported of a fixed eruption due to amytal. Further observations on this patient showed that only the barbiturates with the ethyl-barbituric acid radical would reproduce the eruption.

DISCUSSION

HARRY E. ALDERSON, M.D. (490 Post Street, San Francisco).—I have seen numerous examples of eruptions due to all the drugs mentioned, excepting amytal. As I prescribe amytal a great deal in small doses, for the relief of pruritus, I may some day see a case of dermatitis medicamentosa due to this drug.

STANLEY O. CHAMBERS, M.D. (826 Roosevelt Building, Los Angeles).—This particular subject, dealing with drugs so commonly employed in general medicine, seems most apropos. It is appreciated by the author that cutaneous reactions of the common order are familiar to most of us. The intriguing portion of the presentation deals with a fixed eruption. This picture is infrequently identified, and yet relatively common. The discusser has witnessed such lesions about the scrotum and anal region, considered as recurrent scrotal eczema and pruritus ani. These lesions appeared in direct proportion to the ingestion of the drug, and disappeared with its withdrawal. Recurrence was always at the same site. Greater consideration of such possibilities should increase therapeutic effectiveness.

Doctor Novy is to be complimented for his interpretation of such an unfamiliar dermatitis.

PHILIP K. ALLEN, M.D. (314 Medico-Dental Building, San Diego).—The widespread use of many different barbiturate derivatives and the inevitable intolerance exhibited by some individuals to their use, make the subject an important one.

I think that the fixed eruption is the most interesting type of the drug idiosyncrasies. Its exact place in the field of hypersensitive reactions is still a debatable point. The reaction is not only independent of any circulating antibodies (as shown by the absence of the Prausnitz-Kustner phenomenon), but is confined strictly to certain groups of the fixed tissue cells. Similar tissue outside the reacting areas fails to exhibit the phenomenon, so that cutaneous tests are of little significance except in the areas previously involved.

An interesting feature of Doctor Novy's case is the degree of specificity shown to a certain type of barbiturate derivative. It is frequently of great value to know that a hypersensitivity to one type of drug does not imply that related substances will produce the same reaction.

ACUTE GONORRHEAL ARTHRITIS COMPLICATING PREGNANCY*

By JOHN R. UPTON, M.D.
San Francisco

DISCUSSION *by Karl L. Schaupp, M. D., San Francisco; Frances Baker, M. D., San Francisco; William Benbow Thompson, M. D., Los Angeles.*

THE comparative rarity* of acute gonorrheal arthritis complicating pregnancy, and the peculiar problems which arise in its treatment during the pregnant state, warrant a consideration of the subject, a review of the literature, and the reporting of a case. The "Index Medicus" for the last ten years contains no articles on this subject.

LITERATURE

Lindermann,[1] in 1892, appears to have been the first man to connect the gonococcus with the resultant complicating arthritis. Jundell,[2] in 1894,

* By permission of the San Francisco Public Health Department, Dr. J. C. Geiger, director.

From the Department of Obstetrics and Gynecology, University of California Medical School.

and Aehman,[3] in 1897, recovered the gonococci from infected tendon sheaths. Edgar,[4] in his 1903 volume of Obstetrics, makes no reference to the gonococcus during pregnancy, but does state: "The etiology (puerperal septic arthritis) is evident from the pathology. It has been seen, however, as the result of gonorrheal infection. There is always considerable danger of destruction of the joint and of permanent anchylosis and loss of function." Webster,[5] in 1907, only says: "It (gonococcus) may be carried to distant parts, *e. g.,* joints, endocardium, and pleura, and set up pathological processes. The marked liability of pregnant and puerperal women to acute gonorrheal infection must be noted; and also the tendency to development in these states of an acute exacerbation of what was previously a slight infective inflammatory process. Thus a latent condition may develop into an acute outbreak in pregnancy, or in the puerperum, without any fresh infection from without." Lea,[6] and Taussig,[7] and Harrar,[8] likewise made further advances in the study of the gonorrheal organism as a causal factor in arthritis. DeLee,[9] in 1915, briefly calls attention to the increased vascularity and succulence of the vaginal tissues, and the appearance of the vaginal mucosa when infected. Royston,[10] in 1923, reported four cases of pregnancy complicated by gonorrheal arthritis; these were the first histories I could find reported in the literature, and I shall have occasion to refer to them more fully later. Williams,[11] in 1926, in his volume on Obstetrics, stresses the rôle played by the gonococcus during the puerperium, but makes no mention of any complicating disorder during pregnancy.

DIAGNOSIS

Diagnosis[12,13] should present few difficulties. The question of pregnancy is usually self-evident. A characteristic history for gonorrhea from the husband, wife, or both, may or may not be elicited. The gonorrheal infection responsible for the acute arthritis appears to be most frequently acquired after conception takes place.[10,11] The isolation [14,15] of the Neisserian organism from the vaginal tract leaves no possibility of doubt—if the smears have been prepared by the use of Gram's staining technique. On this well-known clinical picture of gonorrhea, and usually within four weeks' time, is superimposed a rather suddenly severe fever, chills, some prostration, sweats, shifting pain in the skeletal articulations, swelling of the joint capsules and adjacent tendon sheaths, with final permanent localization of this acute pain in some one or more skeletal junction. In a few patients where repeated vaginal and cervical smears are negative for the Neisserian cocci, or, in patients who are too close to term to warrant the vaginal manipulation incident to the cervical visualization, the complement-fixation test is of real assistance in establishing a diagnosis; the test should be routinely performed. Intradermal tests with the gonococcal filtrates are not specific and, therefore, they are misleading.

Many physicians, in order to establish a diagnosis, aspirate some fluid from the affected joints or tendon sheaths, but this procedure, I believe, is attendant with considerable risk to the patient. The gonococcus organisms are difficult to culture and isolate from such aspirated fluid, even though the joint spaces are washed carefully, and the resultant liquid centrifuged. The possibility of a secondary infection makes a seemingly simple procedure fraught with danger. The above questionable diagnostic procedure is nullified, however, when an acute purulent tenosynovitis occurs; for in such a case the treatment is surgical incision and drainage.

SOME GENERAL CONSIDERATIONS

A few general considerations must be disposed of first, for certain pertinent side issues continually creep into the discussion and refuse to be ignored. The pregnancy must be considered as a complicating factor. The period of gestation is of importance; Royston's[10] four cases all developed their acute arthritis in the latter half of pregnancy, and my reported patient was in the twenty-ninth week of pregnancy; therefore, from the few reported cases the impression is obtained that the arthritic manifestations occur in the last trimester. Earlier writers[4,5] believed that many spontaneous abortions occurring in the first trimester were caused by a gonorrheal infection, with the disease being contracted at or shortly after impregnation occurred. This infection, they believed, caused an endometritis and deciduitis which, if severe enough, would precipitate an abortion. The presence of a fetus complicates matters greatly, but suffice to say that, if it is possible for the patient to carry through to term, so much the better for the ultimate results. Any mechanical interference in the earlier months of pregnancy through the vagina, in order to induce an abortion, will unseal the route to the abdominal cavity. This permits the causal gonococcus an opportunity to initiate, and form the tubo-ovarian and pelvic manifestations so familiar to all gynecologists.[12,13] Astrinsky and Grinner[16] report 30 per cent of complications when induced abortion occurred in their series of cases of gonorrhea. Gonorrheal arthritis is sown by an infected blood stream. Contiguous invasion from the infected Bartholin, Skene, and cervical glands is usually prevented after conception by natural cervical barriers, but if these are destroyed by surgical or criminal interference the utero-tubo-abdominal passageway is again patent. Another cautioning factor against indiscriminate therapeutic abortions is the strong possibility of a secondary invader obtaining a foothold in the excellent pabulum created by the unavoidable trauma incident to the surgical interference. The most-feared organism is the hemolytic streptococcus.[17] The resultant infection would also be augmented by the general lowered body resistance of the patient due to the infective arthritis.

The available evidence indicates that the acute infectious process is due to the gonorrhea having been contracted after conception occurred. An old gonorrheal infection frequently prevents fertilization by occluding the fallopian tubes, while if the disease is localized in the lower genital tract, attenuation of the cocci may result. Williams[11] states that many puerperal fevers are flare-ups of a qui-

escent antepartum infection. The diminished virulence might be the result of conservative treatment if recognized, or again it might be the reaction due to an increased resistance on the part of the maternal body defenses. When postconceptional in character, the invading organism is fresh and virulent, while the maternal tissues, being succulent and hypervascular due to the pregnancy,[9] offer an excellent medium for multiplication and for possible invasion; trauma to the vaginal mucosa or the cervix abets the infection. Several investigators[18] have shown that pregnancy increases the resistance of the maternal body to disease; were it not for this fact[19] many more women would present the acute gonorrheal arthritic symptomatology. As it is, the disease is rare, whereas vaginal gonorrheal infections during pregnancy are quite common;[16,20,21,22] Taussig[7] reported 5 to 10 per cent, Royston[10] 3 per cent, and Rorke[22] 16 per cent of their clinical patients.

TYPES

Acute gonorrheal arthritis is either monoarticular or polyarticular. Multiple joint involvement appears most frequently; this fact is rather fortunate, for when one joint alone is diseased the course is frequently stormy, as an inflammation of the tendons and tendon sheaths may take place, and a high percentage of cases progress into a purulent tenosynovitis. If a purulent tenosynovitis supervenes, the original condition must be subordinated until adequate surgical measures[23,24] have cleared away the septic infection between the tendons and delicate sheaths. Frequent, minute examination of all involved joints and adjacent tendons is mandatory to circumvent such a chain of distressing events.

The Neisserian organism appears to have a predilection for the upper extremities in women, and for the lower members in males. The wrists, elbows, metacarpal and phalangeal joints, shoulders, sternoclavicular articulations and knees are attacked most frequently in women. Complete ankylosis of one or more joints is the most fearsome aftermath, and the condition to be guarded against. Royston[10] tells us that all four of his cases suffered some permanent damage; Kanavel[25] warns against the possible dire results after a gonococcal arthritis. A vexing question is the problem of splinting the involved members; there is a wide diversity of opinion as to whether splints are necessary.

TREATMENT

Nature immobilizes diseased articulations and tendons rather effectively, but we can aid and encourage nature, and at the same time provide more comfort for the patient. When the elbow or wrist is involved—and these two constitute the commonest sites—logical treatment, based on anatomical considerations, is to apply a posterior arm supportive plaster splint with the elbow held in the mid-flexion attitude, the forearm in midsupination, and the wrist assuming a slight dorsiflexion. This type of support is easily removed so that passive and active massage may be instituted at the proper time.[25] Involvement of distal extremities, likewise, demands adequate support of the involved members. The physician should be rather cautious, however, for splinted patients may rely overly much on this artificial rest, with the resultant freedom from discomfort. Atrophy of muscle groups, tenosynofibrosis, and sometimes bony ankylosis takes place, a truly dire catastrophe. Splint if necessary, but always encourage the patient to move her involved members within the angle of painless motion when the splint is removed. This slight activity will stimulate peripheral circulation, prevent marked muscle wasting, prevent and break up tendon adhesions, and will greatly lessen the danger of joint fixation. When these patients first present themselves for treatment, roentgen-ray studies of the affected joints should be taken, for then we have valuable comparison films for use at a later date. Films frequently show involvement of the bone in the form of an osteitis; therefore, interval pictures will shed necessary information on the progression or retrogression of the disease. This being so, the roentgen films constitute valuable adjuvants in the treatment of the patient, for by their interpretation of the bony lesions the calcium-phosphorus therapy can be intelligently administered. We should not forget that such records are also medico-legal safeguards for the doctor.

Sagging, pendulous breasts require support. A snugly fitted uplift brassiere will give great relief. My patient complained bitterly about her heavy breasts resting on the extremely tender bicep muscles, but when the pressure was relieved by an uplift brassiere she instantly remarked on the improvement. A minor point, but one which the patient heartily welcomed.

The heart, like a good campaigner, frequently takes care of itself, but it behooves the physician to protect it throughout the tedious illness.[26,27] If the heart has been damaged by former infections, greater watchfulness is necessary, for the high fever and toxic condition multiply the work of the organ many times. Bodansky[28] says that an increase of one degree centigrade in the body temperature causes a rise in metabolism of about 13 per cent. Lewis[29] says that "rest is essential until active mischief is no longer suspected; an object of rest is to avoid strains of joints or increased work of the heart that may help to light up active trouble; return to exercise must be very gradual." The friendly counsel of a cardiologist is warmly appreciated in dealing with such a damaged heart during pregnancy[30] when other contributing factors are present.

RECENT THERAPEUTIC MEASURES

Modern therapeutic measures directed against gonorrheal arthritis in the nonpregnant state are now uniformly effective.[31-34] When, however, we are forced to deal with a pregnant woman suffering with an acute gonorrheal arthritis, we must of necessity modify one of the newest and most effective weapons in the therapeutic armamentarium, *i. e.*, hyperpyrexia or hyperthermia. Under

the heading of hyperpyrexia, I shall only include:

1. Hypertherm cabinets. The air-conditioned hypertherm cabinet is perhaps the best of the present-day apparatus, but as yet I believe it has not been manufactured commercially. Hench, et al.,[31] report of this machine that, "of patients with gonorrheal arthritis, well over two-thirds are promptly cured, and practically none go without considerable relief." Owens[32] says: "Given patients who can and will take the treatment, better than 80 per cent of gonococcic infections, regardless of complications, may be absolutely cured in the space of two weeks."

2. Diathermy.[35-40]

(*a*) Contact metal electrodes.

(*b*) High frequency alternating electric field.

(1) Cable and coil; double cuff.

(2) Electric-field electrodes.

(3) Glass or composition, air-separated electrodes.

(*c*) High frequency electromagnetic field.

3. Hydrothermia.[41-43] Total or partial immersion can be used. Various clinics advocate varying degrees of heat, and different methods of application.

4. Nonspecific foreign protein therapy. In this group, typhoid vaccine given I. V. has had the stellar rôle. Cecil, Friess, et al.,[44] report disappointing results with malaria. Sterile milk injections[45] are not without danger to the patient.

Systemic hyperthermia should not be used for the pregnant patient suffering from acute gonorrheal arthritis, since the products of conception always suffer, and death of the fetus may occur when the body temperature is elevated, and sustained for any period of time. This fact is demonstrated by the many intra-uterine deaths caused by the various organisms which have, as one of their manifestations, the disturbance and elevation of the heat-regulatory mechanism. Pneumonia is an example. It is possible to modify some one of the above hyperthermic methods, but the physician must realize fully that the sensitive heat-regulatory centers in the gravid patient will tolerate less interference, and that the line of demarcation between the normal and pathological is more obscure. Local hyperthermic measures will give some certain relief, but, as Harrison[46] trenchantly puts it, "The primary focus of infection should be treated first, then measures are instituted to sterilize the blood stream, and the joints are treated last of all." Here diathermy produces beneficial results.

It might be advisable here to inject a word of warning, as it has been shown that the improper usage of short-wave diathermy machines is not without real danger.[35,36,47] Cartilage is devoid of circulation and sensation, possessing neither protecting nerves nor cooling blood vessels. If injured, articular cartilage has no power of regeneration, and little power of repair.[48] When short-wave diathermy machines are used, particularly referring to the double-cuff application method, the above warning is real. Deeper tissues sustain higher temperature rises, so that if, for instance, the knee joint is under treatment, the physician must be aware of the irreparable damage he may inflict to the articular cartilage of the knee. Some knowledge of electricity and physics is essential. Cardiac collapse, embolic phenomenon, hemorrhagic encephalitis, vascular collapse, and deterioration and hemorrhage of the suprarenal glands have all been encountered by those who have used this newer method of fever therapy.

Extremely gratifying results are frequently encountered when local roentgen-ray therapy is carried out by a competent roentgenologist.[49,50] Adequate screening[51] of the pelvic contents to avoid fetal and maternal damage is, of course, mandatory. Indiscriminate use of these roentgen rays might only show their harmful effect in later generations. Our reported patient responded more quickly to local x-ray therapy than to any other treatment; we were most favorably impressed with the results obtained.

In evaluating the results obtained by any of the hyperthermic methods we should realize that it is the production of heat, and heat alone, that aids; so far as now known, there is no specific bacterial action other than that produced by the increased rise of temperature.[37]

Chemotherapy has its staunch partisans and equally fervent opponents. I have not used this debatable form of treatment.

In regard to drugs, as with the hyperthermic measures, we are again confronted with the inevitable question, will the fetus suffer damage? Naturally, the mother's life must not be jeopardized nor her pain left unrelieved for want of administering necessary sedatives or analgesics. The salicylates, opium derivatives, quinin, and the cinchophens, judiciously used, will give considerable relief. Weak links in the maternal chain must be constantly sought for. Irritative drugs are prone to hurt an already damaged kidney; therefore, a daily urinalysis is indicated to pick up the first signs of a nephritic condition.*

Multiple small blood transfusions and intravenous 10 per cent dextrose are excellent supportive measures; especially is this true during the high-fever stage.

OTHER THERAPEUTIC FACTORS

A brief listing of certain other cogent factors which will intrude themselves for solution are: the eradication, if possible, of the primary source of infection and the cleansing of other nonspecific foci of infection; the choosing of a diet rich in vitamins and supplemented with some form of easily assimilated iron—trays which tempt the appetite and do not repulse; the approaching problem of vaginal delivery versus cesarean section; if the birth is per vaginum, to safeguard the child's eyes by adequate treatment, and if the baby is a female, to recall that the vagina of the new-born girl may be infected during the descent via the maternal birth canal; the baby should be bottle-fed from the start, to prevent any possibility of infection from the mother to the child, etc. Lamb[52] says that there is

* I am now studying the effect of prontosil and prontolyn in relation to the above condition, and hope that I may be able to report the results later.

a short period during and after birth when the vaginae of female babies are difficult to infect with the gonococci, due to the influence exerted by the theelin contained in the maternal blood. If this is true, it would partially explain the relative rarity of gonorrheal vaginitis in the new-born baby girls, even following breech deliveries.

PROGNOSIS

A favorable prognosis depends, necessarily, on various pertinent factors, but we may postulate: that if the bony destruction is minimal, and the angle of movement only partially restricted; if the heart has not suffered additional damage; if the kidneys function satisfactorily; if the primary source of infection has been adequately treated, and, finally, if the patient comes through the ordeal of labor successfully, then we may reasonably hold out the promise of a complete cure.

All patients should be followed for varying intervals after their discharge from the hospital, for ambulatory treatment is always necessary. A prolonged convalescence, abetted by a general building-up regimen, spells for greater end-result success.

REPORT OF CASE

A case of acute gonorrheal arthritis complicating pregnancy is hereby summarized:

Mrs. G. B., a primiparous white American housewife of twenty-two, entered the San Francisco County Hospital on August 29, 1935. Her complaints were: Severe upper extremity joint pain and stiffness for six days' duration. She had never attended a prenatal clinic.

Past History.—Resided in San Francisco for the past year. Previous to that she resided in Illinois, where she was born. She drank a moderate amount of alcohol up to the time she became pregnant. She had no menstrual irregularity until she became pregnant. L. M. P., January 11, 1935. E. D. C., October 18, 1935.

Present Illness.—One and a half months prior to entry she first noticed a vaginal discharge which gradually became worse, and quite profuse during the past two weeks. Her husband had had gonorrhea. Was treated; no urethral discharge for some weeks. One week previous to hospital entry she noticed stiffness of back, neck, shoulders, legs, ankles, toes, and fingers; any movement was attendant with great pain. Two days later the stiffness and pain became localized in the elbows, which became slightly swollen and exquisitely tender.

Physical Examination.—Temperature was 100 degrees Fahrenheit, pulse 130, respirations 22. A young woman, who cringed and whimpered if any attempt was made to examine her arms.

The skin was moist and pale, and the excessive perspiration necessitated frequent changes of nightgowns. Generalized flea-bites. Heart sounds not unusual, rate 130; blood pressure, 125/85. Uterine fundus was 25 centimeters above the S. P. Position of fetus R. O. T. sounds regular, but rapid—at 160 per minute. The child's head settled in the pelvis. Pelvic mensuration was within normal limits. The arms were held in half-flexion; shoulders, elbows, and wrists were exquisitely painful; some swelling at joints. Any attempt to examine the patient caused her to cry in an hysterical manner. There were no signs of a purulent tenosynovitis.

Laboratory Work.—Urethral and cervical smears were positive for neisserian intracellularis.

Complement-fixation test was positive. Wassermann, negative.

Sedimentation time was eight minutes. Blood: Hemoglobin, 80 per cent; red blood cells, 4,830,000; white blood cells, 12,400; polymorphonuclears, 78 per cent; lymphocytes, 22 per cent; type two, Moss.

X-ray report showed osteitis of both margins of the symphysis pubis, both wrists and elbows.

Urine: Catheterized specimen showed many bacteria, but otherwise negative.

Diagnosis.— Pregnancy, intra-uterine, seven months. Acute polyarticular arthritis, neisserian. Gonorrhea, subacute—skenitis, specific; cervicitis, specific. Tenosynovitis, bilateral wrists and elbows.

Treatment.—Absolute bed rest. High vitamin diet supplemented with cod-liver oil and iron. Massive hot compresses applied four times a day, from fingers to shoulders, with slight decrease of pain. Later on, local hot bakes by use of electric cradle; poor result. The arms were supported with slings at first; later, posterior splints were applied, with great relief to the patient. Gentle massage to arms and shoulders three times a day, using oil of wintergreen. Fluids forced to 4,000 to 5,000 cubic centimeters per day. One ounce of 6 per cent mercurochrome was injected into the vagina once every three days. Acetyl salicylic acid, sodium salicylate, and phenobarbital were the only drugs used.

Five intramuscular injections of gonococcus filtrate were given, with only slight decrease of pain. The initial dose was 0.05 cubic centimeters, the last and largest dose was 0.5 cubic centimeters.

Nine intravenous injections of typhoid vaccine with the initial dose of ten million, and the final dose of five hundred million. After the first injection the temperature rose to 101.6 degrees Fahrenheit; this was the highest elevation during the course. The second I. V. injection of vaccine was always given within half an hour after the primary rise; injections were given every other day. After the eighth injection the fetal heart became irregular and weak in quality; when this irregularity was again repeated after the ninth treatment, it was deemed advisable to stop the vaccine medication. The clinical response to this form of therapy was disappointing.

Six roentgen-ray treatments to the shoulders, elbows, and wrists were given before the patient delivered. Total dosage to each of the three mentioned areas was 450 r. When the patient returned to the ward after each exposure, she would always comment on the marked decrease of pain, and she stated, when she left the hospital, that the x-ray treatments had given her more relief than any other measure.

After the first eight days of her hospital stay, the swinging temperature dropped to a normal level and did not rise again until the intravenous typhoid vaccine therapy was administered.

Spontaneous labor pains began at 7:30 a. m., and at 10:14 p. m. of the same day, October 26, 1935, she spontaneously delivered a normal female baby. The patient was unable to use her arms to assist herself during the second stage of labor, and it was necessary to keep her under heavy pentobarbital sedation to relieve the arthritic pain in the arms, which was augmented by the labor pains. The female baby showed no congenital defects. Especial attention was paid to the eyes and the vagina, to prevent a contact gonorrheal infection.

Course.—During the third, fifth, and sixth days postpartum, she ran a slight fever; the highest point being 100 degrees Fahrenheit on the third day, after which time the slight temperature rather quickly returned to a normal level. Although she lost very little blood during the delivery, estimated at 250 cubic centimeters, the blood picture, postpartum, showed the following changes:

October 27, 1935—Hemoglobin, 75 per cent (Sahli); red blood cells, 3,500,000; white blood cells, 7,900.

October 30, 1935—Hemoglobin, 55 per cent (Sahli); red blood cells, 2,250,000; white blood cells, 6,600.

November 5, 1935—Hemoglobin, 55 per cent (Sahli); red blood cells, 3,600,000; white blood cells, 7,600.

A transfusion of whole blood was started, but the patient complained so bitterly (ankle vessel had to be used) that the transfusion was terminated after 100 cubic centimeters had been run in.

After a five weeks' convalescence, she was discharged to the University of California Out-Patient Clinic for physiotherapy and for anti-gonorrheal treatment. On discharge she still presented some moderate restriction of movement of the left elbow and wrist, but the right arm had full and free motion; her general condition was fair; mental state was excellent. The uterus was found to be in a third degree retrodisplaced position and quite painful to move. The

hemoglobin content was only 55 per cent (Sahli), and the red cell count was 3,600,000.

SUMMARY

Presenting a few facts and ideas relative to the diagnosis and treatment of acute gonorrheal arthritis complicating pregnancy.

A successful outcome for the mother and child is dependent on the drastic modification of modern medical therapeutics. The presence of a fetus excludes several of our most efficient measures from the course of treatment. Especial emphasis is directed to the narrow margin of safety in relation to the use of medicinal and hyperthermic procedures when confronted by this rather rare disease condition.

A recent case report is presented for illustration.

DISCUSSION

Karl L. Schaupp, M.D. (490 Post Street, San Francisco).—Acute gonorrheal arthritis complicating pregnancy is so rare that, in eighteen years at the San Francisco Hospital, the patient described by Doctor Upton is the only one I know to have been admitted for that condition. Personally, I have never had the opportunity to treat such a patient.

The patients that we see more often are those who flare up postpartum where there is not the complicating factor

of a living fetus. I believe the use of hyperpyrexia as a means of treatment to be dangerous to the fetus, as is shown by the number of premature labors with a high fetal mortality rate in patients who are suffering from pyelitis or other conditions with which high temperatures are associated.

Doctor Upton's discussion mentions the many patients who are known to have local infection, as shown by positive smears at some time during the prenatal period. It reminds us again of the need of vigorous treatment of all these patients, so that the local condition may be cleared up before there is systemic invasion.

*

Frances Baker, M.D. (University of California Hospital, San Francisco).—It is very gratifying to read such a paper as this in which the subject is so carefully approached from every angle. There are a few points, however, upon which I wish to enlarge slightly, or to emphasize.

Nature does immobilize involved joints, the muscles contracting into marked spasm where pain is acute. Usually, however, the position assumed is bad. The shoulder is adducted, being held close to the side so that abduction and rotation are very difficult to obtain. If the shoulder is splinted in abduction at 80 to 90 degrees, with some external rotation, movement is much easier to obtain as pain decreases and pain is less where spasm can be relieved. The elbow is usually held flexed and pronated. If it fuses in this position, it is of little value; whereas even a stiff elbow held at 90 degrees in midposition between pronation and supination is valuable. A patient holds the wrist in palmar flexion, while dorsiflexion is necessary for grasp. Hips and knees will be flexed and feet extended, if permitted to remain in positions of comfort, while traction and splinting relieve strain and place joints in positions of least deformity.

This orthopedic care is necessary and must be done early and not left, as Doctor Upton has quoted Harrison[46] as saying, "until the last." Orthopedic care can be carried on while search for infection is being made, and while the blood stream is being sterilized.

I am glad that Doctor Upton has stressed the point that short-wave diathermy is not without danger. Diathermy is of value, but it is not a cure-all, as many seem led to believe. There is no point in using diathermy when radiant heat is as effective or even more so. It should never be used where there may be hemorrhage, as in pregnancy, during the menstrual period, where ulceration exists, etc. Diathermy is a valuable asset, but must be used as carefully as one does potent chemicals.

*

William Benbow Thompson, M.D. (803 Wilshire Medical Building, Los Angeles).—It is extremely difficult to add anything of value to the excellent summarization concerning the treatment of gonorrheal arthritis.

Unfortunately, the addition of pregnancy largely prevents the use of the various hyperthermia methods, since the maintenance of fever would probably destroy the pregnancy and, with the casting off of the dead fetus, open an avenue through which the organism could progress into the uterus and its appendages. It is possible that the judicious employment of hydrothermia might give satisfactory results, especially since Pettit has recently pointed out that sterilization of the active focus can be effected almost as certainly with repeated small febrile reactions as with the prolonged temperature elevations obtained in electrical cabinets. This is, however, no more than a conjecture and, since Upton has so clearly evaluated the beneficial results of other agents, it would seem inexpedient for the present to attempt other than the therapy outlined. Fortunately, the combination of pregnancy and gonorrheal arthritis is extremely rare. With a satisfactory result obtainable by one mode of treatment, there is little justification for experimentation unless this be well within the bounds of safety.

In my opinion, the only agent which should be subjected to further investigation is the effect of sulfanilamid, and for that reason alone I might wish that Doctor Upton would have further opportunity for study of this perplexing problem.

THROMBOCYTOPENIC PURPURA HEMORRHAGICA*

BLOOD STUDIES DURING INFECTIONS AFTER SPLENECTOMY FOR THROMBOCYTOPENIC PURPURA HEMORRHAGICA (INFECTIOUS ORIGIN)

By Kenneth H. Abbott, M.D.
Ontario, California

Discussion *by T. S. Kimball, M. D., Glendale; Robert E. Ramsay, M. D., Pasadena.*

BLOOD studies before and after removal of the spleen have been made by a large number of investigators, but the literature fails to reveal blood studies during infections after splenectomy for thrombocytopenic purpura hemorrhagica (hemorrhagic thrombopenia). However, the relation of the spleen to the defense mechanism of the body against infection is not a new idea. The spleen has long been known as the possible chief organ of the body's immunological forces. Giffin and Holloway,[1] McLean et al.,[2] and others, have called attention to the frequent occurrence of infections, both before and accompanying the onset of thrombocytopenic purpura. That fatal infections occur after splenectomy has been shown by many writers; for instance, one of Wollstein's[3] patients ("N. V.") died of a pneumococcic meningitis sixteen months after splenectomy. It is my purpose to call attention to the infections occurring after splenectomy, and particularly to the changes seen in the cellular elements of the blood in a case of thrombocytopenic purpura.

REPORT OF CASE

G. S., a boy, five and one-half years old, complained, on January 9, 1935, of a sore throat. His mother thought he had fever. He went back to school in three days. Past history up to this time was negative.

The sore throat and fever returned on January 15, and the cervical lymph glands became markedly enlarged and tender. When his physician was called, on the 18th, he had also developed a bright-red macular rash over the face, neck, and thorax, which soon spread over the whole body and then rapidly disappeared. No peeling of the skin followed the disappearance of the rash. His temperature ranged from 102 to 104 degrees. The condition subsided in several days, and he was up and around the house on the 28th.

He then developed, on February 2, a left otitis media. Permission to do a paracentesis was refused until the 6th. Following the paracentesis, improvement was continuous until February 9, when he had a severe epistaxis, and another on the next day. Purpuric spots were found on the skin overlying the sternum on the 11th. Thereupon he was moved to the hospital.

The temperature was 102.6; pulse 120; and within the next twelve hours the purpuric spots had appeared over the whole body. The epistaxis continued. Blood examinations showed 3,000,000 red cells; 60 per cent hemoglobin; 10,300 white cells with 82 per cent neutrophils, 13 per cent lymphocytes, and 5 per cent large mononuclears. The platelet count was 122,000; coagulation time was nine minutes; clot retraction in five and one-half hours; and the fragility test was maximum at 0.38 per cent, and minimum at 0.34 per cent.

A diagnosis was made of symptomatic purpura hemorrhagica.

* From the Department of Medicine of the College of Medical Evangelists, Loma Linda and Los Angeles.

TABLE 1.—*Notes Concerning the Erythrocytes of Patient Herein Reported*

Date	Achromia	Basophilia	Polychromatic Stippling	Normoblasts Per 100 White Blood Cells	Cabot's Rings
February 19, 1935	++++	++++	++++	5	Many
February 20, 1935	++++	++++	++++		
February 22, 1935	++++	++++	++++	2	Few

February 28, 1935	++++	++++	++++	2	
March 1, 1935	+++	+++			
March 2, 1935				1	
March 3, 1935				0	
March 4, 1935	+++	+++	+++	1	
March 7, 1935	++	++	++	0	
March 9, 1935	No change in red blood cells				
March 12, 1935	No change in red blood cells				
March 18, 1935			++++		
March 20, 1935	Slightly improved red blood cells				
March 25, 1935	+	+	+ Marked improvement		

February 3–4, 1936, slight achromia and basophilia. Occasional normoblast. No Cabot's rings.

The subsequent course was critical. Blood cultures taken later were positive for Staphylococcus albus on repeated examinations. X-rays of the left mastoid region were cloudy. However, after repeated blood transfusions, and other treatment, he was greatly improved by March 9. The purpuric spots had entirely disappeared. All bleeding had stopped, and the platelet count had climbed to 368,000. The blood transfusions were discontinued, largely because of the lack of suitable donors. Immediately after discontinuing the transfusions, the platelet count began to drop, and had reached the low level of 66,000 by March 14. There was no further bleeding, however. His spleen was removed on the 19th. He recovered from the operation without complications, and went home by ambulance on the 21st with a platelet count of 446,000.

His tonsils were infected, and they were removed on April 25. Following this operation, he got along excellently through the summer, except for slight trouble with a chronic sinusitis, and was able to return to school in the fall.

In December, 1935, he again had a left otitis media, from which he recovered after a paracentesis had been done. But on January 19, 1936, he had another attack from which he did not recover after a paracentesis, but which definitely developed into an acute mastoiditis. Mastoidectomy was done on the 29th. Immediately following this operation he was very seriously ill for a while, but later gradually improved until February 8, when he developed trouble in the right chest, which proved to be an empyema. This was treated by closed drainage. As he was recovering, following the mastoidectomy and the empyema, on March 14 he developed an acute appendicitis. Appendectomy was done. Following this, his convalescence was without further complications, and he was dismissed from the hospital on April 1, 1936. When last seen, in September of this year, he was in very good condition, having gained in weight, and was looking fine. Roentgenograms of his chest showed the empyema to have completely healed.

Most of the blood findings have not been given above, as they are shown in the various charts in relation to his different infections. It was of interest that Cabot's rings in the red cell were seen before splenectomy, and none thereafter. Nucleated erythrocytes were present during the anemia periods, as shown in the accompanying charts.

COMMENT

As has already been mentioned, McLean [2] reported twenty-one cases of purpura in children, twelve patients giving a definite history of recent infection preceding the onset of hemorrhages. Nine of these had upper respiratory infections and six preceded the onset by a few days. It is of interest that his patient, who died on the twenty-fifth postoperative day, failed to show a rise in the blood platelet count.

It was Frank [4] who showed that there was a group of purpura cases which had low blood platelet counts. Kaznelson [5] demonstrated, in 1916, that splenectomy had a remarkably beneficial effect on those cases of purpura that had previously been shown by Frank to have a low blood platelet count. This stimulated considerable interest in this phase of the spleen problem. The rise in the platelet count has been found by all observers, both experimentally [6] and clinically, [7] though the evidence varies as to the duration of the increase. Krumbhaar [8] has demonstrated that the removal of the normal mammalian spleen causes a true, mild anemia, the appearance of nucleated red cells, and an increase in reticulocytes and in platelets. The latter begins about the sixth to eighth postsplenectomy day. Wollstein [3] did not find anemia in their splenectomy cases of thrombocytopenic purpura. A number of investigators [9] have pointed out that the rise in the platelets begins immediately [10] after the removal of the spleen in thrombocytopenic purpura patients, and the increase reaches a maximum in three to ten days. A million to over a million and a half platelets per cubic millimeter have frequently been reported, and the increased level is maintained at from 600,000 to 900,000 for many months. Dawburn, [7] Hueck, [11] and Shore [7] have shown that a rise

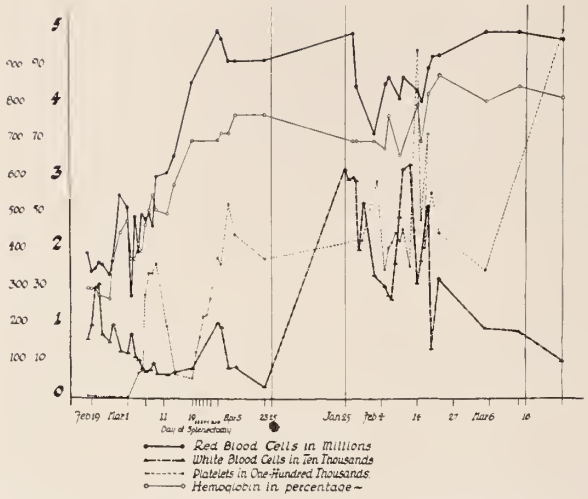

Fig. 1.—Graph showing changes in the formed elements of the blood just before and following splenectomy.

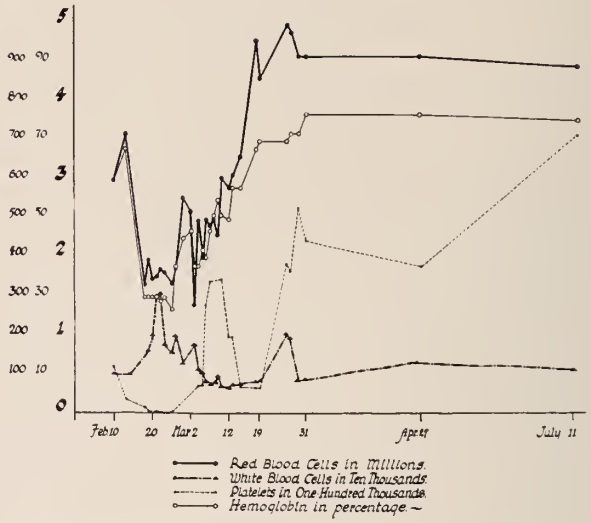

Fig. 2.—Graph showing the changes in the blood cells and hemoglobin during infections about one year after splenectomy.

in platelets about the sixth to eighth postoperative day occurs after any surgical operation with an equal amount of trauma to the tissues as occurs in a splenectomy operation.

Holloway and Blackford,[7] Cari,[12] and Galloway [7] have demonsrated a lowered platelet count in the splenic vein, as compared with that of the peripheral veins, capillaries and splenic artery; this, however, has not always been demonstrated. Holloway [7] has reported the blood platelet count of the splenic vein is not normally below that of the splenic artery, but is usually slightly elevated above that of the arterial blood. This all is in support of the theory that the etiologic agent of "hemorrhagic thrombopenia" (McLean) is in some way related to an infectious process. Giffin [1] suggests that it is a toxic material from an infectious process which rapidly destroys platelets. "The toxin affecting these changes is perhaps a secondary substance; the production of which is initiated by the pathological process; possibly some abortive substance originally designed to protect," he says.

Naegeli [13] found that lymphocytosis is a constant sequel to the spleen. Wollstein [3] and others have noted an eosinophilia. There have been no satisfactory explanations for either one of these.

RÔLE OF THE SPLEEN

All of these facts point to the spleen as a center for platelet destruction, a chief immunological organ; and, possibly, a factor in the maturation of the red blood cells and in the control of the lymphocytes in the peripheral blood. Our knowledge of the latter two is at present very meager, and certainly far from settled. What the essential change or pathologic process is in the spleen that makes it destroy excessively large quantities of platelets (or in some way alter their useful nature), and what causes the increased permeability or fragility of the capillaries, all of which occur in purpura, still remain problematical. However, the case herein reported does suggest that the spleen is probably: (*a*) an organ of defense against infections; (*b*) it apparently controls the number of platelets in the circulating blood, both in "time of peace and in times of infection."

It is evident that the diagnosis of the case herein reported was erroneous, for it was definitely of infectious origin. However, the observations following splenectomy are interesting and tend to substantiate the above observations in that the platelet count increased immediately upon removal of the spleen (Figs. 1 and 3). It was also interesting to see the relation between each new infection, particularly the severity of the infection, and the platelet count. The platelets increased or decreased with each rise or fall in the white cell count, and with an equal clinically evident increase or abatement in the severity of an infection. There was, however, a lag of about twenty-four to forty-eight hours in the increase or decrease of the platelet count in respect to the leukocytes, as is shown in Fig. 2. This close relationship of the platelets to the leukocytes is evident even when one has considered the trauma of the operations performed on this patient, and the blood transfusions given him. Anemia was mild, but not of sufficient prominence to corroborate Krumbhaar's findings of anemia in splenectomized mammalians. However, nucleated red cells and Sabot's rings in red cells were seen before the splenectomy was done; the nucleated erythrocytes appeared apparently because of the anemia, as they reappeared with the anemia accompanying the postsplenectomy infections and have disappeared again now that he is apparently in good health. The mild eosinophilia reported by several authors was not encountered in this case. Our patient is keeping a high platelet count in the peripheral blood. This may be in part due to our laboratory's method of determining the platelet count: they are made on venous blood, and we have found our determinations to be about 50,000 higher than those taken from capillary punctures.

We have been of the opinion that, from the standpoint of infection, this patient was done more harm by the splenectomy than if he had received only

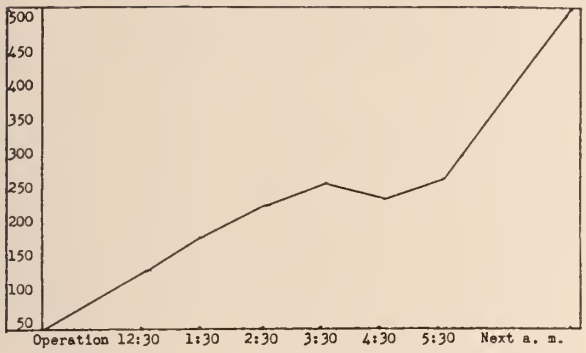

Fig. 3.—Showing rise in blood platelets immediately following splenectomy.

blood transfusions; since his purpura was probably of infectious origin.

SUMMARY

1. A case of thrombocytopenic purpura hemorrhagica, infectious origin, in a five and one-half year old male, has been reported. Splenectomy was performed, which resulted in the expected rise in platelets and cessation of hemorrhages. In the year following this, the patient suffered several severe infections, during which blood studies showed a close relationship between the platelets and the leukocyte counts.

2. The literature pertaining to infections and blood-cell findings, before and after splenectomy in hemorrhagic thrombopenia, has been reviewed.

DISCUSSION

T. S. Kimball, M.D. (217 North Central Avenue, Glendale).—The case reported by Doctor Abbott is most interesting from a hematological point of view. I believe this case well illustrates what hematologists very often find but seldom report. Most cases of thrombocytopenic purpura are precipitated by acute infections, drugs, exposure or some other harmful agent, but the mechanism of platelet destruction is not understood at all. It has been a well-known fact that removal of the spleen in most cases causes an abrupt and marked rise in the number of platelets. On several occasions we have seen, at the Los Angeles County Hospital, cases following splenectomy which showed spontaneous reduction in platelet counts during acute infections. It is also a well-known fact that, following a splenectomy, there is hyperplasia of the so-called reticulo-endothelial deposits in other parts of the body, and probably they function in much the same manner as the spleen if it were present.

No paper on this subject would be complete without mention of the excellent results obtained with the use of deep x-ray therapy over the spleen. This is much safer than splenectomy and seems to have all the benefits of that operation.

❋

Robert E. Ramsey, M.D. (65 North Madison Avenue, Pasadena).—From the clinical symptoms and positive blood cultures, we may assume that the patient had a bacteremia. It is possible to explain his purpura as a manifestation of toxemia affecting bone marrow, spleen, and the permeability of blood vessels. It is noteworthy that hemorrhage had stopped before splenectomy was performed. It is, therefore, seriously to be doubted whether a platelet count of 60,000 was low enough to warrant splenectomy. The ability of this patient to surmount such an array of complications as later followed is remarkable, spleen or no spleen, and, to my mind, supports the supposition of foci of infection based on the original condition. The present condition of the patient indicates recovery from infection due to the eradication of active foci, but is no assurance of freedom from subsequent infection.

THROMBOCYTOPENIC PURPURA HEMORRHAGICA*

TREATMENT WITH MASSIVE DOSES OF MOCCASIN SNAKE VENOM

By Carlyle P. Imerman, M.D.
AND
Stanley W. Imerman, M.D.
Los Angeles

Discussion *by Ernest H. Falconer, M. D., San Francisco; Cyrus C. Sturgis, M. D., Ann Arbor; V. R. Mason, M. D., Los Angeles.*

In 1928, Shwartzman[1] described a phenomenon of skin reactivity (local hemorrhagic necrosis) to bacterial filtrates, which was produced when intradermal injections of these filtrates were followed at suitable intervals by intravenous injections. The use of moccasin snake venom in the treatment of hemorrhage was based on the experiments of Peck and Sobotka[2] in 1931. They demonstrated that if a period of from fourteen days to one month was allowed to elapse after the injection of rabbits with moccasin snake venom, a large number of the animals became refractory to the Shwartzman phe-

* Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

nomenon. In 1932, Peck[3] made an attempt to treat various hemorrhagic conditions with moccasin snake venom, and this clinical trial included five cases of thrombocytopenic purpura which exhibited such symptoms as epistaxis, purpura, and prolonged and profuse menstrual periods. All of these cases showed definite clinical improvement.

The following case is presented to demonstrate the remarkable effect of massive doses of moccasin snake venom administered to a patient with thrombocytopenic purpura hemorrhagica, after the usual standard doses and blood transfusions had failed.

REPORT OF CASE

Male, age forty-seven years, complained of bleeding from the gums, purpuric spots under the skin and mucous membranes of the mouth, malaise, bloody urine, and tarry stools for a period of eight days. There was no family history of hemorrhagic diathesis. A tonsillectomy was performed in 1930 without any unusual bleeding. Physical examination on September 3, 1936, revealed: temperature 100.6 degrees, pulse 120 per minute, respiration 28 per minute. The patient was well nourished. The skin was very pale and there were numerous purpuric spots over the entire body, and buccal mucous membranes. The teeth were carious, and the gums presented marked pyorrhea and profuse hemorrhage. The tonsils were absent. Heart and lungs were normal. Liver and spleen were not enlarged. The blood pressure was 100/60, and after the cuff was allowed to remain inflated for five minutes numerous ecchymoses were noted in the forearm below the cuff. The urine showed a heavy trace of albumin and a macroscopic hematuria.

The blood examination revealed a marked secondary anemia, hemoglobin 57 per cent, erythrocytes 2,930,000, color index .97, leukocytes 10,800, and a normal differential. Stained smear showed a slight anisocytosis, and a few cells showed polychromatophilia, and stippling, and evidence of toxic changes. Platelet count was 18,000 per cubic millimeter. Bleeding time was five minutes, coagulation time two and one-half minutes, and the clot showed nonretractility. Fragility test was normal. The prognostic venom reaction[4] elicited by the intradermal injection of 0.1 cubic centimeter of 1:3000 standardized moccasin snake venom, with a control of 0.1 cubic centimeter of physiologic solution of sodium chlorid, showed a positive capillary rupture with diffusion of blood into the tissues in one hour. Blood chemical examination of the stools was strongly positive.

Therapy consisted of three subcutaneous injections of .3, .5, and 1 cubic centimeter, respectively, of moccasin snake venom, three whole-blood transfusions of 500 cubic centimeters each, and two intramuscular injections of 20 cubic centimeters each of patient's own blood. In spite of this treatment, the patient's general condition became worse, bleeding from the gums became more profuse, and the platelet count dropped to 12,000 per cubic millimeter, hemoglobin 56 per cent, and erythrocytes 2,100,000. On September 9, 1936, under general anesthesia, the carious teeth were extracted and the necrotic gum tissue was removed. A transfusion of 500 cubic centimeters of whole blood was given, and two hours later the patient went into shock; pulse 160, temperature 96 degrees, and blood pressure 80/60, and the hemorrhage from the gums was enormous. At this time a 5 cubic centimeter dose of moccasin snake venom was given subcutaneously and the gums were tightly packed. Within twenty-four hours the gingival bleeding stopped completely, the platelet count rose to 18,660, and the patient's general condition improved remarkably. Subsequent therapy consisted of a one cubic centimeter dose of snake venom on September 13, 1936, a whole-blood transfusion of 500 cubic centimeters on September 14, 1936, three doses of 3 cubic centimeters each of intramuscular liver extract, and reduced iron grains seven and one-half three times daily orally. The platelet count rose steadily to 231,000 per cubic millimeter on the fourth day after the massive 5 cubic centimeter dose was given, and the purpuric spots on the skin and buccal mucous membranes had completely disappeared, the urine showed no red blood cells and the stool was negative for occult blood. On the sixth day the platelet count was 302,000 per cubic millimeter, hemoglobin was 62 per cent, and red blood cells 3,560,000. On the eighth day the prognostic venom reaction was negative and the patient was discharged from the hospital. The patient was seen at subsequent intervals of every two weeks up to February 4, 1937. He was given a two cubic centimeter dose of moccasin snake venom and a one cubic centimeter dose of intramuscular liver extract on each occasion. On November 2, 1936, and November 16, 1936, the remaining teeth were extracted under general anesthesia, and there was a prompt cessation of bleeding on each occasion in about two minutes. Darkfield showed positive Vincent's spirillae and bacilli. The platelet count varied between 220,000 and 333,000. On February 4, 1937, the hemoglobin rose to 88 per cent and red blood cells to 4,700,000. Bleeding time was one minute, coagulation time four and one-quarter minutes, and the prognostic venom reaction was negative.

COMMENT

1. This is a case of severe thrombocytopenic purpura hemorrhagica which may have been caused by carious and abscessed teeth, extreme pyorrhea alveolaris, and Vincent's angina.

2. The patient's general condition and blood picture became worse following the administration of the usual maximum standard doses of one cubic centimeter of moccasin snake venom, as suggested by Peck and Rosenthal,[5] transfusions of whole blood and intramuscular injections of whole blood.

3. It is plausible that the prompt cessation of bleeding, which occurred in twenty-four hours, and the marked hematological and clinical improvement, which occurred in four days, was due to the subcutaneous injection of a massive 5 cubic centimeter dose of moccasin snake venom. It is entirely possible that large doses may accomplish spectacular results after smaller doses have failed, in view of the fact that the platelet count dropped, and bleeding became more profuse after three blood transfusions and three relatively small injections of snake venom. Although one cannot eliminate the fact that the platelets may normally fluctuate greatly, Sturgis[6] states that he cannot recall that he has ever seen the platelet count spontaneously increase as rapidly in any patient in a period of four days.

4. The theory that moccasin snake venom achieves its results by acting directly on the blood vessels is substantiated by the experiments of Peck[3] in 1932. This viewpoint is strengthened when one considers the fact that there was marked beneficial effect on the tendency to hemorrhage in cases with varied etiological factors, such as idiopathic epistaxis,[3,5,7] functional uterine bleeding,[3,5] toxic, anaphylactic, and endocrinal purpura,[3,5] multiple hereditary telangiectases,[3,5] and in those cases of thrombocytopenic purpura hemorrhagica in which the platelet count did not rise appreciably.[3,5] Peck and Rosenthal[5] stated that the severity of the disease does not depend on the number of platelets, but more likely on the fundamental principles, such as a functional qualitative capacity of the capillaries either in their contractile function or the character of their wall. Furthermore, certain patients following splenectomy[8] have failed to show subsequent hemorrhage even though the platelet count returned to its previous low level. However, in spite of these facts, it is possible that even though relatively small doses do not induce any definite change in the blood picture, large doses may cause an increase in platelets and thereby

hasten recovery in those cases in which there is a deficiency in regeneration of capillary walls.

5. It is well to bear in mind that there are no contraindications to the use of moccasin snake venom. A hypersensitive individual may be desensitized according to the method of Peck and Rosenthal,[5] and exacerbations of the underlying conditions do not occur. Furthermore, this massive dose was given during a period of acute shock, and demonstrates that it can be given safely even under the most unfavorable conditions.

SUMMARY

1. This patient received the largest dose of moccasin snake venom that has been reported in the literature.

2. This massive 5 cubic centimeter dose was given during shock, without any danger to the patient, and was followed by prompt, rapid, clinical and hematological recovery.

3. The rapid response and beneficial effect to the patient which occurred in four days cannot be explained on the basis of a spontaneous remission. It cannot be stated whether large doses affect the capillary walls directly or whether the cure was due to the platelet regeneration.

4. Massive doses should be tried in those cases that are refractive to the usual therapeutic measures, and before any surgical procedure as formidable as splenectomy is contemplated.

5. The importance of the removal of all foci of infection, in spite of the bleeding tendency, is again emphasized.

6. The results of one case are not conclusive, but it is hoped that further cases will occur to substantiate our observations that the suggested doses of moccasin snake venom are inadequate in certain cases.

DISCUSSION

Ernest H. Falconer, M.D. (384 Post Street, San Francisco).—To those of us interested in testing the therapeutic effects of moccasin-snake venom in thrombocytopenic purpura hemorrhagica, this report of Doctors Carlyle and Stanley Imerman furnishes food for thought. In our use of the venom at the University of California Hematology Clinic, we have considered any favorable results that have occurred as due to tonic effects of the venom on the capillaries. We have not found any significant increase in blood platelets following its use. Our dosage, however, has been even smaller than the recommended dose of one cubic centimeter. One serious constitutional and local reaction following the use of one-half cubic centimeter of moccasin venom has made us, perhaps, overly cautious in its use. The striking increase in platelets in the above reported case, therefore, certainly merits further investigation, particularly from the experimental side.

❦

Cyrus C. Sturgis, M.D. (University of Michigan Medical School, Ann Arbor).—The Doctors Imerman paper is of great interest to me, as it must be to anyone who has been confronted with the difficulty of managing patients with purpura who are bleeding extensively. I have always advised repeated transfusions as the procedure which is least harmful and the most likely to benefit the patient. It must be admitted, however, that this does not always control the bleeding. While splenectomy may accomplish remarkable improvement, it should be attempted only after all other measures fail. This is because it is a radical operation in a bleeding patient, and because it is not possible to predict, in any given case, that improvement will result.

I have used moccasin-snake venom, but without striking success. It deserves more consideration and further trial. It is possible that, if a larger dose had been used, as in Doctor Imerman's patient, better results might have been obtained.

❦

V. R. Mason, M.D. (838 Pacific Mutual Building, Los Angeles).—The report of a single instance of a rare disease treated by very large doses of a remedy whose pharmacological properties are not well known is of importance in urging others to do likewise with wisdom. However, in dealing with purpura of the thrombocytopenic type, it should be kept clearly in mind that the differentiation between the essential and symptomatic types may be extremely difficult or impossible even after the patient has been kept under observation for many months. The confusion in the literature regarding the efficacy of various therapeutic procedures is produced by incomplete temporal observation and by failure to distinguish between symptomatic relief and cure. In my experience with thrombocytopenic purpuric states, startling results, both good and bad, have been frequent and usually unexpected.

The case reported here probably should be classified as an example of a symptomatic thrombocytopenic purpura hemorrhagica, in which the snake venom tided the patient over the spectacular, but statistically not very dangerous, period of acute hemorrhagic manifestations.

ENDOCRINE THERAPY IN ACNE VULGARIS*

By H. J. Templeton, M.D.
and
Stanley R. Truman, M.D.
Oakland

Discussion *by Hans Lisser, M.D., San Francisco; Stanley O. Chambers, M.D., Los Angeles; Laurence R. Taussig, M.D., San Francisco.*

IT has always been a common belief among physicians that there is some relationship between acne vulgaris and the functioning, or dysfunctioning, of the endocrine glands. This belief is based upon certain well-established clinical observations, namely, that the onset of acne nearly always coincides with the onset of puberty, that an extremely high percentage of young girls will develop a few

Read before the Dermatology and Syphilology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

acne lesions, or suffer from an exacerbation of their acne, at their menstrual periods, and that there is a tendency for acne to retrogress after puberty and during early married life.

EARLIER DAYS OF ENDOCRINE THERAPY

In the earlier days of endocrine therapy, a number of clinicians treated acne by means of the oral administration of the products then available, such as thyroid, ovarian, testicular, and adrenal extracts. Their results were so uniformly discouraging that it is unnecessary to review the bibliography. Following these discouraging reports, endocrine therapy of acne fell into disuse. It was but natural, however, that when modern methods of determining sex-gland activity were developed, and when accurately standardized, physiologically potent extracts became available, physicians should again turn their attention to this type of treatment.

LATER METHODS

Inasmuch as it is possible to accurately measure the amount of estrogenic substance in the urine of female patients, it would seem logical to compare the amounts present in the urine of acne patients with the amounts present in the urine of normal controls. Then if a deficiency were found in the acne group, they could be treated by means of injections of accurately standardized estrogenic substance. Reasoning along such lines, Rosenthal and Kurzrock [1] determined the amount of estrogenic substance in the urine of patients with acne. Estrogenic substances should be normally present in the urine of all women during their active sex life. These workers found that it was absent in twenty-seven, normal in six, and in a small quantity in one. No gonadtropic substance was demonstrated in any of these urines. Rosenthal [2] then treated a series of thirty-eight acne patients by injections of estrogenic substance. Of these, thirteen patients definitely improved, ten showed slight improvement, and fifteen failed to improve. Van Studdiford [3] treated fifteen patients with estrogenic substance and reported that eleven of them improved. He treated another series of sixteen patients with a gonadtropic substance given postmenstrually, along with estrogenic substance given premenstrually. Eight of these patients improved. Lawrence [4] treated thirty patients (ten males and twenty females) with a gonadtropic substance (antuitrin "S"). Ten of these patients were cured, eleven were much improved, while seven showed only moderate improvement.

OTHER REPORTS

The above reports give the brighter side of the picture. Less encouraging results were reported by Michael,[5] who stated: ". . . twenty-six females have received what may be considered as reasonably good opotherapy . . . the therapeutic results have been poor and discouraging." It should be noted that Michael was working along with a gynecologist in order to determine the type of endocrine needed by each patient, and that these were modern products.

McCarthy [6] treated a large series of patients with modern hormone preparations such as antuitrin "S" and theelin. He concluded, "hormonal therapy is of no value in acne vulgaris except in the recurrent papulopustular types that have been previously treated with sufficient x-ray."

AUTHOR'S SERIES

Group A:

Seventeen college students—nine boys and eight girls—constituted one series. They presented acne vulgaris of various degrees of severity. Most of them had been treated previously with various local applications. Several had had x-ray, and/or ultraviolet light, and/or estrogenic substance, and had not responded favorably.

Photographs were taken of most of the patients before treatment was begun, in order to establish a base line for future comparison. Then 200 rat units of anterior pituitary-like substance of pregnancy urine (antuitrin "S")* was injected three times a week. Absolutely no other treatment, either local or general, was given. The injections were given over periods of six to eighteen weeks, for an average of ten weeks.

Ten of the group showed no improvement. Of the seven who improved, none were completely cured; four improved 33 per cent; one improved 50 per cent, and two improved 66 per cent.

In those showing improvement there was no correlation between length of treatment and improvement, except that most of the improvement seemed to take place in the first three or four weeks of treatment.

Those patients who showed no improvement were treated as follows: twelve weeks, one; eleven weeks, three; ten weeks, one; nine weeks, two; eight weeks, two; seven weeks, one.

Group B:

Another series of twenty-two patients, all female college students, was treated by injections of estrogenic substance (amniotin)† and 2000 international units were given at approximately weekly intervals. An average of nine injections were given each patient, the number varying from six to nineteen injections.

Eleven of the group showed no improvement. Of the eleven who improved, none were completely cured; two improved 33 per cent; five improved 50 per cent; and two improved 66 per cent.

A clinical impression that we gained while observing those patients treated with antuitrin "S" was that there was a certain indefinable improvement in the texture of the skin of a number of the patients. This somewhat resembled the softening in skin texture seen in hypothyroid patients when they are given thyroid.

COMMENT

Although a certain number of these patients showed improvement, the results were certainly far inferior to orthodox dermatologic-roentgen

* Furnished through the courtesy of Parke, Davis & Co.
† Furnished through the courtesy of E. R. Squibb and Sons.

therapy. And yet, the improvement which did result encourages us in our belief that acne is related to the endocrine system, and that further experiments with endocrine therapy are in order.

However, when only 50 per cent or less show any improvement and none show complete remission, the physician who undertakes the treatment of an individual with anterior pituitary-like substance of pregnancy urine or estrogenic substance is promising less chance of cure than the average patient is willing to take. Until it is possible to determine which gland preparation to use, which patient will respond, and how much to give, it would seem wise to refer endocrine therapy in acne back to the field of research problems.

DISCUSSION

HANS LISSER, M.D. (384 Post Street, San Francisco).—Naturally, I am in entire agreement with Doctor Templeton in his postulation of the theory that, in all likelihood, there is an endocrine background for acne. Its almost invariable appearance at puberty, and its continuance for a varying number of years thereafter, are suggestive evidence of such a relationship. It is also pertinent and interesting that in cases of sexual precocity, where adult sex characters appear in the first few years of life, acne likewise accompanies this. It has also been noted that adult women who, let us say, have been menstruating normally and who had not suffered from acne, and who in their thirties develop Cushing's syndrome with amenorrhea, heterosexual hypertrichosis, obesity, hypertension, etc., acne makes its appearance with this endocrine upheaval. There is, therefore, considerable clinical experience to justify the assumption that acne has endocrine affiliations. The precise relationship, however, remains to be determined. The situation is comparable to migraine which commonly begins at adolescence, and in women, at least, disappears with menopause. One is also reminded of the sudden appearance of dental caries in the 'teen age, despite regular and conscientious dental care all through childhood.

Doctor Templeton deserves credit for having made a clean-cut attempt to evaluate a specific type of endocrine therapy in acne. His results are not particularly favorable. This indicates merely that prolan injections do not solve the endocrine problem of acne. That some other organotherapy might be more effectual remains to be proved.

Acting on the assumption that there is some relationship between ductless gland disturbances and acne, granting that for the present this remains a vague one, I have for many years investigated, from an endocrine standpoint, a great number of boys and girls who have suffered from acne; they do not fit into any single endocrine type or endocrinopathy. Accordingly, I have treated them with the endocrine products they seemed to need in the hope that this would also have a beneficial influence on the acne. My clinical impression of all this can be summed up as follows: that neither endocrine therapy alone, nor dermatological procedures alone, evoke the best results; but that the utilization of both maneuvres, coincidentally, achieve better effects than either alone. However, I must repeat that the endocrine therapy must be individualized for the particular case. In other words, as yet there is no specific endocrine treatment for acne; but coöperation by dermatologist and internist (endocrinologist) is desirable.

STANLEY O. CHAMBERS, M.D. (826 Roosevelt Building, Los Angeles).—From other sources, as well as this rather complete study by Doctor Templeton, it would seem most rational to question the use and effectiveness of endocrine medication in the treatment of acne, regardless of its type. It is, however, difficult not to believe that the endocrine mechanism plays a part in its development. This part which the endocrines play must by quite different from the effect of these agents as we visualize it clinically and in the laboratory today. An increase in skin function would be directly opposed to our present dermatologic efforts, for we feel that the development of the acne papule is the result of a hyperactivity of the cutaneous gland. I believe we have sensed a relation between the disease and the endocrines. In neglecting the two principles which I have just noted, we have tried to utilize an agent in the treatment of acne because of its specificity in affecting the endocrine mechanism in other abnormal states.

With the publication of recent data relative to the effect of endocrine substances on other glandular tissue, and the favoring of malignant tendencies in these tissues, we have further reasons for caution in the use of these substances for the treatment of acne.

If these were partial evidence of specificity, then the assuming of some risk would seem warranted.

❦

LAURENCE R. TAUSSIG, M. D. (384 Post Street, San Francisco).—Acne vulgaris is one of the most common cutaneous diseases with which we have to deal. It is very distressing to the patient, and the methods of treatment available are far from ideal. The eruption undoubtedly is the result of a combination of factors rather than of some single factor. Furthermore, these factors are not constant, but vary from patient to patient. One important factor is very possibly coupled with the sex hormones. It is noteworthy, however, that eunuchs do not have acne as a rule. Carefully controlled research, such as this, is of distinct value. The only possible criticism is that the dose of antuitrin "S" given was not very large, and the dose of amniotin was quite low. It might be worth while to repeat these series, giving a considerably higher dosage in each group. I am wholly in accord with the author's conclusion that the evidence presented does not warrant the indiscriminate use of these hormones in the treatment of acne.

ROTATING ANODE X-RAY TUBE*

By ROBERT A. POWERS, M.D.
Palo Alto

DISCUSSION *by R. R. Newell, M.D., San Francisco; Robert S. Stone, M.D., San Francisco; L. H. Garland, M.D., San Francisco.*

THE rotating anode x-ray tube was developed to meet the modern demand for a heavy-duty tube with a small focal spot. These observations will consist entirely of a few notes on actual experience with the new tube and reactions thereto. A splendid and complete description of the tube is available in the manufacturer's announcement.† The principle of construction is, of course, familiar to all radiologists, and will not be discussed here.

* Read before the Radiology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

† The General Electric X-Ray Corporation. The foreign "Rotalix" tube, manufactured by Phillips, is not herein discussed.

Essentially the tube is shock-proof, oil-immersed, and has two focal spots of the amazing size of one and two millimeters.

ADVANTAGES OF THE TUBE

A tube with a two-millimeter focal spot, capable of delivering 500 ma. at 80 KVP for one-thirtieth second, excites the imagination of the radiologist, and opens up new vistas as to the future possibilities in radiological diagnosis. Needless to state, these improvements in diagnosis will be limited to those parts which cannot be adequately immobilized (heart, lungs, abdominal organs), and to children and those patients whose movements cannot be controlled. To discuss some of the advantages of the tube: In lung examinations the high milliamperage available makes possible the use of extremely low kilovoltage resulting in high contrast with increased visibility of small parenchymal densities. In cases of lung consolidation, Bucky diaphragm exposures can be made in a very short time. Lateral chest examinations, even with the Bucky grid, can be made in as little as one-sixth second. Cardiac valve and coronary artery calcifications should be much more easily demonstrated. In filming children's chests the tube is invaluable, especially when using grid technique. Excellent p. a. projections may be obtained in as little as 1/120 second. The tube is especially valuable in children's mastoid examinations. Here the combination of high speed, good contrast, and finest detail is essential and the tube fulfills every demand.

Gastro-intestinal and gall-bladder diagnosis are greatly enhanced, and lateral stomach examinations on the Bucky grid can be made in as little as one-fifth second. On nervous and "jittery" patients, exposure time can be cut to a minimum and motion "stopped." An instance of the tube's value in this type of patient occurred shortly after its arrival. At previous examinations we had found extensive caries, involving one of the vertebra. We were never able to completely immobilize the patient, however, and it was impossible to determine the amount of bone destruction present. Examination with the new tube demonstrated normal bone trabeculae throughout most of the vertebra, whereas previous films had suggested rather extensive disease. Treatment could be planned accordingly. Having used the tube for only a short time, we have barely approached the optimum in technique, but feel that with additional experience and exchange of ideas our roentgenological work will be greatly improved.

LESS DESIRABLE CHARACTERISTICS

Having briefly discussed some of the many advantages of the tube, I will touch on some of the less desirable characteristics, necessary to the type of construction. The tube is quite heavy, weighing fifty-eight to sixty pounds. Average tube stands are inadequate. The stand at present provided by the manufacturer has an insufficient up-and-down range, as the tube can be lowered only to a point 51½ inches above the floor. This is inadequate and makes impossible many routine technical procedures.

The motor in the tube causes a slight vibration which can be felt with the hand. The amount of vibration increases the size of the focal spot, but our tests show this to be negligible. The motor in the tube also makes a moderate amount of noise. As aptly stated by the service man, "It sounds like a kid going down the street on roller skates." This noise is a little disturbing to nervous patients, who may tense-up. In discussing the motor, it should be stated that the manufacturer's instructions state that the total time of rotation should not exceed one minute in any three-minute interval. Also the exposure should not be made until the motor has been in operation one second, but not more than a few seconds. This requires quick work on the part of the technician.

The filament current ranges from 3.5 to 5.7 amperes, requiring recalibration of the average ammeter, which only goes to 5 amperes. The ammeter divisions must be fine, as the slightest deviation may result in an error of 25 to 50 milliamperes. The manufacturer has provided a chart for presetting the ammeter value, or a ballistic meter may be used.

DETERMINATION OF HEAT UNITS

Cooling is a problem in this type construction: 50,000 heat units is the maximum permissible in any five-minute interval. We have determined the number of heat units generated in the various types of routine examination as follows:

Type of Examination	No. of Films	Heat Units
Stereoscopic skull study	8	75,360
Paranasal sinuses	5	65,020
Teeth Fast films	16	27,700
Teeth Radiatized films	16	68,352
Stomach(average)	8	14,702
Grid films(average)	5	16,071
Chest(average)	3	5,592
Spine—lumbar	3	47,720

As a five-minute rest period is required following the storage of 50,000 heat units (or one sinus examination), busy clinics must have another tube unit available during the cooling interval.

TARGET ANGLE

Due to the type of anode construction, the target angle is set at 15 degrees. At the average distance used, this covers a limited area of film. Film areas covered are as follows:

Film Size	Minimum Focal-Film Distance
8 x 10	22½ inches
10 x 12	26 inches
11 x 14	30 inches
14 x 17	36 inches

This is a minor disadvantage, however, as most films may be exposed at 36 inches.

The voltage permissible through the tube is 90 KVP. With the high milliamperage available, however, this appears entirely adequate.

SUMMARY

We have found the new rotating anode x-ray tube a valuable addition to diagnostic x-ray equipment, particularly in the examination of the heart and lungs, children, and nervous patients.

Disadvantages inherent in the type of construction are briefly discussed.

Medico-Dental Building.

DISCUSSION

R. R. Newell, M.D. (Stanford University Hospital, San Francisco).—Phillips Company in Holland has made a successful rotating anode tube for eight years. Only with General Electric Company's announcement of their double-focus, oil-immersed tube, did it become evident that rotating anode would be applicable to all radiography. Doctor Powers is to be congratulated for installing one of these as soon as he could get it.

Doctor Powers' paper well sets forth the advantages of this tube—advantages shared, of course, by the Phillips tube which is now being made in the United States, and is available with double focus. In our experience the work of this tube is so much superior that, for most examinations, one becomes dissatisfied with films made with stationary anode.

The fine focus is the one to use. Very rarely should one choose the two-millimeter focal spot. I am publishing in *Radiology* a discussion of optimum technique for showing detail in the lung field. Even if that means that one must move the tube up to one meter distance, still one should choose the one-millimeter focal spot.

The rotating anode tube is definitely expendable equipment, being good for only about ten thousand exposures. Replacements are costly. But even so, the additional cost per exposure is only about five cents. This is a small fraction of the total cost of the examination, and we ought not to begrudge it, considering the betterment in the radiographs.

Robert S. Stone, M.D. (University of California Hospital, San Francisco).—Doctor Powers has given us a very careful description of the rotating anode tube, showing its advantages and disadvantages. There have been some disadvantages in every x-ray tube so far produced. I think that in the rotating anode tube the disadvantages are less than in any tube previously produced, and the advantages are so much greater than anything before available that they far outweigh the disadvantages. The only objection I have to the rotating anode tube that is in use at the University of California Hospital is that it produces films of such sharpness in detail that films from other tubes seem to be of poor quality, and we are continually blaming the technicians for not getting better films. It is my feeling that just as soon as we are financially able, we will have rotating anode tubes in all of the diagnostic services.

L. H. Garland, M.D. (450 Sutter Street, San Francisco).—The early diagnosis of many diseases depends upon their early detection by the roentgenologist. The finer the detail obtainable in a given set of roentgenograms the more probable it is that early disease will be detected. During the last decade the research departments of film, chemical and equipment manufacturing companies, have given us steadily improving tools with which to detect early disease. We now have excellent high speed, nonscreen x-ray films, fast developer solutions, and high output x-ray equipment. For several years it has been my privilege to use a 1000 milliampere 140 KV diagnostic x-ray unit. The impulse timer designed for this unit permits the use of very short exposures and thereby the satisfactory reproduction of detail in fast-moving regions such as the left lower lobe of the lung and the small bowel. Until recently it was necessary to use a rather large, fixed focal spot with this type of equipment, but, as Doctor Powers has mentioned, with the introduction of the rotating target tube it is now possible to use small focal spots with extremely short exposure times. There is no doubt that the earlier diagnosis of common lesions, such as pulmonary tuberculosis, osteomyelitis, and metastatic carcinoma of bone, will be immensely facilitated by the new tube. It is still somewhat limited in the voltage that can be applied to it, but no doubt this will be improved with time.

In order to utilize the advantages of the small focal spot of the rotating anode tube to the fullest, it is necessary to use nonscreen film. It is well known that intensifying screens obliterate fine detail. Unfortunately, the increase in exposure time necessary in the case of thick patients or thick parts limits the use of nonscreen film to patients weighing less than 140 pounds, or at the present time to thinner portions of the body. (See Files, G. W., *Radiology*, p. 582, November, 1937.) When the speed of nonscreen films has been increased, then physicians possessing both rotating anode tubes and high-speed Buckys will be able to do a quality of general radiographic work which is as good as can now be done with extremities. Nonscreen films can be magnified and almost "microscopic" detail studied in them. The detection of the fine nodulation of early silicosis, the tiny cholesterin calculi of early cholelithiasis and the first trabecular thinning of osteomyelitis, are but three examples of the potential usefulness of this new weapon.

The diagnostic possibilities opened up by this tube are such that it is imperative to consider the economic situation involved. The increasing distribution throughout lay and professional fields of small x-ray units, by high pressure manufacturers, has resulted in much routine work being "taken away" from the radiologist's domain; it was by this very routine work that his main overhead was defrayed. The investment involved in the installation of rotating anode tube equipment is approximately as follows: high milliamperage transformer unit, impulse timer, rotating anode tube with tube support and rail, $6,000; vertical high-speed Bucky, mounted, $700; a total investment of $6,700. The tube itself is a minor cost; it is the equipment to operate it efficiently and make proper use of it that is expensive. It is to be hoped that dissemination of small units will decrease in order that patients may have a better chance of having their x-ray examinations conducted under proper circumstances. Only by reasonable concentration of x-ray work in properly equipped medical specialists' hands can such circumstances exist. Doctor Powers is to be congratulated on his distinction of having been the first radiologist in the Bay district to install a double-focus rotating anode x-ray tube.

RECONSTRUCTION OF THE ENLARGED BREAST*

By H. O. Bames, M.D.
Los Angeles

Discussion *by John Hunt Shephard, M. D., San Jose; Nelson J. Howard, M. D., San Francisco; Arthur E. Smith, M. D., Los Angeles.*

IN two papers, published last year, I presented a review of general considerations involved in plastic operations of the breast; technique was stated only in general terms.[1, 2]

Today I submit in film and words the operative technique, as well as preoperative preparation and postoperative results.

For the purpose of this paper, we consider as enlarged any breast which is larger than its owner desires, regardless of whether relief is requested on the basis of physical symptoms or mental distress

* Read before the General Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

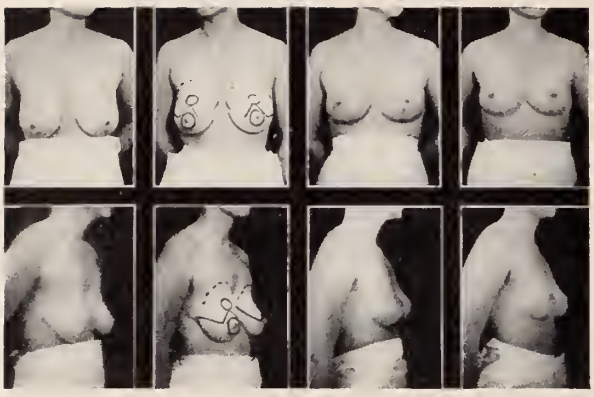

Fig. 1.—Front and three-quarter profile, showing condition and progress in various stages.

Column 1 shows symmetrical hypertrophy of both breasts, about one-third larger than would be normal for the size of her body; degree of ptosis is three inches below anatomical lower border.

Column 2 shows preoperative marking of incision lines, denoting new locus of nipple; circumcision line of areola; anterior line of new lower border with inverted "V"; posterior lower border is not visible, but parallels the new anterior border and coincides with the normal anatomical lower border of the breast. The dotted line denotes the upper limit of the area to be undermined for the new bed of the gland.

Column 3 shows the reconstructed breast three weeks after operation, reduced in size, secured in normal position. All incision lines and suture marks obviously noticeable.

Column 4, result a year later shows normal size, position, and esthetic contour well maintained.

over the abnormal development; regardless also of whether the enlargement and ptosis is only relative, or whether it amounts to actual gross deformity, for the technique of correction is essentially the same.

We assume also that a careful examination has proved the breast mass free of all pathology, except fatty infiltration or benign glandular hypertrophy.

Let us, therefore, proceed with the running of the film.

INSPECTION

We note that both breasts are about one-fourth larger than seems normal for this body, and that there is a ptosis of fully three inches. We note also that the areola has enlarged to twice the average size.

DELINEATION

Determining the new locus of the nipple is more by sculptural visualization than by actual measurements, with reference to certain anatomical landmarks. With the patient in the upright posture, we mark, with brilliant green, a circle 1½ inches in diameter, denoting the new locus. Next, the new size of the areola is marked, and while we make it smaller than its present size, we leave it actually larger than the above circle to allow for shrinkage from its overstretched condition. Experience has shown that a nipple formerly devoid of sensation and reaction can thus regain its normal irritability.

A third line is made along the normal inframammary groove, and a fourth one paralleling this third line upon the anterior surface of the breast, these two lines becoming confluent at their mesial and lateral termination.

The fifth delineation marks an inverted "V" from the new nipple locus to the lower border, sufficiently wide to take out the lateral redundancy of skin.

OPERATION

Skin incisions follow exactly these delineations. The gland is freed of all its overlying skin, excepting the nipple and areola, the attachment of which to its blood and nerve supply is most carefully guarded. In furtherance of this object, the periareolar skin ablation is made very superficial. The new bed for the gland is prepared by blunt dissection with the hot gauze sponge.

Proceeding next to reduce the size of the gland, we remove a sector representing approximately one-fourth of the mass, endeavoring to make the section between acini rather than across them, palpation acting as guide. The section is usually taken from the inferolateral area, as we thereby gain a better esthetic form. By closing this defect with a few interrupted sutures, we restore peripheral continuity and recreate the normal conical contour of the gland.

Had the enlargement been due to fatty infiltration instead of glandular hypertrophy, we would have ablated the periglandular fat and left the gland itself undisturbed.

We next close the "V" incision and thereby create a covering flap of skin which admirably fits upon the conical contour.

The gland is now transposed upward in its new bed, the nipple and areola emerging in the new locus and secured there with a row of interrupted sutures.

The fascia of the lower border is coapted with interrupted, nonabsorbable sutures, and the skin wound closed with a running lock suture.

A rubber drain is placed through this wound into the new bed, and left in place twenty-four to forty-eight hours.

Normal location of the gland is obtained by accurate planning of the new bed and its conical covering, rather than by suturing to the fascia. Experience has proved this to be an even better guard against recurring ptosis than fixation to the pectoral fascia.

EVALUATION OF RESULTS

In submitting this technique for discussion, may we suggest that it be checked by the results obtained, as shown in the closing scene of the film, which shows the patient four months after operation.

On the serial photograph, the first line represents front and profile of the condition complained of. Second line: with preoperative delineation of incision lines. Third line: four weeks postoperative. Fourth line: twelve months postoperative.

SUMMARY

The actual technique of reconstructing the enlarged and ptosed breast is submitted in word and Kodachrome film.

Sculptural visualization, more than anything else, is relied upon to secure good esthetic form and firm anatomical fixation.

Nipple, areola, and remaining gland tissue are transferred to their new locus, with blood and nerve supply practically unimpaired, making the reconstruction a true one in form as well as nervous sensibility. Lactation, in so far as this function existed residually in the breast before the operation, is practically uninfluenced by the operation.

Scars are held to a minimum of noticeability by suitable planning of the incision lines, and by placing all tension of approximation on the fascia instead of the skin.

DISCUSSION

John Hunt Shephard, M.D. (Medico-Dental Building, San Jose).—While enlarged breasts do not endanger life, they frequently do cause both physical and mental discomfort, entitling the patient to our earnest and sincere consideration.

For years these unfortunate individuals have had to choose between accepting the *status quo* or submitting to a mammectomy. Today we can offer them relief from their discomfort without partially desexing them, which, at times, does bring about serious psychological and domestic discord. Doctor Bames, by word and film, has shown us what he has been able to do for these patients, and he is to be congratulated upon his results.

My personal experiences with plastic operations on the breast is very limited; and while my results have not been as beautiful as Doctor Bames', my patients have been most grateful.

One point which Doctor Bames mentions in the technique of this operation I want to emphasize, namely, the preservation of the nerve and blood supply to the nipple and areola. The major blood supply to this area is quite superficial, and in the reflection of the superior flap one must keep his dissection close to the skin and do the most of it by a moist sponge over the fingers, instead of using a scalpel or scissors.

While the technique of this operation is not difficult, those of us who do not possess the eye of the sculptor will not be found exhibiting our results.

Nelson J. Howard, M.D. (350 Post Street, San Francisco).—Count as fortunate those physicians who saw the colored motion pictures shown by Doctor Bames at the 1937 State meeting. No written description could convey half so well the operative technique or the cosmetic after-results as presented in this film.

It seems an unnecessary comment that only pathologically normal, distinctly enlarged or exceedingly pendulous breasts should be submitted to these operative procedures. Where one should draw the line between abnormally enlarged, or exceedingly pendulous breasts and normal pectoral protuberances, is the difficult thing to determine. In the minor grades of these abnormalities, especially in the distinctly pendulous breast, one can be surprised at the return of contours and more pleasing form which follow the prolonged wearing of modern types of uplift brassiers. This change is an anatomical one, the so-called suspensory ligaments of the breast shorten, and the subcutaneous fat of the upper border of the breast is no longer atrophic or gravitated dependent. With painful breasts, in which pain fails to be relieved by adequate support, one cannot expect pain to disappear by this operation. The sole purpose, then, of the operation is the cosmetic effect, which, however, can be obtained by effective modern brassiers, unless the hypertrophy of gland or fat tissue is extreme.

Any operative plastic procedure on the breast must preserve the nipple and areolar intact for physiological as well as psychological reasons. I should like to know whether Doctor Bames has encountered sloughing and necrosis of these structures in this operation. Again, it would be of interest to know how many of these patients have had subsequent pregnancies, and how many of them were able to nurse their babies.

Arthur E. Smith, M.D. (1930 Wilshire Boulevard, Los Angeles).—Plastic reconstruction of the enlarged breast has been done for many years with a varied degree of success by plastic surgeons in Europe. Inefficient surgical planning and procedure often resulted in the loss of nipples, asymmetry of the breasts, and excessive scarring and interference with normal glandular function. Therefore, plastic surgeons in the United States were reticent in accepting the surgical results of their European colleagues. One of the first reconstructive plastic procedures for mastopexy was suggested by Dartiques, who adjusted the breast tissue by axillary resection. Then, later, the perpendicular subareolar incision with the excision of superfluous glandular tissue was practiced which resulted in large disfiguring scars and asymmetry of breasts. Thorek, in 1922, described his surgical procedure, which was a great step forward in plastic reduction and consisted of making a supra-areolar curved incision over the pendulous mass, and a second curved incision just beneath the breast. Excessive adipose and glandular tissues between the two incisions were removed. The nipple and areolar tissues were separated from the surrounding skin by a circular incision. The surrounding skin was undermined and the reduced breast was pushed upward beneath the loosened skin. The nipple and areolar tissue emerged through a new opening at the desired location. By this technique the curved scar line was located beneath the breast.

For a number of years I have employed a two-stage technique in the plastic reconstruction of the enlarged breast. The primary stage is for the establishment of collateral circulation and consists of loosening the skin over the major portion of the breast. This diminishes the possibility of losing the nipple or skin by superficial necrosis at the time of the major reconstruction.

Two months later the second operation is done. One-half inch of skin outside the areolar tissue margin is included within the circular incision. The skin is de-epithelized to the skin-areolar tissue junction. Two convex incisions are made: the upper one over the breast, and the lower one in the curved outline beneath the breast. No vertical incisions are made. A disk of skin, the diameter of the areolar tissue only, is removed at normal breast level and nipple location. The skin over the entire breast is loosened and the circumference of the breast reduced; the newly molded breast is pushed upward, and the nipple and areolar tissues are advanced through the circular opening. The one-half inch of de-epithelized skin surrounding the areolar tissue is covered by the surrounding skin which gives greater skin surface contact and better blood supply. The only scar line is situated beneath and hidden by the overhanging breast.

I wish to emphasize that the greatest surgical exactitude is necessary in plastic reconstruction of pendulous, hypertrophied breasts in order to create proper contour, preserve glandular function, prevent surface necrosis and scarring, lumping, and asymmetry. Women in the social, theatrical, and business world, who possess excessively large breasts are subjected to a physical and psychic handicap, which can be overcome by proper surgical procedures.

SIMMONDS' DISEASE (HYPOPHYSEAL CACHEXIA)*

CLINICAL REPORT OF SEVERAL CASES WITH DISCUSSION OF DIAGNOSIS AND TREATMENT

By Roberto F. Escamilla, M.D.
and
Hans Lisser, M.D.
San Francisco

Discussion *by C. Kelly Canelo, M. D., San Jose; Lewis T. Bullock, M. D., Los Angeles.*

IN 1914, Simmonds,[1] a pathologist of Hamburg, first suggested that the symptom-complex, now recognized as hypophyseal cachexia, was due primarily to diminished function of the anterior hypophysis. He arrived at this conclusion after

* From the Department of Medicine, University of California Medical School, San Francisco.
Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

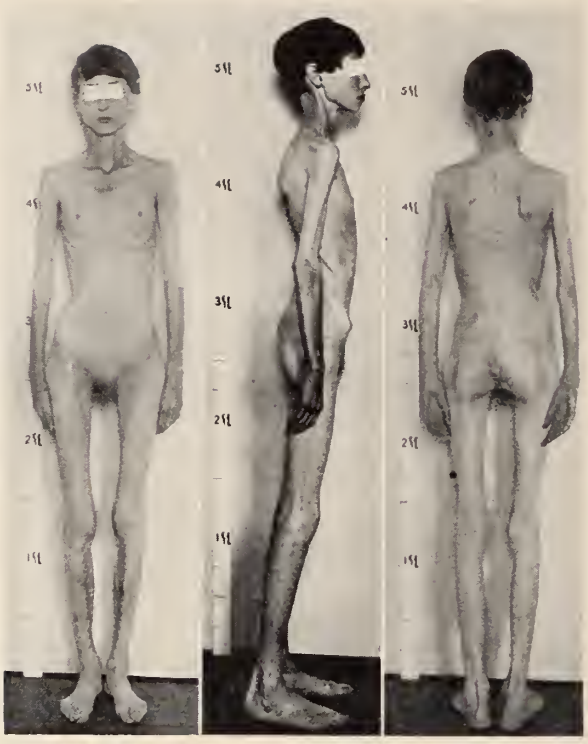

Fig. 1

several years of study of the structural changes in the pituitary gland in correlation with the clinical findings. As a result, the condition now known as Simmonds' disease has come to be generally recognized as a clinical entity.

Chief and most constant characteristics of the syndrome are: (1) marked loss of weight, frequently progressing to emaciation; (2) diminished sexual function; and (3) a very low basal metabolic rate. Other characteristic but less constant findings are: asthenia; intolerance to cold; premature senility; psychic changes; gastro-intestinal upsets; dry skin and hair, with loss of the latter particularly in the axillary and pubic regions; atrophy of the jaw-bone, and dental caries; low blood pressure; slow pulse rate; flat glucose tolerance curve with tendency to hypoglycemia (occasionally a diabetic type of curve); diminished specific dynamic reaction to food; secondary anemia; and visceromicria. The disease may occur in either sex at any age, but is most frequently found in females during those age periods when pituitary integrity is in greatest demand, as at puberty, during the menopause, or after many pregnancies.

Altogether, about 154 typical cases had been reported prior to 1936. However, as recently as 1933, Silver [2] accepted for his survey as cases of true Simmonds' disease only those in which necropsy findings had been reported—a total of forty-one cases at that time. The clinical picture now seems to be fairly well established, and is not likely to be confused with any other, with the possible exception of a state of severe malnutrition due to anorexia nervosa, of which amenorrhea may be a consequence.

We wish to present case histories of eight patients whose clinical findings, in our opinion, necessitate a diagnosis of Simmonds' disease, and one patient who was originally so classified but whose eventual course caused us to favor a diagnosis of anorexia nervosa. The fact that this number of cases has been collected in one clinic within a few years seems to indicate that the malady is not as rare as has been heretofore supposed. It is hoped that this presentation will stimulate consideration of the diagnosis of Simmonds' disease if cachexia is encountered that cannot be explained by any of the common causes.

REPORT OF CASES*

Case 1 (Fig. 1)—C. M. (43169M), a 25-year-old, single, Irish, female office worker, was admitted to the University of California Hospital on March 17, 1928, complaining of loss of weight and amenorrhea. In the past she had had the usual childhood diseases. It is of interest that one brother was thin. She had never menstruated.

When the patient was fifteen years of age she weighed 90 pounds (41 kilograms). At that time she had an attack of influenza, following which she began to lose weight rapidly and had associated symptoms of anorexia with slight constipation, and vomiting. A gastro-enterostomy was performed, resulting in some relief from vomiting. However, she continued to lose weight gradually, although she had occasionally slight temporary increase in weight during periods of rest and greater intake of food. Administration of ovarian and pituitary tablets did not improve her condition.

Physical Examination.—The patient's height was 62¾ inches (159 centimeters); her weight, 59¾ pounds (27 kilograms)—ideal weight, 124 pounds (56.3 kilograms). The pulse rate was 68 to 78 beats per minute, and the temperature was 36 to 37 degrees centigrade. She was emaciated. A downy growth of hair was present on the cheeks and upper lip, but elsewhere the hair was sparse and felt dry, especially in the axillary and pubic regions and outer thirds of the eyebrows. The jaw-bone was atrophied, but the teeth were in fair condition. The breasts were atrophic. Blood pressure was 88 millimeters of mercury systolic, and 64 diastolic. The finger nails were soft and ridged, and the tips of the fingers were cyanotic. Pelvic examination by Dr. Frank Lynch showed a small midline thickening which may have been a vestigeal uterus; and endoscopic examination revealed complete absence of the cervix.

Laboratory Findings.—Blood: hemoglobin, 78 per cent (12.2 grams) (Sahli); red blood cells 4,800,000 per cubic millimeter; white blood cells 9,000 per cubic millimeter, with a normal differential count, including 2 per cent eosinophils. Urine: faintest possible trace of albumin on one examination. Basal metabolic rate, 18.5 per cent minus. Blood sugar (fasting), 89 milligrams per cent. Roentgenological examination showed the sella turcica to be small and shallow; the bone age was that of an adult. Aschheim-Zondek and Allen Doisy folliculin tests on the urine, made in the laboratory of Dr. Herbert M. Evans, were negative. The blood was examined for anterior pituitary sex factors by Dr. C. Frederic Fluhmann of the Stanford Medical School, and these were not found.

Course and Treatment.—The patient was given anterior pituitary substance (Armour) in doses of five grains three times daily, with pancreatin. She improved slightly, but gained only 1¼ pounds in four months, at the end of which time the basal metabolic rate was 10.1 per cent minus. Eight months later she was found to have a diabetic type of glucose tolerance curve (blood sugar: fasting, 172; thirty-minute specimen lost; one hour 336; two hours 178 milligrams per cent; there were large amounts of sugar in the urine). One month later the curve had leveled somewhat as follows: fasting, 80; one-half hour 163; one hour 240; two hours 97 milligrams per cent. The patient was started on insulin therapy and a weighed diet of 1,620 calories. At this time her weight was 61 pounds (27.8 kilograms), and it gradually increased over a period of 10 months to 70 pounds (31.8 kilograms). The basal metabolic rate rose to 7.5 per

* Case histories of nine patients were given when the paper was read. Only three are printed in California and Western Medicine; others will appear in the reprints.

cent plus. Because she began to have insulin reactions and some gastric symptoms, medication was stopped for a time, but was later resumed in limited doses. At this time the glucose tolerance curve was flat (blood sugar: fasting, 81; one-half hour 129; one hour 84; two hours 77 milligrams per cent). The following year, despite continued treatment with insulin, anterior pituitary substance, ovarian extract, and thyroid extract, the patient began to fail in health and to lose weight. Fourteen months later (February, 1931), her basal metabolic rate had dropped to 37.3 per cent minus, and her weight had decreased to 61¾ pounds (28 kilograms). Injections of theelin were given, but the downhill progress continued. She was seen last at the University of California clinic on September 10, 1931, her weight at that time being 59¼ pounds (26.8 kilograms). Dr. Richard E. Graun of Los Gatos later informed us that she had died in August, 1933. During the last two years of life her course had continued downhill, despite general supportive measures. When seen on the day of her death, she was comatose and very emaciated, and weighed "not more than 50 pounds" (22.7 kilograms); her pulse rate was 44, and the blood pressure was 58 millimeters of mercury systolic, with no definite diastolic level. Permission for an autopsy, unfortunately, was refused.

* * *

Case 2.*—L. B. (73089M), a 17-year-old, American schoolgirl was admitted to the University of California Hospital on September 11, 1933, with complaints of loss of weight, amenorrhea, and increased growth of hair.

One brother and a cousin were Mongolian idiots. In the past the patient had had only measles. Menarche had occurred at the age of eleven years, and her menstrual periods were regular until the beginning of her present illness. At the time of onset of symptoms her weight was 127 pounds (57.7 kilograms).

Six years before admission to the hospital the patient had had a severe febrile illness, accompanied by an extraocular paresis. During the three weeks of illness she lost 25 pounds (11.3 kilograms) in weight. She then developed anorexia and constipation, and continued to lose weight. Amenorrhea had been present from that time. Four years before entry a downy growth of hair appeared on the face, neck, and back. Two years later she had attacks of acute lower abdominal pain, for which appendectomy was performed without relief resulting. For six months prior to entry she had noted intolerance to cold, slight asthenia, and occasional edema of the ankles in the evening. Basal metabolic rates determined six months before entry were minus 32 per cent and minus 29 per cent. Treatment with various drugs, including thyroid substance, ovarian extract, theelin, and insulin, was of no benefit. Her total loss of weight was 53 pounds (24.0 kilograms).

Physical Examination.—The patient's height was 67¾ inches (172 centimeters); her weight, 74 pounds (33.6 kilograms)—ideal weight, 137 pounds (62.3 kilograms). The pulse rate was 40 per minute, and the temperature 34 degrees centigrade. She appeared cachectic, and her skin was dry. A growth of downy hair was visible on the face, back, and extremities. The pubic hair showed normal distribution. The heart was small. The blood pressure was 90 millimeters of mercury systolic; 70 diastolic. A pelvic examination performed by Dr. Charles Hayden showed the uterus to be small, and the external genitalia infantile. The extremities were cold and cyanotic, and there was slight edema of the ankles.

Laboratory Examinations.—Blood: hemoglobin, 78 per cent (10.8 grams) (Sahli); red blood cells 3,900,000 per cubic millimeter; white blood cells 9,100 per cubic millimeter, with a normal differential count including one per cent eosinophils. Basal metabolic rate: 47 per cent minus. Glucose tolerance test: blood sugar (fasting), 76; one-half hour 66; one hour 90; two hours 74 milligrams per cent. Whole blood cholesterol, 149 milligrams per cent. Serum calcium, 11.9 milligrams per cent; phosphorus, 3.1 milligrams per cent. Plasma chlorids, 529 milligrams per cent. In the electrocardiogram the complexes were small in all leads. In the roentgenological examination the sella turcica was seen to be normal. Pyelograms showed the kidneys to be normal in size and shape. The bone age was over eighteen years. No abnormalities were observed in the chest, except for a small heart.

Course and Treatment.—The progressive loss of weight continued, despite a daily intake of 1,200 to 2,300 calories. Administration of thyroid extract for ten days, followed by injections of Antuitrin S for eleven days, did not improve the patient's condition. During the fourth week she suddenly became very weak and the edema of the ankles increased. The visual fields, which had been normal, showed marked concentric contraction. She finally lapsed into coma and died, despite the use of stimulants, fluids injected intravenously, and large amounts of adrenal-cortical extract (Eschatin) on the day of her death. The last weight determined was 62 pounds (28.2 kilograms).

Postmortem examination showed the presence of a chromophobe hyperplasia of the anterior pituitary, atrophy of the adrenal cortex, immature ovaries, and some terminal bronchopneumonia. The viscera were small.

* * *

Case 3.—P. P. (U 12003), a 17-year-old, white American schoolgirl, was admitted to the University of California Hospital (service of Dr. Francis Scott Smyth and Dr. Howard Naffziger) on April 1, 1937. Her complaints were loss of weight, amenorrhea, and easy fatiguability.

One cousin had died of tuberculosis, and a maternal grandmother of carcinoma. The patient had had the usual childhood diseases. Menarche had occurred at the age of twelve, and her periods had been fairly regular and normal until onset of her present illness. Her average weight had been 125 to 130 pounds (56.8 to 59.0 kilograms) during the year before her illness began.

Ten months before entry into the hospital the patient had had some anorexia, and had begun to lose weight. After a two-month interval, she had a normal menstrual period; and then complete amenorrhea. She was troubled also by sensitivity to cold, constipation, and some irritability and easy weeping. Six months before entry, a basal metabolic rate was found to be minus 40 per cent; and the administration of thyroid substance was started which the patient was still taking at the time of entry. The metabolic rate increased to as high as 5 per cent plus, but she felt no better and continued to lose weight. Her weight at onset of illness had been 130 pounds (59.0 kilograms); and she lost a total of 40 pounds (18.2 kilograms). She had some loss of axillary and pubic hair. Asthenia developed gradually, and finally she had to stop school.

Physical Examination.—The patient's height was 64½ inches (164 centimeters); her weight, 89.7 pounds (40.8 kilograms)—ideal weight, 125 pounds (56.8 kilograms). Her pulse rate was 56 per minute, her temperature 36.4 degrees centigrade. She was very thin; her movements and speech were rather slow. The skin was dry, with slight pigmentation over the abdomen (probably due to ultraviolet light treatments). The hair was normal in texture, scant in the axillae, and slightly thinned in the pubic region. The teeth were in good condition. The breasts were fairly well developed. The heart was small. Blood pressure was 94 millimeters of mercury systolic and 60 diastolic; it decreased to 74 millimeters of mercury systolic and 58 diastolic, when she was raised from a prone to a standing position (postural hypotension—Schellong-Strisower reaction). The viscera were small. Pelvic examination by Dr. Alice Maxwell showed that the uterus was normal in size, and the left ovary cystic. The extremities were cold.

Laboratory Examinations.—Blood: hemoglobin, 92 per cent (13.2 grams) (Sahli); red blood cells 4,700,000 per cubic millimeter; white blood cells 6,800 per cubic millimeter, with normal differential count, including 2 per cent eosinophils. Basal metabolic rate: 24 per cent minus (the patient still taking thyroid). Glucose tolerance test (1.75 gram per kilogram): fasting, 53.8; one-half hour 108.5; one hour 127.8; two hours 97; three hours 71.6; four hours 60; five hours 105.2; six hours 100.1 milligrams per cent. Nonprotein nitrogen: 42.2 milligrams per cent. Blood urea nitrogen, 22.8 milligrams per cent. Creatinin, 1.8 milligrams per cent. Whole blood chlorids, 351 milligrams per cent (as NaCl). Plasma chlorids (later), 544 milligrams per cent (as NaCl). Serum calcium, 9.8 milligrams per cent. Phosphorus, 6.68 milligrams per cent. Visual fields normal. Gastric analysis (fasting specimen only), no free HCl; total acidity not over two units. Tuberculin tests, negative. Roentgenological examination showed the sella

* This case, with discussion of pathologic findings, will be reported more fully in a later paper.

turcica to be normal; the bone age was seventeen to eighteen years; the lungs were clear; the heart small.

Course and Treatment.—The patient was started on daily injections of whole pituitary extract (Armour), but these did not have any appreciable effect. She was then started on Polyansyn, and discharged from the hospital. However, the regimen was not well followed at home, and she was finally readmitted with the general condition definitely worse. She was then started on a regimen of Polyansyn and insulin together, but after two weeks of this she became disoriented and depressed and refused to eat. The therapy was stopped and psychotherapy begun, under which she gradually cleared and began to take food satisfactorily. This resulted in a gain in weight of 25 pounds (11.4 kilograms) in seven weeks, and on discharge the patient weighed 104.7 pounds (47.6 kilograms). Her response to psychotherapy and increased intake of food would suggest that the primary diagnosis here should have been anorexia nervosa, rather than Simmonds' disease. This case is an excellent example of the occasional difficulty experienced in differentiating these two conditions clinically.

DIAGNOSIS

All of the patients whose histories are given above manifested the cardinal findings of Simmonds' disease as noted in the introductory paragraphs of this paper. Each had had considerable loss of weight, the least being 22.5 pounds (10.2 kilograms) (Case 7) and the most, 53 pounds (24.0 kilograms) (Case 2); the average loss of weight was 35.6 pounds (16.1 kilograms). At least five patients (Cases 1, 2, 3, 4, and 5) showed definite emaciation, being, respectively, 64¼ pounds (29.2 kilograms), 63 pounds (28.7 kilograms), 35 pounds (15.9 kilograms), 43 pounds (19.5 kilograms), and 51 pounds (23.2 kilograms) under their ideal weights. One of the female patients in whom the onset had occurred at puberty had never menstruated; while amenorrhea lasting from ten months to seventeen years was experienced by each of the others. The basal metabolic rates of all the patients were low, varying from minus 18 per cent to minus 47 per cent and averaging 32.1 per cent minus.

Concerning the less constant characteristics: All but one of the patients were females. Onset of illness occurred at or shortly after puberty in three patients; early in the second decade of life in four; in the third decade in one; and at the beginning of the fourth decade in one (the male patient, Case 7). The latest onset among the female patients (Case 6) followed a fifth pregnancy which had been attended by severe complications. At the time of examination the duration of the disease had been from ten months to seventeen years. All of the patients complained of asthenia, and three specifically of loss of libido although this symptom was not always ascertained in the unmarried patients. Seven patients had noted intolerance to cold. In regard to psychic changes, four patients had experienced decided slowing of mental processes (Cases 4, 5, 6, and 7); three had had a feeling of depression (Cases 3, 5, and 9); and one (Case 6) had at one time been apathetic to the extent of suggesting a diagnosis of "dementia praecox." Gastro-intestinal symptoms were of common occurrence, and were specific complaints of seven of the patients. Slight transient diabetes insipidus was present in one instance (Case 9). Anorexia, which was a frequent symptom, undoubtedly contributed to the continued loss of weight, but was not considered to be the primary cause. However, it is of interest to note that the subsequent course of Case 3, with a continued gain in weight under psychotherapy and increased intake of food, caused us to doubt the diagnosis and eventually classify the patient as a case of anorexia nervosa.

Of the physical findings, dry skin was noted in eight of the patients, but scanty axillary and pubic hair was noted in only three. Four patients had dental caries, and all had hypotension (the limits were 80 to 100 millimeters of mercury systolic and 50 to 70 diastolic). In the female patients the internal genitalia were small in six instances, and in one patient (Case 1) the cervix was absent. The one male patient showed slight genital atrophy.

The laboratory findings were of some interest. In the glucose tolerance studies, definitely flat curves were found at some time in seven patients, while two (Cases 1 and 5) had curves of the diabetic type; however, one of the latter was transient. In Cases 7 and 9 there were definite symptoms of hypoglycemia. Three patients were tested for specific dynamic reaction to food, which was found to be diminished in two. A mild secondary anemia was present in three cases, and a slight eosinophilia in one. The blood cholesterol was normal in four cases, and elevated in two. In sevent patients the sella turcica was normal, and it was small and shallow in one (Case 1, onset aet. 15).

Therefore, in our series, loss of weight, amenorrhea in females and loss of libido in the male patient, and lowered basal metabolic rates, were constant findings; the other characteristics were more or less variable.

TREATMENT

Since it is accepted that the pathologic physiology of Simmonds' disease is related to failure of the anterior pituitary, the logical treatment would seem to be therapy by replacement with anterior pituitary extract. For some of our recent cases an extract prepared by Professor J. B. Collip of Montreal (polyansyn) and kindly furnished to us by Ayerst, McKenna and Harrison, has been used. Administration of this extract caused some subjective improvement in general well-being, and appetite, and decrease of mental sluggishness; but except in one patient (Case 6), it did not result in a marked gain of weight. The symptoms of amenorrhea and lack of libido were not affected. Insulin therapy improved the condition of one patient (Case 1) temporarily, and caused a definite gain in two others (Cases 5 and 7). However, it must be administered with caution in this disease because of the frequent tendency to hypoglycemia. It is interesting to note that in Case 5, Polyansyn was necessary in addition to the insulin in order to cause continued gain in weight. Thyroid medication gave temporary benefit to one patient (Case 6) early in the course of the disease, but later was poorly tolerated. Five other patients who were treated with thyroid substance reacted unfavorably. This form of therapy seemed to hasten loss of weight, and to cause increased nervousness. Daily injections of Follutein gave temporary benefit to one patient early in the disease.

It is felt that preparations of anterior pituitary should be tried in adequate amounts and for long periods of time. Further observation of our patients is considered necessary before we can definitely accept the preparations available at present as being specifically beneficial.

SUMMARY

Nine cases are presented in which the history and findings were suggestive of Simmonds' disease. The classical and most constant findings are loss of weight, loss of sexual function, and lowered basal metabolic rate. The authors feel that this disease should be considered when a patient presents continued loss of weight for which no other cause can be found. Clinical differentiation from anorexia nervosa is occasionally very difficult, and the subsequent course of one of our cases caused it to be placed in this category.

Treatment is discussed; and, although therapy by replacement with anterior pituitary extract seems logical, its administration has thus far, at least in our experience, been somewhat disappointing. More potent preparations are needed. Despite the low basal metabolic rates found in these patients, administration of thyroid substance is ineffectual. A fattening regimen, with the use of insulin, may be tried cautiously.

The condition of some patients may improve spontaneously, but the eventual prognosis is usually grave.

DISCUSSION

C. Kelly Canelo, M.D. (Medico-Dental Building, San Jose).—Simmonds' disease is a condition of extreme debility and cachexia, caused by lack of function of the anterior lobe of the pituitary.

The most common etiological factor is an obstruction to the blood supply resulting from an embolus. Tumors, cysts and inflammatory processes of the pituitary itself are frequent. It is not uncommon to find a history of frequent pregnancies and then a delivery complicated by hemorrhage and infection. Howard reports a case of Simmond's disease, proved at autopsy, in a woman of twenty-three years, due to a tumor of Rathke's pouch, producing pressure on the pituitary.

The cardinal symptoms of this disease are: (1) Loss of weight and strength; (2) Loss of sex function; (3) Low basal metabolic rate. Weight loss is often as much as 65 per cent of the original weight of the patient. Brattan reported a case in a woman who died nine months after a long series of pregnancies; autopsy showed all the usual findings of Simmond's disease, except that there was no weight loss.

Loss of sex function includes amenorrhea and loss of libido and potentia.

The basal metabolic rate is frequently from 30 to 40 per cent below the calculated normal rate.

Other findings usually present are: dry, pallid skin, falling of the hair and teeth, senile atrophy of the lower jaw, decalcification of the bones, hypotension, subnormal temperature, bradycardia, splanchnomicria, low-fasting blood sugar and loss of specific dynamic reaction to protein, carbohydrate, and fat.

In making a diagnosis of Simmonds' disease, one must not be caught in the "endocrine whirl," but must rule out all other debilitating diseases. Anorexia nervosa mimics Simmond's disease and requires competent psychiatric observation to rule out this possibility. In the absence of pituitary signs, cancer must be thought of and diligently searched for. Addison's disease most usually shows pigmentation especially of the mucous membranes, and in this condition wasting is not the usual finding.

In spite of basal metabolic rates of minus 30 to 40 per cent, thyroid extract does not benefit these patients even though their metabolic rate be brought up to normal by means of thyroid.

This series of cases, although carefully controlled and treated with a reliable anterior pituitary preparation, has failed to show the complete response that might be desired.

Turner, however, reports a case of Simmonds' disease which responded quite promptly and completely with a similar anterior pituitary preparation.

Hawkinson, in 1935, reported one case that responded satisfactorily to A. P. L.

Herman reported, in the German literature in 1934, the good results he obtained in three cases by the use of prolan.

Barr reports one case that showed marked improvement with storage of calcium, phosphorus and nitrogen on no specific treatment, but adequate and attractive diet, rest, and good nursing care; it is possible that this was a case of transient Simmonds' disease due to mere suppression of the anterior lobe of the pituitary, or it may have been a case of anorexia nervosa.

Kylin reports a series of twenty-three cases treated by implantation of calves' hypophyses. Of these patients, three had been under observation only a short time at the time of his report; of the other twenty, eighteen showed good results.

Steinitz, in 1932, gave a report of six cases. He treated his cases at first with pituitary preparations alone and found that he was able to correct the trophic changes, but the weight loss either progressed or remained unimproved. In spite of low-fasting blood sugars, he found that the glucose tolerance curves suggested a lack of insulin; accordingly, he added insulin to his treatment and achieved a satisfactory response in his patients.

In the majority of patients this latter method of treatment would seem to be the most satisfactory at the present time.

❦

Lewis T. Bullock, M.D. (1136 West Sixth Street, Los Angeles).—There are many problems concerning Simmonds' disease that remain unanswered. In theory, at least, it is due to a lack of all of the secretions of the anterior pituitary gland. It is safe to say that we will not entirely understand this syndrome until we know all of the essential aspects of the physiology of the pituitary, and that day is still for the future. A case of pituitary cachexia, however, provides the inquisitive physician with a remarkable opportunity to study in man the disturbances produced by the absence of pituitary secretions, and it may be that important physiological data will be developed from this source.

The essential problem of why these patients lose weight and die is not entirely clear. Though necessary for normal growth in stature, it has not been proved that the lack of growth hormone is alone responsible for the loss of weight. Even if this were true the mechanism is not understood. Is it a lack of appetite and food intake, a lack of absorption, or a lack of utilization of absorbed food elements? I had the pleasure of observing one of the autopsied patients in this series, who lost weight in spite of an increased and adequate consumption of food. The flat glucose tolerance curve and absence of specific dynamic action of protein raise the question of inadequate absorption. If it is from a lack of utilization of absorbed material, the metabolic changes responsible for this require clarification. The lack of thyrotropic hormone would not explain the loss of weight or death and deleterious results which have followed its administration. It does not seem probable that the gonadotropic hormones are important in maintaining weight, and life and improvement reported in the literature from the use of these substances seem questionable. Hypoglycemia is often present, but there is no proof that this is the usual cause of death. Adrenal insufficiency is a possible cause of the terminal coma and death, but this has not been confirmed by experience. In the absence of more detailed knowledge concerning the mechanism of the loss of weight and the cause of death, it is obvious that treatment must be unsatisfactory.

The clinical aspects of this syndrome have been well reviewed, and the characteristic picture should be in the diagnostic armamentarium of every physician. I should

like to add the loss of pubic hair to the list of cardinal findings. This change was present in thirty-five of Silver's forty-one autopsied and proved cases. Doctors Escamilla and Lisser have wisely emphasized that the other findings of cachexia, amenorrhea, and low basal metabolism can be exactly duplicated by anorexia nervosa. I have seen a similar case of a patient completely cured by psychotherapy alone. This important finding which distinguishes Simmonds' disease from anorexia nervosa is absent in almost all of the cases reported in the literature as having been cured by various injections or transplants. No claim for cure can be accepted as conclusive when this is absent. The characteristic remissions with a prolonged course of the disease, up to forty-four years in proved cases, must also be considered in relation to therapeutic triumphs.

I wish to congratulate Doctors Escamilla and Lisser on their excellent report of the clinical aspects of this syndrome, and most particularly upon their sound, careful and conservative approach to the problem of therapy. It is by studies of this type, with careful observations of the results obtained from available preparations, that we may finally arrive at a preparation capable of replacing the essential secretions of the anterior pituitary that are lacking in Simmonds' disease.

❦

Doctor Escamilla (Closing).—I wish to thank Doctor Canelo and Doctor Bullock for their discussions, which have contributed substantially to a more complete consideration of Simmonds' disease. Doctor Canelo has added data concerning the types of treatment utilized for this disease. Doctor Bullock has stressed our inability at present to explain adequately some of the characteristics of the disease. He has added the interesting suggestion that loss of pubic hair should be included in the list of cardinal signs. It is true that a recent review of the literature has revealed more or less thinning or loss of axillary and pubic hair in 81 per cent of sixty-nine autopsied cases. This is essentially the sexual hair, and may be related to lack of the gonadotropic fraction from the anterior pituitary. However, it is frequently a late development and is most marked in the far-advanced or very severe cases. It seems safe to state that the clinical diagnosis can frequently be made with reasonable certainty, even if there has been little or no thinning of axillary or pubic hair, and therefore, in our opinion, its inclusion as a cardinal or essential finding does not seem justified. Indeed, the patient which Doctor Bullock observed (Case 2 in the paper), who died and was found to have pituitary pathology, had abundant pubic and axillary hair, yet in every other respect was a most typical example of Simmonds' disease. It is of interest to note that since this paper was presented communications have been received from colleagues in several parts of the state, describing cases which apparently can be classified as Simmonds' disease. This seems a further confirmation of the suggestion that the disease is more common than heretofore suspected.

MONOCYTIC LEUKEMIA: SOME BLOOD AND BONE-MARROW STUDIES*

By H. A. Wyckoff, M.D.
San Francisco

Discussion *by Harold P. Hill, M.D., San Francisco; A. M. Moody, M.D., San Francisco; A. G. Foord, M.D., Pasadena.*

CASES of monocytic leukemia, so far studied by the author, have exemplified the necessity of careful identification of both mature and primitive monocytes in the blood. Observations require repeated verification. This is the more true because of the close similarity of the clinical picture to that of other types of acute leukemia.

The sudden, although transient appearance of considerable numbers of myelocytes in the blood during the course of monocytic leukemia, and the occasional finding of noticeable numbers of cells closely like or identical in morphology with mature and primitive monocytes in the blood of cases of acute myeloblastic leukemia suggest a close relationship of these cell types.

TWO TYPES OF BLOOD PICTURE

In general there are two types of blood picture in monocytic leukemia:

1. The one occurs most often in patients whose condition tends to be less acute and who have short periods of slight improvement, suggesting remissions. In these cases the blood picture may show an inclination to become partially myeloblastic and myelocytic as a terminal event. It appears to be due to the occurrence of this type of case that controversy as to the existence of monocytic leukemia as a separate form so long existed. In this type the total white count is either within normal limits or is already moderately elevated when the patient is first seen. The count may show considerable day-to-day variation, but shows a general tendency to rise as the disease progresses. The platelet count also varies, but usually remains definitely subnormal and progresses to a low level, accompanied by a lengthened bleeding time. While the neutrophils are reduced in percentage, the absolute number remains, for the most part, above the lower limit of normal, and rises with the increase in the total leukocyte count. Lymphocytes also usually increase in absolute numbers with the leukocyte increase.

It is important to note that in one patient who was classed within this group, and in which the myelocytic cells reached 19 per cent of 258,000 leukocytes per cubic millimeter, the monocytic cells were still 51 per cent of all the leukocytes. This was observed during the last few days of life. Two days before death, the monocytic cells were 59 per cent of the leukocytes.

2. With the other type of blood picture some patients show a neutrophilic leukopenia when first seen, although there is a simultaneous left nuclear shift. Progression to transient, complete agranulocytosis, with low total leukocyte count, may occur. The red cell count, hemoglobin content of the blood and platelet count, may still remain comparatively undisturbed at the earlier observations, so that the diagnosis rests largely upon recognition of the monocytic picture. This tendency to agranulocytosis is evident not only during leukopenic phases, but persisted in one patient studied at a time when the total leukocyte count was as high as 130,000 per cubic millimeters.

It is further significant that in this second type of blood picture, primitive myeloid cells are absent from the blood throughout the entire course of the disease, or appear in less conspicuous numbers than ordinarily seen in neutrophilic leukocytosis with a similarly pronounced left nuclear shift.

Relative to this second type in which the more acute cases of monocytic leukemia appear to fall, there can be no question of confusion with myeloblastic leukemia.

* Read before the Pathology and Bacteriology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

GENERAL CHARACTERISTICS

In all cases there is early and progressive anemia with red cell counts of one and one-half to two million per cubic millimeter and hemoglobin of 30 to 40 per cent (Sahli) (5.16 to 6.88 grams per cent). In general, the color index may be moderately reduced in the earlier phases to rise well above the normal later. In one case with a red cell count of 1.5 million per cubic millimeter the mean corpuscular volume of the red blood cells was approximately 14 per cent above the normal, and the color index was 7.7 per cent above normal.

Monocytic cells in various stages of maturity make up a noticeably large per cent of the white cells early in the disease. Some are mature monocytes. An increasing number of more primitive cells appear later. In stained blood films the latter show lobulated, furrowed or folded nuclei, with fairly fine chromatin reticulum. In some of these cells the nucleus contains one or two nucleoli. The cytoplasm in the immature cells may be quite irregular in outline, with knob-like or bluntly rounded projections, suggesting motility.

In the cytoplasm immediately surrounding the nucleus, most of the cells have an area filled with very fine lilac-colored granules. This area shows considerable variation in width and extent. The cytoplasm toward the periphery of the cell is basophilic. In some cells the basophilic cytoplasm is reduced to a narrow peripheral rim which is expanded in width to fill the cytoplasmic projections.

In supravital preparations a large proportion of the monocytic cells show the neutral red absorbing vacuoles grouped in the cytoplasm opposite the nuclear indentation in a characteristic "rosette." Some of the cells, presumably less mature forms, contain a minimum of neutral red staining material scattered in what appears to be an unstained rosette. Others contain a somewhat more strongly staining, but still faint rosette.

Some of the cells are small, with narrow rim of basophilic cytoplasm and mottled nucleus. These cells closely resemble lymphocytes. The nucleus is, however, faintly reticular, an occasional nucleolus is found and the cytoplasm is packed with black granules in peroxidase preparations. Many of the larger monocytic cells are quite negative with the peroxidase stain. Others contain but one or two black granules in the cytoplasm with this stain.

Some of the cells are freely motile. Long protoplasmic projections are occasionally formed and these are promptly invaded by mitochondria granules. Occasionally the motile cells show inclusions in the cytoplasm.

The bone marrow is usually hyperplastic and, in the sternum, devoid of fat cells. The stroma is filled with cells. Many of these can be recognized as identical with the monocytic cells seen in the peripheral blood stream. The nucleus is deeply indented, furrowed or roughly lobulated. The nuclear chromatin is finely reticulated and the nucleus may contain one or two nucleoli. The reaction of these cells to the peroxidase stain is variable. In some of them the cytoplasm contains numerous blue-black granules. Some contain but few granules. A few are without peroxidase-staining material in the cytoplasm.

Eosinophils may be numerous. Neutrophilic granulocytes are reduced in number. Small and imperfect foci of erythropoietic cells remain.

Megakaryocytes are rare. Those found contain a condensed and structureless nucleus.

Phagocytic endothelial cells (histiocytes) are sometimes numerous. The cytoplasm of these cells contains vacuoles, pigment granules, and fragments of red cells and leukocytes.

Stanford Hospital.

DISCUSSION

HAROLD P. HILL, M.D. (384 Post Street, San Francisco). Monocytic leukemia is a comparatively infrequent disease. The course is usually subacute. The diagnosis rests entirely on the presence of predominant immature monocytes in the blood.

The clinical picture and course vary little from subacute forms of the myelogenous or lymphatic leukemias. Throat and mouth symptoms may be the first complaint. These lesions in the cases we have seen have been no more severe than in the other forms of leukemia. Anemia with prostration is marked. Thrombocytopenia is present with the usual variable accompaniment of purpura and hemorrhage.

Daily blood studies in three cases showed considerable variation in the total count and percentage of immature monocytes, with no relationship to the patient's symptoms, except a tendency toward an increased count with the progression of the disease.

Adenopathy may be regional or general, but is not as marked as in the lymphatic type. The spleen is enlarged, but does not attain the size of the chronic myelogenous form.

The course tends progressively toward a fatal termination, with but minor remissions in signs and symptoms. No treatment has changed the progressively fatal course. Transfusions improve the patient's symptoms temporarily when the anemia is profound.

❦

A. M. MOODY, M.D. (Saint Francis Hospital, San Francisco).—Doctor Wyckoff's paper deals with certain facts which he has observed in a study of a few cases of monocytic leukemia. These studies add materially to already recorded points for the differentiation of atypical cells present in the blood of leukemic patients.

I believe that the statements in the first two paragraphs are important to all interested in this subject.

The condition is rare, and its course is ordinarily quite rapidly fatal. I have studied only two cases.

There is still a difference of opinion as to the origin of the monocyte, although the majority believe that it arises from reticular tissue.

A recent report by Conway contains experimental evidence of a close relationship between lymphocytes and monocytes.

❦

A. G. FOORD, M.D. (Huntington Memorial Hospital, Pasadena). — Our experiences with cases of monocytic leukemia are quite similar to those of Doctor Wyckoff, and we feel very strongly that there is one type—namely, the second group in Doctor Wyckoff's discussion—which is as clear-cut as cases of myeloid or lymphatic leukemia. Hematologically, the immature cells are typically those of the monocytic series, and at postmortem one finds profound proliferation of the reticulum cells throughout the organs of the body. Smears of the bone marrow and lymph nodes show these cells to be indistinguishable from those in the blood stream. It has always been a mystery to me why these cases were not picked up more frequently in the past. Our experience has been that the clinical pictures have been quite similar to those of the other types of leukemia, and that the diagnosis must be made by careful studies of the blood.

THE LURE OF MEDICAL HISTORY†

HUGH HUGER TOLAND*

A SKILLFUL SURGEON—"TOLAND'S LUCK"

VI

By EDGAR LORRINGTON GILCREEST, M.D.
San Francisco

PART II**

IT has been said of Toland that, "without much originality of conception, he possessed in a marked degree the qualifications we look for in a great surgeon—steadiness of hand and boldness combined with caution." Eminently practical in all that he did, no useless or unnecessary preparations characterized his operations. The rapidity of his execution was remarkable, and was based on his thorough knowledge of anatomy. Few surgeons possessed more manual dexterity. He was cool, imperturbable, and decisive in execution. He had great poise in the midst of an unexpected emergency or eventuality, and "would, when circumstances demanded it, relinquish further procedure without a moments vacillation. As an operator, his success was proverbial: 'Toland's luck,' it was called. But the so-called luck was merited, due to skill."[10]

COURTEOUS TO HIS CRITICS

He is reputed to have operated successfully on innumerable patients who had been refused as hopeless by others. This, in a large part, explains the jealousy of many of Toland's confrères who were free in their criticisms of him. Although aware of this, he was often generous and courteous to his critics. When the welfare of a patient was likely to be sacrificed by the ignorance of his attending physician, however, Toland's manner was somewhat less polished and more direct, and occasionally he would violate all the rules of medical ethics by refusing to protect a brother practitioner who had called him in consultation. The following story in point was given to me by Dr. Herbert Evans as told to him by his uncle, Dr. Robert McLean: "On one such occasion, when his fellow practitioner was late to a consultation and he could wait no longer, hearing from the patient that his physician's diagnosis was an axillary abscess, Toland pinned to the patient's clothes a scrawled note that he who ran might read, 'Dear Doctor ———: Do not lance this patient's auxiliary abscess, or he will bleed at once to death.' It was, of course, an aneurism."

VERSATILITY AS A SURGEON

His operations ran the gamut of general surgery from the head to the toes. As early as 1858 he did trephining, and thyroidectomies, ligated for aneurysms, repaired vesicovaginal fistulae, removed loose cartilages from the knee joint, treated enlarged bursae of the knee joint, did radical bone operations for osteomyelitis and for removal of sequestra, and partial resections of the tongue with ligation of the lingual artery. He also operated on several patients with incarcerated hernia, and on a large double scrotal hernia by invaginating the scrotum on the finger up to the external inguinal ring, and fixing it there with several sutures which were removed when adhesions had formed which prevented the descent of the hernia. In addition, he removed cystic tumors of the breast, treated varicose veins by excision and ligation, and performed iridectomies for glaucoma. It is interesting that Beard of New Orleans and Toland, independently, were the first Americans to perform this operation.

HIS VASCULAR SURGERY

According to his assistant, Robert A. McLean, surgery owes many valuable discoveries to Toland's genius. He wrote that Dr. Toland discovered "an improved method of ligating arteries by which the danger of secondary hemorrhage was almost entirely eliminated from the after-effects of ligature. I allude to the use of the double ligature. . . . His success in the practice of this method was remarkable. I do not know the exact number of his operations, but I believe that in nearly sixty instances he lost but two cases from secondary hemorrhages.[5,6]

Toland ligated the subclavian artery three times,[6,8] once for axillary aneurysm and twice for aneurysm of the subclavian artery. These two were cases of distal ligature of the vessel, and were alleged to be the only two successful cases reported up to that time. Gross, of Philadelphia, in his book on surgery of that year (1874), reported the cases of nineteen patients all of whom died, seventeen from secondary hemorrhage. Toland reported six instances of ligation of the brachial artery and of these, two were for true aneurysm, three for false aneurysm, and one for a wound. He ligated the femoral artery eight times, three times for true aneurysm, twice for false aneurysm of the popliteal artery, once for a knife wound and twice for secondary hemorrhage. He ligated the external iliac artery ten times, without a death; more often, McLean stated, than any other surgeon. His ninth case was reported in 1878.[9] He ligated the common carotid artery in his office, with the patient in an armchair, and many times performed capital operations with the patient on his office lounge.

HIS BONE SURGERY

His bone work was perhaps his best. He operated on eleven patients and reported eleven cases of trephining of the cranium up to 1858 with but one death. In 1876, he reported four cases of disease of the temporal bone with caries of the mastoid process, in which operation was successful, several cases of excision and resection of long bones of the upper and lower extremities (in some of

†A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of CALIFORNIA AND WESTERN MEDICINE. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

** Part I of this paper appeared in the April issue, on page 263.

which curettement of the whole tibia, or two and one-half inches of the proximal end of the femur and part of the acetabulum was required), with good functional results, as well as several cases of amputation and resection.[7]

HIS ORIGINAL WORK

His most original work in this line was his article, "Reproduction of Bone," published in 1858. In this he reported seventeen cases of removal of diseased bone, and laid great emphasis on the preservation of the periosteum in order that new bone might be reproduced and amputation avoided. He wrote: "As the partial reproduction of bone has long been known, I only claim to have discovered that entire bones and joints are restored by proper management, even under the most unfavorable circumstances: whether they are as perfect as the original is yet to be determined. I know, however, that they possess sufficient strength and motion to subserve the purpose for which they were originally intended."

Duhamel, the discoverer of the osteogenic function of periosteum, had reported in 1739, that, in a case of necrosis of the humerus, the bone had been reproduced after expulsion of the necrosed diaphysis. Larghi, of Verceil, an Italian surgeon, following the theories of Duhamel, had been methodically saving the periosteum in his surgical operations. Ollier, in his textbook of regeneration of bone and subperiosteal resection, wrote he had found in 1858 that even after the removal of femur or humerus, reproduction of bone would occur if the periosteum had been saved, and that the joints would be reproduced if the articular cartilage had been left intact.[3]

AN ARDENT DUHAMELITE

Opposed to these views stood the opinions of the great Haller and the immortal John Hunter, both of whom agreed that "the normal periosteum had no bone-producing power" and acted only as "a passive vascular membrane which surrounded and nourished bone." Thus, in the eighteenth century, surgeons became Hallerites or Duhamelites, according to their views on this subject. It is clear that Toland was an ardent Duhamelite, and, like Syme and Macewen in their day, did much in this part of the world to emphasize the importance of conservation of periosteum, and thus prevent the amputation of limbs. Whether he came to his conclusions independently of the work of the European investigators mentioned above, I am unable to say, but this does not minimize the great contributions he made.

He reported three cases of excision of ribs for empyema. These were all drained by insertion into the chest of a silver tube invented in 1856 by Mr. Lindoff, his assistant, at the United States Marine Hospital. Some of these cases were of several years' standing. In these articles he gave a good clinical picture of penetrating wounds of the thorax, with the differential diagnosis, treatment, and prognosis.

PLASTIC SURGERY

In reading about his plastic surgery, whether of the nose, the face, the lips or the legs, one is impressed with his basic knowledge of the fundamental principles for success in this domain. He was thoroughly conversant with the pedicle, the sliding, and the Thiersh grafts, and was familiar with the necessity of securing drainage in order to permit the graft to take. From 1865 to 1876 he reported seventeen cases of plastic operations.

He was a very conservative surgeon, to the extent that he taught that "a limb should never be amputated for ulceration of the soft parts, unless disease of either the bone or joint existed, and very seldom even then."

GYNECOLOGICAL SURGERY

His gynecological operations ranged from repair of a vesicovaginal fistula to the excision of a fibrous tumor of the cervix of the uterus, and the correction of a prolapsed uterus by means of excising portions of the vagina and bringing the edges of the wound together, so that the caliber of the canal was diminished in proportion to the breadth of the strips removed.

LITHOTOMIES

His favorite operation was that for stone in the bladder. According to McLean, "His percentage of cures following lithotomy was higher than any other surgeon. In sixty-four cases of cutting for stone, he lost but two."

MEDICAL CONTRIBUTIONS

His formal addresses delivered to his students were simple, dignified and restrained, but replete with sound and lofty ideals. Although his teaching and his enormous practice occupied most of his time, he found opportunity to write seventy-one articles, mostly surgical case reports, a large number of which were published in the *Pacific Medical and Surgical Journal*. A stenographer took, verbatim, his lectures on the principles of surgery, as illustrated from his own experience. The transcriptions of these notes were published in 1877 as a textbook, entitled "Lectures on Practical Surgery," a work that went into its second edition. He did not confine his writings to surgical subjects, but often wrote on the action of drugs: for example, on the use of Monselle's solution (subsulphate of iron) as a hemostatic, and of American hellebore or Indian poke (veratrum veride) in slowing the action of the heart, reducing the force of the pulse, and thereby preventing secondary hemorrhage. The subject of syphilis always interested him, and he wrote nine articles on it. Also to be found among his addresses are several historical subjects, one on "The Life and Character of Valentine Mott." Although his articles and textbook were criticized by some of his colleagues, they reveal judgment, versatility, and sincerity. What he lacked in style, was compensated for by his straightforward description of his surgical procedures.

DECLINING YEARS

It is unfortunate that Toland, years before his death, did not relinquish his chair of surgery to his

brilliant and gifted pupil and successor, Dr. Robert A. McLean, who became one of the greatest surgeons that San Francisco ever has had. Toland carried on in his dotage after his luster had dimmed, which was, as always, a sad mistake. In those days, however, professors did not resign readily and give younger men with imagination and creative ability a chance. They tenaciously clung to their chairs. They liked to die, so to speak, in harness, and often by that time their successors also had become senile, losing their initiative.*

In his declining years Toland's lectures became a peculiar combination of his experiences in the days when he "walked the Salpetriere in Paris with the great surgical masters," personal anecdotes, and reminiscences of his controversial differences with his San Francisco confrères, with whom he had carried on a fratricidal war for many years. His chief antagonist and critic was Elias Samuel Cooper, who had organized a medical school in 1858. They were bitter enemies, and no opportunity to clash was lost by either, in private practice or in lawsuit. It must be remembered that this was the militant period of medicine, when feeling ran high. Toland was a strong man and a powerful enemy who gave no quarter and asked none. "There were giants in those days" and Toland was not the least of them.

DEATH COMES TO THE GREAT SURGEON OF THE PACIFIC COAST

He had often expressed the hope that he might not die a lingering death. This hope was realized on the morning of February 27, 1880. He was about to go downstairs to begin his day's work, when he fell to the floor and immediately died. No autopsy was performed. It was assumed that he had fainted and then fallen, striking his forehead and thus causing a cerebral hemorrhage. I am informed by some who attended his funeral that it was the largest ever held in San Francisco. Thousands of friends and grateful patients followed his remains to Laurel Hill, where he lies in one of the most stately mausoleums in that cemetery. And there one of his former students went again after many decades to pay his respects, and later told me, "I stood beside his costly marble monument blazoned with legends of his successes and the great reputation he acquired, and the good deeds that enshrine his name, with a deep veneration for the good he had done, and the great accomplishments for which his name now justly stands."

He was survived by a widow, a son, and a stepson. His estate was estimated as amounting to between one and a half and two million dollars, part of which was 15,000 acres of land on the lower Sacramento River.

A FRIEND OF ALL MANKIND

In order to evaluate the greatness of any physician it is necessary to bring him into proper alignment with the period of medicine through which he lived, and of which he was a part. In Toland's day, asepsis in surgery was unknown, and the washing of hands was not even suggested. Pasteur's discoveries were not yet appreciated, and the ideas of Lister, just then being introduced, were considered a joke. Koch had not yet discovered the first germ, nor Roentgen the x-rays. The cause of tuberculosis, syphilis, malaria, typhoid fever, diphtheria, and, in fact, infectious and contagious diseases in general, were still matters of conjecture. These were the days when doctors pronounced; it was a time when medicine was an art, not a science. Little wonder that physicians needed personality to help them in their everyday problems. In their saddlebags they carried none of the armamentarium of the graduates of modern medicine; nevertheless, the great physicians of that day cured some, alleviated the distress of many, and sympathized with all. They were, indeed, the friends of all mankind.

BELOVED BY HIS PATIENTS

Years of observation have forced upon me the conclusion that the careful preparation and long years of diversified clinical teaching and laboratory training do not, in many cases, make the doctor and that, perhaps, after all, it is the *man* who is the successful physician. Our young doctors today know little of the tongue and its proper reading, nor is the feel of the pulse impressed upon them. Above all they know little of the art of medicine, though much of its science; and often, the diagnosis having been determined—correctly or incorrectly—they consider their duty to the patient done. They know little of the power of suggestion and the wonders that may be accomplished by personally inspiring their patients. In these aspects of medicine, Doctor Toland was a master and, although his method was often condemned, he cured his patients and retained their veneration. He belonged to a generation of surgeons which is rapidly passing into history. The general surgeon of his day occupied a place in surgical science and in the hearts of the people which the specialist can never fill; and this is one of the dire penalties of specialism.

A PATRON OF SCIENCE

Hugh H. Toland, by his ability as a surgeon, his capacity as a teacher, his contributions to the medical and surgical literature of his day, and his dominant personality was, when he came to die, perhaps the most outstanding figure in medicine not only on the Pacific Coast, but in the West. Today we are permitted to obtain a perspective of him and his achievements. As years have grown into decades, and now, as a full half-century has rolled by, his name looms larger than ever, while most of his bitter and shallow contemporaries, who made light of his achievements, have faded into obscurity. His name will rightfully live as that of a patron of science and learning on the Pacific Coast.

CLINICAL NOTES AND CASE REPORTS

HEMOPOIETIC APLASIAS FOLLOWING THE ARSPHENAMINS, WITH TWO CASE REPORTS

By WILLIAM E. GRAHAM, M.D.
AND
NORMAN H. TOPPING, M.D.
San Francisco

DURING the past few years the arsphenamins have been belabored because of untoward results occurring during the treatment of syphilis. Among these unlooked-for complications, changes in the hemopoietic system, due to the arsphenamins, have more and more been frequently mentioned. This increasing accumulation of literature is probably due in part to several masterful articles appearing during 1932. McCarthy [1] and Wilson published a summary of the literature, and cited two cases of symptomatic theombocytopenic purpura at about the same time that A. B. Loveman [2] also reviewed the literature and added several cases of varied types of blood reactions due to the arsphenamins. These conditions are rare, however. Cole [3] and his coworkers observed only two cases of blood dyscrasias in a total of 338 complications arising in the treatment of 1,212 patients over a ten-year period. Phelps had two cases in 272,354 injections, and Combs one in 4,000 patients. The following two cases have occurred in our antiluetic clinic in some 23,000 injections over a period of six years.

REPORT OF CASES

CASE 1.—T. A., a seaman, white, age forty-two, reported at the outpatient clinic of the Marine Hospital at San Francisco, California, on October 7, 1935, complaining of a penile lesion which had been present, off and on, for the past six months. Blood was obtained for a Wassermann test on that date. The Noguchi antigen was one plus, the cholesterin antigen was four plus, and the Kahn test was positive. The patient stated that he had had no previous treatment. He had gonorrheal urethritis in 1931.

As no contraindications were present, antiluetic therapy was started at once, with prompt healing of the penile lesion. During the course of his outpatient treatment he received twenty-one intramuscular injections of bismuth, totaling 3.15 grams, and twenty-one intravenous injections of neoarsphenamin, totaling 8.55 grams.

On January 15, 1936, however, after receiving his treatment, he complained of nose-bleeds, which had been occurring off and on for the past two weeks. He had also had a cold, with cough, for one week. He was at once sent to the ear, nose, and throat clinic, where a small oozing point was discovered on the septum. The nose was packed with cocain-oxycyanid, the packing being removed on the following day. He returned on January 20, four days after this, when he stated that the bleeding had reappeared and had become almost constant. He was admitted to the hospital on the medical service.

On admission, the patient's only complaints were bleeding from the nose and a cold with coughing. Physical examination revealed the following significant findings:

A moderately obese white male, quite apprehensive, with clotted blood on his lips and bright red blood oozing from his nares.

Eyes: Conjunctiva injected. Definite icteric tint to sclerae. Pupils equal and regular, and react to light and in accommodation. Extra-ocular movements normal.

Nose: Both nostrils filled with fresh blood-clots. Blood oozing from under clots. No bleeding points seen after clots were removed.

Mouth: Lips coated with dried blood. Tongue coated. Petechial spots on palate and on buccal mucous membrane. Pharynx injected and tonsils atrophic. Several ulcerative lesions on uvula and soft palate.

Neck: No adenopathy present.

Heart: Apex impulse in fifth interspace one centimeter outside midclavicular line, rate 68, regular rhythm. No thrills. Soft, blowing systolic murmur heard at aortic area. Blood pressure, 120/80.

Lungs: A few subcrepitant râles heard scattered throughout both lung fields. Otherwise examination was negative.

Abdomen: Obese. No scars, hernias, masses, tenderness, or rigidity. Liver not enlarged or tender. Spleen barely palpable.

Extremities: A few small petechial spots on the right arm and under several fingernails of both hands.

Laboratory work and treatment were immediately started, using the following possibilities as a working diagnosis:

1. Arsenical reaction.
2. Blood dyscrasia.
3. Bacterial endocarditis.

The appended chart indicates the blood picture from day to day, with the accompanying treatment:

COMMENT

The blood culture was found to be negative, and as there was a history of intensive arsenical treatment for the past three months, it seemed evident that the accompanying blood dyscrasia could be best explained on a basis of neoarsphenamin as the etiologic agent. Due to the marked reduction in polymorphonuclear cells, agranulocytosis was thought of at once. There was, seemingly, one serious discrepancy in this diagnosis,

CHART 1.—*Day by Day Blood Picture*

2/24/36 9:00 a. m.		1,500		500	Polys 0 S. Lymphocytes 18 L. Lymphocytes 42 Transitionals 40	No normal W.B.C. seen—all showing marked degeneration. Pentnucleotid 20 c. c. I. M.
4:00 p. m.	4,240,000	3,400	63%		Polys 20 S. Lymphocytes 32 L. Lymphocytes 36 Transitionals 8 Rosin 4	Blood transfusion 210 c. c 26 3:00 p. m. Patient expired at 12:00 midnight.

namely, the tremendous reduction in the blood platelet count, with the accompanying hemorrhagic diathesis. As the case was further studied, however, it was realized that arsphenamin may produce not only an agranulocytosis, but also a thrombocytopenic purpura, and even a complete aplasia of the bone marrow. The patient was, therefore, believed to have a combination of agranulocytosis and thrombocytopenic purpura, the etiologic agent being neoarsphenamin.

In considering the proper treatment to be employed, the question arose as to the extent of damage in the bone marrow. If an aplastic anemia were present the prognosis was, of course, exceedingly grave. There was, however, at no time any definite indication of this, the red-cell count never dropping below 4,000,000 in spite of continuous oozing of blood from the mucous membranes of the nose and throat and, probably, the intestinal tract. We believed, therefore, that we were justified in using large doses of pentnucleotide in combination with blood transfusions and liver extract. In spite of these measures, the bleeding became progressively worse, the polymorphonuclear cells dropped to zero, the blood platelets dropped to 500 centimeters, and the patient died at midnight on February 24, 1936, after being in the hospital less than five days.

NECROPSY REPORT

An obese white male, 65 inches tall, hair tinged with gray. There is a frothy, bloody fluid running from the nose and mouth. The pupils are contracted. Marked subconjunctival hemorrhage in both eyes. No external lymphadenopathy.

Chest: No fluid or adhesions in either pleural cavity. Lungs normal, except for hypostatic congestion of the bases.

Heart: Pericardial sac contains 50 cubic centimeters of clear serous fluid. Several petechiae are present on the epicardium. The left ventricle is pale, and hypertrophic. The valves are normal and the coronary orifices are patent. There are mild luetic changes in the intima of all parts of the aorta. The heart weighed 440 grams.

Abdomen: Obese wall. Tissues show icteric tint. Intestines distended with gas. Numerous purpuric areas present in the lower five feet of the ileum. The lumen contains black, tarry material, evidently partially digested blood.

Spleen: Weighs 240 grams. Is about twice normal size, dark mahogany in color, with numerous petechiae on the surface. It is mushy in consistency and, on sectioning, the surfaces are dark red with areas of hemorrhage present.

Liver: Petechial hemorrhages scattered over the whole surface. Sections show gross hemorrhages interspersed between yellow areas, suggestive of fatty degeneration.

Stomach: Contains about 300 cubic centimeters of a dark, bloody fluid. There are numerous petechial hemorrhages in the mucous membrane along the greater curvature.

Kidneys: Normal size. Both kidneys congested. The capsule strips easily. Petechial hemorrhages are present over the surface. In the cut surfaces the cortex is congested and edematous. Numerous hemorrhagic areas are present throughout the parenchyma.

Bone marrow: Pale in color. Microscopically, there is no evidence of any attempt at regeneration. Normoblasts greatly reduced per oil immersion field. Myelogenous series markedly reduced and very toxic in appearance, vacuolated, with no mature cells seen.

Pancreas, bladder, testicles and prostatic gland are normal.

* * *

CASE 2.—C. M., a seaman, white, age twenty-four years, entered the Marine Hospital at San Francisco, California, on November 28, 1934. He complained of a urethral discharge and penile sores. His family and personal history were not significant. He denied having taken coal-tar derivatives or any additional medication other than the antiluetic treatment mentioned below. Twenty-eight days previous to admission he developed two small ulcers on the penis. He reported to a physician in Los Angeles, who found the blood Wassermann four plus. The patient was given one cubic centimeter of bismuth in oil on November 5, 8, 13, 19, and 26, 1934, and 0.9 gram of neoarsphenamin on November 8, 15, and 22, 1934.

Upon admission to this hospital, physical examination revealed a very robust individual whose only positive findings were healing penile ulcers, enlargement and tenderness of the inguinal glands, and an enlarged and painful prostate. The Noguchi and cholesterin antigens were four plus; the Kahn test was positive. The patient was placed on hot sitz baths, and was given 0.1 gram of arsphenamin and 0.15 gram of bismuth salicylate on December 1 and 5, 1934. He developed a yellow tinge to the sclerae on December 6, 1934; the icteric index was 20 units. The antiluetic treatment was discontinued.

CHART 2.—*Blood Counts in Case 2*

Date	R. B. C.	W. B. C.	Hgb.	Plate	Differential	Remarks
12/9/34						Redness and swelling of gums. Temp. 100.5 F.
12/12/34	5,020,000	4,000	102%	Normal	Polys 0 S. Lymphocytes 54 L. Lymphocytes 30 Transitionals 14 Basophiles 2	Temp. 105 degrees F. Pentnucleotid. 100 I. M. twice daily.
12/19/34	5,000,000	1,800	92%	Normal	Polys 40 S. Lymphocytes 50 L. Lymphocytes 5 Transitionals 5	Temp. normal.
1/3/35	4,890,000	9,600	85%	Normal	Polys 46	Ground liver t. i. d. Up to this time a total of 390 c. c. of pentnucleotid had been given.
1/4/35	4,900,000	11,100	93%	Normal	Polys 63	Pentnucleotid discontinued.

On December 9, 1934, the patient complained of a cold and sore throat. Examination revealed redness and swelling of the gums. The temperature was 100.5 degrees Fahrenheit. Sitz baths were discontinued and the patient was treated expectantly. On December 12, 1934, the mucous membrane of the mouth was diffusely inflamed, and there was a grayish, adherent membrane over the hard palate and gums. The temperature had risen to 105 degrees Fahrenheit. Except for bilateral swelling and tenderness of the submaxillary lymph glands, the physical examination was negative. A culture of the throat smear revealed long chain streptococci and M. catarrhalis; blood culture revealed no growth. Blood counts are recorded in Chart 2.

A diagnosis of agranulocytosis was made. The patient was given normal warm saline irrigations to the throat several times daily, a liquid diet, and a sufficient amount of codein to insure rest. Pentnucleotid (10 cubic centimeters) was administered intramuscularly twice daily.

Pentnucleotid therapy was discontinued on January 14, 1935. This was followed by five doses of iodobismitol; two cubic centimeters was given intramuscularly twice a week for five doses. The percentage of granulocytes decreased from 63 to 36. Pentnucleotid was given again and the iodobismitol was discontinued. The white count returned to normal by January 27, 1935. Mercury inunctions were started and continued three times weekly. The patient felt well and was discharged as fit for duty on May 29, 1935. He was advised to continue the mercury inunctions while he felt well, and to report as an outpatient from time to time for further observation.

The following are some other points of interest in the case. The blood Wassermann test on December 17, 1934, was negative in the Noguchi and cholesterinized antigens, but positive in the Kahn. On March 7, 1935, and April 22, 1935, the blood was negative in all antigens. On May 9, 1935, the spinal fluid examination was entirely negative.

This same patient reported to the outpatient clinic one year later, on April 10, 1936, with a large furuncle on his leg. The white count was 18,000, with 80 per cent polymorphonuclears, showing that he had not suffered any permanent damage to his hemopoietic system.

COMMENT

The two cases reported from this hospital during the past year were direct results of neoarsphenamin therapy in the treatment of syphilis. In the first case here reported, both neutropenia and thrombocytopenia were outstanding findings. Furthermore, postmortem examination plus microscopic studies of the bone marrow indicated an early aplastic anemia. As would be expected from these findings, the case terminated fatally in spite of intensive therapy, consisting of pentnucleotid, liver extract, and blood transfusions.

In the second case, however, in which neutropenia was the only change in the blood picture, there was an excellent response to the pentnucleotid therapy, and the patient had completely recovered when he was discharged from the hospital.

DISCUSSION

The mechanism by which the arsphenamins cause changes in the blood picture is rather vague. Syphilis apparently has no relation to the etiology of agranulocytosis. Culley et al.[4] reported a case following neoarsphenamin therapy in which the patient was not affected with syphilis. It is a well-known fact that both benzene and arsenic cause bone-marrow depression, Kracke[5] having been able to produce agranulocytosis in rabbits by administering benzene subcutaneously; and, since arsphenamin combines these two drugs, we have a compound which may act as a very strong etiologic agent.

The cases of blood dyscrasias following the arsphenamins can be classified as follows:

Class 1. *Thrombocytopenic.* Purpura and external bleeding are constant symptoms and occur within a few hours to days after the last injection. Reduction in the number of platelets is the outstanding feature.

Class 2. *Neutropenic.* Fever, sore throat, and necrotic lesions of the pharynx are the commonest symptoms and findings clinically. The blood picture reveals a great diminution to total absence of the neutrophilic leukocyte.

Class 3. *Thrombocytopenia and Neutropenic.* Purpura, external bleeding, fever, sore throat, and necrotic lesions of the pharynx are all clinically marked. The blood picture is a combination of Classes 1 and 2—revealing a marked reduction in platelets, plus a diminution to total absence of the neutrophilic leukocyte. The red cells, hemoglobin, and lymphocytes, all remain within the normal range.

Class 4. *Aplastic.* This represents the largest group in the literature and is the most serious. The symptoms and clinical findings are varied, ranging from pallor to purpura or bleeding. The blood picture indicates a depression of all the

circulating blood elements, red cells, hemoglobin, platelets, etc.

The prognosis depends upon the amount of bone-marrow depression. The thrombocytopenic group offers the best prognosis, as they almost invariably recover when this is the only change in the blood picture. The cases of neutropenia may be expected to recover as long as there is not a total absence of polymorphonuclear cells. The group in which there is both neutropenia and thrombocytopenia offers a more serious prognosis than either of the two separate types. As shown in Case 1, which clinically fell in this group, while postmortem examination indicates a decided aplasia of the bone marrow, the prognosis may be that of aplastic anemia which, of course, is exceedingly grave, the literature revealing a mortality of 83 per cent, when, clinically, the diagnosis of true aplastic anemia was made.

IN CONCLUSION

The blood dyscrasias, although quite rare, are of sufficient interest and importance to be kept constantly in mind in any clinic where extensive antiluetic therapy is being conducted. We are reporting two cases which have occurred during the past year at the Marine Hospital in San Francisco.

Attention is called to the fact that when either purpura, external bleeding, sore throat, necrotic pharyngeal ulcerations, or pallor are present during the course of arsphenamin therapy, the blood picture should be immediately studied with one of the dyscrasias as the diagnostic possibility, and the appropriate therapy instituted without delay.†

POTASSIUM IODID: ITS USE*

By Fred Baker, M.D.
Point Loma

AT eighty-four I have long been retired from active practice, but a few of my old patients still come to me for slight attention. Having specialized somewhat in diseases of the eye, I occasionally fit a pair of glasses.

So long out of practice, there would seem to be little of value which I could offer to a younger generation of physicians trained in newer methods of practice of which we scarcely dreamed. Yet it does not happen to many members of the profession to observe individuals as I have done in a few cases over a term of more than forty years. Some such observations seem worth while putting on record.

My thesis is the proper and improper use of that old and tried remedy, potassium iodid, which, as it appears to me from reports among my younger friends, is too much neglected in favor of newer drugs, often less efficient than this old reliable one. I trust I may be pardoned for a report on my personal experience.

When I was a medical student I developed a small opacity of the vitreous humor of the right eye. Doctor Frothingham of the eye department wrote me his regular prescription—a dram of iodid of potassium in an ounce of water, a teaspoonful to be taken three times a day, thus giving about seven and a half grains at each dose. I took it for about four days, when I developed an intensely sore throat and had to stop the drug. Naturally, it did no good in so short a time.

About thirty years ago this same opacity apparently increased in size so rapidly that I suspected a retinal hemorrhage. I am not sure whether the opacity actually increased in size or simply shifted its position more directly into the line of central vision. I immediately resorted to my old remedy, the iodid. Forgetful, however, of my former experience, I took ten drops of a saturated aqueous solution of the drug three times a day, about eight grains at each dose. It did splendid work with the opacity, which disappeared almost entirely within a short time, but I found my health failing so seriously that I spent about two months in bed with a rapid and irregularly acting heart and great general depression. None of our local doctors would venture a diagnosis, and I got out of bed with badly impaired health, which has greatly lessened my activities ever since.

It was about a year before any definite diagnosis was made. Then, at a meeting of the State Medical Society, I met Dr. Martin Fisher, who later went to the Medical School of the University of Cincinnati as professor of physiology. He diagnosed the case at once, assuring me that the condition was just being recognized; that there were less than a dozen cases then on record. He said that the overdosage of potassium iodid had brought on a hyperthyroidism, in my case showing only an extreme tremor and irregular heart action with depression, without the usual exophthalmia and enlargement of the thyroid. I have not kept up with medical literature for many years and the condition may be a well-recognized disease now, but it was almost unknown when I acquired it.

Curiously, I had been following a routine with all of my patients for several years which, most unfortunately, I failed to practice in my own case. I always prescribed a saturated solution of the iodid and, beginning with one, or at most, two drops, increased the dose a drop a day if there were no hurry; a drop at a dose three times daily if the case

† We wish to acknowledge the courtesy of Drs. F. C. Stewart and E. L. White, in furnishing the data on our second case.

* These personal observations by a pioneer physician of San Diego, Dr. Fred Baker, known to many of the older members of the California Medical Association, should be of interest. See also Doctor Baker's letter on page 380.

was urgent. But as I was foolish enough to believe that I could stand any reasonable dose, and the case seemed most urgent, disastrous results followed.

Surgery, possibly, offers the best opportunity to observe direct results of treatment. But in internal medicine I believe there is no condition where the physician can so certainly and accurately gauge the effects of his medicine as in observations of the internal anatomy of the eye. In cases of retinitis, choroiditis, vitreous opacity, and cloudy aqueous humor, the oculist prescribes his drugs, and with his ophthalmoscope can observe the results from day to day or from week to week. It has been my good fortune to watch a great number of such cases, some of them through long terms of years.

Recurring to my method of determining the patient's tolerance of the drug, I have found two symptoms of overeffect which seem to be of paramount importance—the induction of a sore throat and loss of appetite, often with severe vomiting. At the first appearance of either of these symptoms, the dose should be well cut down and a very slow approach begun again to find just how much of the drug can be given, generally three times a day, without any disturbance. This dosage can usually be continued indefinitely.

I recall one case of my student days which should have waked us up to the facts here stated. A man about forty, who could not see light in either eye, came to the clinic. His vitreous was so clouded that no red reflex showed on ophthalmoscopic examination. Doctor Frothingham again prescribed his usual dose of the iodid, seven and a half grains, three times daily. After three or four days the patient had severe vomiting, lasting two days. After about five days Dr. Frothingham repeated the same dosage with the same results. I do not know how often this happened, but at the end of a few weeks the opacity in both eyes had cleared absolutely, giving a perfect view of the fundi. But still the patient could not see light. The fundus was scarred all over from what evidently had been an intense chorioretinitis, leaving absolute blindness in its wake. I do not recall whether there was luetic infection in this case, but I believe it does not make much difference. The iodid should be given in all cases where there is an inflammation leaving any amount of deposit in the tissues of the eyes. Observation would simply tend to show that in luetic cases the effect is likely to be more prompt and more startling than in cases where such infection is absent.

It has been my good fortune, many times, to have given iodid of potassium in cases of retinitis, choroiditis, and vitreous opacity, and to have been able to watch, with the ophthalmoscope, the gradual disappearance of the deposit to more or less complete recovery. A case in point: that of a youngster in the grade schools, who came to me professionally over forty years ago for an acute retinitis. His vision was down just below 20/70. As usual, I gave the iodid and ordered the use of atropin and dark glasses. The first time the treatment lasted nearly three months, during which he kept up his school work with the help of his mother. For several years he had frequent recurrences of the trouble, each time with more or less loss of vision and more or less deposit in the retina. I have watched these deposits clear up time and again under the influence of the iodid. After each attack his vision was normal, and it has continued so to the present time. The eyes are strong and he has had no recurrence since his university days. Then he had two attacks and was treated by Dr. A. Barkan, along the same lines that I had tried, with the same results. But he lost so much time that he gave up endeavoring to finish his university course. I have had this patient under observation during all the intervening years, and he still comes to me for changes of glasses. Today he has normal vision in each eye, and the eyes are strong. I greatly doubt if any other treatment than that used could have given the same results.

A curious concomitant of this case puzzles me. When about three years old, this patient had measles with a severe myocarditis as a complication. It left him with one of the loudest mitral murmurs that I have ever heard. This lasted into adult life; but perfect compensation has since taken place and he was accepted by an old line insurance company for a policy of $10,000 about sixteen years ago, although he gave the examiner a history of the old heart murmur. We have all seen more or less compensation take place in such cases, but I have never seen such complete recovery as in this case. I have long believed that the continued dosage with the iodid was a very large factor in this change. Of course, this is not susceptible of proof, but I report it for what it is worth.

As to the difference of toleration, I have seen one case with vision down to 20/40 where distinct retinal deposits disappeared under the influence of a single drop of the saturated solution three times a day; and I had two cases of paresis of the extrinsic muscles of both eyes, with a history of old syphilis, in which I gave a teaspoonful of the saturated solution three times a day without any symptom of overdosage. One patient made a perfect recovery, which continued during about six years that I had him under observation. The other, a professional strumpet, was not affected by the treatment.

Recurring to my own case, I have found that I bear four drops of the iodid solution three times a day. I can continue this dose indefinitely, but five drops almost immediately brings on severe sore throat and nausea.

I have not kept up with medical literature of late, so do not know how far anyone has preceded me in any of the conclusions here drawn. But I have talked with many physicians through the years and find a lot of them following the old and dangerous practice of giving a set dose of the iodid to all patients. In some cases this can very seriously damage the patient; in others it will prove absolutely inert and there will be another physician without any faith in potassium iodid, one of the most reliable remedies, however, in our armamentarium.

Point Loma.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

THE MYOMATOUS UTERUS

I. DIFFERENTIAL DIAGNOSIS AND TREATMENT

CLARENCE W. PAGE, M.D. (2560 Bancroft Way, Berkeley).—*Diagnosis.*—The diagnosis of an uncomplicated myomatous uterus of fair size is one of the simplest in gynecology. A hard, irregular tumor occupying the mid-abdomen is characteristic, and bimanual examination shows the mass to be intimately connected with the cervix. However, in some cases the tumor is more uniform and at times quite soft. Single, pedunculated fibroids may be more difficult to distinguish from tumors arising in other structures.

When the myoma does not distort the uterine cavity there is not likely to be any disturbance of the menstrual flow, and the symptoms are mainly those due to pressure on the other abdominal organs. When the myoma grows into the uterine cavity the menstrual flow is usually increased in both amount and duration. If the myoma should become an intra-uterine polyp, bleeding may be intermenstrual in type as well as menorrhagic.

Pregnancy is the commonest abdominal tumor and must always be considered. It must be remembered also that pregnancy and fibroids frequently coexist. When both conditions are present, there will usually be some areas which are definitely softer than in an uncomplicated fibroid. Amenorrhea is the rule in pregnancy and rare in fibroids. Associated symptoms of pregnancy may make one suspicious at once of the possibility of pregnancy. No patient in whom there is any question of the existence of pregnancy should be operated upon unless the hormone test has been done. Notwithstanding this, nearly every surgeon of experience has occasionally opened an abdomen only to discover what very closely resembles a pregnant uterus. Several points will aid in preventing either the removal of a pregnant uterus or closure in the mistaken idea that one is dealing with a pregnancy. One of these points is the relationship of the tubes and round ligaments to the fundus. In pregnancy the normal relationship is preserved, while in myoma it is likely to be disturbed. In pregnancy, search of the ovaries may reveal the presence of a corpus luteum of pregnancy, while this will be absent in myoma. Finally, aspiration of the tumor may disclose the presence of amniotic fluid, and this procedure is not injurious should pregnancy be present.

Extra-uterine pregnancy, particularly an abdominal pregnancy with formation of a lithopodium, may closely simulate a myoma. The history, if carefully taken, will be suggestive and an x-ray examination will usually reveal the true condition. I have seen operation undertaken under such circumstances. Surgery is indicated anyway, but the mistake may be embarrassing.

Ascites may resemble an abdominal tumor. The dullness is in the dependent portions with tympany in the mid-abdomen while recumbent. The reverse is true in myoma. The dullness also changes with change of position and a fluid wave may be demonstrated. While ascites may accompany fibroids, it is very rare unless due to associated cardiac or renal failure, and these conditions should easily be shown.

Ovarian cysts usually present no great difficulty in differentiation. When the cysts are thick-walled, they may cause some confusion. Malignant cysts, especially when there are solid metastases in the omentum, may closely simulate a myomatous uterus. The frequent association of ascites under these circumstances and its rarity in myoma will assist, and a careful history and palpation of the tumor may settle the question.

Chronic pelvic inflammatory masses, when large and adherent to the uterus, may cause some confusion. Usually a history of previous pelvic inflammation can be obtained. There will commonly be some increase in the white blood count, decrease in the sedimentation time, some elevation of the temperature and more tenderness than is found in myoma. The frequent association of pelvic inflammation and myoma is important to remember. Witherspoon says that his experience has demonstrated the almost universal association of the two conditions in colored patients. I agree that it is very common under these circumstances, but my experience would not justify so extreme a statement. As radium is contraindicated in the presence of pelvic inflammation, the association of the two is important to bear in mind.

Torsion of a pedunculated fibroid is a possibility, though rare compared with the frequency of torsion of ovarian cysts. The symptoms are similar to those presented by torsion of an ovarian cyst, or even of a hydrosalpinx, and a definite differentiation may be almost impossible preoperatively. The diagnosis of an acute surgical abdomen is frequently the preoperative diagnosis.

The development of sarcoma in a myomatous uterus may be suspected if the growth be rapid. Otherwise it is impossible to detect it, unless it should invade the uterine cavity. It would then cause irregular bleeding, and a diagnostic curettage and biopsy would make the diagnosis.

Carcinoma of the uterus rarely presents great difficulty in differentiation. The myomatous uterus seldom bleeds unless the uterine cavity is involved, and then the bleeding is usually menorrhagic in type. The bleeding in carcinoma is usually metrorrhagic. Any patient who is supposed to have a myoma in which there is any vaginal bleeding should be subjected to a preliminary diagnostic curettage with biopsy.

As in carcinoma, the uterine bleeding associated

with hydatidiform mole and chorionepithelioma will ordinarily prevent confusion.

A mole has a short period of amenorrhea and other symptoms suggesting pregnancy preceding the onset of bleeding. The rapid growth of a soft tumor is suggestive, and if the characteristic grape-like portions of the tumor are passed, the diagnosis is certain. Chorionepithelioma usually follows mole or occasionally abortion, and in those cases which I have seen, the enlargement of the uterus has not been great. As bleeding is present, diagnostic curettage is indicated and will reveal the condition. It should be remembered that both of these conditions show a positive hormone test in high dilutions of the urine.

A myoma developing low on the posterior surface of the uterus may simulate a retroverted uterus. If the fundus cannot be palpated anteriorly, and there are no contraindications to the procedure, the passage of a uterine sound may show the true relationships.

If the myoma develops between the layers of the broad ligament, the distinction between it and a solid tumor of the ovary may be difficult, unless the ovaries can be palpated independently of the tumor.

Intra-uterine and cervical polyps present other diagnostic and therapeutic problems. This phase is being set forth by another essayist.

Near the menopause we sometimes encounter a moderate increase in the size of the uterus due to a general replacement of the muscle tissue by fibrous tissue. It will not often cause difficulty in diagnosis except when considering submucous myomata. As bleeding is the compelling symptom, diagnostic curettage is indicated. Delicate manipulation of the curette will reveal the soft velvety feel of malignancy, the hard smooth surface of general fibrosis or the irregularity present in submucous myomata.

Treatment.—In discussing treatment it is important to rememebr that many myomata are relatively symptomless and require no active treatment. Under such circumstances the patient should be urged to report once or twice yearly for examination, and immediately if symptoms develop. If the tumors are not increasing in size or producing symptoms, they may be left alone.

Diagnostic curettage and biopsy should precede or accompany any form of treatment if there is any bleeding.

The methods of treatment available at present may be enumerated as follows: (1) Subtotal abdominal hysterectomy; (2) Total abdominal hysterectomy; (3) Radiation with either x-ray or radium; (4) Abdominal myomectomy; (5) Vaginal hysterectomy; (6) Vaginal myomectomy; and (7) Removal of polypoid tumors through the vagina.

Subtotal abdominal hysterectomy is the commonest procedure. For the technique of this operation and the many modifications, the reader is referred to standard texts. The disposition of the ovaries will need consideration. In younger women the preservation of at least one ovary is desirable if ample circulation can be assured. Removal of the associated tube will frequently prevent ample circulation and cystic degeneration is likely to follow, necessitating additional surgery later. Should it be thought best to remove both ovaries, consideration should be given to the advisability of implanting portions of an ovary, cut into small fragments, in the rectus muscle.

Some surgeons advocate total hysterectomy in all cases. This is based on the fear of the development, or possibly of overlooking, carcinoma in the retained cervix. The skillful surgeon will not materially increase his mortality by practicing routine total hysterectomy. In the hands of the occasional operator, however, the increased risk of the total over the subtotal operation may more than offset the risk of cancer. If the cervix is seriously diseased, it should certainly be removed. An alternative procedure is the deep destruction of the endocervix by the electrocautery as a preliminary step, or the removal of the same from above after amputation of the tumor.

Treatment by x-ray or radium in properly selected cases is an efficient method. Baer *et al.* state that in the Michael Rees Hospital 15 per cent were treated by radiation in 1923, but that in 1933 the number was reduced to 2.1 per cent. Diagnostic curettage and biopsy must always precede or accompany this form of treatment. It is particularly adapted to the tumor not larger than the size of a twelve to fourteen weeks' pregnancy in women over thirty-five years of age. In younger women the menopausal symptoms may be so severe as to cause regret. The patient who is a poor operative risk may be better treated by radiation in many cases, especially if bleeding is the prominent symptom. The bleeding is checked in a high percentage of cases and slow regression of the tumor often follows. Tumors which are causing pressure symptoms or pain are not favorable for treatment by radiation. Pedunculated fibroids and tumors undergoing degeneration present unfavorable conditions. Rapidly growing tumors are better treated by surgery. Chronic pelvic inflammation is unfavorably influenced by radiation, so if there is any suspicion of its presence, surgery is preferable. Pregnancy contraindicates radiation unless the pregnancy is to be terminated at the same time.

The effect of radiation is probably an indirect one, dependent on the effect of the rays on the ovaries. The dosage must, therefore, be sufficient to cause permanent amenorrhea. Two thousand milligram hours of radium, or its equivalent in x-ray, will usually suffice. Proper screening of the radium, firm packing of the vagina, and prevention of a full bladder are some of the necessary precautions. In young women, when it is desired to preserve the child-bearing function, myomectomy may be the operation of choice. It should be restricted to interstitial, subperitoneal, and pedunculated fibroids where the number of tumors is not large. There is considerable risk that some small tumors may be overlooked and necessitate hysterectomy later. It is inadvisable, therefore, unless the desire for pregnancy outweighs the risk of recurrence.

Vaginal hysterectomy in the hands of one skilled in this method of approach is quite satisfactory, provided the tumor is not too large to be delivered

easily through the vagina. Larger tumors have been operated upon by this route, but the technique is difficult and the advantages questionable. Myomectomy may also be done by this route, but I believe it to be inferior to the abdominal approach.

Removal of intra-uterine and cervical polyps through the vagina is sometimes a simple procedure, but in other instances they are preferably treated by hysterectomy. In removing a large extruded polyp, one should rule out the possibility of a chronic inversion of the uterus, for vaginal hysterectomy should be premeditated and not accidental.

* * *

II. THE EFFECT OF FIBROMYOMAS ON LABOR

Donald G. Tollefson, M. D. (511 South Bonnie Brae Street, Los Angeles).—The dystocia produced by fibroid tumors will depend upon their size and situation. While the incidence of this type of tumor in pregnant women is conservatively estimated between 5 to 10 per cent, those of sufficient size to give rise to complications in labor is probably less than one per cent of all obstetrical admissions. The three conditions most often encountered when labor occurs in myomatous uteri are as follows:

1. Obstruction to the birth canal.
2. Increased occurrence of abnormal presentations (such as breech and transverse).
3. Uterine inertia.

It is extremely difficult to prognosticate the end-result, for frequently a tumor which seems to present a definite obstruction is withdrawn upward when the cervix begins to dilate. Tumors which are adherent in the cul-de-sac or cervical myomas will not allow delivery per vagina; while tumors on the anterior wall will seldom obstruct either the descent of the presenting part or the pelvic outlet. The submucous type of growth when located near the inlet is responsible for the faulty adaptation of the presenting part. This gives rise to malposition and presentation. A series reported by Lynch shows the incidence of transverse as 18 per cent and breech 22 per cent, as compared with the usual incidence of 2 and 3 per cent, respectively. The number of such cases requiring operative interference will be greatly increased—a higher maternal and fetal morbidity and mortality will be the result.

Uterine inertia is undoubtedly the most common cause of dystocia in the pregnant woman with fibromyomas. The interstitial growths replace the normal musculature, and weak inefficient contractions result. The first stage of labor will be either greatly prolonged or not completed, and maternal exhaustion and fetal distress will ensue, making the termination of both the first and second stages a major obstetrical procedure. In the third stage of labor, uterine inertia may also produce complications. If the tumor involves the area of placentation, an abnormal decidua may be present, causing difficulty in the mechanism of separation. Adherent placenta will require more manual removals, and with the inertia alarming hemorrhages will frequently result.

Treatment.—Routine management of the complications described above cannot be outlined. The treatment must be individualized. A few suggestions may be of value in the management of these cases, keeping in mind, however, that the size, location, number of tumors, period of gestation, and conditions present at the onset of labor will determine the course that is most advisable to pursue. During the latter months some authors recommend the daily use of the knee-chest position. While this may be of value in so far as relieving the symptoms of pelvic pressure, its value in displacing tumors in a pelvic location is open to question.

The presence of fibroids in pregnancy is not an indication for induction of labor. Prior to the onset of the contractions of labor, patients frequently have irregular pains, which has been described as the preparatory stage of labor. This change may be of some value in pulling the tumor out of the pelvis so that the presenting part may enter. It seems advisable, therefore, to allow labor to come on naturally in order to take advantage of what nature can do.

After the onset of labor, when obstruction of the birth canal is seen to exist, cesarean section is indicated. Patients should not be allowed to labor against this obstacle, for rupture of the uterus may occur. Simple excision of the tumor or removal of the uterus will depend on the size, the location, and type of fibroid encountered.

The most difficult complication to treat in this condition is uterine inertia. Analgesia given too early in labor will increase the tendency toward inefficient uterine contractions. Rest periods have been advocated when the patient shows fatigue, but are usually not indicated until progress is at a standstill. Uterine inertia, if persistent, will require operative interference, and too great delay will add materially to the obstetrical risk when interference becomes imperative.

The third stage should always be treated conservatively, and this should be reëmphasized when one is dealing with inertia or fibroids involving the placental site. Allow the placenta to separate normally and interfere only for the indication of bleeding. The oxytocic drugs should not be used until separation has taken place.

To summarize the effect of fibromyomas on labor it may be said that:

1. Uterine inertia is the most difficult complication to treat and by far the greatest danger.

2. The incidence of tumors which will actually obstruct delivery is small when labor is allowed to ensue.

3. While fibroids may be considered a real complication in labor, the prognosis for a satisfactory end-result is good when the condition is diagnosed and the treatment individualized.

* * *

III. CERVICAL FIBROMYOMATA

Donald A. Dallas, M.D. (490 Post Street, San Francisco).—Cervical fibromyomata are discussed separately here for the reason that they present a somewhat different problem from those occurring in the body of the uterus. They occur much less frequently than the fundal tumors, the

incidence being variously estimated at from 1 to 8 per cent of all uterine fibroids. They are said to be always single tumors as contrasted with those in the fundus, which are frequently multiple. They vary in size from small nodules to large masses, entirely filling the pelvis and weighing up to 7,000 grams. They arise in either the anterior or posterior wall of the cervix—more often in the posterior. As they increase in size they can remain in the wall of the cervix, or can grow in any direction. If the growth is toward the canal of the cervix they frequently become pedunculated and protrude through the external os into the vagina. If the growth is outward they slowly displace the tissues about the cervix in the direction of least resistance, and may ultimately fill the pelvis almost completely. In consequence of being fixed deep in the pelvis by the supporting tissues of the cervix, their growth, if great enough, will displace and compress the ureters, the bladder, the urethra, the sigmoid, and the rectum. The cervix, when these tumors are of the larger type, is usually displaced forward under the symphysis and frequently cannot be exposed for inspection, and occasionally cannot be reached by the examining finger. When the growth is very large, it may protrude through the external os and fill the vagina. Cases have been reported in which the tumor actually spread the vulva and extended beyond it for several centimeters. The cervix in these cases may be dilated as much as during the delivery of a full-term baby. Frequently the fundus of the uterus also contains fibroids, but if free from them it may be "perched on the top of the cervical fibroid like a cap." A number of cases of cervical fibromyoma have been reported which have developed after supravaginal hysterectomy.

Cervical fibromyomata are apparently not as much under the influence of the sex hormones as those located in the body of the uterus, and consequently are more likely to continue to grow after the menopause. It is also interesting to note that they do not respond well to radiation therapy. These tumors have a tendency to become densely adherent to the surrounding organs, especially the urinary bladder and rectum, and this characteristic makes their surgical removal much more difficult.

One of the common symptoms produced by these tumors is profuse hemorrhage. The patients are frequently markedly anemic, and transfusion either before or after operation is often necessary. Pressure symptoms are also common; pain, marked frequency and incontinence of urine due to compression of the bladder, ureters and urethra, and constipation due to pressure on the rectum, are the most usual ones. The engagement of the presenting part during labor is often interfered with by a cervical fibromyoma. About one-half of the cases reported in the literature have been discovered at this time. In these cases the presenting part remains very high and is often deflected toward one or the other iliac fossa. When this occurs in spite of adequate pains, one should always suspect the presence of a cervical fibroid.

The treatment of cervical fibromyomata is always surgical. The pedunculated submucous fibroids which protrude through the external os into the vagina can, as a rule, be removed without difficulty. The pedicle can be ligated, cauterized or clamped. If the pedicle is thick and hemorrhage is feared, the clamp may be left in place for forty-eight hours, when it can be removed without danger of bleeding. These tumors, whether arising from the cervix or from the body of the uterus, are always infected, frequently with streptococci. In cases where abdominal hysterectomy is necessary, it is much wiser to remove the tumor as described and wait about three weeks before doing the abdominal operation.

The treatment of cervical fibroids which interfere with the presenting part during labor varies with the size and location of the tumor. As cesarean section is usually necessary to deliver the child, the tumor can be removed after the placenta has been extracted. This can be accomplished by making an incision through the endometrium over the tumor and shelling it out as in the ordinary myomectomy. If this does not seem feasible, hysterectomy is probably indicated.

The surgical removal of the smaller cervical fibromyomata is not particularly difficult and is attended only by the usual operative risk and, as a rule, complete hysterectomy is the operation of choice. The removal of the larger tumors presents great technical difficulties and carries with it a high mortality. As has been stated before, these large tumors displace and compress to a greater or lesser degree the ureters, bladder, sigmoid, and rectum. Any of these organs may be densely adherent to the growth and may be displaced to a remarkable extent. One surgeon reported that, on incising the peritoneum over the top of a large cervical fibroid, he found that he had incised the bladder. The ureters should always be carefully looked for and identified, for they may be found on top of, beside or below the tumor. The uterine arteries are also located only with difficulty, and it is important that they be found and ligated early in the operation in order to prevent excessive hemorrhage. The bladder and rectum should be freed from the tumor by careful dissection. It is much wiser to leave a part of the tumor attached to the wall of the bowel or bladder than to open either of these organs in attempting to free them. In some of the more difficult cases bisection of the uterus and tumor can be done. This will frequently give the operator more room in which to work and allow him to ligate the uterine artery on one side. He can then free the tumor from below upward, with little bleeding and much less danger of injury to the ureter, bladder, or rectum. The same procedure can then be carried out on the other side and the operation completed in the usual manner.

In conclusion, I should like to emphasize that the treatment of cervical fibromyomata is always surgical; that the removal of the smaller tumors is not difficult if one knows in advance that the tumor originated in the cervix and remembers that the ureters, uterine arteries, bladder, etc., are probably displaced by the tumor. I should also like to stress the fact that the excision of the larger tumors is likely to be exceedingly difficult and suggest that the most expert help available be secured before attempting the operation.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

OFFICIAL BUSINESS

DIGEST OF EXECUTIVE COMMITTEE MINUTES

Committee met in San Francisco on April 2, 1938. Creation of Institution Committees through action of Board of Supervisors was recommended.

Proposed plan for medical and hospital care submitted by Standard Oil Company employees was referred for investigation and report to Public Relations Committee.

A conference of representatives of county societies concerned with medical care of indigent itinerants was approved.

Invitation extended to American College of Physicians to hold its 1939 convocation in San Francisco.

Pneumonia control program referred to Committee on Public Health.

Discussion on malpractice insurance and statement for publication approved.

San Francisco Employees Medical Plan referred to Committee on Public Relations.

Time was fixed for hearing appeal from action of San Diego County Society.

Routine matters acted upon. F. W.

POSTGRADUATE CONFERENCES

The following represent the places and the subjects presented in a series of postgraduate conferences:

RIVERSIDE COUNTY MEDICAL ASSOCIATION

Postgraduate Conference, February 14, 1938, at Sherman Institute, Riverside

PROGRAM

4:00 p.m.—Nonacute Types of Arthritis (clinical demonstration), John Dunlop, Pasadena.

5:00 p.m.—Laboratory Examinations, John F. Kessel, Los Angeles.

6:15 p.m.—Dinner, Sherman Institute.

7:15 p.m.—Menstrual Disorders, Henry N. Shaw, Los Angeles.

8:15 p.m.—Surgical Treatment of Pulmonary Disease (clinical demonstration), Frank S. Dolley, Los Angeles.

* * *

SANTA BARBARA COUNTY MEDICAL SOCIETY

Postgraduate Conference, March 12 and 13, 1938, at Santa Barbara Clinic, Santa Barbara

PROGRAM

Saturday

9:00 a.m.—Clinico-Pathological Conference, Clark E. Brown, Santa Barbara.

10:00 a.m.—Cardiovascular Disturbances, Frank Nuzum, Santa Barbara.
Surgery of Acute Abdomen, W. W. Washburn and George W. Pierce, San Francisco.

11:00 a.m.—Dermatology, Samuel Ayers, Los Angeles.
Gynecology and Obstetrics (sterility, artificial insemination), Erle Henriksen, Los Angeles.

Luncheon

2:00 p.m.—Endocrinology, E. Kost Shelton, Los Angeles.

3:00 p.m.—Pneumonia: Serum Therapy, Roy Thomas, Los Angeles.
Eye Injuries, J. N. Osburn, Los Angeles.
Nasal Hemorrhage (malignancies of nose and throat), Simon Jesberg, Los Angeles.
Gynecology and Obstetrics (cesarean section, specific infections, vomiting of pregnancy), John Vruwink, Los Angeles.

Dinner

Evening—Allergy, Albert Rowe, San Francisco.

Sunday

10:00 a.m.—Bleeding Ulcer, William Boeck, Los Angeles.
Allergy in Children, Albert Rowe, San Francisco.
Drugs and Therapeutics, Chauncey Leake, San Francisco.
Endocrinology (migraine, obesity, undescended testicle), E. Kost Shelton, Los Angeles.

11:00 a.m.—Head Injuries, Howard Naffziger, San Francisco.

Luncheon

2:00 p.m.—Orthopedics (foot and knee injuries, low-back pain), John Wilson, Los Angeles.
Burns, W. W. Washburn and George W. Pierce, San Francisco.
Pneumonia in Children, Earl Moody, Los Angeles.

Afternoon—Eye, Ear, Nose and Throat Symposium, Simon Jesberg, J. McKenzie Brown and J. N. Osburn, Los Angeles.

* * *

ORANGE COUNTY MEDICAL ASSOCIATION

Postgraduate Conference, March 15, 1938, at Santa Ana

PROGRAM

No. 13—Disturbances of the Peripheral Circulation, Howard West, Los Angeles.

No. 24—Appendicitis, Charles E. Phillips, Los Angeles.

No. 90—Proctology Treatment, W. H. Daniel, Los Angeles.

No. 29—Tumors of the Abdominal Cavity, Eric Larson, Los Angeles.

No. 36—The Principles of Treatment of Compound Fractures, Paul E. McMaster, Los Angeles.

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

IMPERIAL COUNTY MEDICAL ASSOCIATION

Postgraduate Conference, March 15, 1938, at Imperial County Hospital, El Centro

PROGRAM

No. 28—Peritonitis, Henry Bonesteel, Los Angeles.
No. 57—Abdominal Pains in Children, J. Norton Nichols, Los Angeles.
No. 38—Menstrual Disturbances, Erle Henricksen, Los Angeles.
No. 45—Postpuerpural Complications, William B. Thompson, Los Angeles.
No. 63—Endocrinology in Children, Ezra Fish, Beverly Hills.

* * *

SAN BERNARDINO COUNTY MEDICAL ASSOCIATION

Postgraduate Conference, April 7, 1938, at Elks Club, San Bernardino

PROGRAM

No. 10—The Decompensated Heart, Robert W. Langley, Los Angeles.
No. 37—Traumatic Surgery, Robert W. Wilcox, Long Beach.
No. 30—Colitis, Frank W. Otto, Los Angeles.
No. 34—Malignancy, Orville Meland, Los Angeles.

* * *

The following appraisal may be quoted as a quite representative expression of opinion expressed by those in attendance:

Bakersfield, March 18, 1938.

To the Secretary:—The conference at Santa Barbara was, I think, a very monumental success, especially considering the fact that it was the first. There were 110 registrations.

Unfortunately, some very disagreeable weather blew in from the north, almost repeating the flood situation of the week before, and the rain in Santa Barbara was very heavy. Ten from Kern braved the weather, having to drive almost into Los Angeles and then back north, not knowing when they could get out of Santa Barbara if the rain continued. San Luis Obispo County was exceptionally well represented. The attendance from Ventura was very disappointing. The program was exceptionally good.

The eye, ear, nose and throat symposium was, I think, exceptionally successful, it remaining in constant session Sunday for about three hours. The Saturday night dinner and dance at the Montecito Country Club was a very enjoyable affair and taxed the capacity of the club. The attendance at both the sessions and the Saturday night dinner were considerably greater than anticipated. Doctor Rowe gave a very excellent talk after the dinner, which he made snappy and to the point and did not drag it out, as often happens at these affairs.

I tried to get the reaction to the conference by different groups of men, and it seemed to be unanimous that it was very fine. At the end of the last general session on Sunday I asked for the pleasure of the group whether or not they wished the conference repeated. There was not a dissenting vote. Some of the men were so enthusiastic that they wished to have it repeated this fall. One thing that impressed me quite strongly, which I heard repeatedly, was that the men were very pleased to meet and become acquainted with the fellows from the adjoining societies.

The wives were entertained by the Auxiliary of Santa Barbara County, and I think they are as enthusiastic about the conference as are the men.

With the first conference now out of the way, I am under the impression that the district should have a permanent postgraduate organization of one or two men from each county and I shall attempt to have that done during the Pasadena meeting.

Taking everything into consideration, I do not see how we could have improved our first effort, and a great deal of credit is due Doctors Henderson and Stone and others who worked with them for the way it was handled.

I believe the next one will see the out-of-town registrations at least doubled.

Sincerely yours,
LOUIS A. PACKARD, M.D.

* * *

March 19, 1938.

To the Secretary:—At your request of March 16 I am herewith giving you reports of the Riverside and Santa Ana conferences.

The Riverside Postgraduate meeting was held on the 14th of February at the Sherman Institute. It was well attended, there being in the neighborhood of one hundred men present. I did not arrive in time to hear the lecture on nonacute types of arthritis and laboratory findings, but all seemed to be well pleased with them. Shaw and Dolley were especially good with their subjects. There was more interest and better attendance than at Riverside a year ago. Clinical material, x-rays, and charts were seen in abundance.

Orange County held its Postgraduate meeting last Tuesday, March 15, at the Ebell Club in Santa Ana. An attendance equal to that of Riverside was present. West, on peripheral circulation, gave an excellent presentation with two clinical cases before him. Phillips' talk was good. Daniels gave an excellent talk on proctology, meeting the general practitioner in so many of the common ills that present themselves to the office. No charts or clinical material was used, but it was a valuable presentation. Larson, on abdominal tumors, was one of the high lights of the meeting.

Very truly yours,
CALVERT L. EMMONS, M.D.

* * *

Holtville, Calif., March 23, 1938.

To the Secretary:—The Imperial County Medical Society's regular meeting was held in the Imperial County Hospital, Tuesday, March 15, at 3 p. m. The meeting was called to order by Dr. H. B. Graeser, president. The following members were present: W. W. Apple, M. A. Barmore, T. C. Bartholomew, F. A. Burger, M. C. Canfield, F. C. Gregg, H. I. Gregg, P. Hodgkin, K. H. Kortheuer, J. L. Parker, F. G. ReBell, and Doctor Hawkenson.

Doctor Barmore, who was in charge of the Postgraduate Clinic, presented the speakers. Owing to a scarcity of cases, the clinic was necessarily didactic. Doctor Collins reviewed the field of peritonitis, giving the generally accepted methods of diagnosis and treatment.

Doctor Henriksen, in discussing menstrual disorders, called particular attention to the lack of uniformity of the results obtained in treating these conditions with endocrine products. Dr. W. Benbow Thompson spoke on postpuerpural complications. He gave a complete account of conditions encountered at this stage and ably discussed their treatment. Dr. J. Norton Nichols spoke on abdominal pains in children, stressing surgical aspects.

A round table discussion was held after each clinic. Dinner was served at the hospital between 6:00 and 7:00, and the clinic was concluded at 9:30 p. m. It was moved and seconded that a vote of thanks be sent to the Postgraduate Committee in obtaining men of such high quality for our Postgraduate Clinic. It was the unanimous opinion of those present that we should have at least one more clinic before the summer season starts.

Sincerely yours,
WILLIAM A. CLARKE, Secretary.

A CHALLENGE TO MEDICINE

Dr. R. G. Leland of the American Medical Association Bureau of Economics, recently commented upon social changes under the title at the head of this item. It is felt that the following extracts will interest members and furnish items for thought:

"Thus far the medical profession in the United States has averted the entanglements, political domination and inevitable deterioration of medical service that would come from a system of compulsory sickness insurance.

"The persistent propaganda of the proponents of socialized medical service has caused many physicians to doubt the future of medicine. A few are even exhibiting a fatalistic attitude in declaring that the socialization of medicine is inevitable.

"The socialization of medicine, as the term is commonly used, refers to any form of medical advice, diagnosis and treatment provided, conducted, controlled or subsidized by the federal or any state government, with the exceptions stated.

"No value can be derived from criticism of a country for having adopted a system of state-managed medicine, but a critical analysis of the systems themselves may be helpful in determining whether such methods are preferable to the free and independent practice of medicine such as exists in the United States.

"A careful examination of the systems of state-managed medicine reveals the following conditions:

"1. There is no decrease in the cost of medical care. Instead, the system adds a staggering cost of administration.

"2. Public health and preventive medicine are not assisted or advanced. State-managed medicine does not provide the annual health examinations or the immunizations usually promised before the system was adopted.

"3. Morbidity and mortality are not reduced.

"4. The problem of so-called catastrophic diseases is not solved.

"5. Neuroses are created.

"6. Overmedication is encouraged.

"7. The burden of the system is distributed over the low-income class, which is least able to bear it.

"8. Medical care for the indigent is omitted.

"9. The medical profession is divided into a 'first' and 'second' class.

"10. Graduate education is not encouraged and is usually neglected.

"11. The hospital load is increased. Hospitals are encouraged to practice medicine.

"12. Attention and financing are concentrated on the less essential health and medical measures.

"13. Diagnosis and treatment are mechanical and superficial.

"14. Professional associations are compelled to devote their energies to the defense of medicine against nonmedical and political interference rather than to scientific and educational activities.

"15. Medical service becomes a political issue.

"16. Control over medical service is placed in the hands of unqualified, nonmedical individuals and organizations.

"17. The road is closed to the use of more desirable methods.

"They have observed that sickness insurance has constantly restricted the direct relations between patients and physicians in private practice. Formerly there was a human relation which depended on confidence in the physician. Between the patient and his physician there is now a third party—the insurance carrier, and a fourth party—the government, a supervising bureaucracy which compels the physician to follow its regulations. Furthermore, these observers assert that if treatment does not bring the expected result, the physician is discredited and is made punishable for every unavoidable failure.

"Reports from countries having state-managed medicine state that the insured have not been satisfied with the new system. Restrictions of the means of healing have been offensive to them; they have looked on the contributions to the sickness insurance system, taken from them through their employers by compulsion, as a retained share of their wages. They knew that they could obtain this retained money only in the form of insurance medical service or cash benefits. They believed they had been compelled to pay out money without receiving an equivalent. The only way in which the money or an equivalent could be recovered was to declare themselves sick and to meet the conditions set down by the law. This was an easy matter.

"Even in Europe some physicians have expressed the view that the idea of a free medical profession must not be abandoned; once it is completely abolished a cultural value will have been lost that cannot be replaced or restored. To physicians, human values are of greater importance than are political expedients.

"Even at its best, do the American people and the American physicians want such a system? Before we wholly destroy our present plan of medical practice through revolutionary legislation, let us inquire carefully into the value of what we have, and study searchingly the proposals of those who would take it from us, lest worse come in its place.

"The proponents and agitators for some radical change in the method of distributing medical services have made some serious and startling charges concerning the methods now in use. They continue to assert that 50 per cent of the population receives no medical care. A survey of some 38,600 persons made by the Committee on the Costs of Medical Care showed that 47.1 per cent had no illness over a period of more than a year. The study also showed that 47.9 per cent of these persons had the services of physicians. Only 5 per cent of the persons involved in the survey were presumably in need of medical services, but for some reason did not avail themselves of medical care. Perhaps 5 per cent is not too large an estimate of those who because of human characteristics manifested as ignorance, stupidity or prejudice prefer cultism, patent medicine, the advice of friends or relatives or no medical service at all.

"The medical profession today is conducting more social experiments in the methods of distributing medical services than all of the proponents for change have ever conducted. Out of the two hundred or more projects that are being studied or operated by county or state medical societies, it is hoped that methods may be found that can be utilized to supplement existing medical facilities wherever necessity demands.

"These meddlers with medical practice assert that present methods in the United States are costly and inefficient. In countries having state-managed medicine, there are as many bureaucratic employees as there are physicians giving medical service. State-managed medicine imposes such extensive red tape, record keeping and political interference, dominance and control on the physicians practicing under the system that they cannot devote the time they should to the actual practice of medicine. Loading the system with unnecessary bureaucratic personnel and with political meddling and direction tend to increase the cost of medical service and at the same time to reduce its quality.

"To combat the agitation for drastic changes in medicine, the medical profession must continue to practice good medicine. It has been accused of being individualistic. This criticism should be accepted as a compliment insofar as the diagnosis, treatment and close personal confidential relations of private practice are concerned. Physicians must continue to be individualistic and ethical in their private ministrations to maintan health and to alleviate sickness. But they must speak and act collectively on matters pertaining to economics, public relations, legislation, the preservation of professional ideals and traditions, and the maintenance and advancement of medical ethics and the standards of medical education and practice.

"The large and representative group of ethical physicians have an obligation to unite solidly in sentiment and in action against the utterly false representations of the reactionary, radical, self-styled experts who would destroy medical values that have required generations and centuries of accumulated scientific effort and experience to acquire.

"Shall medicine continue to be practiced by men and women who are scientifically trained and who are devoted to the relief of suffering humanity, or shall the practice of medicine be taken over by a group of medically untrained bureaucrats who will use the medical profession as a tool and the sick as clay in moulding a huge political machine?

"When physicians become, if they ever should, mere robots, making diagnoses from card indexes and mechanical gadgets and prescribing treatment from prepared and numbered labels, and when patients become a mere collection of interesting human parts to be shunted from one corner to another of a medical repair shop for some heartless and pseudoscientific tinkering, America will have lost one of its greatest institutions—free and independent medicine—and the American people will have lost some of their most valuable human traits, namely, confidence in, respect for, and reliance on the scientific men and women who protect their health and prolong their lives."

The last quotation might well be printed in large type and hung in every doctor's reception room and in the waiting rooms of every hospital.

RESOLUTIONS ESTABLISHING PRINCIPLES OF ETHICS AND CONDUCT

Certain county societies have sought to amplify the Principles of Medical Ethics by adopting, through resolutions, additional rules governing professional conduct. The question has been raised as to the correctness of such a procedure and also whether such rules and regulations can be applied to members. Another question raised is whether disciplinary action against a member for violation of such rules could be sustained.

An opinion was sought from the Judicial Council of the American Medical Association, the highest authority in our federacy. The following opinion has been received:

(COPY)

AMERICAN MEDICAL ASSOCIATION
JUDICIAL COUNCIL

March 19, 1938.

Dear Doctor Warnshuis:

Your letter of March 1 to Doctor West, requesting a ruling or advice concerning basing charges agalnst a member on a resolution adopted by the society, has been sent to me for reply. It appears that there is a particular practice which several of your societies desire to terminate by disciplinary action, viz., entering into contracts and agreements with certain insurance companies to render professional services for fees that are anywhere from 25 to 50 per cent lower than the regular state compensation fee schedule or the fees customary in their respective vicinities.

This is a particular condition which the society desires to remedy by a definite pronouncement, and it is similar to the rules of conduct which a few of the California societies have adopted and have used as a means of disciplining their members, as, for instance, in the Kern County Medical Society. This adoption of rules of conduct has received official disapproval of the Judicial Council in a recent annual report in which the statement was made, if I remember correctly, that all of these rules of conduct covered points on which disciplinary action might be taken successfully under the Principles of Ethics without the adoption of any special rule of conduct. In this particular instance cited by you, it seems to me that the Principles of Medical Ethics cover the situation adequately. There is a section on contract practice which would appear to make that action unethical. There is also the section declaring

it to be unethical for a physician to dispose of his services to a lay body under any terms or circumstances by which a direct profit from the fees or salaries paid accrues to the lay body. It would seem that this section also might apply. I regret that I do not have at hand a copy of the Principles of Medical Ethics to which I can refer, but I am quite sure that some of the general principles of ethics covered in the early sections of the publication could also be evoked.

May I offer you the following argument: The disciplining of a member under a resolution which requires only a majority vote of those present when the resolution is presented is inconsistent with good law and procedure. To judge and discipline one member under a resolution which can be adopted or rescinded at any time by a majority of those present at a meeting and another member by a process much more representative of the whole membership is not good law. I am inclined to think that because the loss of membership in a local society also means loss of membership in a state and national organization, no disciplinary action involving membership should be taken which is not based on violation of the Constitution or By-Laws or else violation of the American Medical Association's Principles of Medical Ethics.

Sincerely yours,

GEORGE EDWARD FOLLANSBEE,
Chairman, Judicial Council.

The attention of county society officers is particularly directed to the last paragraph of this letter.

County societies should promptly initiate suitable action to include their special rules and regulations in their by-laws under that section that governs the conduct of members. This is important, and action in this matter must not be delayed. Introduce such an amendment at your next meeting.

PASSING COMMENT

The following item evidences anew how members are willing to serve their communities.

It may be that there are some folks living in this county who need medical advice or attention, and who feel that they cannot afford to pay for the service.

In order that such people may have the services they need, Dr. William Sullivan, who is located in Mariposa, will set aside Thursday afternoon of each week for receiving all such persons and he will be pleased to give them advice and medical aid without charge.

Doctor Sullivan has had much experience in this kind of work and he asks all those who wish this free service to call at his office on Thursday afternoons.

* * *

American Medical Association, San Francisco, June 13-17: An opportunity you can ill afford to overlook. Be sure you bring your 1938 Fellowship card.

You can make Fellowship application at the Registration Bureau in the Civic Auditorium.

* * *

Minutes of the Pasadena annual session will appear in the July issue.

* * *

Since 1847 over three thousand surveys have been made by a variety of organizations looking into the practice of medicine and the distribution of medical care. Soon there will be indicated a survey of surveys. It is about time to declare a closed season on surveys that are becoming a popular pastime and in some instances something worse.

* * *

There are some three hundred medical societies in this country in addition to the component units of the American Medical Association. President Abel observes that "the utility of many is negligible or questionable." One's first loyalty should, yes, must be, to his county and state medical societies.

* * *

Don't write *direct* to San Francisco hotels for American Medical Association reservations. No matter what influence you may have, *no* hotel will assign you a room. *All* reservations must be made through the American Medical Association Hotel Committee, Room 2004, 450 Sutter Street. Don't pack a grouch if your favorite hotel is booked to capacity and you are assigned somewhere else. Over 2,500 rooms are booked, but plenty first-class rooms continue to be available and you will be comfortable even if not located on Nob Hill or around Union Square.

* * *

It is easy to cite generalities and to quote foreign percentages and ask why the same percentages cannot be recorded in this country. We hear frequently about low infant and maternal mortality in Norway and Sweden. They are low in these countries, but the conditions that prevail can never be instituted here. For instance, practically every parturient woman is attended by a midwife. These midwives have had three years of hospital training, pass rigid examinations, and are required to attend postgraduate classes each year. In Stockholm 98 per cent of all births take place in maternity hospitals. None in general hospitals. In normal cases the women are attended by persons who have no part in the care of medical or surgical patients. Try to establish these two principles in this country!

* * *

To be a continuous student—that is the obligation of every member engaged in practice. He must acquire and reflect an inquisitive, wisdom-seeking attitude and viewpoint. Through personal effort, planned readings, the devotion of time to postgraduate work and attendance at medical meetings, local, state, and national—by these means the physician must remain abreast of scientific progress and keep out of the rut of habit and routine. There is no place in medicine for the indifferent doctor; he must be a continuous student.

AMERICAN MEDICAL ASSOCIATION SAN FRANCISCO SESSION

The week of June 12 will witness the assembling of some ten thousand physicians and surgeons in San Francisco for the annual session of the American Medical Association. Many of them will be accompanied by members of their families. Several eastern states members have arranged to come by special trains that will stop at scenic points en route, not a few will travel by automobile, and some will come by plane. For a goodly number it will be their first visit to the Pacific Coast and the Golden Bear State.

San Francisco's medical fraternity has been engaged for months, under the leadership of Howard Morrow, General Chairman of the Local Committee on Arrangements, in perfecting details for the session and providing for the pleasure and comforts of its guests.

All the sessions will be held in the buildings surrounding the Civic Center. To provide needed accommodations for the commercial and scientific exhibits, general scientific sessions, general meeting, and section meetings, the following buildings will be utilized: Auditorium, Opera House, Veterans' Building, and the Empire Hotel auditoriums. The House of Delegates will convene in the Sir Francis Drake Hotel, which has been reserved completely for delegates, councils, bureaus, and the official family.

The official program will appear in a special San Francisco number of the *Journal of the American Medical Association* that will be issued in May.

* * *

Members should carefully read that issue, as it is impossible to reprint the extended program and announcements for this national gathering.

* * *

A FEW HIGHLIGHTS

1. Monday, June 13, opening of exhibits and registration in the Civic Auditorium.

2. Monday and Tuesday, June 13 and 14, general scientific sessions in the Opera House, morning and afternoons. Thirty-minute talks by distinguished clinicians.

3. Tuesday evening, June 14, opening of general meeting in the Opera House. President's annual address. A formal outstanding function and occasion.

4. Wednesday, Thursday and Friday, morning and afternoon sessions of sixteen scientific sections.

5. Thursday evening, Palace Hotel, president's reception and ball. A magnificent social function.

6. The Woman's Auxiliary, Fairmont Hotel, Monday to Thursday—meetings, luncheons, dinners, receptions.

7. Entertainment: Fraternity and alumni banquets, dinners, scenic trips, boat ride on the Bay, House of Delegates dinner, officers' dinner. Many private dinners and social functions.

* * *

With a welcome and cordiality, in degree exemplified alone by the profession of San Francisco and California, the visitors will find themselves among hosts who will provide for their every comfort and enjoyment. Departing, they will carry with them memories of happy hours and a profitable annual session.

* * *

TO CALIFORNIA MEMBERS

To our California members the advice is given that all who possibly can should not fail to attend this national meeting. It is the greatest postgraduate opportunity in the world. Nowhere else in the world can one find a five-day session that enables a practitioner of medicine to embrace opportunities for educational betterment such as are provided in the sectional and general programs and the scientific and commercial exhibits. He who fails to attend this American Medical Association San Francisco session neglects a golden opportunity.

It is hoped that not less than three thousand California Fellows will register and attend. Do not forget to bring your Fellowship card—and also *you must be a Fellow* to register and gain admission.

* * *

PRESESSION MEETINGS

Commencing on Wednesday, June 8, and extending through Sunday, June 12, there will be presession meetings of allied national medical organizations in San Francisco. The following is a partial list: American Dermatological Association; American Psychiatric Association; American Ophthalmological Association; Academy of Tuberculosis Physicians; American Proctological Association; Society for Study of Rheumatism; Society for Study of Allergy; American Society of Clinical Pathologists; American Pediatric Association; and others.

A MINIMUM PROGRAM FOR COUNTY SOCIETIES

County societies must be maintained as going, active units of our Association, a hit-and-miss policy and indefinite, disassociated activities, are not productive for the greatest good. To achieve results, to attain objectives, and to enlist and hold the interest of members, every county society should place into operation a minimum program of work.

To that end this minimum program is outlined for consideration.

Section 1. Scientific.

(*a*) Ten meetings to be held each year. Local speakers are to appear before six meetings with definite planned papers or case presentations. Four guest speakers.

(*b*) A program of physical examination in which all members shall agree to have a complete physical examination yearly.

(*c*) The establishment of a "Health Hour" in each member's office once or twice a week before or after regular office hours. The Society to sponsor publicity to acquaint the public with the fact that during these hours persons unable to pay regular fees will be given tests and immunization treatment for a reduced fee. This fee to be determined by the county society.

(*d*) Each society to form one or more teams, composed of two or three members, who will prepare a program and present it on request before an adjacent county society.

Section 2. Public Education and Information.

Each society shall sponsor or cause to be sponsored at least five public lectures during the year for: each high school; Parent-Teacher organizations; luncheon clubs; women's clubs; public at large.

Section 3. Social Functions.

Each society shall hold at least three dinner meetings to be addressed by educators, business men, attorney or civic official; one annual banquet; one annual picnic; joint dinner with dentists, attorneys, pharmacists, and hospital officials.

Section 4. Publicity.

Each meeting and activity shall be reported to local newspapers in such form that at least one important fact of interest and value to the public is imparted.

If county societies will adopt this minimum program it is predicted that members will reveal interest and attend. This program is not a self-starter—someone has to assume the initiative. Will you be that someone in your county?

ASSOCIATION NIGHTS

On March 14 President Morrow, Secretary Warnshuis and Councilor Alfred Phillips were in attendance at the Rio Del Mar Club in Aptos at an Association night for Santa Cruz, Monterey, and San Benito county medical societies. Some eighty-five members were present at the dinner and the talks and discussions that continued till 12:15 a. m.

These three societies are active and progressive, and represent the large majority of eligible doctors in these counties.

On March 17 President Morrow, Secretary Warnshuis, and Legal Counsel Hartley Peart attended the seventieth annual banquet meeting of the Sacramento Society for Medical Improvement, our oldest county medical society.

Speaker Lowell S. Goin of Los Angeles, was the guest speaker. Past President Robert A. Peers was also an honor guest. This annual banquet is always an enjoyable function, characterized by friendship and a program of music and local skits in addition to the main address of the evening. Speaker Goin rose to the occasion and gave a very entertaining address. It was a delightful evening in the company of the members of this very active county unit.

WANTED

It is believed that a number of members have in their possession teaching movie medical films. Several of our outlying county societies that have difficulty in obtaining guest speakers are desirous of securing teaching films for their meetings.

The "wanted" request is made that members having such films will kindly advise the State Secretary, and advise as to subject, content, length of run, and whether they may be borrowed for county society use.

Your response and assistance in making such films available for county societies is earnestly requested.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

Hospital Rates

The Association of California Hospitals at its recent annual session adopted the following resolution:

* * *

(COPY)

ASSOCIATION OF CALIFORNIA HOSPITALS

Resolution re Contract Rates

WHEREAS, The hospitals of California are constantly striving to balance budgets, and more often than not fail to balance their budgets; and

WHEREAS, True cost studies show many published rates, particularly ward rates, less than cost; and

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

WHEREAS, Insurance companies, corporations with medical departments, and physicians doing group practice have asked or demanded special rates and in many cases succeeded in getting them; and

WHEREAS, These rates are not founded on any social basis, but are preferential to those most able to pay full costs; and

WHEREAS, Such policy of granting special rates to powerful companies has been thoroughly discredited and branded as bad business ethics; and

WHEREAS, Such policy not only is bad for hospitals, but also results in unfair competition in the profession of medicine also; therefore be it

Resolved, (a) That hospitals in this Association go on record as disapproving the practice of entering into special contracts at special rates;

(b) That hospitals in this Association recommend and urge all hospitals to grant no rates below their own published schedule, except to individual cases of merit, and to those cases after social service investigation proves such right;

(c) That a copy of this resolution be forwarded to the California Medical Association and to its members, assuring each high class practicing physician that secret agreements will place him at a disadvantage.

The resolution is commended. In this connection it is not amiss to remind members that contracting or agreeing to render professional services to insurance companies, corporations, or contractors at reduced fees is a violation of the Principles of Ethics and the policies of the American Medical and California Medical Associations. Violation of these rules by members renders them liable to disciplinary procedures.

County societies do well when they remain alert and exercise their authority in causing observation and compliance with adopted principles.

Health Education

During the past five months two series of public talks have been given in San Francisco through arrangements perfected by the Department of Public Relations. One was a series of eight talks given at a general assembly of the Girls High School in San Francisco. The second was a series of seven talks before the evening assembly of the San Francisco Y. W. C. A. A lecturer was also provided for the Woman's Club of Vallejo.

The following letter of appreciation has been received:

SAN FRANCISCO PUBLIC SCHOOLS

San Francisco, Calif., March 24, 1938.

California Medical Association
450 Sutter Street,
San Francisco, California
Attention: Dr. F. C. Warnshuis, Secretary.

On behalf of the Medical Club of Girls High School, I wish to thank you for your kindness in sending speakers to this Club.

The members of the Medical Club have enjoyed the very interesting talks the speakers have given, and I have written them letters expressing our appreciation and thanks.

We hope that you will be kind enough to continue sending us speakers.

I thank you.

Sincerely,

HAZEL SPENCER, Secretary.

County societies should sponsor such meetings. They accomplish the gaining of public good will for the profession and enlighten the public upon health questions enabling the people to detect the false claims and advice of the quack and manufacturers of drugs. Plan such meetings for your county.

You Will Be Interested

Every member should be interested and read that section of the *Journal of the American Medical Association* devoted to "Organization." In each issue, just before the back advertising section, you will find much information and comment upon legislation, economics, federal activities, and organizational activities.

It is a weekly digest and comment upon what is transpiring in the realms of government, social security, and legislative chambers. The information is accurate, hence dependable. It presents a picture of trends and happenings that are of deep interest to every doctor and with which he should be reliably informed.

This comment is made for it is feared that many doctors overlook this section. To bring that section in more prominence, and which it deserves, it is hoped that the Editor may find it possible as well as advisable to transfer this section's position to one immediately following the editorial section and preceding "Medical News."

Whatever its position in each issue's form, every member should acquire the habit to look for that "Organization" section in our national journal. Read it carefully, ponder upon it and be guided by these facts in your professional work.

Malpractice

In order that members may better appreciate the value of membership affiliation with the Medical Society of the State of California, attention is directed to a communication in the Correspondence department of this issue. This member was sued for one million dollars—no small claim. As a State official his insurance carrier disclaimed liability. There was some misunderstanding also regarding service from the Attorney General's department. Had this member been without the services of the Legal Counsel of this special Medical Society he would have been put to several hundred dollars expense for services of a personal attorney. Read his appreciation.

You too may become involved in a dispute with your insurance company. As a member of this Society the services of a personal attorney will be at your disposal. Had you not better apply for membership now? Send to the State Secretary for an application blank.

COMPONENT COUNTY MEDICAL SOCIETIES

HUMBOLDT COUNTY

The Humboldt County Medical Society presented their first clinic in the past five years on April 7, under the auspices of the postgraduate plan sponsored by the California Medical Association.

Vice-President Kramar presided. The clinic was held at the County Hospital. There was an attendance of nineteen.

The Orthopedic Clinic began at 10 a. m. and lasted until 1 p. m., with Dr. Donald King of San Francisco in charge. Doctor King had a great deal of material to work on and gave the members all that they could ask.

The Heart Clinic, from 1 p. m. until 5 p. m., was conducted by Dr. John Lewis of San Francisco, and was found to be very interesting and well presented. Doctor Wallace supplied many varied cases, the hall being filled at the end of the clinic by patients not being able to be presented.

The members felt that these clinics were very interesting and profitable, and voted thanks to the doctors for coming such a distance to us and at this time of the year.

LAWRENCE A. WING, *Secretary*.

KERN COUNTY

The Kern County Medical Society met at the Mercy Hospital in Bakersfield on Thursday evening, March 17, with Dr. Harry Lange presiding.

Dr. Jack Nicholson announced that the next meeting would be devoted to the subject of medical jurisprudence and would be a dinner meeting at the El Tejon Hotel, with members of the Kern County Bar Association present.

On May 4 the State Board of Public Health has arranged to have Dr. Udo Wile, Professor of Dermatology and Syphilology at the University of Michigan, speak on the *Treatment of Congenital and Prenatal Syphilis* at the El Tejon Hotel.

Doctors William Moore, Peter N. Root, and L. A. Packard reported on the recent Postgraduate Conference held at Santa Barbara, at which ten of the local members registered. They were very enthusiastic about its value, and Doctor Packard expressed the hope that the conference could be made an annual one for the four counties in the Third District. On the motion of Doctor Root, it was voted that a letter of thanks be sent to the Santa Barbara committee who arranged the conference.

Dr. Erle Henriksen of Los Angeles spoke on the *Treatment of Diseases of the Vagina and Cervix.* His talk was most practical and was of great interest to members of the Society. C. S. COMPTON, *Secretary.*

❋

MONTEREY COUNTY

The regular monthly meeting of the Monterey County Medical Society was held at the Santa Lucia Inn at Salinas on April 6. There were twenty-one members present.

Report of Dr. F. E. Wiebe, chairman of the Public Relations Committee, recommending that the secretary write a letter to the supervisors advising passing of a compulsory milk pasteurizing ordinance. A motion was made, seconded and passed, regarding this. A similar arrangement was advocated for the culinary workers as is in effect for the dairy workers.

A paper was presented by Dr. Howard Clark of Monterey on *Common Diseases of the Eye Seen in General Practice.* This was discussed by Doctors R. O. Griess and Wiley Reeves. H. R. LUSIGNAN, *Secretary.*

❋

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Dave Dozier, on February 15, at the Auditorium on Twenty-ninth and L streets.

There were sixty-eight members and guests present.

Dr. Robert A. Scarborough of the Stanford University Medical School presented the paper of the evening, *Anorectal Infections.* Doctor Scarborough took up the symptoms, diagnosis, and treatment of the more common rectal lesions, such as cryptitis, fissure in ano, ulcers of the anal canal, abscesses, and fistula. The surgical treatment of these lesions was discussed in some detail. Discussion was opened by Doctor Ankele, and continued by Doctors Guttman, O. Johnson, and Empey.

Dr. P. Koch asked for the attitude of the Society regarding a new health insurance policy being offered in Sacramento, said policy offering both hospitalization and medical care. Doctor Koch also brought up the subject of acceptable medical fees for those physicians who might handle such work. After some discussion, a motion was made and so passed that the Sacramento Society for Medical Improvement go on record as not endorsing any fee schedule except as put out by its own members, if and as when needed. Doctor Van Den Berg asked that a copy of above discussed insurance policy be turned over to the Public Relations Committee for further study.

A motion was made and so passed that the Society send a bouquet of flowers and a message of congratulation to Dr. F. Sutliff on his eighty-fifth birthday.

Doctor Blanchard, Publicity Director of the Tuberculosis Association, discussed the recent articles on pneumonia which are appearing in the San Francisco *Call-Bulletin,* and asked the Society if it would be interested in carrying out a similar program in the local papers. Discussion by Doctors True, Scatena, Vance, Foster, O. Johnson, Empey, Guttman, Teall, Lee, and Gundrum. The matter was referred to the Public Relations Committee for further study.

Doctor Pulford, reporting for the Cancer Control Committee, discussed the work being done locally and asked the coöperation of members of the Society, especially in regard to speakers available from our membership, to assist the Women's Field Army in their publicity campaign.

G. E. MILLAR, *Secretary.*

❋

SAN JOAQUIN COUNTY

The regular meeting of the San Joaquin County Medical Society was called to order by President A. C. Boehmer on April 7 at 8:20 p. m. in the Medico-Dental clubrooms, Stockton. The meeting was preceded by the customary supper meeting held at the Hotel Wolf, at which there were twenty-six members and guests present. The paper of the evening was presented by Dr. C. D. Holliger of Stockton, who talked on the *Cancer Clinic as It Is Being Run by the San Joaquin County Hospital.*

The application of Dr. Curtis M. Galt of Manteca for membership in the San Joaquin County Medical Society was reported on favorably by the Admissions Committee and, there being no objections from the floor, Doctor Galt was declared a member. Petition of affiliation to the San Joaquin County Medical Society of Dr. Eugene Gay was received. This application was referred to the Admissions Committee.

Doctor Broaddus spoke on the essays submitted by those who had attended the Postgraduate Study Group. He stated that the judges had unanimously declared the paper of Dr. W. W. Fitzgerald of Stockton the best submitted. Doctor Fitzgerald was awarded a cash prize of $25. The runner-up was Dr. E. W. Hill of San Andreas. Both men were congratulated.

President Boehmer announced that the American Medical Association and the California Medical Association were conducting a survey on the amount of medical care that was being given. President Boehmer urged that this work be expedited and be as accurate as possible. He appointed the following committee to carry on the work: J. O. Eccleston (chairman), N. P. Johnson, L. J. Peterson, A. M. Tunnell, J. F. Doughty, C. W. Martin, L. E. Tretheway, A. K. Merchant, Linwood Dozier, E. W. Hill, H. S. Chapman, R. T. McGurk, E. L. Blackmun, G. H. Sanderson, C. M. Galt, and Samuel Hanson.

Dr. A. E. Anderson, councilor for this district, spoke on the importance of the survey of the American Medical Association and of the question of ethics and the county hospital situation as it confronts the physicians and the taxpayers of the state.

The scientific paper of the evening was read by Dr. E. Dickson, Professor of Bacteriology and Public Health at Stanford, whose paper was on *Coccidioides* and was illustrated by slides.

There being no further business to come before the Society the meeting was adjourned at 10:45 p. m., and refreshments were served. G. H. ROHRBACHER, *Secretary.*

❋

SAN MATEO COUNTY

The San Mateo County Medical Society met on Wednesday evening, March 23, in the banquet room of the Benjamin Franklin Hotel, Dr. Hartzell Ray presiding.

The Secretary made an announcement concerning an open house to be given by the local telephone company, to which the county society members have been invited.

An announcement was made concerning malpractice insurance, to the effect that two forms of policies with Lloyd's of London had received the approval of the California Medical Association. These policies bear the key numbers, NS 1131 5M1–38, and LP 4–4–8.

The President announced that a request had been made for the formation of a Woman's Auxiliary to assist in the work of entertaining guests for the annual session of the American Medical Association to be held in San Francisco in June. Dr. Erma Macomber was appointed a committee of one to carry out plans for the organization of an auxiliary.

An announcement was made that the following applications for membership had been received: Dr. Norman Fox, Dr. Werner Glaser, both of San Bruno; and Dr. W. C. Lynch of Daly City.

Mr. Burke, representing the Insurance Association of Approved Hospitals, made a brief talk concerning the present status of the Insurance Association and asked for the coöperation of the county society membership. His talk was supplemented by remarks from Doctor Cleary and the Secretary, requesting the County Society to give the Insurance Association of Approved Hospitals its full support.

The chairman of the evening, Dr. William A. Key, was introduced by the President. Doctor Key first presented Dr. Leon Parker, Chairman of the Subcommittee of the Regional Fracture Committee of the American College of Surgeons, who led an interesting discussion on the *Emergency Treatment of Fractures.* In connection with his talk, three soldiers from the Presidio demonstrated the emergency application of splints. Lieutenant-Colonel Bolibough was introduced and gave an interesting talk on the

Suspension Traction Treatment of Fractures of the Long Bone. Following this talk, Doctor Cleary discussed *Fractures of the Foot and the Importance of Early Weight Bearing.* Discussion followed the presentation of these subjects.

* * *

The meeting of the San Mateo County Medical Society of March 31 was held in the library of Mills Memorial Hospital. The entire board of directors was present.

The recenty inaugurated Health Service System of San Francisco, developed under the direction of Dr. Walter B. Coffey, was discussed. After consideration of, among other things, the fact that the legality of this plan was currently being tested in the courts, the board of directors unanimously voted its disapproval of participation in the plan on the part of county society members. It was suggested that the matter be presented later in open meeting of the Society. It was further suggested that Dr. Karl Schaupp and Dr. Carl Hoag be invited to discuss the subject at such a meeting.

The Secretary announced that many requests had been received concerning uniform fee schedules for physicians practicing in San Mateo County. Doctors Holmes, Gregory, and Bridgman were appointed as a committee to investigate the fee schedule published a few years ago, and to prepare and publish a new schedule.

The Secretary made an announcement concerning the survey being conducted by the American Medical Association on Medical Care in the United States; and of the request recently received from the California Medical Association that San Mateo County Medical Society conduct its part of the survey as soon as possible. Doctors Ray, Knorp, and Bridgman were appointed as a committee of three to carry on this survey.

The following motion was made, seconded, and unanimously carried: Members who become delinquent because of nonpayment of dues prior to April 15 automatically lose their membership and can only regain such membership by vote of the board of directors before membership can be reëstablished. J. Garwood Bridgman, *Secretary.*

SANTA CRUZ COUNTY

The first three meetings of 1938 of the Santa Cruz Medical Society have been very interesting and instructive.

At the January meeting Dr. Edward B. Shaw of San Francisco presented a paper on *Acute Infectious Diseases of Childhood* and especially emphasized the current accepted methods and indications for the various immunization procedures. Treatment was also mentioned, and the value of sulfanilamid in certain streptococcic, meningococcic, and gonococcic involvements was emphasized. The paper dealt with a subject of practical importance, and was of value to those of us in general practice.

The February meeting was in the form of a joint meeting with the Santa Cruz County Bar Association, at which time we were the guests of the Bar Association. Mr. Hartley Peart of San Francisco was the speaker of the evening, and the subject of his remarks had to do with the mutual problems confronting members of the legal and medical professions at this time. Such problems as state medicine, increasing malpractice suits, inroads of cultists, and antivivisection activitists were emphasized. Mr. Peart urged a closer coöperation between the two professions and also suggested the importance of a more active interest in political programs.

Dr. Howard Morrow, President, and Dr. F. C. Warnshuis, Secretary, of the California Medical Association, were present at a joint meeting of the Santa Cruz and Monterey County societies, held at the Club Rio Del Mar, Aptos. Doctor Morrow discussed several dermatological subjects of scientific interest, mentioned the present campaign being waged against venereal diseases and informed those present of the relative merits of the various routines in the treatment of syphilis. Doctor Warnshuis discussed matters of pending importance to the medical profession, especially mentioning the proposed antivivisection bill, efforts to open county hospitals to pay patients, and the so-called chiropractic initiative.

At the March meeting, Dr. J. T. Harrington was elected first vice-president to succeed Dr. Reginal Rood, who has recently left Santa Cruz to assume a position on the staff of the Napa State Hospital.

A committee was appointed at the March meeting to confer with the authorities relative to the information of a visiting staff at the Santa Cruz County Hospital.

Samuel B. Randall, *Secretary.*

TULARE COUNTY

The Tulare County Medical Society met on Sunday evening, March 13, at seven o'clock at Motley's Café. Dr. E. R. Zumwalt presided.

Doctor Cronemiller, program chairman, introduced the guest speaker of the evening, Dr. Donald King, orthopedic surgeon of Stanford University, who spoke on *Backache.* His talk was illustrated by diagrammatic sketches and demonstration. A general round table of discussion followed.

Dr. A. E. Anderson, district councilor, was present and requested an arranged Association evening meeting for discussion of organization affairs. He outlined the active measures at present confronting the California Medical Association Council and answered many questions.

Doctor DeBusk of Visalia, a recent newcomer, was present and was introduced.

* * *

The Tulare County Medical Society held a joint meeting with the Tulare County Bar Association at Motley's on Sunday evening, March 27.

The Hon. Hartley F. Peart, Attorney at Law for the California Medical Association, spoke on *Narrowing Fields of Praetice.*

An excellent group was in attendance of both doctors and lawyers. It consisted of Doctors Falk, Guido, Ginsburg, Weiss, Matthias, Seligman, Cronemiller, Zumwalt, Zeller, Mr. Peart, Kohn, Brigham, A. Miller, N. Miller, Parkinson, Wiens, DeBusk, Hill, Campbell, Ambrose, Powell, Seiberth, Rosson, and Attorneys E. C. Farnsworth, Dan McFadzean, Earl W. Westcott, John Locke, Jr., R. K. Meyers, H. C. Millspaugh, Judge Glenn Moran, W. G. Machetanz, LeRoy McCormick, J. E. Greene, Leroy G. Smith, Judge Frank Lamberson, Walter Haight, Waldo Burford, Lee Lindsay, Homer Wood, Gareth W. Houk, N. F. Bradley, C. L. Bradley, Ward G. Rush, George F. Gill, John P. King, J. T. Crowe, Jim Abercrombie, O. O. Davis, James M. Burke, and Adolph Feierbach.

Karl F. Weiss, *Secretary.*

VENTURA COUNTY

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, March 8. There were thirteen members present. Doctors Bishop, Gilman, Moore, Witten, and Harker were guests.

Doctor Wylie explained the proper procedure for reporting venereal diseases and contacts.

Doctors Gronhovd and Wylie attended the meeting of the Public Health League on March 3 at the Mona Lisa Café in Los Angeles. Doctor Wylie gave a brief report of the meeting and warned the members to be on watch for the Humane Pound Act, the Act to open county hospitals to General Public Use, and the Public Health Liability Act.

Doctors Homer, Sterling Clark, and the interns from the county hospital presented a series of four cases of coccidioides.

* * *

The regular monthly meeting of the Ventura County Medical Society was held at the Saticoy Country Club on Tuesday, April 12. There were fourteen members present. Doctors Gilman, Moore, Bishop, Witten, and Harker were guests.

The following communications were read: The State Secretary's monthly letter; a communication from the

Judicial Council of the American Medical Association; a letter in regard to the Cancer Army Campaign; one from the Massachusetts Indemnity Company regarding group insurance; and a letter in regard to the study and provision of medical care.

Doctor Strong extended thanks from the Ventura County Boy Scouts Council for the work of physicians in examining the boys sent to camp.

The Secretary briefly outlined the purpose of the study for provision of medical care, and passed out blanks to the various members present.

Doctor Wylie discussed the various problems of the Public Health Department and their relationship to the general practitioner. He spoke on communicable diseases, sanitation, laboratory facilities, Public Health nursing, and tuberculosis. He asked for volunteers to make an occasional call to outlying districts to make a diagnosis for the Health Department in certain types of communicable diseases.

The question of the survey for high school seniors throughout the county was discussed. The general feeling was that the survey should be restricted entirely to the high school seniors, and should not include any other school employees.

A motion was made by Doctor Smolt, seconded by Doctor Gronhovd, that we do not hold any May meeting, as the date conflicts with the State meeting at Pasadena.

A. A. Morrison, *Secretary.*

In Memoriam

Blond, Harry Hyman. Died at Los Angeles, March 11, 1938, age 32. Graduate of McGill University Faculty of Medicine, Montreal, 1931. Licensed in California in 1932. Doctor Blond was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✝

Dickerson, Harry William. Died at San Diego, March 24, 1938, age 63. Graduate of Washington University School of Medicine, St. Louis, 1901. Licensed in California in 1929. Doctor Dickerson was a member of the San Diego County Medical Society, the California Medical Association, and the American Medical Association.

Goodman, Emanuel. Died at San Francisco, February 22, 1938, age 82. Graduate of the Medical College of Ohio, Cincinnati, 1892. Licensed in California in 1895. Doctor Goodman was a retired member of the San Francisco County Medical Society, the California Medical Association, and the American Medical Association.

✝

Loehr, Bert E. Died at San Jose, April 12, 1938, age 57. Graduate of Hahnemann Medical College and Hospital of Philadelphia, 1909. Licensed in California in 1910. Doctor Loehr was a member of the Santa Clara County Medical Society, the California Medical Association, and the American Medical Association.

✝

Orbison, Thomas James. Died at Los Angeles, March 26, 1938, age 71. Graduate of the University of Pennsylvania School of Medicine, Philadelphia, 1898. Licensed in California in 1907. Doctor Orbison was a retired member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Payton, William Bruce. Died at Riverside, January 7, 1938, age 81. Graduate of the University of Michigan Medical School, Ann Arbor, 1881. Licensed in California in 1892. Doctor Payton was a member of the Riverside County Medical Society, the California Medical Association, and the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. HOBART ROGERS.....President
MRS. FRED ZUMWALT.....Chairman on Publicity

News Letter

Dear Auxiliary Members:

On March 17 a group of women, twelve in number, met to discuss plans for an Auxiliary to the Merced County Medical Society. They were interested, for then and there they organized. From Merced three of their officers were chosen: For President, Mrs. E. M. Soderstrom; for First Vice-President, Mrs. C. C. FitzGibbon; for Treasurer, Mrs. McNearney. Mrs. A. B. Bigler of Chowchilla was elected Secretary, and Mrs. A. V. Andrews of Livingston, Second Vice-President.

When Mrs. Hobart Rogers of Oakland assumed the presidency her aim was 100 per cent membership. No one woman could accomplish that desire in the short space of one year, but surely Mrs. Rogers must feel satisfied with the results of her administration. The membership has increased four hundred and fifty and over in less than a year. Four new county Auxiliaries have been organized thus far. I say thus far, because San Mateo County is going to join us officially on April 20, at which time officers will be elected.

At the meeting held April 7 "to talk matters over," so to speak, Mrs. R. J. Reitzel of 37 Crystal Springs Road, acted as chairman and Mrs. J. G. Bridgman of 433 Clarke Drive, San Mateo, as Secretary.

Apparently all counties have awakened and have realized that they cannot afford to remain outside an organization that is working for just one object—and one that concerns all of us vitally—the maintenance of the high standards that the profession of medicine has always justly held.

The entire membership welcomes these Auxiliaries, that of Merced, which is already a part of our organization, and that of San Mateo, which is soon to be. It is gratifying to have them become a part of us.

Cordially yours,

MRS. FRED H. ZUMWALT.

Component County Auxiliaries

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association met on Tuesday, March 22, at the Woman's Athletic Club for its regular luncheon meeting, with Mrs. Eliot Alden presiding, and ninety-eight members present.

Most of the program was devoted to a talk by Mr. Ben H. Read, who gave a most interesting résumé on pending legislation. Mrs. B. H. Sherman gave a report on the library, and Mrs. Karl von Hagen read a splendid paper on medical highlights, dealing with certain forms of quackery.

An announcement was made that our membership chairman, Mrs. Mark Albert Glaser, and her committee have added one hundred and fifty new members to our roster this year, making a total membership of 635.

MRS. ROBERT L. CARROLL, *Corresponding Secretary.*

✲

Marin County

The monthly meeting of the Woman's Auxiliary to the Marin County Medical Society was held, March 24, at the Marin Golf and Country Club.

After dinner the members gathered in the lounge to hear a most interesting travelogue by Mrs. H. O. Martin of San Francisco. Mrs. Martin spoke on *Around the World on a Freighter.* Her presentation was not only interesting but amusing as well, particularly the account of her stay in both Norway and Sweden.

The most important part of the business meeting that followed was the election of the nominating committee.

MRS. BERNARD J. CONROY, *Chairman of Publicity.*

✲

Orange County

On Tuesday, April 5, the Woman's Auxiliary to the Orange County Medical Society, met at the home of Mrs. Claude Steen of Fullerton.

Following the business session, the meeting was turned over to Mrs. Arthur Wies, Chairman of the Public Health Committee, who presented Dr. D. A. Harwood of Santa Ana. He spoke of the more recent and encouraging features in the control and care of cancer, emphasizing the importance of early diagnosis.

Preceding the program a short memorial service was conducted for Dr. James Boyd, pioneer physician of Orange County, who recently passed away.

At the May meeting to be held at the Pacific Coast Club in Long Beach, the following nominees will be voted upon: For President, Mrs. Hiram Currey; for Vice-President, Mrs. E. H. Kersten; for Secretary, Mrs. J. W. Price, and Mrs. E. J. Steen, Treasurer.

MRS. K. H. SUTHERLAND, *Publicity Chairman.*

✲

Riverside County

The Woman's Auxiliary to the Riverside County Medical Society held its regular meeting on March 15 at the home of Dr. and Mrs. W. W. Roblee. About twenty members were present. Mrs. E. T. Bartholemew presented the program of the Women's Army for the Prevention of Cancer. Miss Celia Crosse discussed the local health department and its problems and plans. Miss Crosse is a public health nurse in the department.

Following the meeting the members of the Medical Society joined the group for a pleasant social hour. Piano

†As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

solos by Mrs. Charles Miller and vocal selections by Mrs. Wayland Coon were enjoyed. Refreshments were served by the hostess and her committee.

Mrs. T. A. Card, *President.*

Sacramento County

The home of Mrs. Richard O. Schofield was the setting for the March meeting of the Sacramento Auxiliary on Tuesday evening, the 15th.

A business meeting was held with Mrs. William J. Van Den Berg, President, presiding.

Mrs. Hilton Lusk gave a reading of a modern play. Refreshments were served at the close.

Assisting hostesses were: Mesdames Cordes Ankele, James Coyle, W. H. Gibbons, H. M. Kanner, James T. Vance and Gustave Wilson.

Mrs. Hugh Carmichael, *Chairman of Publicity.*

San Diego County

San Diego County held two of its most important meetings during the past month. On March 8, Dr. Lyell C. Kinney, a Past President of the California Medical Association, and chairman of our Advisory Committee, spoke on legislation concerning the medical profession which will come before the voters this fall. He urged us to begin now to form a legislative set-up which will carry over into the next administration, in order that we may be ready when the County Medical Society calls upon us.

On March 18, our third annual Health Education program was held in the House of Hospitality, Balboa Park, with sessions in the afternon and evening. In order to promote the organization of the Women's Field Army for the Control of Cancer, we joined forces with them, presenting Dr. C. C. Little, Managing Director of the American Society for the Control of Cancer, as the main speaker. A talk on *Hearts, Young and Old,* and a movie, showing the work of the Visiting Nurses, concluded the afternoon session.

In the evening, Dr. Donald Davie, Director of the State Health Division of Venereal Diseases, spoke on *Syphilis,* and showed movies to make his words more graphic. Dr. Carl Howson spoke on *Tuberculosis.* The local Vice-Commander of the Field Army told of its work.

The city captain of the new cancer organization in San Diego is a member of our Auxiliary and some of our members are working on the Advisory Board. We hope to do our share toward its success. Several of our members are active in the Visiting Nurses' Association.

For April 12, our Program Chairman, Mrs. W. C. Cooke, has arranged an unusually interesting day. Following the regular luncheon at the Men's University Club, we will adjourn to the pool for crippled children, where a demonstration of the work done there will be given. The mode of operation of the Society for Crippled Children, in which we carry a club membership, its relationship to the State Health Department and the social welfare angles involved, will be explained. The Sunshine School, which gave the land for the "pool," and which is run in connection with the Helping Hand Home for Children, will also be visited. Several of our members do volunteer service at the pool.

San Diego will be well represented at both the State Convention in May at Pasadena, and also at the meeting of the American Medical Association to be held in San Francisco in June.

We have enjoyed the State Membership Trophy, which we have held during the past year. We are sorry to part with it, but our 85 per cent increase could, naturally, not be repeated. We hope the Auxiliary which receives it will take pride in displaying it as we did.

Mrs. Elliot G. Colby, *President.*

San Francisco County

The annual meeting of the Woman's Auxiliary to the San Francisco County Medical Society will be held on Tuesday, April 19, at 2180 Washington Street. Mrs. William H. Sargent of Oakland, a Past State President, will install the newly elected county officers, as follows: Mrs. Thomas E. Gibson, President; Mrs. Edmund J. Morrissey, First Vice-President; Mrs. A. Lincoln Brown, Second Vice-President; Mrs. Fred D. Fellows, Recording Secretary; Mrs. Wilber F. Swett, Corresponding Secretary; Mrs. John D. Humber, Treasurer. Also, newly elected directors as follows: Mrs. William C. Voorsanger, Mrs. E. S. Kilgore, and Mrs. Rea E. Ashley. Directors continuing in office are: Mrs. A. S. Musante, Mrs. Fred H. Zumwalt, Mrs. Harry R. Oliver, Mrs. Frank H. Rodin, and Mrs. Otto Laist.

Dr. J. C. Geiger, City Health Director, will address the Auxiliary on the *Organization and Function of the Public Health Department.*

Following the business session, the officers and directors will give an informal tea in honor of the retiring president, Mrs. Hans Barkan. Miss Helen Zumwalt, gifted daughter of Dr. and Mrs. Fred H. Zumwalt, will be the guest artist for the afternoon, and will render a delightful selection of songs.

The study group will hold their final meeting on April 25, with a luncheon given by Mrs. Julius Sherman at her home in Atherton. Dr. Henry Harris will be the guest of honor, and will review his recent book, *California's Medical Story.* Mrs. Sherman has conducted the round-table discussions on medical topics twice monthly during the current year.

Mrs. Harry R. Oliver, *Publicity Chairman.*

Santa Barbara County

Santa Barbara Auxiliary has announced the date of its annual spring bridge tea. It is to be held on Friday, April 22, at the newly reopened Samarkand Hotel. Mrs. Edward L. Markthaler and Mrs. William R. Hunt will be co-chairmen. A large committee will assist, including Mrs. C. T. Roome, President; Mrs. Harold Schwalenberg, Mrs. Sheldon Paine, Mrs. Edward L. Lamb, Mrs. John Van Paing, Mrs. Kent Wilson, Mrs. Hugh Freidell, Mrs. Franklin R. Nuzum, Mrs. Alfred T. Wilcox, and Mrs. Henry J. Profant. Mrs. Alma Spreckels of San Francisco, who has recently taken over the Samarkand Hotel and has had it redecorated by noteworthy artists, promises us a lovely party.

The Auxiliary is taking part in the program for Cancer Control Week. Dr. Susanne Parsons, chairman of the local committee, spoke of the campaign at the March meeting. Six members will take charge of a table on State Street for the membership drive in the Cancer Control Campaign on Saturday, April 9.

On Monday, March 14, we were honored by a visit from Mrs. Rogers and Mrs. Hall. The meeting took the form of a buffet luncheon at the home of Mrs. Harry DeVigne, and twenty-five members were present. Mrs. Rogers' talk was enthusiastically received by the members, and Mrs. Hall also had a brief message for us. Our guests afterward enjoyed a tour of the Blakesly Botanical Gardens, where the ceonothus spread their lacey blossoms overhead, and next morning left for a visit to the San Luis Obispo Auxiliary at Paso Robles. On the trip they were accompanied by Mrs. Edward L. Markthaler, District Councilor. They had lunch at the Santa Maria Inn with Mrs. O. C. Jones, a member from that city.

Mrs. H. E. Henderson, *Publicity Chairman.*

Santa Cruz County

The Woman's Auxiliary to the Santa Cruz County Medical Society met at luncheon at the Rio Del Mar Country Club. Our President, Mrs. Alfred L. Phillips, presided at this March meeting.

We had a small but very interesting meeting, with Mrs. Lawrence A. Knox of Carmel as guest speaker.

The following committee chairmen were elected: Public Relations, Mrs. F. H. Shenk; Public Health Education, Mrs. J. D. Fuller; and Hygeia, Mrs. G. Bunney.

Our next meeting will be purely social. Mrs. G. Bunney has graciously offered her home for the occasion.

Mrs. R. C. Alsberge, *Chairman of Publicity.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M.D., 535 North Dearborn Street, Chicago, Secretary.

California Medical Association, Hotel Huntington, Pasadena, May 9–12, 1938. F. C. Warnshuis, M.D., 450 Sutter Street, San Francisco, Secretary.

Texas State Medical Association, Galveston, May 9–12, 1938. Holman Taylor, M.D., 1404 West El Paso Street, Forth Worth, Texas, Secretary.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of May is as follows:

Thursday, May 5—KECA, 11:00 a. m., The Road to Health.
Saturday, May 7—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, May 12—KECA, 11:00 a. m., The Road to Health.
Saturday, May 14—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, May 19—KECA, 11:00 a. m., The Road to Health.
Saturday, May 21—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, May 26—KECA, 11:00 a. m., The Road to Health.
Saturday, May 28—KFI, 10:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.

Medical Cyclotron Framework in Place at University of California.—With 155 tons of its steel framework already in place, the new medical cyclotron of the University of California, designed to produce radio-active ammunition for the war against cancer, leukemia and other malignant diseases, is beginning to assume shape. It will be ten months to a year, however, before all of the involved and intricate mechanisms of the cyclotron will be in place and ready for operation.

Within the next two months it is expected that the poles and copper windings, between which the vacuum chamber, the "core" of the cyclotron will be placed, will be in position. Thereafter will come the vacuum chamber itself, together with the maze of conduits and wiring necessary for the operation of the monolithic atom smasher. All of these conduits will be in place in the floor of the cyclotron room before it is finally covered with concrete.

When completed the cyclotron will have an over-all height of 11.6 feet, and will be between 210 and 220 tons in weight.

The framework itself is made up of a number of steel plates, each one and six-tenths tons in weight. It was found more practical to have the framework made of these plates rather than single castings, as this made shipment much easier. The plates are being welded together however, to prevent separation and dislodgment in the event of an earth or other disturbance.

The cyclotron is in its own specially constructed laboratory, in which is already housed a small biological laboratory for premilinary experimentation.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Southern California Medical Association.—The ninety-eighth semiannual meeting of the Southern California Medical Association was held on April 8 and 9, in the Mission Inn, Riverside. The following program was presented:

Friday Afternoon Session

Gonorrheal Vulvovaginitis in Children, Erle Henriksen, M.D., Los Angeles.
Discussion: Eugene F. Hoffman, M.D., and Phillp E. Rothman, M.D., Los Angeles.

Pathologic Bleeding from Ruptured Corpus Luteum Cysts, Hall G. Holder, M.D., San Diego.
Discussion: Bernard J. Hanley, M.D., and Foster K. Collins, M.D., Los Angeles.

The Significance of Bleeding from the Rectum, Kenneth E. Smiley, M.D., Los Angeles.
Discussion: William H. Kiger, M.D., Los Angeles; Bon O. Adams, M.D., Riverside.

The History of Syphilis, H. Sutherland Campbell, M.D., Los Angeles.
Discussion: Richard D. Evans, M.D., Los Angeles; George Dock, M.D., Pasadena.

Friday Evening Session

California's First Great Medical Scientist, Chauncey D. Leake, Ph.D., Professor of Pharmacology, University of California, San Francisco.

Saturday Morning Session

Some Dangers of the Intracranial Use of Thorotrast, David Reeves, M.D., Los Angeles.
Discussion: Richard T. Taylor, M.D., and Kenneth S. Davis, M.D., Los Angeles.

A Plea for the Early Recognition of Left Ventricular Failure, William P. Thompson, M.D., Los Angeles.
Discussion: James R. Sanford, M.D., Pasadena; Ralph M. Tandowsky, M.D., Los Angeles.

Headache, W. Howard Halsey, M.D., San Diego.
Discussion: Frank E. Detling, M.D., and Joseph B. Stevens, M.D., Los Angeles.

Acute Pancreatitis, E. Eric Larson, M.D., Los Angeles.
Discussion: Ray B. McCarty, M.D., Riverside; Charles T. Sturgeon, M.D., Los Angeles.

Saturday Afternoon Session

Tuberculosis of the Appendix, Thomas A. Card, M.D., Riverside.
Discussion: Carl R. Howson, M.D., and Verne C. Hunt, M.D., Los Angeles.

Peritoneoscopy—The Differential Diagnosis of Abdominal Malignancy by Biopsy, John C. Ruddock, M.D., Los Angeles.
Discussion: Clarence G. Toland, M.D., and John W. Budd, M.D., Los Angeles.

The Effects of Histone Insulin in the Treatment of Diabetes Mellitus, Percival A. Gray, M.D., Santa Barbara.
Discussion: William C. Boeck, M.D., and Howard F. West, M.D., Los Angeles.

The Demonstration by Radiological Methods of the Mucous Membrane Pattern of the Gastro-Intestinal Tract and Its Defects, Wilbur Bailey, M.D., Los Angeles.
Discussion: Lyell C. Kinney, M.D., San Diego; Milton J. Geyman, M.D., Santa Barbara.

The officers for 1938 are as follows:
William H. Barrow, M.D., San Diego, President.
Alvin G. Foord, M.D., Pasadena, First Vice-President.
William P. Corr, M.D., Riverside, Second Vice-President.
John B. Doyle, M.D., Los Angeles, Secretary-Treasurer.
Councilors—Frank R. Nuzum, M.D., Santa Barbara; Robert W. Langley, M.D., Los Angeles; Merrill W. Hollingsworth, M.D., Santa Ana; William H. Barrow, M.D., ex officio; John B. Doyle, M.D., ex officio.
Board of Governors—F. M. Pottenger, M.D., Los Angeles; Egerton L. Crispin, M.D., Los Angeles; Joseph M. King, M.D., Los Angeles; Joseph K. Swindt, M.D., Pomona; Charles T. Sturgeon, M.D., Los Angeles; Paul E. Simonds, M.D., Riverside; Raymond G. Taylor, M.D., Los Angeles; Fred B. Clarke, M.D., Long Beach; Carl R. Howson, M.D., Los Angeles; Bon O. Adams, M.D., Riverside; H. Douglas Eaton, M.D., Los Angeles.

New York Bans Psittacine Birds.—The Public Health Council of the State of New York at its meeting in New York City on February 18 adopted the following amendment to Chapter II of the State Sanitary Code:

Regulation 38. Importation, Breeding, or Sale of Psittacine Birds Prohibited. The importation, breeding or sale of birds of the psittacine family is hereby prohibited, provided, however, that the importation and breeding of such birds for scientific research or exhibition in public zoological gardens may be permitted subject to the approval of the state commissioner of health. This regulation is to take effect on the first day of March, 1938.

More California Marriages in 1937.—Marriages in California for the year have been tabulated, with a total of 64,397 as compared with 60,197 in 1936, an increased number of 4,200 or 6.98 per cent. Of the ten counties having a population of 100,000 or more in 1930 all showed increased numbers of marriages and in those twenty-one counties having populations of more than 50,000 only one showed a decrease. In the group from 10,000 to 50,000 population, there were increases in seventeen of the twenty-three counties, but in the group of counties having small populations, those with less than 10,000 inhabitants, only five showed increased numbers of marriages, while five showed decreased numbers and four showed no change. The California marriage rate in 1937 is 9.9 per 1,000 inhabitants as compared with a rate of 9.4 per 1,000 estimated population in 1936. Since 1932, when the number of marriages reached its lowest point of 43,164 with a rate of 7.3 per 1,000 estimated population, there has been a steady increase. There has been a registration increase of 48.7 per cent in numbers and 35.6 per cent in rate.

Another Human Death in Los Angeles from Rabies.—A laborer in Los Angeles, aged fifty-seven, died in the General Hospital of rabies on March 12, 1938. The history of the case, prepared by Dr. Hyman I. Vener, Assistant Epidemiologist in the Los Angeles City Department of Public Health, reveals that the patient was bitten on the second finger of the right hand about February 22. He had been bitten by a small brown dog which was lying in the street, apparently dead. When the laborer attempted to pick up the sick dog, the animal bit him and ran away. No attention was paid to the bite and no thought was given to the matter until after the onset of the illness.

A brown spaniel dog, at the same time, was responsible for biting seven other persons, three of whom were in the vicinity of the accident to the laborer. It is, therefore, reasonable to presume that the same dog was responsible. It is quite probable that this event occurred prior to the time indicated, as considerable difficulty was experienced in obtaining reliable data because of the violent illness of the patient who died within twenty-four hours after entering the hospital.

Herzstein Lectures.—Stanford University and the University of California take pleasure in announcing the sixth course of the Morris Herzstein Lectures to be given by Dr. George W. Pickering, Department of Clinical Research, University College Hospital Medical School, London, England. Through the provisions of the will of the late Dr. Morris Herzstein of San Francisco, these lectures are held in San Francisco under the auspices of the two universities.

Doctor Pickering will give three lectures at 8:15 p. m. on the dates given below at the University of California Extension Division, 540 Powell Street, San Francisco, as follows:

Monday, May 23—"The Problem of High Blood Pressure in Man."

Tuesday, May 24—"Experimental Hypertension."

Wednesday, May 25—"The Renal Pressor Substance."

Members of the profession, including practitioners and medical students and other interested persons are cordially invited to attend.

In addition, he will give a popular lecture at luncheon on:

Thursday, May 26—"The Biological Significance of Pain."

The place of the luncheon will be announced later.

(Signed): Loren R. Chandler, M.D., *Dean*,
Stanford University School of Medicine.
Langley Porter, M.D., *Dean*,
University of California Medical School.

Trailer Hospital Newest Departure in United States Medicine.—The day when a patient can call up the Board of Health and order a trailer hospital sent to his door for an operation on an unruly kidney may be at hand.

It has already arrived in Texas, according to Dr. Guy S. Millberry, Dean of the College of Dentistry, University of California, who has, himself, completed a six months' trailer trip through the United States and a portion of Canada in an effort to gain first-hand information on the public health phases of dentistry everywhere.

The hospital trailer was found in the little city of Ysleta, Texas, and is owned by a Doctor Love, according to Doctor Millberry. While it is equipped chiefly for obstetrical work in the rural sections, it can accommodate other types of cases. In some respects it is far superior to a number of the smaller, isolated hospitals throughout the country, Doctor Millberry says. The trailer hospital works within a range of fifty miles or so around Ysleta and accomplishes from thirty to thirty-five deliveries a month. A trained nurse accompanies it as a rule, but additional technicians can be accommodated when needed.

Hospital Payment Plans.—In an effort to help both the doctor and the patient, several plans of payment have recently been announced by the Berkeley General Hospital. In order to avoid confusion in the minds of the profession, they are outlined below:

1. *Cash Payment in Advance.*—Traditional plan of collecting one week in advance.

2. *Patient's Installment Plan.*—The admission of responsible private patients with a small down payment and small weekly or monthly installment payments.

3. *Collection of Physician's Fee.*—The extension of the installment plan to add doctor's professional fees to the patient's installment contract, in any case where the doctor might feel that the hospital is in a better position to collect from the patient because of the security behind its written agreement and its follow-up system. This Medical Credit Service is entirely optional with the physician and is taken up with the patient only when requested by the physician.

4. *Part-pay Medical and Dental Clinics.*—This plan is not open to private patients, but provides only for the care of deserving patients who, upon strict social service investigation and with the consent of the last attending physician, have been found eligible for out-patient care or hospitalization by the clinic staff, at reduced part-pay rates in small installment payments.

Lectures on High Blood Pressure.—High blood pressure and chronic headache, two baffling complaints that seem to have become a part of American tension, love of speed, overwork and kindred features of modern life, are to be detailed in a popular manner by a world authority on these complaints, in the sixth course of the Morris Herzstein Lectures under the auspices of the University of California and Stanford University Medical Schools. The lecturer is Dr. George W. Pickering, Department of Clinical Research, University College Hospital Medical School, London, England. The lectures on high blood pressure are to be given at the University of California Extension Division Auditorium, 540 Powell Street, but the headache talk will be made the feature of a luncheon to be held in the Rose Room of the Palace Hotel. Both lectures and luncheon are open to the public. There will be a charge for the latter event.

The dates of the lectures are May 24, with the subject, "The Problem of High Blood Pressure in Man"; May 25, "Experimental Hypertension," and May 25, "The Renal Pressor Substance." The luncheon will be held on May 26.

Doctor Pickering, a profound student on the subject of high blood pressure, has written a number of papers on the subject which have been given wide circulation.

The lectures are provided in the will of Dr. Morris Herzstein, pioneer California practitioner and associate of Dr. William Watt Kerr and Dr. Herbert Moffitt. He left his estate to the medical schools of the two universities, and it is through this that the lectures are endowed. They are open to all members of the profession and all others interested.

Dentist Appointed to State Board.—Governor Frank F. Merriam has appointed V. A. Rossiter, D.D.S., of Santa Ana, to membership on the California State Board of Public Health. Doctor Rossiter is the eighth member of the Board, his appointment having been provided through an amendment to Section 372 of the Political Code enacted by the 1937 session of the Legislature.

Heart Disease.—The crude death rate for heart disease, which ranks first among all the causes of death, dropped slightly in 1937. A bright spot in the heart disease mortality record is the fact that the rate is declining among young people where most of the deaths are caused by chronic endocarditis, which, in turn, is most often induced by infectious diseases, chiefly acute rheumatism, streptococcic infection, and syphilis. The trend is still upward for cardiac diseases of the senescent or arteriosclerotic type which are predominant in the higher age ranges of life and which are, for the most part, the result of the inevitable breakdown of the organism with advancing age.

Eye Health to Be Studied at Summer Session.—Annette M. Phelan, Ph. D., Associate in Education, National Society for the Prevention of Blindness, has accepted an invitation to offer two courses in eye health education in the University of California Summer Session, June 27 to August 5. One course, Eye Health of the School Child, will deal with educational and health problems involved in visual defects among school children; and the other course, Eye Health in Teacher Education, will take up the eye health content of curricula for teacher education in the light of contributions by the sciences, teaching practices and classroom conditions.

Miss Phelan has been instructor in Health Education at Columbia University since 1933. She is the author of "A Study of School Health Standards," "Conserving the Sight of School Children," and a co-author of "Adventures in Living."

Summer Session Bulletins will be mailed upon request by the Dean of the Summer Sessions, 104 California Hall, Berkeley, California.

American Board of Obstetrics and Gynecology Examinations.—The oral, clinical, and pathological examinations for Group A and Group B applicants will be held in San Francisco, California, on Monday and Tuesday, June 13 and 14, 1938.

An informal dinner for the diplomates of this Board, their wives and others interested in the work of the Board, will be held at the Palace Hotel, San Francisco, on Wednesday evening, June 15, 1938, at seven o'clock. Dr. William D. Cutter, Secretary of the Council on Medical Education and Hospitals of the American Medical Association, will address the group, and the successful candidates of the preceding two days' examinations will be introduced in person. Tickets, at $2.25 each, may be obtained in advance from Dr. Joseph L. Baer, 104 South Michigan Avenue, Chicago, Illinois, or at the door. Reservations should be made in advance if possible.

Application blanks and booklets of information may be obtained from Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

National Health Council's Library on Public Health Literature.—Research workers from all parts of the United States used the facilities of the National Health Council Library, at 50 West Fiftieth Street, New York City, during the past year, and they were used also by education and nurses's training classes in local and nearby colleges. In 1937, the services of the library were made available more than 1,500 times to others than staff members of the seventeen organizations in the Council.

The library now contains more than six thousand volumes and thirty thousand pamphlets dealing with public health, sanitation, hygiene, and related subjects. More than five hundred medical and educational periodicals are received regularly from all parts of the world. As an aid to public libraries in the selection of books on health subjects, a list of approximately three hundred health books of interest to the general public is being compiled at present.

Active member agencies in the National Health Council include the following: American Society for the Hard of Hearing, American Heart Association, American Public Health Association, American Red Cross, American Social Hygiene Association, American Society for the Control of Cancer, Conference of State and Provincial Health Authorities of North America, Maternity Center Association, National Committee of Health Council Executives, National Committee for Mental Hygiene, National Organization for Public Health Nursing, National Society for the Prevention of Blindness, and the National Tuberculosis Association.

The United States Children's Bureau and the United States Public Health Service are advisory members of the Council. The American Nurses' Association and the Foundation for Positive Health are associate members.

New York State Enacts First Prenatal Health Law. As the *News* goes to press, comes word that Governor Lehman has signed the Twomey-Newell "baby health bill," recently passed by both houses of the New York State Legislature. New York thus has the honor of being the first state to enact a law for the protection of the unborn from congenital syphilis. It is, in fact, the first law of its kind to be enacted anywhere.

Thirteen thousand New York State babies, health authorities estimate, will be saved each year from death or disease by this law,[1] which requires all persons licensed to attend women in pregnancy to administer, or cause to have administered, a standard serological test, and to indicate on the birth or stillbirth certificate if such test was made. If the test has not been made, the reason for the omission must be shown, but results of such tests are not to be indicated on the certificate.

This life-saving legislation is an example of results obtained when all concerned work together. Drafted by social hygiene experts, proposed by the *New York Post*,[2] supported strongly by other New York newspapers, endorsed by official and voluntary health agencies, medical societies and civic groups, the bill moved forward steadily to passage by an overwhelming majority. . . .

As the prenatal bill was made into law, the Desmond-Breitbart bill for premarital examination for syphilis was being pressed forward to passage before the legislature adjourns. With the signing of this second bill, New York State will have taken two long steps toward stamping out syphilis within its borders. If every state will do likewise, "within a generation" need not be an extravagant prophecy as to when the "shadow" may "lift from our land."

Press Clippings.—Some news items from the lay press, on matters related to medical practice, follow:

Revenue Producing Apartments Can Be Made of Old Houses*

Outmoded residence properties, still structurally sound but no longer in demand by reason of excessive size, dated architecture, or neighborhood changes, may be converted into revenue-producing flats and apartments with funds available under the Property Improvement Credit Plan of the Federal Housing Administration.

Many residential landmarks are today but specters of past magnificence—deserted, falling into dilapidation, unwanted by the descendants of the original owner. These properties cannot be rented for homes in their present condition and serve only to gather unwanted taxes for the owners. Many have been demolished to ease the tax burden or with the hope of renting the vacant lot for some purpose.

By the expenditure of a reasonable amount of modernization many old homes may be remodeled into several small apartment units and placed on an income basis that will justify the expenditure.

The provisions of the National Housing Act as amended permit the insurance of modernization loans up to $10,000 on a single property. Repayments are made in equal

[1] Four thousand infants are now born annually in New York with syphilis, and these and nearly half the annual toll of 18,000 still births could be prevented by early diagnosis and treatment of the mother for this disease.

[2] In an editorial of January 5, and illustrated feature articles. Health and welfare agencies interested in promoting this type of legislation in their own states may secure a limited number of reprints of the *Post* articles upon request to the American Social Hygiene Association at 50 West Fiftieth Street, New York.

* Editor's Note.—This item may have suggestive value to smaller county medical societies, or branches of larger societies, contemplating "headquarters," and to those already in possession of a "headquarters home."

monthly installments over a period of as long as five years and thirty-two days. Charges for this credit are reasonable. The Federal Housing Administration insures the loans, and the funds are made available by private lending institutions, including banks, building and loan associations, finance companies and like agencies.

Extensive alterations necessary to remodel a dwelling for apartment purposes do not always require the service of an architect, but the scope of the work makes it desirable. Among the improvements eligible to be financed under the Property Improvement Credit Plan are: Installation of new heating, wiring and plumbing units and systems; redivision of floor space, painting and papering, and any other improvements that become an integral part of the building.

The exterior may require extensive alteration, which may also be financed with loans insured by the Federal Housing Administration. Brick work may be pointed up, roof repaired, or a new roof put on; porches removed, walkways and drives built, entrances cut, and the building painted.

Depreciation checked by modernization will pay off in income in many instances. A dwelling is not usually obsolete unless the structure is so unsound that it would be more economical to completely rebuild it.—Los Angeles *Evening News*, April 7.

Hospitalization Program Ruled Illegal by Webb

Corporations cannot engage in the practice of medicine.

Firms not licensed to insure cannot issue contracts providing for medical and surgical care and hospitalization.

Citing California law to this effect, Attorney-General Webb yesterday gave an opinion in San Francisco that the First National Protective Association of Los Angeles was obtaining members on a contract which violated a previous ruling that corporations cannot engage in the practice of medicine.

Opinion Transmitted

The opinion was transmitted to State Insurance Commissioner Carpenter following an inquiry concerning the association's operations by Inspector Risbrough of the Los Angeles office.

Webb held that the contract violated the State Medical Practice Act because it agreed to furnish medical service, which corporations are not permitted to do. It also violated the insurance law providing that only licensed insurers can issue policies, because the contract provided insurance, he said.

No Previous Complaints

"We have operated for five years without complaint," James W. Weitzman, president and general manager of the association, said. "If we are operating in a manner not in conformity with California law we shall have to revise our organization. We are now organized as a nonprofit corporation."

The association's offices are at 416 West Eighth Street.—Los Angeles *Times*, March 25.

Two Hundred Dogs Impounded in Los Angeles Quarantine

For the second day, crews of city humane department officers patrolled the city today to enforce the new quarantine against dogs.

Bertram E. Morse, inspector in charge of the Ann Street Shelter, and other humane officers reported that more than 200 dogs had been impounded in the drive under the direction or Dr. George Parrish, city health officer and chief advocate of the quarantine, and Dr. C. C. Warn, head of the humane department.

The animals in the various pounds will be held under observation for rabies for ten days. Then unlicensed or unclaimed dogs will be destroyed, and those with a license and found to be healthy can be reclaimed by owners.

General rules of the quarantine:

Dogs must be confined in the home or on the premises of the owner at all times; or must be kept on leash in the custody of a person over 15 years of age when in a public street or public place; or must be securely confined in closed automobiles on the public highway.

Claim Only Part of Dog Fees Used for Humane Department Work

With Los Angeles dog population under the restraint of a quarantine, dog owners today were renewing their demands for a more adequate humane department in the city and for more diligently enforced preventive measures as a means of effectively minimizing rabies danger.

Los Angeles' humane department facilities are inadequate and antiquated, it was pointed out, despite the fact that dog owners of the city pay into the public treasury annually a sum in excess of $200,000 in dog license fees.

This sum, it is contended, is ample in every way to provide an adequate humane department, large and efficient enough to cope with any situation.

Claim Fund Diverted

The rub, according to the dog owners, is that much of the money paid in license fees is not used for the humane department, but rather is put into the city general fund and is expended for purposes which have nothing to do with small animal regulation.

James Lindsey, executive head of the Tailwagger Association, an association of dog owners and dog lovers, cited figures to show how much of the annual dog license money is being diverted from humane department purposes.

In 1937, Lindsey pointed out, 83,624 dogs were licensed in Los Angeles city. The fees from these licenses plus smaller amounts realized from kennel license charges and pound fees, brought the receipts for the year to $213,240.

Put in General Fund

However, only $98,771 of this amount was put back into the humane department as budgetary expense. The remainder, $114,469, considerably more than half the money collected from dog owners, went into the general fund of the city and was used for general municipal purposes.

Last year was not an exceptional year in this regard. For the past four years the surplus earnings of the humane department have been consistently more than $100,000 a year. During the twenty years of the department's existence, there has been diverted into the city's general fund surplus earnings from the humane department of $1,230,688.

Lindsey and other dog owners contend that if only a reasonable portion of this surplus were spent in an effective humane patrol that would pick up stray dogs and cats and would police the city for sick animals, that the possibility of rabies becoming epidemic would be almost nil.

"But the city does not do this," said Lindsey, "despite the fact that dog owners tax themselves more than $200,000 annually in Los Angeles in the hope of getting such service."

Lindsey pointed out that many dog owners are threatening to discontinue the payment of license fees unless more of the money goes for the purposes intended.

"A Superior Court in San Diego County decided last April that it was unconstitutional to exact a license fee from owners who keep their animals on their own premises at all times," said Lindsey. "A large proportion of Los Angeles dog owners keep their animals continually under such restraint and feel that they would be justified legally in refusing to pay the license under this ruling."—Los Angeles *Times*, April 7.

* * *

Dr. Harold Brunn Named by Surgeons

Election of Dr. Harold Brunn of San Francisco as president of the American Association for Thoracic Surgery at the group's convention in Atlanta, Ga., was reported on April 5 by the Associated Press. He succeeds Dr. Stuart W. Harrington of Rochester, Minn.—San Francisco *Examiner*, April 6, 1938.

* * *

Rabies Fatal

Los Angeles, March 25.—(AP)—Rufus Bradley died today of rabies, the second victim of a mad dog, which bit him a month ago. Stephen Wilson, the first victim, died last week. Seven others bitten by the dog took the Pasteur treatment. Bradley and Wilson did not.—San Francisco *Examiner*, March 26.

* * *

American College of Physicians

New York, April 7.—(AP)—The new president of the American College of Physicians, William J. Kerr, M.D., of San Francisco, took office today and promised forward action on "medical situations arising in the country."

His remarks were taken to refer to the proposal of the association's retiring president, Dr. James H. Means of Boston, last night to organize an opposition party within the American Medical Association and "bring to light leaders" to solve problems of medical care and proposed federal medical aid.—Los Angeles *Examiner*, April 8.

* * *

Aid for Sufferers

Safe Use of Sulfanilamide

Memphis (Tenn.), March 28.—(AP)—Dr. William B. Wendel, University of Tennessee chemist, said today he had developed methylene blue dye as a means of counteracting ill effects of sulfanilamide.

The chemist said that an injection of the blue dye erases one of the most serious toxic effects sulfanilamide produces, as well as providing a simple method of determining when a person is suffering such use of the drug.

Sulfanilamide has been successful in the treatment of throat irritations, erysipelas and mastoid.

"With the development of methylene blue dye as an antidote," Wendel said, "there should be no reason why sulfanilamide should not be administered safely in nearly all cases."—San Francisco *Examiner*, March 29.

Split in United States Doctor Group Widens

Chicago, April 8.—(AP)—A new attack by Dr. Morris Fishbein, spokesman for the American Medical Association, on the use of federal funds for public medical service, widened the breach today between groups at odds over the question.

Doctor Fishbein said in an address last night that "only the physician is capable of determining the real medical needs of the people."

"Proposals for the use of federal funds in medical service," he said, "are in accord with the extraordinary delusions of grandeur and with the vague and misguided conceptions that continue to emanate from the social service workers who have sought to assume control of the practice of medicine in the United States."

Reply to Statement

Doctor Fishbein replied to Dr. James H. Means, retiring president of the American College of Physicians, who said in a New York address it would be "wholesome" if there was an "enlightened opposition party within the Democracy of the American Medical Association." Doctor Means said he was "not advocating a revolt" against the association.

"Doctor Means," said Doctor Fishbein, "is unfortunately typical of a considerable number of physicians snugly ensconced in laboratories or in full-time positions in medical schools who are unaware of the problems of the general practitioner and who never see the people or even understand those whom they would serve."

Seek U. S. Funds

Their chief objective, Doctor Fishbein continued, was to secure "more and more government funds for the subsidizing of medical education, of hospitals and of the care of the sick." This, he contended, would lead to "confiscatory taxation" of industry and the individual worker "for the benefit of the employees of the bureaucracy and those who have not or will not work."

He said the medical profession has compiled a record in the United States that could challenge that of any state-controlled system in foreign nations. The profession, he added, does not propose to relinquish its functions until satisfied that "some other system will give better medical service to more people."

Health Plan Action Sought

The California State Supreme Court yesterday was asked to set in operation San Francisco's municipal employees' health insurance plan.

Unable to consider the matter at their conference yesterday, Justices of the Court postponed discussion of the plan until Thursday or Friday.

Asked from the Court, in a petition filed by the Health Service Board, was a writ of mandate directing Controller Harold Boyd to make available to the board all sums deducted from the compensation of members of the health service system.

Court test of the legality of the health plan was forced by Boyd when he refused to turn initial collections over to the board. The plan provides deductions of $2.50 per month from over 11,500 city workers.

Boyd forced the court action because numerous employee groups of the city have assailed the plan.—San Francisco *Examiner*, March 22.

* * *

Cancer Control Month Called

Washington, March 28.—(AP)—The White House made public today a proclamation by President Roosevelt proclaiming April as cancer control month and urging support for a national program for the control of cancer by education.

The President invited governors of the states and territories to issue similar proclamations.—San Francisco *Examiner*, March 29.

* * *

Los Angeles County Auto Death Toll Reaches 231

Three men were dead today, and a three-year-old boy may die of injuries in traffic accidents that made the figures for the year's death toll to date, read 231 for Los Angeles County.—Los Angeles *Evening News*, April 7.

Five Hundred Thousand Are Victims of Daily Injuries

Ten Million Accidents Each Year in U. S.

Washington, April 2.—Ten million accidents serious enough to disable their victims one day or longer occur annually in the United States.

Each day 500,000 persons are unable to work, go to school or pursue their usual activities as the result of injuries caused by accidents resulting from multiple sources, the Public Health Service announced today.

The service disclosed that 7 per cent of the deaths among the 70,000 families canvassed were the result of accidental injury. Accidental deaths were exceeded only by mortalities from disease of the heart, cancer and pneumonia.

It was revealed that sixteen of every 1,000 persons are disabled for a week or longer by injuries each year. The average period of disability experienced by the victims of serious accidents is forty-six days. This is compared with the average duration of disability from all causes, which is fifty-seven days. Automobile accidents average fifty-five days of disability.

Many Are Maimed

Maiming injuries occur most frequently in the course of work, the report states, since 70 per cent of the lost fingers and 46 per cent of the loss of other members are are attributed to occupational casualties. For impaired members, however, home accidents are of equal importance to industrial mishaps.

The home is far from being the safest place, as it is usually considered. More than 30 per cent of all accidents occur there. The home injuries result mainly from falls, burns and cuts.

Boys and men are more liable to suffer accidental injury than are girls and women until the age group above 65 years is reached. The situation is then reversed.

The greatest single source of accidental injury is the fall, which is credited with 39 per cent of all the serious disabling factors. Falls are even a greater menace at present than automobiles, which are responsible for 20 per cent of the nation's yearly accident toll.

Autos Are Deadly

However, the automobile is responsible for the greatest number of accidental fatalities. Persons injured in an automobile are two and one-half times as likely to die as persons injured by any other means.

The report associates the higher rate of accidents in the homes of the very poor with inadequate housing facilities. Faulty stairways, poor lighting and heating conditions and rickety furniture are all factors which are responsible for the excessive home injuries among the lower third income group.

The National Health Survey is attempting a solution of the nation's ever-increasing accident problem by endeavoring to ascertain the source and circumstances under which serious mishaps occur. In this way they hope to suggest preventive measures for each type of accident.—San Francisco *Examiner*, April 3.

LETTERS

Concerning a recent malpractice suit.

STATE OF CALIFORNIA
DEPARTMENT OF INSTITUTIONS
MENDOCINO STATE HOSPITAL

Talmage, California,
March, 29, 1938.

To the Secretary:—I am just in receipt of a telephone message from Mr. Hartley Peart stating that the case of Sarah Florence vs. Doctors Toner, Beardslee, Reilly, Sheehy, Tillman, Cushman, and Mr. Charles Waymire, had been dismissed by order of Judge Michael Roche of the Federal Court in San Francisco. As you know, this suit for one million dollars was brought about three years since, and has been continued from time to time, has been stubbornly fought by the attorney for the plaintiff, Miss ———; but in spite of this strenuous effort on the part of the plaintiff and her attorney, it has now been terminated by the above-mentioned dismissal of the case.

I feel that this case was won only by the earnest, persistent, intelligent and painstaking effort of Mr. Hartley Peart, the attorney for the Medical Society of the State of California, and his associates, Messrs. Gus L. Baraty and Howard Hassard. I wish to express to you my heartfelt appreciation for the faithful service rendered by that society. I had, also, the assistance of Mr. Kilkenny, Deputy

from the Attorney-General's office, who was protecting the State's rights in the matter. However, my individual protection was especially provided by the efforts of the Medical Society of the State of California.

You, perhaps, are aware of the fact that after this suit was filed against us, the ——— Company refused further continuation of protection under that policy which I had carried with that company for several years, on the grounds that the policy did not cover the points at issue.

I feel that if the members of the Association knew more of the dangers of medical practice that they would not hesitate to join the Medical Society of the State of California and pay its small annual charge.

Very sincerely,

R. A. Cushman, M.D.,
Medical Superintendent.

Concerning articles on the Los Angeles County General Hospital.

(copy)

The Queen's Hospital

Honolulu, T. H.,
March 18, 1938.

To the Editor:—Today I received a copy of the February issue of California and Western Medicine, for which I sent an order with stamps to cover to the publication office in San Francisco a couple of weeks ago. I had read in the Los Angeles *Times* a front-page news article about your editorial and comments on the charging and billing innovations at the Los Angeles County General Hospital and felt keenly interested in the subject.

For the past two hours I have been occupied with the reading of the editorial article, the exhibits and comments. Not a word escaped my attention, so completely was my interest engrossed. I congratulate you upon the manner in which you have handled the whole matter. It is typical of your forceful and effective way of dealing with medical-administrative dilettanteism and confusion whether it be in the realm of ethics or economics. More power to you in this crusade!

I take pleasure in sending you, under separate cover, a copy of the Seventy-eighth Annual Report of The Queen's Hospital, just published. I recall your often expressed desire for a printed report from the Los Angeles County General Hospital. It is no credit to Los Angeles County that they continue to neglect so elemental an obligation to the doctors who perform the medical services in the hospital as well as to the taxpayers who support it, not to mention the universally accepted reciprocal obligations between important hospitals to exchange reports on their experiences. The Queen's Hospital of Honolulu has not missed publishing its annual report for many decades, not even during the worst depression years.

My work here has been pleasant, well received and fruitful of results. I look forward to many years of productive activity in my present position despite my advancing years. I feel as young as ten years ago. The marvelous climate of these islands is exceedingly favorable for my health. . . .

P. O. Box 614.

Very sincerely yours,

(Signed): G. W. Olsen.*

Concerning the May meeting of the American Neisserian Medical Society.

March 16, 1938.

Dear Doctor:

The fourth annual session of the American Neisserian Medical Society will be held in Washington, D. C., on May 16 and 17, 1938, in the Public Health Auditorium located at Nineteenth Street and Constitution Avenue, N. W.

The session will open with a symposium on sulfanilamid, which will be timely and of great value to everyone. Perrin H. Long, M. D., of the Johns Hopkins Hospital will deliver the principal address. Doctor Long's work puts him in the position of being the country's leading authority on the chemistry, mode of action, and clinical use of sulfanilamid.

Following the presidential address there will be simultaneous meetings of the three following sections: Male Clinical, Female Clinical, Laboratory and Research. The Male Clinical Section will discuss in considerable detail the question of nomenclature, standard record forms, diagnosis, and cure. The Female Clinical Section will discuss diagnosis and cure. The Laboratory and Research Section will discuss bacteriology, serology, and research. The reports of these deliberations as accepted on the following day will become the Society's official opinion and will serve as authoritative information which, when disseminated, will undoubtedly result in clarifying some of the present needless confusion. This would seem to be an important next step toward improving the management and control of gonorrhea.

For further information, address the Office of the Secretary, 113 Bay State Road, Boston, Massachusetts.

Oscar F. Cox, M. D.,
Secretary.

Concerning venereal disease program of the State Board of Public Health.

State of California
Department of Public Health
Sacramento

San Francisco,
March 23, 1938.

To the Secretary:—Your letter of March 17 addressed to Dr. Howard Morrow has been referred to our office.

This is to advise you that within the next ten days copies of the enclosed letter to physicians will be mailed to all registered physicians in the State. This should clear up any question with reference to the drug distribution program.

We are not in a position as yet to directly subsidize physicians for the care of indigent patients. In the larger centers of population, clinics are available for the care of such cases. Within the next few months it is anticipated that we shall be able to extend our program so that patients in rural districts can be given care. Meanwhile we are furnishing drugs for the treatment of these cases, and in each instance attempting to get the physician to make some arrangement for the patients so that they may be kept under treatment.

If you feel that an article should be prepared for California and Western Medicine with reference to the drug distribution program, may we hear from you to that effect.

Very truly yours,

Malcolm H. Merrill, M.D.,
Chief, Bureau of Venereal Diseases.

San Francisco, California

Walter M. Dickie, M. D., *Director*

Letter No. 3

To the Physicians of California:

The venereal disease control program has progressed to the point where the third objective can now be announced. A restatement of the first two objectives with the addition of the third is as follows:

1. Every case of venereal disease to be reported.

* Mr. G. W. Olsen was formerly superintendent of the California Hospital at Los Angeles, and later, as assistant superintendent of the Los Angeles County General Hospital, the twelve-million-dollar acute unit building was largely placed in usable form under his supervision. In a shift of officers, his work was not recognized. At that time, upon recommendation of Doctor MacEachern of the American College of Surgeons, he received the offer of the superintendency of The Queen's Hospital in Honolulu, where, we have been informed from other sources, his services have given great satisfaction.—Editor.

2. Every case of venereal disease to have a complete epidemiological investigation.

3. Every case of venereal disease to be kept under the care of a physician until the disease has been arrested or cured.

Studies of the Coöperative Clinical Group have shown from 60 to 80 per cent of clinic patients with syphilis discontinue treatment prematurely. While no statistics are available concerning private patients, indications are that the situation is comparable. The early cases that are lapsing from treatment now will fill our clinics and institutions in years to come. Many will become sources of infection for others as a result of infectious relapse. Adequate treatment for every case of syphilis is the basis of all control measures for this disease. It eliminates foci of infection and prevents the development of late complications.

Why do patients lapse from treatment? This problem was studied some years ago in the Syphilis Clinic of the University of Pennsylvania Hospital. Reasons most frequently mentioned were: painful reactions to treatment; clinic hours interfere with work; financial inability to continue; did not realize the seriousness of the disease; thought themselves cured.

How are we to prevent such lapses? We offer you the following suggestions and specific aids that should assist you in keeping your cases under treatment.

1. The proper instruction of the patient is of paramount importance. It must include convincing evidence of the correctness of diagnosis, outline of treatment to be given, necessity for continuing treatment, some explanation of the interpretation of serological reactions, and possibilities of reactions to treatment. The patient should be told that symptoms will rapidly disappear but ultimate cure requires prolonged treatment. To be really effective this instruction must be given as soon as the diagnosis is made.

2. Frequently the physician's instructions can be fortified by literature for the patient. We have already forwarded to you a copy of our pamphlet entitled *Combating Syphilis*. A companion pamphlet, entitled *Combating Gonorrhea*, is enclosed. A copy of one of these pamphlets will be mailed to you by your local health officer upon receipt of each report of a case of syphilis or gonorrhea. Additional copies can be obtained upon request, from your local health officer or from this Bureau.

3. Probably the most frequent cause of lapse from treatment in private practice is financial inability to continue. During the first interview after diagnosis is made, the financial problem should be discussed fully. Patients should be advised to consider their problem frankly and to depend upon their physicians to arrange for their continued treatment in a clinic if they are unable to continue under private medical care. As physicians we must face this problem realistically if these lapses from treatment are to be prevented. In an effort to relieve part of the financial strain, the State Department of Public Health is now prepared to issue through local health officers a limited supply of antisyphilitic drugs to private physicians for the treatment of indigent and marginal cases. A requisition form is enclosed. A limit of ten ampoules of an arsenical and twelve ampoules of bismuth salicylate (or, if more than one patient, one 60 cc. bottle) will be issued at one time for each patient. Additional drugs can be obtained for any case as the first supply is exhausted. Cases must have been reported before drugs will be issued.

4. Practically all full-time health departments are now equipped to assist you in returning lapsed cases to treatment. Ask for their assistance. The Venereal Disease Act passed by the 1937 session of the State Legislature imposes upon you the legal obligation to keep your patients under treatment, or report the patient by name to the health department. It also gives health officers adequate power to assist you. A copy of this law and State Board of Public Health rulings will be forwarded to you upon request.

5. Enclosed also is a letter from Dr. Thomas Parran regarding the United States Public Health Service periodical entitled *Venereal Disease Information*. This would be a valuable addition to your library.

MALCOLM H. MERRILL, M.D.,
Assistant Acting Surgeon, United States Public Health Service.

Approved:

WALTER M. DICKIE, M.D.
Field Agent, U. S. P. H. S.
Coöperating with United States Public Health Service.

Concerning June 17 and 18 meeting of the American Academy of Tuberculosis Physicians.

Auberry, April 10, 1938.

To the Secretary:—The scientific program of the American Academy of Tuberculosis Physicians to be held in the Hotel Mark Hopkins, San Francisco, June 17 and 18, is almost complete.

Among the speakers are men nationally and internationally known in their particular field of medicine. For this reason, the Program Committee desires to give the medical profession of California an opportunity to hear some or all of these papers.

With this in mind, we are writing to request that you contact the proper authorities with the view of having the program published in the May issue of CALIFORNIA AND WESTERN MEDICINE.

Thanking you in advance for whatever you may be able to do in this, I am

Cordially yours,
EVERETT MORRIS,
Chairman, Program Committee.

Concerning California laws on "disability insurance contracts."

DEPARTMENT OF PROFESSIONAL AND VOCATIONAL STANDARDS
BOARD OF MEDICAL EXAMINERS
STATE OF CALIFORNIA

Sacramento, California,
April 4, 1938.

To the Editor:—Enclosed please find copy of Attorney-General's Opinion No. NS900 addressed to Honorable Samuel L. Carpenter, Jr., Insurance Commissioner of the State of California, in relation to the First National Protective Association of Los Angeles, which we thought might be of interest to readers of CALIFORNIA AND WESTERN MEDICINE in connection with the study of the so-called hospital associations.

420 State Office Building.

C. B. PINKHAM, M.D.,
Secretary-Treasurer.

* * *

(COPY)

San Francisco, March 23, 1938.

Hon. Samuel L. Carpenter, Jr.,
Insurance Commissioner,
417 Montgomery Street,
San Francisco, California.

Dear Sir:

I have your letter of January 6, 1938, relative to First National Protective Association of Los Angeles in which letter you enclose the following documents:

1. Pink card entitled "Now in Effect";
2. Business reply card;
3. Application blank;
4. Certificate;
5. Memorandum from Mr. Risbrough dated December 20, 1937;
6. Memorandum to Mr. Risbrough dated December 29, 1937;
7. Memorandum from Mr. Risbrough dated January 3, 1937.

You state that the definition of "disability" insurance, Section 106, Insurance Code, is essentially the same as the definition of accident and sickness or health insurance contained in Subdivision 6 of old Section 594 of the Political Code, as amended in 1933, which section has since been repealed. The term "accident and health insurance" was the subject of my Opinion No. 9055.

You ask my opinion as to whether the contract issued by the National Protective Association constitutes a contract of insurance which may only be written by licensed companies and whether the contract violates other provisions of law.

The contract in question in substance provides that the member is entitled to all the rights and privileges of the Association as provided in the by-laws and the provisions contained in the certificate.

In the general provisions of the certificate the following services are enumerated: medical service at office of corporation or at home of member; minor surgical operations, treatment of eye, ear, nose, and throat; maternity cases; major surgery; hospitalization; x-rays, and ambulance. The services enumerated are practically the same as those which were mentioned and described in Opinion No. 9055, rendered to the then Insurance Commissioner, under date of December 3, 1938.

I am of the opinion that said contract constitutes a contract of disability insurance and may only be written by a duly licensed insurance company authorized to write disability insurance.

It further violates the principle of a corporation engaging in the practice of medicine expressly denounced in the case of *Pacific Employers Ins. Co.* vs. *Carpenter,* 10 Cal. App. (2d) 592.

The documents submitted with your request are herewith returned.

Very truly yours,

U. S. Webb, *Attorney-General.*

State Quarantine Order for Los Angeles City—Rabies

An investigation having been made as required in Chapter 369, Statutes of 1913, of the State of California, and rabies having been found to exist among dogs living within the City of Los Angeles, the California State Board of Public Health, in accordance with the provisions of Chapter 369, Statutes of 1913, hereby declares a quarantine against all dogs on those portions of property within the city boundaries of Los Angeles, as shown on map, entitled "Map of the City of Los Angeles, California, prepared by Lloyd Aldrich, City Engineer," obtained from the City Engineer's office, March, 1938.

Quarantine under this Act* means the strict confinement, upon the private premises of the owners, under restraint by leash or within properly constructed enclosure, of all dogs within the above described area.

It shall be the duty of all peace officers, all deputies of the City Health Officer, as well as the City Health Officer, to enforce the provisions of this order within the above quarantined area.

The City Health Officer, or other properly constituted officials, may make inspection or examination and enter upon all private premises for the enforcement of this quarantine.

Any owner, or other person, in possession of any animal then being held or maintained in violation of this quarantine, shall be subject to arrest on the charge of committing a misdemeanor.

W. M. Dickie,
Executive Officer, California State Board of Public Health.

Issued by the State Board of Public Health in regular session, March 26, 1938.

Modification of Order Issued March 26, 1938, Declaring a Quarantine against All Dogs within the Boundaries of the City of Los Angeles

Having received from George Parrish, M.D., Health Officer of the City of Los Angeles, a request for the modification of the order issued March 26, 1938, declaring a quarantine against all dogs within the boundaries of the City of Los Angeles, the California State Board of Public Health having made an investigation in accordance with the provisions of Section 2, Chapter 369, Statutes of 1913, hereby modifies the above mentioned quarantine order as follows:

Quarantine shall be defined as the confinement of all dogs within the designated area upon the private premises of the owners under restraint by leash or within properly constructed enclosure, except that persons over the age of fifteen years shall be permitted to take their dogs on the public streets and highways when such animals are controlled by suitable leash not over six feet in length, and when so controlled may also take them on the highway in automobiles but not in any bus, or other public conveyance; except, that those dogs quarantined as rabies contacts and confined to their premises or such other place as may be designated by the health officer, or his representative, shall not be permitted to leave the designated premises upon which they are confined.

W. M. Dickie,
Executive Officer, California State Board of Public Health.

Issued by the State Board of Public Health in regular session, March 26, 1938.

Concerning Clinical Notes paper by Dr. Fred Baker of San Diego, which appears in this issue on page 356.

Point Loma, California,
February 17, 1938.

To the Editor:—I do not know how good your memory of us old codgers out in the sticks may be, but I remember you rather intimately when I was a more active youngster.

I have just passed my eighty-fourth birthday and cannot have many years ahead. I have long had in mind writing of my personal experiences with iodid of potassium during my thirty-odd years of active practice, with notes on one case which I have been able to observe for over forty years. I do not know how far I may have been preceded in my conclusions, as I have not kept up my medical reading for a good many years; but I do know that there are a good many physicians who still prescribe set doses of iodid of potassium, which calls for carefully studied dosage in each case.

It so happens that about thirty years ago I nearly killed myself with overdosage with this drug, and have suffered ever since from a moderate hyperthyroidism combined with a most troublesome tremor and more or less heart disturbance. I want to report this case, as well as personal observations carried on through many years, with some suggestions that, so far as I know, have never been published.

A rough draft of the paper covers only four and a quarter pages of typewriting, spaced, so it will not take up a great deal of space. What I wish to know before working it up more carefully is whether you would probably care to publish such a paper, if I send it in? Of course, you cannot adjudge it properly till you see it, but if such a paper seems likely to meet your approval, I will prepare it and send it to you within a short time after receiving your answer. I am enclosing an addressed postal on which you can send only a line, thus saving the time of a very busy man.

Sincerely and fraternally yours,

Fred Baker.

842 Rosecrans Boulevard.

* * *

Point Loma, California,
February 27, 1938.

Dear Doctor Kress:

Your very kind letter came in this morning and, as I had a rough draft of my paper drawn, I sat down this afternoon and made the enclosed copy, which you can use if it seems worth while. I have not given it a title, but will leave that to you.

I hope you and your readers will pardon the personal element. My case seemed of great importance, especially if the condition has not been emphasized of late. The report may save somebody a lot of trouble if the condition reported is not well known. It has made me a semi-invalid for these thirty or more years, and I came very near dying of heart failure during my two months in bed. Today I am handicapped badly by a very shaky hand, especially as I am devoting most of my time to conchology and use a microscope a great deal. My heart has settled down into a very good heart, which will probably last as long as I do.

For years I have had this paper in mind, feeling that the warning in it should be sounded unless someone else had already done it, but I never got to it. Now it is off my chest and I feel better.

I developed cataract several years ago and had a fine operation, giving me normal vision and a strong eye, which

* California law makes it mandatory upon the State Board of Public Health to declare the quarantine in this form. It is provided, however, that the State Board of Health may modify subsequently, as in its judgment is deemed best.

I work ten or twelve hours a day if needed. I am not strong, but have few important weaknesses. Doctor Charlotte* was in bed for six years and a half, and I took practically all care of her. As it meant night and day work, I was badly used up when she left us. She had severe angina and my consultants give me credit for prolonging her life for several years by being on hand to handle each attack. Two or three times she rallied and we started to teach her to walk again, but each time she fell back very soon. She was cheery to the end, though a great sufferer, and passed quietly in her sleep. It has left me a very lonely old man, but I keep actively at work to forget.

You may not know it, but my hobby for nearly fifty years has been conchology, and it has brought me much wider acquaintance and reputation than ever medicine did. I have published about twenty papers on various subjects and have been in touch with conchologists practically all over the world through exchanging of shells. I have the largest private collection of shells on this coast, I think. If Doctor Charlotte could have kept well through the years, I would have had a most satisfactory existence. As it is I have splendid memories of a most eventful life and a most happy one till the last few years, so why worry. Shall be mighty glad to see you if ever the opportunity comes.

Very sincerely yours,
FRED BAKER.

842 Rosecrans Boulevard.

P. S.—Should have added that in my report the retinitis case was my son. He is husky and has strong eyes, with perfect vision. I have another patient who comes to me occasionally, whom I saw first forty-six years ago. Going some.

MEDICAL JURISPRUDENCE †

By HARTLEY F. PEART, ESQ.
San Francisco

Provisions of the California Insurance Code Relating to So-called "Medical and Hospital" Insurance and to Hospital Service Plans

The Insurance Code adopted by the Legislature in 1935 is a codification of the California statutes relating to the business of insurance. Except for those sections of the California Constitution which concern insurance, all of the laws governing insurance in this State are now to be found in the Insurance Code.

The Insurance Code divides all insurance into twenty classes of which the most familiar are life, fire, surety, disability, liability, workmen's compensation and automobile. All types of insurance done in this State must fall within one of the twenty enumerated classes. For example, "malpractice" insurance falls within the class known as "liability" insurance. "Health and accident" insurance is within the class termed "disability" insurance. So-called "medical and hospital" insurance, which is full or partial idnemnification for payments made by the insured to his own physician for medical care or for payments made for hospital facilities, likewise falls within the disability insurance classification. Hence, this discussion will be limited to a brief consideration of those provisions of the Insurance Code which govern the conduct of the business of disability insurance.

Part II of Division 2 of the Insurance Code is entitled "Life and Disability Insurance" and consists of thirteen chapters, each dealing with some phase of life insurance or disability insurance or both. Chapter 1 of Division 2, Part II, contains certain requirements with respect to life and disability insurance contracts. Chapter 2 relates solely to group life insurance. Chapter 3 governs burial contracts; Chapter 4 contains the various statutory requirements, known as "standard provisions," which must be contained in all disability insurance policies.

One section contained in Chapter 4 requires that all disability insurance policies must be approved as to form by the Insurance Commissioner prior to issuance or delivery to any person. Other sections require that disability insurance policies must express on their face the entire consideration therefor, the times at which the insurance takes effect and terminates, the number of persons insured, and must not contain exceptions printed in smaller type than the benefits to which they apply. Chapter 4 also contains compulsory standard provisions for disability policies which are deemed to be incorporated in the insurance contract whether or not they appear therein. Optional standard provisions are also set forth which may or may not be included by the insurer.

Chapter 5 contains general regulations governing life insurance only, and Chapter 6 provides for incorporated life insurers issuing policies on a reserve basis.

Chapter 7 governs mutual life and disability insurers. Under this chapter a corporation having a capital stock of not less than $200,000 fully paid in and a guaranty fund of not less than $250,000 may qualify as a mutual life and disability insurer and issue life insurance contracts or various forms of disability insurance policies. This would include, of course, contracts indemnifying against loss for the cost of medical care or hospital services.

Chapter 8 governs life insurance upon the mutual benefit assessment plan and contains a provision forbidding the entrance of new associations into this field after January 1, 1936. Mutual benefit assessment associations flourished some years ago, but experience proved that the tendency of these associations was to dwindle in membership as members died and thus to penalize those who lived the longest and paid the greatest number of assessments. The Legislature evidently felt that it was a type of insurance which should not be continued.

Chapter 9 is entitled "Mutual Life and Disability Insurance on the Stipulated Premium Plan, with Provision for Assessments." Briefly, this means that a corporation may engage in the business of issuing life and disability insurance policies which combine two different insurance concepts: one, the collection of necessary reserves by means of periodic premiums in a stipulated amount, and the other, the accumulation of necessary funds by means of assessment of policyholders as the need arises. A corporation engaging in life and disability insurance under Chapter 9 must provide in its insurance policies for periodic premiums payable monthly, and, in addition, must provide for the payment by policyholders of additional premiums or assessments "to the extent needed to pay for their share of claims and expenses and to maintain the tabular reserves required . . ." (Insurance Code, Sec. 10875.)

In other words, insurance policies issued by insurers doing business under Chapter 9 provide for the collection of additional sums from policyholders in the event that premiums collected and the reserves of the insurer are insufficient to meet claims and expenses without impairment of the minimum reserves required by the Insurance Code.

An insurer organized under Chapter 9 may not issue any policy or certificate until at least one thousand persons have subscribed in writing an agreement for each to be insured therein for a death benefit of not less than $1,000 if life insurance, or for a disability benefit of not less than $5 a week if disability insurance, and until each subscriber has paid one premium or assessment of not less than $5 and the insurer has deposited $25,000 with the Insurance Commissioner (Insurance Code, Sec. 10830.) Thus, it may readily be seen that the reserves required of a Chapter 9 insurer are much less than those required of mutual life and disability insurers.

Chapter 9 also contains a provision under which any insurance company, doing business as a Chapter 9 life and disability insurer, may elect to operate as a "mutual legal reserve insurer." In order to take advantage of this provision, such an insurance company must have a minimum paid-in capital of at least $200,000 to issue life insurance policies and an additional $50,000 to issue disability insurance policies. A Chapter 9 insurance company, by securing a paid-in capital of at least $250,000 and converting itself into a mutual legal reserve insurer, may thereby eliminate the assessment provisions of its policies. The Legislature has evidently felt that if an insurance company is to do life and disability insurance business with only a reserve of $25,000, it must have access to additional funds in cases of

* Editor's Note.—See obituary of Dr. Charlotte Johnson Baker, in CALIFORNIA AND WESTERN MEDICINE, March, 1938, on page 203.

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, containing copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

emergency by means of assessments levied upon policyholders, but that if a minimum of $250,000 in paid-in capital is held by an insurance company, it is not necessary to require of policyholders that they be subject to assessment.

Chapter 10 deals with fraternal benefit societies, and Chapter 10 (a) governs firemen's, policemen's, or peace officers' benefit and relief associations. Chapter 11 contains provisions authorizing a change by assessment plan insurers to reserve plan insurers. A minimum paid-in capital of $200,000 is required.

Chapter 11 (a), which was adopted in 1937, is entitled "Nonprofit Hospital Service Plans." Under this chapter nonprofit corporations may issue policies of insurance whereby policyholders are entitled, in the event of illness or accident, to "hospital services." Hospital services are defined as including any or all of the following services: Maintenance and care in hospital, nursing care, drugs, medicines, physiotherapy, transportation, material appliances and their upkeep. (Insurance Code, Sec. 11493.)

Before a nonprofit corporation may qualify under Chapter 11 (a), it must secure a certificate of approval from the State Department of Public Health and, in addition, must secure a certificate of authority from the Insurance Commissioner. The chapter contains provisions with respect to minimum reserve funds and requires that all hospital service insurance contracts must comply as to form with certain enumerated requirements. One of these is that such contracts for hospital service must contain in black-faced type not less than ten point the following:

"Nothing in this contract contained shall in any way or manner restrict or interfere with the right of the subscriber to select the contracting hospital or to make a free choice of his attending physician, who shall be the holder of a valid and unrevoked physicians and surgeons' certificate and who is a member of, or acceptable to, the attending staff and board of directors of the hospital, in which said hospital services are to be provided and rendered." (Insurance Code, Sec. 11512.)

Chapter 12 governs grants and annuities societies. Chapter 13 relates to voluntary mutualization of incorporated life, and life and disability insurers having a capital stock and issuing non-assessable policies on a reserve basis. In order that an insurance company may take advantage of the provisions of Chapter 13, it must have a minimum paid-in capital of at least $200,000 for life insurance and $50,000 for disability insurance. If it intends to issue both life and disability policies (it cannot issue disability policies alone), it must have a minimum paid-in capital of $250,000.

SPECIAL ARTICLES

CONGRESSMAN SCOTT AND THE A. M. A. RESOLUTION*

The *Bulletin of the San Diego County Medical Society*, in its issue of April 15, 1938, printed the following:

The Washington, D. C., newspaper *Labor*, under date of April 5, 1938, offered "Probe of 'Doctors' Trust' Urged as Health Safeguard" as a special tid-bit to its readers.

The Bulletin voices but two remarks: (1) Please note that San Diego is on the map—for better or worse. (2) That California "Demos" Scott and Voorhis led the attack. Here it is verbatim!

* * *

Congressman Scott Declares "Odious Monopoly" Is Striking at Coöperatives Over Bodies of Suffering Members; Persecution Nation-Wide; Likened to Racketeering.

Forty workers suffering severe illnesses requiring operations are denied treatment in Washington hospitals because they are members of the Group Health Association, a coöperative organization maintained by government employees.

The hospitals are willing to make facilities available, but are restrained by fear of a boycott by the Washington Medical Society.

These disclosures were made in the House this week by Congressman Byron N. Scott (Democrat, California) in an appeal for adoption of his resolution calling for a congressional investigation of the "Doctors' Trust." Scott's demand was seconded by Congressman Jerry Voorhis (Democrat, California).

Unless Congress exposes and scotches "this odious monopoly," Scott declared, sufferers who can be saved by quick surgical attention may go to their graves, martyrs to "inhuman greed."

The California lawmaker declared that several persons whose lives were hanging by a thread were refused admission to hospitals until the Health Association met the exorbitant demands of physicians who are members of the Medical Society.

Because of its low membership fees the coöperative, its officials declare, cannot meet the physicians' charges without going "broke." That is the object of the campaign against the association, the officials charged.

Scott told Congress that, if an investigation is ordered, witnesses will come from all sections of the country with evidence showing that the tactics being employed in Washington are part of a nation-wide crusade by the "Doctors' Trust" against efforts of workers to help themselves.

"Has it come to this," Scott demanded, "that workers are unable to join together in the employment of a group of doctors without experiencing severe limitations in the use of hospital facilities and without incurring the ruthless opposition of doctors who control the medical society?"

It is "high time," Scott emphasized, that members of Congress air "the high-handed attitude of the combine" and let the people understand that "selfish physicians have taken the position they have a vested interest in the sufferings of the people." He added:

"Is it possible that the public, which supports both doctors and hospitals, have no voice in establishing justice and fair dealing?

"Are government and other workers to be subjected to autocratic, domineering, inhuman discrimination because they desire to enjoy the benefits of a coöperative association through which they can obtain medical attention?

"It is an amazing spectacle, in the year 1938, to witness the efforts of a group of physicians here in Washington and in other cities of the United States who are determined to check the course of progress toward a more humane, comprehensive and efficient service in dealing with sickness and the prevention of disease."

What doctors are doing in Washington they have also attempted in scores of other communities, Scott said. He insisted the fight on coöperatives is directed by the American Medical Association, which in turn is dominated by Dr. Morris Fishbein, a bitter foe of every movement to secure medical service for that half of the population which is now going without attention because it is unable to pay doctors' bills.

These specific instances of intimidation and coercion were cited by the California Congressman:

In St. Louis a group of doctors who have been giving fine service to the Wage Earners' Health Association have been notified they will be ousted from the medical society. Here the fight has gone so far that the staff of the Missouri Pacific Railroad Hospital is under attack.

In Milwaukee, outstanding physicians serving a cooperative have been blacklisted by the hospitals after being ousted from the medical society.

Plans of union labor at Akron, Ohio, to form a large health coöperative are being held up by threats of boycotting.

In San Diego, California, doctors who have served a cooperative for five years were suddenly confronted with charges of "unprofessional conduct" and threatened with ouster from the health society.

The Voluntary Health Association of San Francisco, which by city charter provides medical and hospital service for nine thousand municipal workers and their dependents, finds it impossible to get into operation because the medical society has notified the organization committee it would oust any doctor it might employ.

Physicians at Little Rock, Arkansas, who have been engaged in group health work, have resigned from the medical society rather than be kicked out.

Scott recalled that several Washington physicians were subjected to "such bitter abuse and persecution" that they resigned from the coöperative. Doctors who decided to stand by the coöperative have been ousted from the medical society, denied admission to hospitals and are being badgered in other ways.

The situation is not only a national scandal, but it is fraught with the gravest danger to the health and lives of millions of people, Scott contended. A full disclosure, he predicted, would show that many physicians have turned their noble profession into a form of "racketeering."

LOS ANGELES COUNTY HOSPITAL* (Continued)

CALIFORNIA AND WESTERN MEDICINE, in its issues of February (see pages 73 and 97), March (see pages 156 and 216), and April (see pages 234 and 297), printed articles in which attention was called to certain procedures in vogue in the Los Angeles County General Hospital, as regards admission of patients, billing of indigent patients, follow-up methods in attempting to collect from indigents and near indigents, legal phases and other matters. For the information of those who have been interested in the important principles involved, some press clippings, in which later developments are outlined, are printed below.

* * *

Hospital Probe To Call New Witnesses

Following new attacks by Dr. George H. Kress, President of the Los Angeles County Medical Association, against the system of charging patients at the General Hospital, the County Grand Jury today was planning to call additional witnesses in an investigation of the situation.

Doctor Kress, a member of the staff of the hospital, placed his charges before the jury and in an informal discussion with the jurors asserted that in some cases the hospital charges patients higher fees than the average physician would demand.

He said he believed the hospital should not care for non-indigent patients and that indigents should not be billed for treatment they receive. The medical care given at the hospital, he pointed out, is absolutely free, being donated by 508 physicians and surgeons who give their time and skill so that indigents may not suffer.

In a recent magazine article Doctor Kress cited a case where he said a charity patient at the General Hospital was billed for a $136 operating room fee which, at an exclusive Hollywood hospital would have cost but $12.50. He also declared that the county maintains a collecting bureau which spends more than $100,000 annually sending bills to former General Hospital patients totaling more than $4,000,000, of which only about $300,000 is collected.

It was expected that Rex Thomson, County Superintendent of Charities, would be among the witnesses called by the jury to give the county's side of the matter. Following publication of Doctor Kress's magazine article Thomson declared that under State law the county is compelled to collect the amount of actual cost of service from patients able to pay.—Los Angeles *Evening Herald Express*, April 7.

Cites County Loss in General Hospital Plan of Billing Indigents

Billing indigent County Hospital patients is unprofitable as well as unethical, Dr. George H. Kress had informed the County Grand Jury today.

A member of the General Hospital medical staff as well as President of the Los Angeles County Medical Association, Doctor Kress was closeted with the jury for more than an hour, making and supporting charges which are expected to lead to an audit of hospital records.

It costs $109,000 a year to bill patients who have received treatment at the hospital, Doctor Kress said, and although $4,000,000 worth of bills were sent out last year, only $300,000 was collected.

Much of this, he added, was from persons unable to afford the high fees charged—fees which, he declared, are often greater than in private hospitals.

"I know of one case where a patient was billed $136 for operating room service which would have cost only $12.50 in the most expensive private hospital in Los Angeles."

Doctor Kress pointed out that the hospital was actually accepting free services from physicians and then attempting to sell them to indigent patients.

"General Hospital is staffed by 508 of the county's best medical men," he said. "They volunteer their services to care for indigents—services worth $2,000,000 a year—and neither ask nor receive fees, but the hospital charges for the work they do."

The Medical Association president suggested that hospital services be confined to those who are indigents or near indigents and that services for indigents should be free, for near indigents at nominal rates.

A test case in Kern County, upheld by the Appellate Court in 1936, held the billing of indigents for county hospital services clearly illegal, Doctor Kress concluded.

The jurors, although announcing no decision, indicated they would question Superintendent of Charities Rex Thomson on the matters touched by Doctor Kress and then probably order an audit of hospital books.—Los Angeles *Evening News*, April 7.

Hospital Fees Protest Aired

Doctor Kress Tells Grand Jury of Asserted Excessive Charges

Cumulative protests against charges assessed against patients at General Hospital were placed before the Grand Jury yesterday by Dr. George H. Kress, a member of the county institution's medical staff.

In an informal discussion with the jury as a whole, Doctor Kress declared that in some instances higher fees were assessed than the average physician charges.

Services Donated

"Moreover, these people receiving treatment at the hospital are supposed to be indigents—supposedly unable to pay even a fraction of regular costs," Doctor Kress said.

The physician then explained that there are 508 doctors who volunteer their services to care for the indigents and that the hospital is charging for duties these doctors perform, but for which they do not ask nor receive a fee.

May Order Audit

Of approximately $4,000,000 in bills sent out for hospital charges each year, about $300,000 is collected, Doctor Kress said. Cost of collecting the bills from indigents and emergency cases runs more than $100,000 annually, he said.

The jury indicated that an audit of hospital records may be ordered.—Los Angeles *Times*, April 7.

California

(Comments in *Journal of the American Medical Association*, March 19, 1938)

Admission and Collection System Attacked in Charges of County Hospital Graft.—A Grand Jury investigation of the system of admission and collections at the Los Angeles County General Hospital is suggested in an article by Dr. George H. Kress, published in the February issue of CALIFORNIA AND WESTERN MEDICINE. Doctor Kress takes exception to the practice of billing all indigents for hospitalization charges. In addition he terms the amounts charged "stupid and outrageous." He charges that since July 1, 1937, when a new system of admission and collections was introduced at the hospital, the administration has overstepped its bounds in billing all indigents. Prior to July 1, billing was restricted to those hospital patients for whom bills were recommended by the hospital social service department. In answer to an inquiry from Doctor Kress the superintendent of charities stated: "It was felt that it would be more equitable to bill all patients and then arrange payments in accordance with financial ability, rather than bill only a restricted group selected on the basis of immediate financial ability." Charges were made to conform, so far as possible, to the actual cost to the county of providing care, it was said. Under the new system, the client is made aware of his obligation even though there is no immediate prospect of payment. Doctor Kress criticizes this practice and asks the purpose of an elaborate system of bookkeeping to carry accounts which are known in advance to be of no value, in view of the fact that indigent or near indigent are classified as "free" patients. In some instances efforts have been made to force patients to give liens on insurance and property they may have in the future; many patients have been "bombarded" with bills, the letters being almost mandatory in their request for payment, the article asserts. The department of charities, replying to Doctor Kress, denied that the Kern County Hospital Appellate Court opinion, rendered in January, 1936, which declared that county hospitals may hospitalize and care only for indigent or near indigent persons, was used as a basis for claiming reimbursement from a county client. The opinion was considered, however, when the board of supervisors adopted a new schedule of charges for hospital care, based on a cost accounting system, to supersede the old flat rate of $4 per day. In his analysis of the system at the hospital, Doctor Kress uses the total of 56,774 in-patients who received care in the fiscal year 1936–1937. For this group the average number of patient days was 14.7. There are 508 physicians, surgeons and specialists who give their services gratuitously to the institution, the value of which to the group of 56,774 was estimated to be $2,000,000. In contrast, Doctor Kress compares the fund of $2,865,654 collected by the Community Chest from 1,000,000 persons in Los Angeles. For the period 1936–1937 the county received $306,974.02 on accounts for the Los Angeles County Hospital, indicating that the institution received payment from patients while the entire group of professional persons providing the care received not one cent. From July 1 to November 1, 1937, bills amounting to $1,169,921.87 were prepared by the hospital business office; on this basis the total amount of bills sent out for hospitalization to cover the entire year would be $3,509,765.61. About 90 per cent of the statements appear to be "bureaucratic bookkeeping," Doctor Kress

* Concerning Los Angeles County Hospital topics here discussed, see CALIFORNIA AND WESTERN MEDICINE: issues of February, 1938, on pages 73 and 97; March, on pages 156 and 216; and April, on pages 234 and 297.

declares, pointing out that maintenance of the bureau that sends out these notices cost $109,383.09, or 18.7 cents on the dollar collected.

Los Angeles Woman Cleared of Relief Perjury Charge

Tragedy in the form of a broken leg, a major operation, lack of employment, a reportedly broken home and finally arrest, was followed today by a ray of sunshine in the life of Mrs. Blanche Baker, a wheel-chair cripple, when Municipal Judge Newcomb Condee freed her after a preliminary hearing on a charge of perjury.

The woman, who was wheeled into court by her attractive daughter, Joan, twenty, was charged with making an affidavit that she was destitute and without means of support when she applied at the General Hospital last month for a major operation whereas the hospital authorities contended her husband, Albert, was earning $150 a month as a lumber worker and was qualified to support her and pay the bill.

"The hospital could do better than to quibble over a case of this kind where the woman had a broken leg, was ill and destitute," Judge Condee commented as he discharged the complaint.

The husband testified he had been separated from Mrs. Baker for years, did not support her, and that he admitted her into his home ot 1018½ South Vancouver Street after the operation because the daughter, Joan, had brought her there.

Deputy District Attorney John Galliano said he did not concur in Judge Condee's freeing the woman whereupon the jurist offered to wager $5 with him that no judge or jury would convict her.

About one hundred persons in the courtroom applauded when Mrs. Baker was told to go home. — Los Angeles *Herald-Express,* April 11.

Mother in Wheelchair Free in Chiseling Case

"I think it contrary to public policy to quibble over an affidavit made by a woman flat on her back in a hospital and under the influence of sedatives."

That statement from Municipal Judge Newcomb Condee brought cheers and applause from a crowded courtroom when he refused to hold for Superior Court trial Mrs. Blanche Baker, forty-four, brought into court in a wheelchair to be tried as a "charity chiseler."

Arrested and charged with technical perjury the day after she was discharged from General Hospital, Mrs. Baker was accompanied to court today by her twenty year old daughter, Joan Baker.

After calling witnesses to prove the technical charge that Mrs. Baker claimed, while ill in the hospital, that she had no one to support her, when, in truth, her estranged husband had a $150 a month job, Judge Condee dismissed the case.

Judge Condee expressed sharp disapproval of the practice of harassing and worrying sick persons in General Hospital by forcing them to answer questions and sign affidavits when hardly out of the operating room.

Albert Baker testified he had been estranged from his wife and did not support her but did support his daughter.

Mrs. Lee Phifer, 3053 Whittier Boulevard, testified Mrs. Baker came to her on March 5 ill and without funds and she had taken her in. Three days later, she said, Mrs. Baker collapsed with a hemorrhage and the landlady sent her to General Hospital despite Mrs. Baker's desire to go to a private hospital. — Los Angeles *Evening News,* March 11.

PRESS CLIPPINGS: ON MATTERS MEDICAL

Having Relationship to Scientific and Organized Medicine

Private Practice Brings Progress in United States Medicine

Chicago.—(By Science Service).—The United States has made greater progress in providing medical care for its people under the present system than any country that has abandoned that system and the nation should, therefore, hesitate to adopt any system that would give less progress toward good health.

That is the American Medical Association's answer to the report of Miss Josephine Roche, head of the Interdepartmental Committee to Coördinate Health and Welfare Activities of the United States Government. The report was just presented recently to the President. The American Medical Association has commented on it editorially in the *Journal.*

Miss Roche's report, in the opinion of the medical association's editor, says in effect that the answer "to the problem of medical care is sickness insurance and federal or other subsidy or both."

Failure of the authors of the report to mention the positive side of present American accomplishments in the field of medicine and health "gives their report a dismal tone beyond what the situation warrants," the medical association's editor comments. He adds:

"Our progress up to now, which is greater than that in any country that has abandoned our system in behalf of some socialized system of medical care, should cause hesitation in rejecting the pattern of progress that has brought such results, in favor of patterns that have been tried elsewhere with far less success."

Rockefeller Gifts Policy Liberalized

Rockefeller Groups Give Wider Scope for Use of Funds

New York, March 20.—(AP)—The Rockefeller Foundation and the General Education Board today announced adoption of a liberalizing policy to permit recipients of gifts to endowment funds to have wide discretion in their uses.

At the same time the foundation, created by the late John D. Rockefeller, disclosed its appropriations and authorizations in 1937 totaled roughly $5,000,000.

Look to Future

"These liberalizing provisions," said a preliminary report, written by Raymond B. Fosdick, president of the Foundation, "represent an attempt to free the future from frozen funds and 'tired' endowments, in the belief that the wisdom of this generation cannot be substituted for the wisdom of the next in the solution of problems hidden from our eyes.

"The endowments affected by these provisions amount to $51,000,000 given to date by the Rockefeller Foundation, and $148,000,000 given by the General Education Board."

Gifts Total

Rockefeller, who died in his ninety-eighth year on May 23, 1937, gave away about $530,000,000 before his death. He gave a total of $446,000,000 to establish four funds: The Rockefeller Institute for Medical Research, the General Education Board, the Rockefeller Foundation, and the Laura Spellman Rockefeller Memorial. In addition he had made individual contributions of about $84,000,000 for educational, religious, and charitable purposes.

"Specifically," the announcement said, "under a resolution passed by both boards in 1937, notification is sent to each recipient that it is the desire of the boards that the gift, 'whether the income only is spent or the principal as well, shall always be regarded as available for use in the broadest way so as best to promote the general purpose for which it was made.'

Provisions Outlined

"The notification contains the provisions outlined in general terms in the three succeeding paragraphs:

"1. Ten years after the date of the gift, the income from it may be used in whole or in part for some purpose other than that for which the gift was made, such purpose to be as reasonably related to the original purpose as may be found practicable at the time, having regard to intervening changing conditions.

"2. Beginning five years after the date of the gift 5 per cent of the principal of the fund may be used each year for any purpose for which income may then be used.

"3. After the expiration of twenty-five years, any part or the whole of the principal may be used for some other purpose, the new purpose—as in point one—to be as reasonably related to the original purpose as may be found practicable at the time, having regard to intervening changing conditions."

Money Spent

Since the founding of the four funds by Rockefeller, the announcement goes on, a total of $645,000,000 has been spent in eighty-eight different countries.

Explaining the liberalizing move, the announcement says Rockefeller himself "trusted the future."

"He did not think that benevolence and wisdom were confined to his generation. He was not under the illusion that what seems important today will necessarily be important tomorrow."—Los Angeles *Times,* March 21.

General Tax for Medical Care Urged

Federal Subsidy for Schools, Hospitals, and Laboratories Also Sought by United States Society

New York, April 4.—(AP)—General taxation to help pay for medical care and Government subsidy for medical schools, hospitals, and laboratories that "produce" medical

discoveries, were advocated today before the American College of Physicians, one of America's powerful medical societies.

An ideal was declared at issue, for which it was said only Government aid might suffice. This ideal is giving "the highest quality" of medical service, rather than merely "adequate" care.

The proposals were made by John P. Peters, M.D., of Yale University, secretary of the famous "Committee of 430" doctors which last November upset precedent with a declaration in "the lay press" that health is a direct concern of Government.

Health Problems

A breach which this threatened with the American Medical Association was reported healed last month when the association announced it would investigate all aspects of medical care.

Doctor Peters made a distinction between practice of medicine and its "production." Practicing doctors, he maintained, no longer produce much medicine. That is done mostly by "educational and research institutes and hospitals."

But he said practicing physicians offer solutions for health problems that overlook the production side. Meanwhile the medically productive institutions are reduced more and more to philanthropy for their funds.

"It is," said Doctor Peters, "in their complete neglect of the productive aspects of medicine that such measures as health insurance and ordinary coöperative organizations fail to meet the situation."

He declared that "governmental subsidy" is the only sound alternative yet discovered for this situation.—Los Angeles *Examiner*, April 7.

California Ranks Second in New Deal Cash

Report Shows How $32,000,000,000 Was Distributed in Recovery Drive in Nation

Washington, April 16.—(Exclusive)—A new report on the way nearly $32,000,000,000 worth of Federal cash and credit was distributed in less than five years in the New Deal effort to restore prosperity showed today that seven states have received more than one-third of the benefits from President Roosevelt's relief and recovery program.

The detailed accounting shows California standing second in the list of beneficiaries of New Deal outlays. . . .

California Benefits

Primarily because of the amounts borrowed from miscellaneous Federal agencies under different relief programs, California has received more money and credit from the Federal government than any other state except New York. Other states getting benefits in excess of $1,000,000,000 each are Illinois, Michigan, Ohio, Pennsylvania, and Texas.

From the time President Roosevelt entered the White House until the end of 1937, California received—in loans and grants to individuals, cities, counties, other political bodies and the State government—$1,884,759,607. In contrast, benefits to New York aggregated $3,008,440,820.

Not All Profit

While California stands next to the top among the chief beneficiaries, the State's share of the New Deal outlays is by no means all profit. California is expected to pay back more than any other state except New York. Also, the total includes $237,716,337 worth of Federal Housing Administration insurance on bank, insurance company, building and loan association, and other institutional advances to citizens.

From the standpoint of direct cash grants and expenditures, California ranks fourth, with New York, Pennsylvania, and Illinois receiving more outright benefits from the Federal Treasury.

Types of Aid

Total Federal expenditures credited to California, including eleven different major types of aid, are $866,266,057, against New York's $1,665,434,364.

This sum is broken down as follows:

Agricultural Adjustment Administration crop-curtailment and soil conservation payments, $26,816,242; Farm Security Administration grants, $807,471; Civil Works Administration grants, $38,752,560; Federal Emergency Relief Administration grants, $163,934,678; Civilian Conservation Corps expenses, $125,960,159; Bureau of Public Roads advances, $55,960,159; Social Security benefits, $32,178,990; Public Works Administration grants, $113,523,478; Works Progress Administration grants, $215,160,989; Reclamation Service expenses, $43,505,940; public buildings, $1,950,668; miscellaneous, $47,687,841.

Loan Figures

California has borrowed $780,777,213, the second largest amount of any state.

This is broken down as follows:

From the Reconstruction Finance Corporation, $387,409,766; Farm Credit Administration, $218,912,140; Commodity Credit Corporation, $1,831,161; Farm Security Administration, $4,030,354; Home Owners' Loan Corporation, $136,706,750; Public Works Administration, $23,547,115; Rural Electrification Administration, $1,483,000; Disaster Loan Corporation, $6,300; Federal Reserve Board, $6,850,627.

Besides lending this sum, the Federal government has underwritten $237,716,337 worth of loans made under the Federal housing program. Showing California has played a leading part in this effort to stimulate recovery, the report disclosed residents of the State have borrowed $78,059,815 for repairs and modernization of property and $159,656,522 to finance purchase of homes.—Los Angeles *Times*, April 17.

Cancer Death Slash Seen

Doctors Expect Reduction of Half

New York, March 25.—(AP)—Fifty per cent of the loss of life from cancer, second largest cause of American deaths, can be stopped with present medical treatments, the American Society for the Control of Cancer was told tonight.

The cut in half was predicted by Ellis Fischel, M.D., Chairman of the Missouri Cancer Commission. Furthermore, he said, Missouri is now going to show the world that this can be done. The annual deaths are 150,000 in the United States.

Backing for Doctor Fischel's record-breaking forecast came from United States Surgeon General Thomas Parran, M.D., speaking to the society by radio from Washington.

The best treatment now available, if used, he said, could save 25,000 lives annually. The potential number that could be saved, he added, would be greatly increased if diagnosis could be made earlier than at present.

The meeting was the twenty-fifth anniversary of the American Society for the Control of Cancer. It laid the blame for much of the loss of life in cancer to fear, ignorance, and public apathy. Cancer as a death cause is second only to heart disease, which takes more than 300,000 lives a year.

Doctor Fischel said that all over the United States cancer kills twice as many as tuberculosis. Nevertheless, only seven states "have taken on themselves any real responsibility." Other states care for feeble-minded, blind and tuberculous, he explained, but not cancer.

Missouri, one of the seven, he said, has sponsored lay cancer education, medical training to recognize cancer, and facilities for diagnosis and treatment.

If, he declared, the agencies fighting cancer fully understand these measures, work harmoniously and "use the knowledge we now possess, we can confidently expect a 50 per cent decrease in the annual death rate from cancer."

James Ewing, M.D., one of the half dozen foremost cancer authorities, proposed seven steps to fight cancer:

1.—Periodical examination.

2.—End of the misconception that cancer is a single disease.

3.—Quiet, scientific rather than emotional study of cancer.

4.—Emphasis that speed of cure differs in various stages.

5.—New ways of approaching the non-reading masses.

6.—More emphasis on prevention.

7.—A readable cancer book for laymen.

A new move to combat cancer, known as the Cured Cancer Club, was recognized at the celebration. Its president, Dr. Anna C. Palmer, who was cured of cancer eighteen years ago, said the club members are persons who have been cured for five or more years.

Their object is to convince the public that fear of cancer is exaggerated, but that vigilance is essential.—San Francisco *Examiner*, March 26.

CALIFORNIA'S CHILDREN LARGER AND TALLER

In the late fifties, Dr. Henry Gibbons, a pioneer physician and first president of the California State Board of Health, stated in a medical journal that babies born in his practice in California were much heavier and longer than those delivered by him when practicing medicine in eastern states.

In 1918, Children's Year, medical examinations of children were made by physicians throughout the country and their findings assembled by the Children's Bureau of Wash-

ington. Weighing and measuring were done carefully and records from all of the states were analyzed by Dr. Robert Woodbury of the Children's Bureau. He found that California infants were taller and heavier than those of other states.

A new study covering children of school age in California has been undertaken by Dr. Orren Lloyd-Jones in Los Angeles. He has found that California school children exceed in stature and weight any available published record of comparable groups elsewhere. His report, published in the bulletin of the Los Angeles Department of Physical Education, reads as follows:

"Many persons who have worked with school children have long believed that the children of California were bigger than those who lived in other parts of the country.

"The question is, do California living conditions stimulate body growth in children to a greater extent than do living conditions in eastern and middle western states? Doctor Lokrantz decided to bring forth evidence that would bear on the matter. Through the agency of the WPA, a massive amount of data has been collected and studied statistically.

"Merely to measure all California school children of a given age and compare them with a comparable group of the East would obscure in a measure any specific California influence. This is because children now in California schools have in large part come here from the East and have been subjected to the out-of-door life and perpetual sunshine of the environment for varying periods. One way to make a critical study would be to measure California native-born children alone, and to compare their average heights, age for age, with the heights of school children as recorded in other cities. Strange to say, there are available but very few published records comprising data of this kind with which we can compare the native-born California children. That is one reason why the whole subject has remained so long in the discussion phase and why a satisfactory 'show down' has been impossible.

"If, in truth, California climate is acting as any special influence on growth, it must be acting constantly though slowly. Its effect should be accumulative year by year as the growing child lives longer and longer in California. We sought for evidence of such cumulative effect, and we have devised a method to measure it. For example: assemble all the fifteen-year-old girls or boys in our schools who have been born outside the state; record for each one the date of coming to California; list these children in columns according to the number of years they have spent in California; in these columns set down the height of each child. We can now derive the average heights for each 'years in California' group. You readily see that we now have figures that will reveal any effect of an environmental influence which has been operating during residence in California. We can now not only compare the heights of the 'five years in California' with the 'ten years in California' group among fifteen-year-olds, but we can also compare each of these figures with the average heights of fifteen-year-olds who have been born in this State.

"Such studies we have made not only on fifteen-year-olds, but on each age from six to seventeen years. Altogether we have records of some 25,000 white children who have been born elsewhere and on some 50,000 white children who have been born in California.

"A detailed and critical analysis of these elaborate statistical tables will be made in a scientific paper in an appropriate place. At this time we are able to state that the average height of children of a given age born elsewhere than California is invariably less than the average height of California native-born children. Now consider the interrelationship of the 'several years in California' groups into which the 'born elsewhere' children have been subdivided as above described. For the fifteen-year-olds, for example, there are three such 'years in California' groups. We find that the shortest children are in general those who have dwelt in California five years or less. Slightly taller is the group who have lived here six to ten years. The tallest of the three groups is the 'eleven to fourteen years.' Yet remember that taller than any of these three groups is the 'born in California' average. And remember that we are dealing with averages and not individuals. It might well turn out to be a fact that the shortest fifteen-year-old in the California schools is a 'native-born Californian's' grandson of a Forty-niner; and that, towering among the tallest fifteen-year-olds is a youth only recently arrived from dingy Pittsburgh. These conditions might obtain without in any way reflecting on the statistical validity of our results.

CONCLUSIONS

"1. In the upper statures and ages of school children there is a definite increase in ratio of height to weight among California children.

"2. Average weight for height in school children of lower statures and ages has not been altered by residence in California.

"3. California school children of every age exceed in stature and weight any available published record of comparable groups elsewhere.

"4. California school children born in this state (*i. e.*, native born) exceed in stature and weight California school children born elsewhere of the same age.

"5. There is a definite positive correlation between length of body and length of stay in California when recorded in 'five-year-periods' within any school age."

"ASSOCIATED HOSPITAL SERVICE OF SOUTHERN CALIFORNIA"†

LESS THAN THREE CENTS A DAY FOR HOSPITAL CARE

When we are well the possibility that later we may have to go to a hospital seems remote. We forget that one family out of five on the average throughout the nation has a hospital case every year. If we knew in advance when we or a member of our family should go to a hospital, we might save enough to pay the bills, but usually there is no way of knowing this.

There is a common-sense way of being constantly prepared for hospital costs. This is the three cents a day plan.

Through this low cost plan, residents of Southern California may assure themselves of excellent hospital care in any one of more than twenty-eight member hospitals.

WHAT THIS PLAN OFFERS YOU

Every subscriber, including family members accepted by the plan, is entitled to any or all of these services when his own doctor says he must go to a hospital:

Hospital care for twenty-one days in one or more admissions each contract year.

Semi-private accommodations (a bed in two-, three-, or four-bed room).

General nursing care.

Meals and services of dietitian.

Routine medications and dressings.

Casts, splints, intravenous medications.

Surgery supplies and medications.

Use of operating rooms.

Use of cystoscopic rooms.

Use of labor and birth rooms and care of mother and baby for twelve days (after waiting period and other provisions of subscriber's contract).

Private room upon the payment of the difference between $5 and the daily rate of the room selected. Subscribers selecting a private room are entitled to the above services.

The above listed services will be rendered for any illness or injury except Workmen's Compensation Act cases, tuberculosis, quarantinable disease, mental disorder or alcoholism (as outlined in subscriber's contract).

SERVICES NOT INCLUDED

Services rendered by your physician or surgeon and his consultants or medical specialists and special private nurses are excluded.

The plan does not include services for conditions resulting from pregnancy during the first year of enrollment.

Out-patient services are not included.

† This is the first corporation to start operations in California under the Nonprofit Hospitalization Law enacted by the last California Legislature (A. B. 1132). See item in CALIFORNIA AND WESTERN MEDICINE, December, 1937, on page 434.

HOW MUCH OF ORDINARY HOSPITAL SERVICES DO YOU RECEIVE IN CASE OF ILLNESS OR ACCIDENT?

You receive practically all of these services without charge; the exception being those services rendered by medical specialists or consultants of your physician while you are in the hospital, such as the services of the physician administering the anesthetic, the roentgenologist and his technicians who make and interpret the x-ray films, the pathologist and his assistants who make and interpret the laboratory examinations. You pay these medical specialists for their services as you pay your attending physician, but you do not pay for the use of x-ray or laboratory rooms.

SAFEGUARDS FOR YOUR PROTECTION

The California State Insurance Commissioner has free access to the books of Associated Hospital Service of Southern California. Rates charged the subscriber are subject to his approval. All contracting hospitals are approved by the State Department of Public Health.

NONPROFIT

Associated Hospital Service of Southern California is a nonprofit corporation organized for the benefit of the community.

VACATIONISTS OR TRAVELERS

In case of accident or emergency illness while on vacation or while traveling outside of this area, benefits will be provided, but the cost of such service will be met only to the extent of payment up to the amount paid to member hospitals.

HOW TO JOIN

It will be noted that applications are accepted only in *groups*.

Enrollment in groups is necessary:

1. Because there is no physical examination of applicants.
2. So that the subscribers will represent a normal cross-section of the community, and the volume of hospital service they require will be no more than occurs annually among any average or normal group of persons.
3. To prevent abuse and to equalize risks.

Applications submitted individually cannot be accepted. Associated Hospital Service of Southern California will not form groups from individually submitted applications.

WHO MAY JOIN

Applicants must be:

1. In good health.
2. Not more than sixty-five years old.
3. Residents of the area served by our member hospitals.

Once a person's application is accepted at the age of sixty-five or less, he may continue as a subscriber.

The application form which every subscriber must sign contains the statement that he or she understands that the benefits of the plan do not apply if a definite need for hospital care is known at the time application is made.

A NONPROFIT SERVICE

This three cents a day community service is operated by the Associated Hospital Service of Southern California, a nonprofit corporation, organized under the provisions of a special act of the California State Legislature.

WHEN SUBSCRIBER GETS SERVICE

Accident or emergency illness: Immediately after your application has been accepted.

Other illness or injury: Immediately after your application has been accepted.

Hospital maternity care: Any time after husband and wife have been members for one year.

You receive service as soon as your physician decides that you need bed care in a hospital.

WHAT THIS COSTS YOU

Rates have been so established that the plan will operate on a self-sustaining basis. The plan does not depend on new enrollments to provide financial soundness.

Subscription charges are as follows:

1. Individual subscription, where 60 per cent of employees in a group are men.

Monthly	Quarterly	Semiannually	Annually
$.75	$2.60	$ 5.00	$ 9.00

2. Individual subscription, other groups than above.

Monthly	Quarterly	Semiannually	Annually
$.85	$2.75	$ 5.30	$10.00

3. Husband and wife.

Monthly	Quarterly	Semiannually	Annually
$1.50	$4.70	$ 9.20	$18.00

4. Husband, wife and all unmarried children under nineteen years of age.

Monthly	Quarterly	Semiannually	Annually
$2.00	$6.00	$12.20	$24.00

Monthly payments are accepted only through payroll deduction. Payments of the individual subscription rates except monthly may be made direct to Associated Hospital Service of Southern California by each subscriber upon written notice. An initial payment must accompany each application unless payroll deduction method is used.

FAMILIES IN PAYROLL GROUP GET LOW RATE

The seven cents a day service for whole families is available only to groups, and is limited to husband and wife, one of whom must be employed by the organization, and to all of their unmarried children under nineteen.

Other members of a family or household may enroll, provided their applications are submitted at the same time by another member of the family or household who is an employed subscriber.

METHOD OF ENROLLMENT

Each subscriber must sign an application form in duplicate made available through the coöperation of the employer for persons employed in organized groups. Others may obtain such application forms direct from Associated Hospital Service of Southern California. Applications must be submitted by employed groups.

Each subscriber will be furnished with a subscriber's certificate setting forth the benefits and conditions of the plan and bearing the date on which the subscription agreement becomes effective.

The subscription agreement with each subscriber covers the period of one year from its effective date, and from year to year thereafter, and does not mean a calendar year. The application of the subscriber and the subscriber's certificate issued as evidence of the acceptance of such application constitute the agreement with the subscriber.

OTHER FACTS YOU SHOULD KNOW ABOUT HOSPITAL PLAN

Size of Organization Where You Work

Less than twenty employees, but not less than five.

In small groups as above 100 per cent of employees must enroll.

Percentage of Group Required

In organizations of twenty or more employees 40 to 60 per cent must enroll, depending upon—

(1) Total number of employees.

(2) Percentage of women in the employed group.

Group Enrollment Only

(1) Individual subscribers are not taken. Everyone must enroll through employed groups.

(2) Members of the family can join only at the time wage earner in family joins.

(3) Monthly payments can be made only through your employer by payroll deduction method.

(4) Direct payments to Associated Hospital Service of Southern California can be made on a quarterly, semiannual or annual basis in advance.

(5) Employees or members of their families wishing to join after a group has been organized can join only under the following provisions:

(*a*) If they are new employees.

(*b*) By physical examination (cost to be paid by applicant).

(*c*) Additions to families.

Range of Costs

From 75 cents per month per individual to $2 a month for husband, wife and children. See schedule above.

Other Family Members

Members of family or household (other than wife or children), may join as individual subscribers by paying $2.75 quarterly; $5.30 semiannually or $10 annually (in advance) direct to Associated Hospital Service of Southern California.

No High Pressure

No agency or salesman is employed to solicit subscriptions on a commission basis.

Hospital Plan Set-Up

A fund is created from the regular and equal payments of subscription charges paid by subscribers, and is used for the sole purpose of paying their hospital bills.

HOW YOU ENTER HOSPITAL

When your doctor says you should go to the hospital, you and your doctor select a hospital where he is privileged to practice from Associated Hospital Service list of hospitals in Southern California. Your doctor will make the usual arrangements for your admission as a patient and when you arrive at the hospital you will give the hospital admitting officer your Associated Hospital Service identification card. There will be no embarrassing questions. You will be admitted without delay.

Only participating member hospitals are authorized to render service under this plan. Other hospitals may render such service only in event of accident or emergency illness occurring to the subscriber when more than fifty miles from a member hospital.

ENDORSEMENTS

Associated Hospital Service is endorsed and approved by the Los Angeles County Medical Association and the California Medical Association. It has the support of many large business organizations in Southern California.

* * *

Sacramento, Calif., March 2, 1938.

R. E. Heerman, President,
Associated Hospital Service of Southern California,
525 Chamber of Commerce Bldg.. Los Angeles.

Have just learned that you are now ready to operate under new legislation Assembly Bill 1,132 for group hospitalization in Southern California. This is a most worthwhile service to the community and I congratulate you on being the first organization in California to operate under this law.

Frank F. Merriam,
Governor of California.

* * *

Los Angeles, March 2, 1938.

Mr. R. E. Heerman, President,
Associated Hospital Service of Southern California,
Los Angeles, California.

Dear Mr. Heerman:

It has come to my attention that the Associated Hospital Service of Southern California, which has been organized in California for group hospitalization, has received its permit to operate on this basis from the California Insurance Commissioner and the Los Angeles Chamber of Commerce wishes to be one of the first to congratulate you and your organization upon this accomplishment.

We believe that such an institution properly handled, as we feel confident yours will be, will go far toward providing those facilities for individuals who in the past have not been able to obtain first-class and efficient hospitalization under competent hospital personnel.

We wish you and your organization every success.

Sincerely yours,
Los Angeles Chamber of Commerce,
W. S. Rosecrans, President.

SYPHILIS, A FORMER "HUSH-HUSH" DISEASE

It has become commonplace to speak of syphilis in public these days. How strange! Only a few years ago it was strictly a hush-hush disease. This is a good sign, for the decks are now cleared for action and the attack may be launched with all its force.

This was true about tuberculosis in the old days. When people stopped whispering "She's got consumption. Isn't it a shame?" and openly declared "She has tuberculosis. It's lucky she found out early," then the great white plague began to fold up its tent.

Surgeon-General Parran recently said he didn't know which was the worst tragedy, an unwanted baby or a syphilitic baby. It is a difficult decision to make, but at least the unwanted child may have a healthy body, while the syphilitic child faces life with a serious physical or mental handicap. Doctors have found that an adult can be cured of acquired syphilis in virtually 100 per cent of the cases if modern treatment is begun early and carried on long enough. But the child with congenital syphilis faces a much more gloomy outlook for the possibility of a cure. Congenital syphilis is much more resistant to treatment, and even at best a much lower percentage of cures can be achieved. However, with treatment, the condition of every child can be improved and destructive processes can be prevented or held in check.

The great tragedy of congenital syphilis is that it doesn't need to occur. More than ninety babies out of one hundred with syphilitic mothers will be born free from syphilis if their mothers begin treatment before the fifth month of pregnancy and keep it up.

The difficulty is that mothers refuse to have the simple test and to take treatment if they are found to have syphilis, and many doctors do not give the test. What can be done? Mothers refuse because they think of a test for syphilis as

* Office is in the Chamber of Commerce Building, 1151 South Broadway, Los Angeles. Telephone, PRospect 2579.

disgraceful. It is to them an insult by the doctor. They forget that much syphilis is acquired innocently. Perhaps they suspect syphilis and may wish to hide it, to their everlasting regret, if their child is born dead or diseased. Doctors too often do not ask their patients to have a test because they do not want to risk "hurt feelings." Seven states have made a stab right at the heart of the problem and now require that all couples present a certificate showing freedom from syphilis before a marriage license is issued. There is one loophole, however, in this procedure. Syphilis may be acquired after marriage but before the children come along. The only safe method of preventing congenital syphilis is to test each pregnant woman as early in pregnancy as possible and at least before the fifth month, and, if she is found to have syphilis, to give continuous treatment until the baby is born.

There is now pending before the New York State Legislature a bill requiring blood tests by law for expectant mothers as a protection against syphilis for them and their babies.* It has the backing of medical, civic, and health groups. If it passes, it should remove whatever stigma there is in the minds of mothers about taking a test for syphilis. Doctors need not apologize for asking their patients to have the test. All they need to say is "The law requires it for every mother."

Would not similar laws in all states be effective in saving thousands of babies from the ravages of congenital syphilis? Those who are interested in this proposed legislation for their states may secure copies of the New York State bill from the Maternity Center Association. "Briefs": Published by the Maternity Center Association, New York City.

CALIFORNIA BIRTHS IN 1937

There were 94,286 births registered in California last year, as compared with 84,460 in 1936, and 80,222 in 1935. The rates per thousand population were 14.4, 13.2, and 12.8 respectively. The 1937 rate of 14.4 is the highest that has been recorded in recent years. There were 14,064 more births registered in 1937 than in 1935. This represents an increase of 17.5 per cent.

While this increase in births is found in almost every community of the State, it is noticeable that in the San Joaquin Valley, where large numbers of migratory laborers have been present during the past two years, the increased number of births is particularly conspicuous. In the larger cities of the State, while the increase is noticeable, the rate of increase is not so great as that for the State as a whole. In San Francisco, Los Angeles, San Diego, Long Beach, Oakland, Sacramento, Pasadena, and Berkeley there were 42,647 births last year as compared with 36,495 in 1935. This represents an increase of 6,152, or 16.8 per cent. In the eight counties of the San Joaquin Valley where migratory laborers have been present in large numbers (San Joaquin, Stanislaus, Merced, Madera, Fresno, Kings, Tulare, and Kern counties), there were 12,402 births registered in 1937 as compared with 9,812 in 1935. This represents an increase of 2,590 or 26.4 per cent in those counties.

Births among members of the white race continued to show an increase in 1937. During that year, the percentage of white births was 82.3 per cent as compared with 80.8 per cent in 1936 and 80.4 per cent in 1935. The proportion of Mexican births was slightly lower in 1937. In that year 12.9 per cent of the total were Mexicans as compared with 14.4 per cent in 1936 and 14.7 per cent in 1935. A similar reduction is noted in Japanese births and a slight increase is noted in the proportion of Negro births. Births among Indian, Chinese, and other races remain at stationary levels. Out of the 94,286 births registered last year, 77,576 were whites, 12,173 Mexican, 1,534 Negro, 1,436 Japanese, 542 Chinese, 436 Indian, 377 Filipino, and 212 of other races.

The following table gives the number of births and the annual birth rate for the counties of California during the years, 1935, 1936, and 1937:

BIRTHS BY COUNTIES

	1937		1936		1935

HOW ORGANIZED NURSING LOOKS UPON NURSING HOURS*

Facts, Not Rumors Wanted.—Last year the Nursing Information Bureau of the American Nurses' Association adopted the policy of publishing a bulletin only when something urgent and important needed to be broadcast to registered nurses all over the country. Such a time seems to be here now!

Rumors and rumblings about the eight-hour day, not enough nurses to care for the sick, not enough students for nursing schools, inadequate preparation for nursing jobs, and unskilled services of various kinds, permeate the atmosphere of the nursing world and are seeping into that of the general world as well. But are they based on facts? Actual data can be found in current literature. Here are some of them.

* This bill was passed and is now a New York law.

* From *The Bulletin*, published for the American Nurses' Association, the National League of Nursing Education, and the National Organization for Public Health Nursing. (Vol. 9, No. 1, December, 1937.)

The Eight-Hour Day Is Here to Stay.—Hospitals, one by one the country over, are discovering that eight-hour service means better nursing service for patients and a more contented nursing personnel. Evidence is the fact that calls for eight-hour service are going up in number, and calls for nurses for twelve-hour service are on the wane. By December, 1937, 899 hospitals throughout the United States reported to the American Nurses' Association that they had adopted the eight-hour schedule for special nurses. This represents a steady increase in number since 1934, when only 278 had adopted it.

Why this comparison with conditions in 1934? Because at the biennial convention of that year, the American Nurses' Association proclaimed that, "In the interest of good nursing, we believe that nurses in caring for *acutely ill persons* should not be expected to work more than eight hours out of twenty-four." Since then, through intensive field work rendered by the American Nurses' Association headquarters staff, through the wide distribution of printed material, through illustrated talks and radio speeches, and through individual and group conferences, the American Nurses' Association has carried on an active educational program in behalf of the eight-hour day. State nurses' associations and their unit members have coöperated with the American Nurses' Association in this program and are pushing it forward so effectively that the combined efforts of national, state, and local groups are slowly but surely convincing all of the rightness of the eight-hour schedule.

Factors Affecting Employment of Nurses: Increased Demand for Nursing Service.—Between 1930 and 1935, the capacity of hospitals throughout the country increased by 119,270 beds.[1] And, for the last twenty-seven years, the capacity of hospitals has been increased by an average of 25,024 beds a year.[2]

Since 1932 the number of hospitals with schools which employ graduate nurses for bedside care has increased by 55 per cent.[3]

In 1934, according to registrars' reports to American Nurses' Association headquarters, 12 per cent of the nurses on call were unemployed all month; in 1936, only 2 per cent were unemployed all month.[4]

Also, in 1934, 25 per cent of the nurses on call reported twenty or more days'employment a month; in 1936, 34 per cent were employed twenty days or more a month.[4]

Economic Conditions.—Calls for private duty nurses for eight-hour service have increased from a monthly average of 41.91 per cent in 1934, to 59.84 per cent in 1936; while calls for twelve-hour service have decreased from a monthly average of 47.70 per cent in 1934, to 32.27 per cent in 1936.[5]

According to reports of registrars, "Registrants are unwilling to accept prevailing conditions of employment for general staff nursing."[6]

Nearly half of the directors of nursing schools employing general staff nurses who answered the National Information Bureau's fall questionnaire, believe that "low salaries" are largely responsible for their difficulty in securing general staff nurses. Other factors given are: long or broken hours of work; unsatisfactory living conditions; too heavy a load of work to permit good nursing.[7]

According to Joint Vocational Service, "low salaries" are largely responsible, also, for difficulty in securing well-qualified nurses for supervisory, teaching, and executive positions in public health nursing.

Staff Education Programs.—"In only 50 per cent of the hospitals (reporting) are the general staff nurses given the opportunity to attend regular staff conferences and to participate in discussions about the conduct and procedures of the nursing service."[7]

Basic Preparation of Nurses.—One of the requirements which nurses must meet in order to qualify for public health nursing positions, especially those created as a result of the Social Security Act, is: "Graduation from an accredited school of nursing connected with a hospital having a daily average of one hundred patients, or a minimum of fifty patients with one or more affiliations affording supplementary preparation." According to the League's 1935 list of schools meeting the minimum requirements set by law in the states, 363 schools were connected with hospitals having a daily average of less than fifty patients and 833 with hospitals having a daily average of less than one hundred patients.

A requirement for registration imposed by law in some of the states is that applicants must have completed a course of instruction in nursing covering not less than thirty-six months. In most states where this three-year law obtains, nurses who have not had a full three-year course cannot make up the deficiency in time through post-graduate work.

Do these factors which affect the employment of nurses hold true for your hospital, community, or state?

Are There Enough Qualified Nurses?—According to reliable sources, not enough qualified nurses are available for existing nursing positions. Directors of hospital nursing services report difficulty in securing a sufficient number of qualified nurses for general staff nursing positions.[8]

Registrars reported a one per cent increase in the number of unfilled calls in 1936 over 1935.[9]

The recent census of public health nurses shows that at present the ratio of public health nurses to population is 1:7000, while a desirable ratio is 1:2000.[10]

Joint Vocational Service reports a dearth of public health nurses well qualified for supervisory and teaching positions.

These statements apply to the country as a whole. What is the situation in your community?

Fall 1937 Enrollments.—The Nursing Information Bureau voices a large *Thank you* to all the directors of nursing schools who filled out and returned the questionnaires on fall enrollments in October. The findings from the questionnaire appeared in the December issue of the *American Journal of Nursing* under the title, "Student and Graduate Nurses—Are There Enough?" In a nutshell, the findings are:

1. More students enrolled in nursing schools in the fall of 1937 than in the fall of 1936.

2. However, the increase in admissions, 1937 versus 1936, was only one per cent, compared with a five per cent increase, 1936 versus 1935.

3. Nevertheless, 64 per cent of the schools were satisfied with the number of students enrolled; 36 per cent were not.

4. Fifteen per cent of the students enrolled in 1937 have had one or more years of college work, compared with 14 per cent in 1936.

5. And approximately two-thirds of the students who have completed high school only stand in the upper third of their classes.

6. Graduate staff nurses for general duty service are employed in 88 per cent of the hospitals connected with nursing schools which replied to the questionnaire. Their number totals approximately 20,500. In 1932, nearly two-thirds of the schools did not employ even one graduate nurse for bedside nursing.

7. In 55 per cent of these hospitals, directors of nursing services have experienced difficulty in securing qualified graduate staff nurses. In 45 per cent they have not.

8. Subsidiary workers, in the form of ward attendants, helpers or aides, are employed in 71 per cent of the hospitals replying to the questionnaire. The actual number so employed in these institutions is 13,562.

The Accrediting Committee Acts.—The Committee on Accrediting of the National League of Nursing Education

10 P. H. N., p. 651, November, 1937.

has swung into action. At a meeting of its Executive Committee on October 30, it was decided that the coming year is to be spent developing accrediting criteria, testing their application in a limited number of representative schools, and making studies of the costs of surveys which are a necessary part of the committee's work. The expense of this first year's work will be borne by the Accrediting Committee.[11]

The central aim of the committee, of course, is "to stimulate, through accrediting practices, the general improvement of nursing education and nursing practice in the United States." Other aims include "helping those responsible for the administration of schools of nursing to improve their schools, publishing a list of accredited schools, and promoting interstate relationships in the professional registration of nurses."[11]

Excerpts from the Curriculum Guide.—The Curriculum Guide for Schools of Nursing is proving itself a professional best seller. It was completed in July, and 4,000 copies of it have already been sold. This book may be purchased from the National League of Nursing Education, 50 West Fiftieth Street, New York City, for $3.50.

What are its purposes and recommendations? Here are some of them: "The League's primary objective in preparing and publishing its Curriculum has been to encourage schools to study their own educational problems and to provide guidance to those interested in revising or building curricula for their nursing schools."[12]

Should nurses be trained or educated? The answer is for you to give. The Curriculum Guide states, however: "Training is a matter of fixing habits and skills by a process of repetition so that when a given situation presents itself a certain definite response will automatically result. . . . Where training methods predominate, the tendency is to emphasize obedience to the orders of others and to demand conformity to certain prescribed patterns of thought and behavior, to stress the practical utilitarian types of habits and skills, and to pay little attention to intellectual and social skills or to the development of personality. Education, as contrasted with training, is concerned with the growth of the whole individual. While it includes training and discipline, it emphasizes the control of habit by intelligence and the variation of responses to meet the demands of each situation."[13]

"If the main aim of nursing is to help the patient regain and maintain health . . . and if in certain cases activities such as cleaning the room, bathing the patient, taking temperatures, and serving diets, can be carried on by a non-professional person in such a way as to achieve these results satisfactorily, such duties should be assigned to those who can do them at the lowest cost commensurate with good results."[14]

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 5, May, 1913

From Some Editorial Notes:

Who Are Your Friends?—There are a number of people who have been pretty good friends of yours; it is beside the question that they are working for their own reasonable profit. They have helped you to build up your JOURNAL and they make it possible for you to have a journal of the size and make-up of the STATE JOURNAL. Do you trade with your friends, other things being equal, or do you not? Did you ever stop to think that there is scarcely a thing that you need to buy, from green soap to groceries, from surgical instruments to sermons in print, and that there is not an institution to which you may wish to send a patient, that is not advertised in your JOURNAL? If you do not believe this—and there are always some who will not believe without evidence—just look carefully through the advertising pages and you will be convinced. In these pages your friends, your advertisers, present for your notice and attention a great variety of wares; all are good and reliable, or they would not be there. Recognize your friends when you see them and deal with them as they deal with you.

* * *

The Annual Meeting at Oakland.—The forty-third annual meeting of the State Society, held at Oakland April 15, 16 and 17, was a great success. It is not possible to print all the reports, minutes, etc., in this issue of the JOURNAL, and so they will all be held back and the whole story will be printed in the June number. The registration was the largest in the history of the Society—618.

The officers elected for the year are as follows: President, F. C. E. Mattison, Pasadena; first vice-president, Barton J. Powell, Stockton; second vice-president, George Tucker, Riverside; secretary, Philip Mills Jones, San Francisco; councilors, George H. Kress, C. G. Kenyon, J. H. Parkinson, O. D. Hamlin.

* * *

A Most Valuable Book.—Beginning, some seven years ago, as a very small pamphlet, the annual edition of "New and Nonofficial Remedies" has grown till the edition for 1913 has indeed reached a most respectable size. It is a book that should be on the desk of every physician who ever writes a prescription. It is difficult enough, even with all the tremendously valuable work that the Council on Pharmacy and Chemistry of the American Medical Association has done for us, to tell those remedies which are decently and honestly made and marketed from those that are not; it is impossible to do so without frequently consulting this book.

* * *

On a New Kind of Surgical Literature.—It is time that the eye of reprobation be more specifically directed toward a new and regrettable departure in surgical literature. Certain publications have appeared in the near past whose purpose appears to be the exploiting of the surgical, and especially the operative skill of their authors, without permitting us to judge with any degree of certainty for ourselves of the quality of those virtues. Proclaiming themselves greatly sired, these books are in nowise great.

* * *

The American Royal College of Surgeons—J. B. M.—In this fair month of May, in the good city of Washington, is to be held a most remarkable meeting for the purpose of conferring upon American surgeons (query: who—or what—is a surgeon?) a collection of letters indicative of some title, both title and string of letters being subjects for discussion. Martin (of *Surgery, Gynecology and Ob-*

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.
Secretary-Treasurer

News

"Attorney-General U. S. Webb, in an opinion to State Insurance Commissioner Samuel Carpenter, today said that the National Protective Association of Los Angeles is taking in members on a contract which violates a previous ruling that corporations cannot engage in the practice of medicine. . . ." (Sacramento *Bee,* March 24, 1938.)

"The Association of Western Hospitals and the Western Conference of the Catholic Hospital Association were on record today in opposition to anticipated legislation which would force public hospitals supported by taxation to throw open their doors to any patient, regardless of his ability to pay for private hospitalization. . . ." (Oakland *Tribune,* March 4, 1938.)

"A. I. Stewart of Pasadena is the new State Director of Professional and Vocational Standards. His appointment to the $6,000 a year cabinet post was announced last night by Governor Frank F. Merriam, the statement describing the new state officer as a past president of the California League of Municipalities. Stewart will enter the Governor's cabinet as the successor of William G. Bonelli of Los Angeles, resigned to accept a Merriam appointment to the State Board of Equalization." (Sacramento *Bee,* April 7, 1938.)

Report of the Investigation Department relates that Ernest George Wollenweber, M. D., said to have been a former practitioner of Iowa, recently pleaded guilty to one of four counts of violation of the Business and Professions Code and was sentenced to serve ninety days in the county jail and to pay a fine of $100, jail commitment being suspended, as well as $50 of the fine, on condition that he in future abstain from violating any of the laws of the State of California. He is reported to have come to this state and associated himself with a licensed California physician, without even the formality of applying for a license to practice in this state.

Recent reports from Topeka, Kansas, related that an impostor, known as J. Therman Steele (and with a host of aliases), had recently been imposing upon the medical practitioners of that state, issuing fraudulent checks. He was apprehended in Los Angeles, where the police found he had quite a criminal record, and has been returned to Topeka, Kansas, for trial. He is just another of the host of impostors who prey upon the medical profession by false claims of medical education and licensure.

Olea Moreno, alias Cleopas O. Marino, recently charged in Imperial County with alleged violation of the Business and Professions Code, was said to have been imposing upon the inhabitants of Imperial County. Among his asserted credentials was a framed certificate bearing the caption "International Spiritualist Union, Omaha, Nebraska." This certificate was said to empower him to perform the marriage ceremony, conduct burial service, make reasonable charge therefor, and "to exercise all other functions usually granted in the rite of ordination." Our investigator reported "one case in which there is not ample evidence to support it, is that of a Mexican woman, who suffered from appendicitis. He ordered four people to hold this woman over a flame, the flame touching her abdomen. This was said to have been done in his so-called temple. He said he would burn out the evil spirits."

ONLY THESE SOLUTIONS ARE VACOLITER PROTECTED

B A X T E R ' S

INTRAVENOUS SOLUTIONS IN VACOLITERS

You can have Baxter quality for your money

Whatever you are spending now . . . whether it is five hundred dollars or five thousand dollars . . . for intravenous solutions . . . you can have Baxter quality . . . Baxter convenience . . . and at the same time, keep your costs in line.

Consequently, when you specify Baxter's Dextrose and Saline Solutions in Vacoliters you are, in reality, getting much more than fine intravenous solutions: you are getting the unique Vacoliter which protects the tested purity of your Baxter's solutions . . . the line of fine service accessories . . . the collective experience of a highly trained group of laboratory experts . . . all these are yours. All these are the *extra* services that make Baxter's Dextrose and Saline Solutions pure and sterile . . . convenient and economical to use.

How do you do it all?

Tonight, Doctor, after the last patient has gone, when the day's trying cases have been reviewed and recorded, when all that life has piled on tired and willing shoulders has had its will of you . . .

. . . we ask that you sink into an easy chair and let the old fighting chin rest on your necktie and *think* the whole long evening through on these questions:

How *do* you do it all?

Is all you do *worth* the doing?

Do you ever rest? travel? play golf? Do you ever *work* in your study on pet theories? Do you ever find time to *write* the priceless things you know?

Shouldn't you do *all* of these? Would you? if you could? Isn't it truth that little, *inconsequential* things are barriers to the finer things you would love to do?

In our files, in our memories, we will find for you *some day* (the day you ask us to), a man, a physician, a man who'd be release for you to *hours* and *days* and *weeks* and *years* . . . to do with as you will.

We would find a man to come to you to do gladly the things you call *beginners'* tasks; tasks that take your years and make them *less* than you would make them; tasks that give *him* skills and poise and judgment that come only from doing.

The plan would give you TIME . . . *years* . . . to do with as you will . . . to lengthen life, to make it sweeter, to make it give the *greater* things. . . .

Will you write us . . . soon. . . .

Our BOOTH at the meeting of the

California State Medical Meeting, May 9–12, is number fourteen

Rabies in Wild Animals in California.*—There is no direct evidence as to when rabies first appeared within California, but Dr. George Lyman in his book, "John Marsh, Pioneer," refers to the presence of rabies in dogs and to cases of hydrophobia" cared for by Doctor Marsh in the early forties. This pioneer physician lived in the vicinity of the present community of Brentwood, in Contra Costa County, and he was the only practitioner of medicine in this extremely sparsely populated district. He is known to have traveled at least seventy-five miles in order to care for patients in his extensive practice.

In 1909, a school teacher of Morgan Hill, in Santa Clara County, went on an outing with three young boys to Coyote Creek, several miles east of Morgan Hill. The three boys were bathing in the stream when a lioness appeared suddenly, attacking one of the boys, striking him with her claws and leaving wounds in his scalp and ear. The teacher ran to his assistance and the animal jumped upon her, knocking her down. In an effort to prevent attacks on her head and face, she raised her left arm and attempted to jab the lioness with a hatpin. The teacher was badly wounded, her left arm being mangled from bites and scratches, with gashes on the right arm, leg, and back. There were also scratches and abrasions on her head and face. Seven weeks later, after an apparently uneventful recovery, the woman was taken violently ill with spectacular symptoms and died within one week. The boy, who was first attacked by the lioness, returned to his home in Santa Cruz, where he died, with the cause of death pronounced as tetanus.

These cases were brought to public attention in 1923 by Dr. Tracy I. Storer, now professor of Zoölogy in the University of California College of Agriculture at Davis. Fourteen years after the occurrence, he painstakingly resurrected all the presumptive data, including reports of physicians who had attended one of the cases. It was agreed that the cause of death was rabies, and not tetanus. The incubation periods and other factors virtually proved the diagnosis. At that time, laboratory service for the diagnosis of rabies was not readily available; and, while the evidence is purely circumstantial, there is every indication that the mountain lion that attacked these individuals was suffering from rabies.

The first recorded appearance of rabies in California dogs was in Pasadena in 1899. At various times suspected cases in wild animals were reported after 1899; but it was not until 1915, when an extensive outbreak of the disease occurred in Modoc and Lassen counties, that the prevalence of rabies in the wild animals of California was proved. The reports of rabies in northeastern California in 1915 included the following comments relative to rabies in coyotes:

"One coyote came into a rancher's yard, passed through a flock of turkeys, apparently without noticing them, and was killed by the rancher at his very doorstep.

"Another one came into the yard, biting and attacking several chickens, snapping at everything he saw, and after being killed it was found that his stomach contained nothing but bits of wood.

For Acidity and Allied Conditions, we suggest
ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS
By PROF. SYDNEY A. TIBBETTS, *Berkeley*

ADAMS SPRINGS, LAKE COUNTY, CALIFORNIA

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

(Continued from Preceding Page)

"Mr. Sans, of the United States Biological Survey, reports that several trains in Nevada have recently run over six coyotes that, at different times, had gotten on the tracks while biting and snapping at the locomotive.

"While in an automobile in the Surprise Valley, Mr. Sans states that he passed a herd of cattle and saw a coyote in the midst of the herd, biting and snapping at the cattle. When he stopped the machine, the coyote ran at it and was shot while within ten feet of the machine. This head, upon examination, proved positive for rabies. Five animals in the herd died of the disease.

"In another instance, a coyote chased a boy into the yard. He slammed the gate just in time to save himself, and the coyote began to gnaw and bite at the pickets. It was shot, and upon bacterial examination the case proved positive for rabies.

"In another place, a coyote ran into a railroad roundhouse and attacked an employee. It was killed before biting the man. This case was proved bacteriologically also.

"A government surveyor in Nevada was bitten at night by a coyote that ran into his tent. An examination of this animal's head also proved that it was a positive case of rabies.

"In a small town in Nevada, a coyote ran into a bunkhouse, jumped on a man's bed, tearing and biting at the covers. The man saved himself by pulling the covers over his head and calling for help. Before the coyote was killed, four dogs, three hogs, and one horse were bitten, and later died of rabies."

During the past fifteen years, 1922 to 1937, cases of rabies in the following numbers of wild animals have been reported to the California State Department of Public Health:

Coyotes	25
Skunks	5
Foxes	2
Raccoons	2

It is reasonable to assume that many cases of rabies have occurred in wild animals, and that these figures represent only a few of the cases that have actually occurred. It would seem, in fact, that rabies is primarily a disease of wild animals and that the dog population has contracted the disease through contact with carnivorous animals living in the wild.

The recent occurrence of rabies in a "bobcat" in Colusa County indicates the importance of observing possible cases of rabies in wild animals at the present time. In this instance, a wildcat is said to have suddenly appeared from a roadside and leaped upon the hood of a school bus carrying seven children. The animal scratched and tore at the windshield before falling from the machine. It is said to have sunk its teeth into one of the front tires and was rendered unconscious by the force of its contact with the front wheel of the bus. One of the older students cut the throat of the animal with his pocket knife. The head was sent to the State Laboratory for examination, where positive results were obtained. Because of the fact that the boy's hands bore abrasions, he is being given the Pasteur treatment for the prevention of rabies.

Reports of suspected cases in mountain lions in several districts of the state have been received recently, and there would seem to be justification at the present time for taking proper safeguards against attacks by rabid animals in the outlying districts of the state. Ordinarily, wild animals shun man and his habitations; but when rabies is epidemic it is safer to exercise ordinary precautions against attacks.

Cancer Exhibit of the New York World's Fair, 1939. Hope for the thousands throughout the world afflicted by cancer, with dramatic demonstrations by dioramas of what science is accomplishing in fighting the scourge, is the theme of an exhibit to be made at the New York World's Fair in 1939 by the New York City Cancer Committee of the American Society for the Control of Cancer.

Contract for 500 square feet of display space in the exposition's $400,000 Medicine and Public Health Building was signed on March 18 by Dr. Francis Carter Wood, Di-

●

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

III. EXHAUSTING OR PREHEATING

● Modern canning procedures provide for the exclusion from the sealed container of air, and other gases present in raw food material, to the greatest possible degree.

In the sealed can, oxygen, in particular, is undesirable, whether it be released from food cells or be present in the form of entrapped air. If present in the sealed tin container, oxygen can react with the food and the interior of the can and directly affect the quality, nutritive value and merchantable life of the canned food. Other gases—for example, carbon dioxide produced by cellular respiration—should also be excluded as far as is practical. If present in large amounts, these gases may place undue strain on the container during the heat process to which canned foods are subjected.

In commercial canning practice, certain operations—specifically the blanch—may aid in elimination of gases from raw food tissues. However, main dependence is placed upon what are known as "exhausting" or "preheating" operations, not only to expel gases from raw foods, but also to exclude air from the can.

Briefly, the exhausting operation is accomplished by mechanically passing the open can containing the raw food through a so-called "exhaust box" in which hot water or steam is used to expand the food by heat and drive out air and other gases contained in the food and in the can. The times and temperatures used in commercial exhausting operations will naturally vary with the nature of the product (1).

After exhausting, the can is immediately permanently sealed, heat processed and cooled. During cooling, the contraction of the heated contents of the can creates the vacuum normally present in commercially canned foods.

With certain products, instead of exhausting as described above, the same effect is produced by preheating the food in kettles or similar devices; filling into the cans while still hot; and immediately sealing the containers. With still other products, an exhausting effect is produced by adding boiling water, syrup or brines to the food in the can. In some instances, exhausting is accomplished by mechanical rather than by thermal means. Specially designed sealing or "closing" machines are used to withdraw air and other gases by applying high vacuum to the can and immediately sealing on the cover.

Such in brief are the purposes of commercial exhausting operations and the means by which they are usually accomplished. Modern canners recognize that these operations are most important to the success of their canning procedures. They appreciate that only by strict supervision and control of exhausting operations can the quality and nutritive values of their products be maintained at a consistently high level.

AMERICAN CAN COMPANY

230 Park Avenue, New York, N. Y.

(1) Appertizing or The Art of Canning", A. W. Bitting, The Trade Pressroom, San Francisco, 1937.

This is the thirty-sixth in a series of monthly articles, which will summarize, for your convenience, the conclusions about canned foods which authorities in nutritional research have reached. We want to make this series valuable to you, and so we ask your help. Will you tell us on a post card addressed to the American Can Company, New York, N. Y., what phases of canned foods knowledge are of greatest interest to you? Your suggestions will determine the subject matter of future articles.

The Seal of Acceptance denotes that the statements in this advertisement are acceptable to the Council on Foods of the American Medical Association.

rector of the Institute for Cancer Research, Columbia University, and Grover A. Whalen, President of the Fair Corporation, in the latter's office in the Empire State Building.

The contract is the first to be signed for exhibit space in the Medicine and Public Health Building, which is now built and will be ready for inspection by visitors on the occasion of the Fair's great Motorcade and Preview on April 30 next, just a year to the day before the exposition gates are to be opened.

In explanation of the intent of the exhibit, Dr. John C. A. Gerster, Chairman of the New York City Cancer Committee, said:

"The exhibit will include a presentation of the powerful weapons which can be used in the war to conquer the disease, which takes an annual toll of more than 140,000 lives in this country.

"The plan is to give the public an opportunity to study a cancer exhibit primarily designed to make people conscious of the fact that cancer, if adequately treated in time, is curable in a large percentage of cases.

"It will be pointed out that the three recognized forms of treatment are: surgery, x-ray and radium, and that the public must do its share in acquiring knowledge necessary to fight the disease. The keynote of the exhibit is to be Hope—which, after all, is the basis of the entire program in cancer education."

Among the dioramic presentations to be made in the treatment category will be an exact reproduction in miniature of the Paris laboratory of Marie and Pierre Curie where, in 1898, they discovered radium. The model, with lifelike figures of M. Curie and his wife, will show them at their work bench, intently watching a substance which glows, in symbolism of their tremendous discovery. Beside the diorama is to be shown the identical watch belonging to Mme. Curie by which the time of radium dosage was originally determined. Supplemental models will show how radium is mined and refined in Canada and the Belgian Congo.

Another diorama is to be a similar reproduction of the laboratory of Wilhelm Konrad Roentgen in Wurzburg, Bavaria, in which, in 1895, the great physicist, made his startling discovery of the x-ray. A spark in a diminutive tube is to indicate the discovery.

In the case of each of these dioramas, the equipment is to be identical with that used by the scientists, these having been contrived from measurements, diagrams, and photographs of the originals. There will be, in addition, a full-size reproduction of the x-ray tube used by Roentgen.

As deep x-ray therapy has become one of the agencies in treating cancer, the exhibit is to include a model of the 1,000,000-volt x-ray machine designed by Doctor Wood and used by him in giving treatments at Presbyterian Hospital, and also one of the 400,000-volt machines used generally in hospital practice.

In the field of surgery in treatment of cancer, the dioramas are to be equally dramatic. One will present a scene in ancient Babylonia, with sick persons on stretchers and the general public gathered about eager to give advice; another will show a medieval hospital, where only the most simple needs could be met. Nearby, a barber-surgeon of the sixteenth century, with his "magic wand" for diagnosis, and propensity for cupping and leeching and little other knowledge, is to be shown.

Coming down the years, dioramas are to portray the plague doctor and the crude surgical practices of the seventeenth century, and, in sharp contrast, the well-equipped operating room of today, with its advantages of anesthetics and of antiseptics resulting from the studies of Pasteur and Lister.

The life-size figure of a woman etched on glass and lighted from the back will be shown to reveal the manner in which cancer may spread through the body if not properly diagnosed and treated in time. A motion picture, prepared under direction of Doctor Wood, is to tell the story of experimental work in cancer, illustrating the method of inoculating mice and rats with the disease and how the

progress of the infection is watched and studied. Also, cancer statistics from one hundred countries are to be displayed to show that the disease is a world problem.

The Treatment of Syphilis Versus Treatment of Wassermann Reactions.—Dr. Matthias Nicoll, Jr., Commissioner of Health, Westchester County, New York State, discussed recently, in the bulletin issued by his department, the significance of the Wassermann reaction as an index to the presence of syphilis. He said:

It is generally accepted that a Wassermann reaction denotes active syphilitic infection except in the presence of malaria, leprosy, yaws (which may or may not be a form of syphilis) and certain acute febrile states. However, this is an assumption and not a proven fact. There are those who believe the Wassermann reaction in late syphilis is of no more significance than a tuberculin reaction in tuberculosis, that it has little, if any, bearing on the present activity of the underlying disease, although its presence unquestionably demands a thorough physical overhauling of the patient, with special attention to the central nervous system (including the eye grounds) and the cardio-vascular system.

In the management of cases of syphilis, he said:

Treatment of the early case of syphilis is relatively easy. As a rule, such patients respond quickly to treatment and serological as well as clinical cure usually results within two years. But the old case of syphilis who may have been infected five or more years previously is a decidedly different problem. If spinal fluid findings are negative, the eye grounds are normal, the cardio-vascular system is negative and there are no manifestations of syphilis other than a Wassermann reaction, a similar course of two years' continuous treatment using both arsenicals and heavy metal should suffice. If the Wassermann test remains positive (as it probably will), well and good. Let the physician and the patient forget it. It is extremely doubtful that the latter will develop subsequently any late manifestation of the disease and his life expectancy will probably not be increased by treatment.

Motor Vehicles Checked for Poisonous Gases.—Honk! honk! A giant truck with red cab, red trailer, and house-high superstructure roars around the bend on the ribbon-like highway and starts to climb the grade over California's famed Tehachapi Pass. This is only one of thousands of such vehicles that carry the state's agricultural crops and merchandise of all sorts from north to south and south to north. Like slow-crawling dragons they creep over the mountain passes, smoke emitting from their Diesel motors, and pale exhaust gases from those equipped with standard motors.

At a small depression in the mountains where there is a short stretch of nearly level highway, stand a highway patrolman and a young doctor with strange-looking boxes that contain scientific equipment. The patrolman signals the truck driver, and the Leviathan comes to a slow stop. The head of the driver leans out of the half-open cab window.

"What's wrong, Buddy? I'm not overweight."

"Nothing wrong, yet," responds the patrolman. This doctor is from the State Department of Public Health and he wants to test your bus for poisonous gases in the exhaust, to find out if you're in danger of passing out."

"O. K.! Glad to find out about that. Sometimes I get sleepy going over the hump. The steady roar of the old motor sort of puts you to sleep, but sometimes I think that the sleepiness when I'm on the grade has a headache along with it and I don't feel so good."

"We'll find out about that," says the young doctor. "I'll put my instruments on your floor board, get in the cab with you, and make the test while you are running. It wouldn't be a fair test if we were at a standstill with your motor running. We might get unreliable readings because of leakage of gases through cracks between the floor boards."

"What gas is it that is so poisonous?" asks the driver.

"Carbon monoxid," replied the doctor. "The same old CO that used to cause so many deaths in the days of artificially manufactured domestic and illuminating gas. It is released in the combustion of gasoline and, while it is very

dangerous, it is impossible to recognize its presence except through a scientific test such as this. The gas is colorless, odorless, and in sufficient quantity might produce death without the victim ever knowing what happened to him. In small quantities it may produce drowsiness, headache, nausea, dizziness, weakness, or difficult breathing."

The doctor rode in the cab with the driver for several miles—a five-minute run—at the end of which time he took readings from his instruments to measure the carbon monoxid in the atmosphere.

"Well, Doc, what's the answer?" asked the driver.

"You are exposed to a dangerous concentration of carbon monoxid—150 parts per million. The presence of more than 100 parts per million constitutes a serious health hazard. No doubt your drowsiness and headaches were due to this exposure. Many accidents supposed to be due to a sleepy driver are actually due to carbon monoxid poisoning. You'd better find the mechanical defect that causes this concentration of gas."

"I know right now," replied the driver. "The exhaust pipe gasket blew out a month ago and I didn't have any repairs made because I didn't regard it as necessary. I'm going to get a new gasket installed at the next stop. Thanks for the test, Doctor. No more headaches for me!"

During the past month the California State Department of Public Health Industrial Hygiene Service has, in cooperation with the State Highway Patrol, tested 688 motor vehicles for the determination of carbon monoxid. They were distributed as follows:

Truckee and Donner Grade	70
Dunsmuir	134
Altamont Pass	191
El Tejon Grade (Ridge Route)	154
San Gorgonio Grade (Banning)	139
Total	688

Of these, the drivers of twenty-four vehicles (or 3.47 per cent of the total) were found to have been exposed to

DIET

When the impulse to defecate is lessened due to improper diet or lack of discipline, the fecal matter usually becomes dehydrated and impacted in the bowel . . . To simplify the problem of bowel regularity, Petrolagar may be prescribed to advantage, as it assists in the regulation of bowel movement. Petrolagar mixes intimately with the bulk of the stool to induce a soft, easily passed mass. By reason of its pleasant taste and mild but thorough action, Petrolagar is agreeable to patients of all ages. Five types of Petrolagar provide a choice of laxative medication suitable for the individual patient. Petrolagar Laboratories, Inc., 8134 McCormick Blvd., Chicago, Ill.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

dangerous concentrations of carbon monoxid while operating vehicles on the highway.

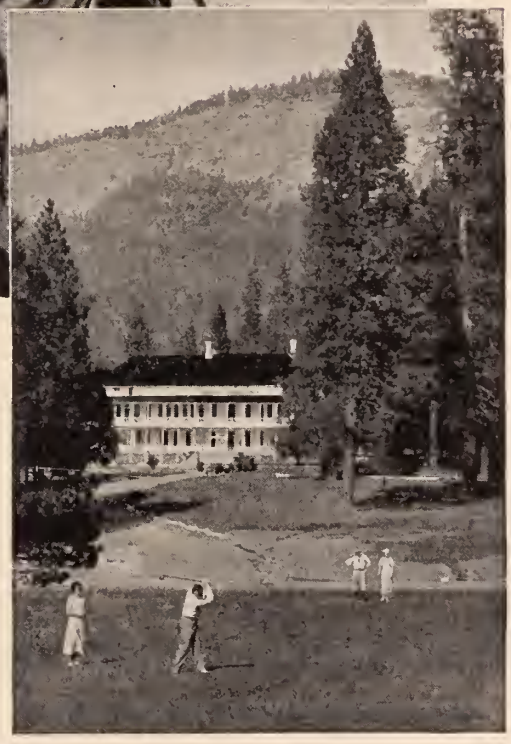
These investigations, undertaken by Dr. J. P. Russell of the Industrial Hygiene Service of the California State Department of Public Health, will be continued during the coming weeks. Drivers of motor vehicles, in order to play safe, should always keep car windows open while driving. If drowsiness and headache occur, it is safer to have the mechanical equipment checked and corrected, if found faulty, than to take a chance of incurring an accident or serious illness by carbon monoxid poisoning.

Eye Hazards in Industry.—The eye hazards in industry constitute one of the principal causes of blindness in America. Every year hundreds of men and women lose their sight, and thousands of others suffer serious eye injuries, through occupational accidents.

It is estimated that the industries of America would save $50,000,000 a year if known methods of eliminating eye accident hazards were conscientiously observed by employers and employees. Aside from the humanitarian aspect, it is cheaper to prevent accidents than to pay for them.

When an individual worker—man or woman—suffers a serious eye injury, a long chain of costly interruption of work ensues.

One cannot estimate in terms of dollars, of course, the tragedy that enters every home in which a person has been blinded or has lost part of his sight permanently.



What are the eye hazards in industry? Briefly, they are the accident hazards, the disease hazards, and the hazards of excessive eye fatigue. The accident hazards are produced chiefly by flying chips of metal, wood, rock, or other hard substances; by falling or thrown tools, raw materials, and other large objects; by the splashing of molten metal or injurious chemicals. Disease hazards affecting the eyes with which industry is or should be concerned are the venereal diseases, trachoma, cataract, nystagmus, and the general toxic effects of those poisonous chemicals commonly

used in many industries which may affect the eyes as well as other organs. The hazards of excessive eye fatigue are those due to insufficient light, too much light (glare), flickering light, or too long neglect of eye conditions requiring refraction or other corrective measures.

The accident hazards are, of course, the most serious of all these. How can these hazards be eliminated or their effects counteracted? Briefly, they can be prevented in three ways: (1) by the provision of protective equipment, such as goggles and head masks for individual workmen, screens of metal, wood or canvas between workmen and glass shields or other approved protective devices at the point of operation of emery wheels and other machines, operation of which is attended by flying particles, or splashing of molten metal, or injurious chemicals; (2) by revision of the process of work, by redesign of tools and machines, by rearrangement of machines and other plant equipment; and (3) by rules of work, by supervision, training and education in safe practices of workmen and foremen.

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

TREATMENT OF BRONCHIAL ASTHMA BY ORAL INHALATION

ADRENALIN CHLORIDE SOLUTION 1:100

THE oral inhalation of Adrenalin Chloride Solution 1:100 is promptly effective in relieving symptoms of bronchial asthma—in most cases results have been quite as satisfactory as those following hypodermic injection of the familiar 1:1000 solution. Nervousness and tachycardia, as well as other reactions which often accompany parenteral administration, are much less frequent following inhalation therapy. Discomfort and inconvenience of hypodermic injection are obviated by this new treatment.

Adrenalin is the Parke-Davis brand of Epinephrine U.S.P. Adrenalin Chloride Solution 1:100 is accepted by the Council on Pharmacy and Chemistry of the American Medical Association; it is supplied in 5-cc. vials, together with dropper for transferring the solution to a suitable atomizer, vaporizer, or nebulizer. The apparatus used must deliver a fine spray entirely free from drops.

PARKE, DAVIS & COMPANY · DETROIT

The World's Largest Makers of Pharmaceutical and Biological Products

Now only one dose given at each visit

Cutter Phase I concentrate pertussis vaccine contains the same number of organisms, in half the volume, as ordinary pertussis vaccines, and requires only a single injection for each dose.

As with Cutter's regular Phase I pertussis vaccine, Phase I concentrate is grown on human blood media, from fresh cultures, according to the method of Sauer. In addition, both the regular and concentrated Phase I vaccine (Cutter) are checked for toxicity and specific agglutinability according to the criteria of Leslie and Gardiner, and Kendrick and Eldering. The capacity of each lot of Cutter's vaccine to produce Phase I antibodies, when injected into rabbits, is determined.

•

PHASE I CONCENTRATE
(20 billion organisms per c.c.)
BDM—4 c.c.—one immunization—$2.50
BDO—12 c.c.—three immunizations—$4.50

Methods

THAT

GET

RESULTS

Are Recommended in

Management of

SICK INFANT and CHILD

By **LANGLEY PORTER,** Dean, University of California Medical School and Professor of Medicine; and **WILLIAM E. CARTER,** Director, University of California Hospital Out-Patient Department.

Fifth Edition. 874 Pages. 94 Illustrations.

PRICE, $10.00

Critics reviewing the previous editions of Porter and Carter's book always emphasize the value of the section on METHODS. In the new Fifth Edition the section on METHODS is even more practical. In this section the authors describe successful methods in practice, both for diagnosis and treatment—METHODS THAT GET RESULTS. Nothing is omitted, from the taking of the temperature to the puncture of the cisterna magna; from the preparation of any and every kind of feeding to the application of a mustard plaster.

The book is conveniently divided into three parts—the first section dealing with Vomiting, Diarrhea, Constipation, Nutrition, Hemorrhage, Pain and Tenderness, Convulsions and Syncope, Fever, Cough, and Prematurity. Part II assigns a chapter to diseases of each of the special systems and tracts of the body, concluding with infectious diseases. An important addition to this section is the Chapter on "Behavior." Part III is devoted to METHODS. Formulas and recipes enable the physician to fluently and conveniently prescribe any and every indicated diet for both the sick and the healthy infant and child. The penultimate chapter in the book constitutes a reliable pediatric formulary, while the concluding chapter on poisons will serve as a handy consultant for those emergencies which require immediate and accurate action.

OTHER NEW MOSBY BOOKS

Symptoms of VISCERAL DISEASE

A study of the vegetative nervous system in its relationship to clinical medicine. In this new edition Dr. Pottenger has dealt with visceral pain in a separate chapter. He has also added a chapter describing the vegetative centers in the brain and cord. He has given more emphasis to the endocrines. By FRANCIS M. POTTENGER. Fifth Edition, 442 pages, 87 illustrations, 10 color plates. Price, $5.00.

HERNIA

A complete treatise on hernia, its diagnosis and treatment. All varieties of abdominal and internal hernias are thoroughly and systematically considered from the standpoint of anatomy, etiology, symptoms, diagnosis, differential diagnosis, prognosis, and operative treatment. By LEIGH F. WATSON, 591 pages, 281 illustrations. Price, $7.50.

The HEART *in* PREGNANCY

An inquiry into the relationship between the heart and pregnancy. Among the subjects discussed are the following: Effect of pregnancy on the normal heart; increase in cardiac work during pregnancy; how the heart takes care of its additional burden; abnormal cardiac impulse formation during pregnancy; and relationship between rheumatic heart diseases and pregnancy. By JULIUS JENSEN. 370 pages, 5 illustrations. Price, $5.50.

HEMORRHOIDS

This book includes the details of technic of the injection treatment, with a discussion of the several solutions advocated, as well as a detailed description of the accepted operations. By MARION C. PRUITT. 170 pages, 73 illustrations, 7 color plates. Price, $4.00.

ACOUSTICON

invites you to visit their exhibit at the American Medical Association's Annual Convention in San Francisco.

We would consider it a pleasure to fully explain the many meritorious advantages of the ACOUSTICON LIFETIME GUARANTEED HEARING AID.

Dictograph Products Company, Inc.
705 Foreman Bldg., 707 So. Hill St.
LOS ANGELES, CALIFORNIA • Telephone TUcker 2191
World's foremost manufacturer of aids for the Deafened
Since 1902

Industry has learned that healthy workers are better workers. Industrial, medical, health and hygiene programs have paid good dividends on the money expended. Employers are in favor of these programs because of their effect on the balance sheet. Practiced in searching out and eliminating wasteful operating procedure, management engineers and industrial leaders will certainly get into action once they are fully aware of the tragic wastes of syphilis. With relatively little urging, many industrial organizations are ready to take immediate steps toward syphilis control.—*The Health Officer.*

Until the general public views the doctor not only as someone to be called in when something suddenly goes wrong with children but uses him as a professional counselor, the child health program will not be able to render its maximum service.—Virginia State Department of Health.

ISOPHRIN

TRADE MARK REG. CALIF.

A non-irritating Neo-Synephrin Solution used as a nasal spray or drops

ISOPHRIN is ¼% Neo-Synephrin Hydrochloride in a special isotonic solution prepared only by Broemmel Laboratories.

Neo-Synephrin Hydrochloride is a synthetic substance of epinephrine-like action, but possesses the advantage that it is more stable, its effects are prolonged, and it does not irritate the nasal mucosa or cause sneezing.

Prolonged contact with certain metals may cause discoloration, therefore use spray bottles with only glass or hard rubber fittings.

Supplied in original bottles of 1 oz.

Meeting, *Second Monday.*

Siskiyou County Medical Society
President, J. B. McGuire, Mt. Shasta.
Secretary, Victor W. Hart, 113 No. Oregon Street, Yreka.
Meeting, *Second Sunday.*

Solano County Medical Society
President, Ream S. Leachman, 727 Sonoma St., Vallejo.
Secretary, Jobn W. Green, Box 539, Vallejo.
Meeting, *Second Tuesday, 8 p. m., Casa de Vallejo Hotel, Vallejo.*

Sonoma County Medical Society
President, Alfred A. Thurlow, 505 B St., Santa Rosa.
Secretary, C. M. Carlson, 534 B Street, Santa Rosa.
Meeting, *Second Thursday.*

Stanislaus County Medical Society
President, Joseph L. Azevedo, Jr., 1024 "J" Street, Modesto.
Secretary, Hoyt R. Gant, 401 Beaty Building, Modesto.
Meeting, *Second Friday.*

Tehama County Medical Society
President, Donald E. Tbompson, Red Bluff.
Secretary, F. J. Bailey, Red Bluff.
Meeting, *At Call of President.*

Tulare County Medical Society
President, E. R. Zumwalt, Tulare.
Secretary, Karl F. Weiss, Security First National Bank Building, Visalia.
Meeting, *Sunday Evening once a month.*

Ventura County Medical Society
President, Grundy C. Coffey, Bank of America Building, Ventura.
Secretary, A. A. Morrison, 625 Main Street, Santa Paula.
Meeting, *Second Tuesday, Ventura County Country Club.*

Yolo-Colusa-Glenn County Medical Society
President, Cbarles S. Roller, Woodland Clinic, Woodland.
Secretary, W. J. Blevins, Jr., Woodland.
Meeting, *First Tuesday.*

Yuba-Sutter County Medical Society
President, Neal M. Loomis, Yuba City.
Secretary, Fred W. Didier, Wheatland.
Meeting, *Second Tuesday.*

PHYSICIANS•HOSPITAL ADMINISTRATORS•GRADUATE NURSES•DIETITIANS•TECHNICIANS

How do you do it all?

Tonight, Doctor, after the last patient has gone, when the day's trying cases have been reviewed and recorded, when all that life has piled on tired and willing shoulders has had its will of you . . .

. . . we ask that you sink into an easy chair and let the old fighting chin rest on your necktie and *think* the whole long evening through on these questions:

How *do* you do it all?

Is all you do *worth* the doing?

Do you ever rest? travel? play golf? Do you ever *work* in your study on pet theories? Do you ever find time to *write* the priceless things you know?

Shouldn't you do *all* of these? Would you? if you could? Isn't it truth that little, *inconsequential* things are barriers to the finer things you would love to do?

In our files, in our memories, we will find for you *some day* (the day you ask us to), a man, a physician, a man who'd be release for you to *hours* and *days* and *weeks* and *years* . . . to do with as you will.

We would find a man to come to you to do gladly the things you call *beginners'* tasks; tasks that take your years and make them *less* than you would make them; tasks that give *him* skills and poise and judgment that come only from doing.

The plan would give you TIME . . . *years* . . . to do with as you will . . . to lengthen life, to make it sweeter, to make it give the *greater* things. . . .

Will you write us . . . soon. . . .

Our BOOTH at the meeting of the

California State Medical Meeting, May 9–12, is number fourteen
American Psychiatric Association, June 6–10, is number eleven
American Medical Association, June 13–17, is number eighty-eight

The MEDICAL BUREAU

55 East Washington Street
The top floor of the tower of the Pittsfield Building
CHICAGO, ILLINOIS

OFFICERS OF SCIENTIFIC SECTIONS, CALIFORNIA MEDICAL ASSOCIATION

Anesthesiology

Chairman, William LeRoy Garth, 1252 Third Street, San Diego.
Secretary, John G. Dunlop, 168 So. Kingsley Drive, Los Angeles.

Dermatology and Syphilology

Chairman, Stanley O. Chambers, 826 Roosevelt Building, 727 West Seventh Street, Los Angeles.
Vice-Chairman, Arne E. Ingels, 490 Post Street, San Francisco.
Secretary, Nelson Paul Anderson, 2007 Wilshire Boulevard, Los Angeles.

Eye, Ear, Nose and Throat

Chairman, Frank Baxter, 1624 Franklin Street, Oakland.
Vice-Chairman, Dewey R. Powell, Medico-Dental Building, Stockton.
Secretary, Clifford B. Walker, 427 West Fifth Street, Los Angeles.

General Medicine

Chairman, Edwin L. Bruck, 384 Post Street, San Francisco.
Secretary, Howard F. West, 602 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.

General Surgery

Chairman, Harlan Shoemaker, 1014 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Secretary, Nelson J. Howard, 2957 Divisadero Street, San Francisco.
Assistant Secretary, Ray B. McCarty, 3616 Main Street, Riverside

Industrial Medicine and Surgery

Chairman, Frederic C. Bost, 384 Post Street, San Francisco.
Vice-Chairman, Harvey G. McNeil, 523 West Sixth Street, Los Angeles.
Secretary, George H. Sanderson, 242 North Sutter Street, Stockton.

Neuropsychiatry

Chairman, Fred O. Butler, Sonoma State Hospital, Eldridge.
Secretary, John B. Doyle, 1930 Wilshire Boulevard, Los Angeles.

Obstetrics and Gynecology

Chairman, R. Glenn Craig, Medico-Dental Building, 490 Post Street, San Francisco.
Vice-Chairman, George W. Coon, 3770 Twelfth Street, Riverside.
Secretary, John N. Ewer, 411 Thirtieth Street, Oakland.

Pathology and Bacteriology

Chairman, Gertrude Moore, 2404 Broadway, Oakland.
Secretary, George D. Maner, 657 South Westlake Boulevard, Los Angeles.
Assistant Secretary, Paul H. Guttman, 1127 Eleventh Street, Sacramento.

Pediatrics

Chairman, Harold K. Faber, Stanford Hospital, San Francisco.
Secretary, Hartzell H. Ray, 23 Second Avenue, San Mateo.
Assistant Secretary, W. W. Belford, 601 Medico-Dental Building, San Diego.

Radiology

Chairman, John D. Lawson, 1306 California State Life Building, Sacramento.
Secretary, Karl M. Bonoff, 1930 Wilshire Boulevard, Los Angeles.

Urology

Chairman, Lloyd E. Kindall, 400 Twenty-ninth Street, Oakland.
Secretary, Carl F. Rusche, 905 Taft Building, 1680 North Vine Street, Hollywood.

IN ADVISING PATIENTS ON SMOKING

WITH the many and varied claims made for cigarettes, *you* can be of assistance to your patients. With your scientific knowledge, you can discriminate between mere claims and basic facts.

Due to the use of diethylene glycol as the hygroscopic agent, Philip Morris have been proved* less irritating than other cigarettes... proved so conclusively that the medical profession recognizes the substantial nature of this improvement in cigarette manufacture.

Test Philip Morris on patients suffering from congestion of the nose and throat due to smoking. Verify for yourself Philip Morris superiority.

COÖPERATE WITH YOUR ADVERTISERS

California and Western Medicine, the official publication of your Association, is made possible in part by reason of the coöperation of business firms and institutions who use advertising space. Their purpose is to direct attention to their products and services to present and future patrons.

Members and readers are urged to give preference to and to patronize these advertisers. When ordering goods, mention California and Western Medicine.

This coöperation will please the advertiser, increase advertising income, and enable your Association to increase the value of this Journal to members and readers.

A SERVICE AGENCY—FOR READERS

The Journal of the California State Medical Association and the Coöperative Medical Advertising Bureau of Chicago maintain a Service Department to answer inquiries from you about manufactured products, such as soaps, clothing, automobiles, etc., which you may need in your home, office, sanitarium or hospital, or we will refer your request to the proper department of the A. M. A. for reply.

We invite and urge you to use this Service. It is absolutely *free* to every member of the California Medical Association. The Coöperative Bureau is equipped with catalogues and price lists of manufacturers, and can supply you information by return mail.

Perhaps you want a certain kind of instrument which is not advertised in California and Western Medicine, and do not know where to secure it; or do not know where to obtain some automobile supplies you need. This A. M. A. Service Bureau will give you the information. Whenever possible, the goods will be advertised in our pages; but if they are not, we urge you to write direct to the Coöperative Medical Advertising Bureau, 535 N. Dearborn Street, Chicago, Illinois. California and Western Medicine and the A. M. A. Service Bureau desire to serve *you*.

THE NEW YORK POLYCLINIC

MEDICAL SCHOOL AND HOSPITAL

(Organized 1881)

(The Pioneer Post-Graduate Medical Institution in America)

ROENTGENOLOGY

An intensive course, with a minimum of ten hours a week devoted to lectures and demonstrations on film interpretation, fluoroscopy and technique. The department is open daily from 9 a. m. to 5 p. m. Matriculants are extended the opportunity to attend in the department during radiographic and fluoroscopic examinations.

FOR THE

GENERAL PRACTITIONER

Intensive full-time instruction in those subjects which are of particular interest to the physician in general practice. The course covers all branches of Medicine and Surgery.

FOR INFORMATION ADDRESS

MEDICAL EXECUTIVE OFFICER 345 West 50th Street, New York City

MULFORD COLLOID LABORATORIES
H. K. MULFORD, Founder

RHUS VENENATA ANTIGEN

(Poison Oak Antigen)

Williams and MacGregor report "The most striking feature was the rapid improvement, usually after a single dose . . ." In their series of twenty-six patients from the New York Skin and Cancer Hospital, only one patient failed to show improvement until the third dose was given. Williams concludes, "The results to be obtained by this method are nothing less than brilliant."

The Antigens reported by Strickler, Williams, MacGregor, and Bivings are made exclusively by The Mulford Colloid Laboratories, U. S. Government License No. 102, and are accepted by The Council on Pharmacy and Chemistry of The American Medical Association.

Caustic Poisons.—In Washington, D. C., four hardware dealers sold hydrochloric (muriatic) acid in discarded whisky and gin bottles . . . without relabeling and with the original labels intact. Although it is a common practice to sell small quantities of poisonous and nauseous liquids from a larger container in such discarded bottles without relabeling or removing the old label, the Federal Food and Drug Administration reminds that it is a dangerous and, in some places, an illegal practice.

Hydrochloric acid, for example—used for removing stains from such surfaces as brick, tile or porcelain—is a deadly poison if taken internally. Commercial hydrochloric acid is a transparent, yellow, corrosive liquid. It is not hard to imagine, says the Administration, what might happen if the purchaser, forgetting that the label no longer applied, or a member of his family or a friend taking the label for granted, chanced to use the contents of one of these bottles. The symptoms of hydrochloric acid poisoning do not make pleasant reading.

The Food and Drug Administration prosecuted these four cases, because it has local jurisdiction in the District of Columbia in enforcing food, drug and insecticide laws, including the Federal Caustic Poison Act which covered these cases. It has not jurisdiction over retail sales generally, but cites these as practical examples of an all too common custom of selling dangerous and nauseous liquids in discarded beverage bottles.

Food and Drug Administration officials also warn dealers of the heavy risks they run in selling destructive chemicals in discarded beverage bottles. A tragic mistake by a careless customer might let a dealer in for a series of criminal and civil actions disastrous to his business and his bank account, whether he won or lost.

The Federal Caustic Poison Act covers the following caustic or corrosive substances or mixtures containing as much or more than the percentage noted: Hydrochloric, sulphuric, and oxalic acids, 10 per cent; nitric and carbolic acids, 5 per cent; acetic acid, 20 per cent; any salt of oxalic acid, 10 per cent; hypochlorous acid or its salts, except chlorinated lime to yield available chlorine, 10 per cent; potassium hydroxide, 10 per cent; sodium hydroxide, 10 per cent; silver nitrate, 5 per cent; and ammonia water, 5 per cent.

Some states and cities, but by no means all, have comparable laws governing retail sales. The Federal Act does not cover retail sales from bulk containers, except in the District of Columbia and the Territories of the United States, but does cover sales in containers when the goods cross a state line or are offered for importation into the country. The Caustic Poison Act does not require more than local laws should, to be effective. This act requires adequate and conspicuous labeling of the poison including the common name, the word "poison," and antidote and directions for treatment. The label must also give the name of the manufacturer, packer, seller, or distributor.

There are a number of other products, either poisonous or nauseating, that are often retailed from bulk goods and enter the home in discarded beverage and other small containers with the original labels intact. Reports of mortality records show that kerosene and gasoline are responsible for many child deaths. A fatal dose of these substances for a child is in the neighborhood of one or two tablespoonfuls. Other products that may be mentioned are some antifreeze mixtures, turpentine, cleaning mixtures and solvents, lubricating oils, insecticides, and denatured alcohol.

Through the efforts of the American Medical Association and other interested persons and organizations, Congress passed the Federal Caustic Poison Act on March 4, 1927, for the purpose of insuring the use of poison labels on certain dangerous caustic or corrosive products and thus putting users on their guard. Enforcement of the act was assigned to the Food and Drug Administration.

Ill health is now bad business. It is possible, by applying the public health knowledge we now have, to cut down greatly the economic losses by preventable diseases. It is far less expensive to control these diseases than to continue to pay tax money, charity, and insurance dollars for the needlessly sick and premature dead.—Parran.

Immunize now for effective control of

IVY DERMATITIS

PLANS FOR SPENDING summer vacations outdoors or at summer camps should include preliminary prophylactic administration of Poison Ivy Extract to avoid the risk of much misery and spoiled vacations from ivy poisoning.

Experience has shown that two small injections (1 cc. each) of "Poison Ivy Extract *Lederle*" administered a week or two apart, confer a marked degree of protection in a high percentage of cases against the distressing dermatitis which follows the usual casual, accidental contact with Poison Ivy. This protection should suffice to immunize the individual for the entire season.

In the *treatment* of ivy poisoning, "Poison Ivy Extract *Lederle*" has at times performed most spectacularly. A single injection often gives marked relief within 24 to 48 hours. A second injection 24 hours later may be required; this has an added value in its probable preventive effect in case of later exposure. A third injection is rarely necessary.

Results of Experiment in C. C. C. Camps in 1935

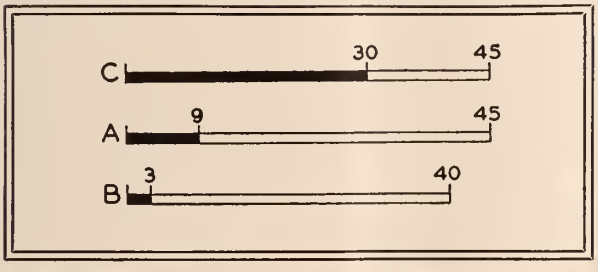

Chart shown at left covers a 6-week period following the first prophylactic dose. One hundred and thirty men were divided into three groups: A, B, C. All intermingled in their work in clearing ivy-infested areas.

Group C received no previous injections.

Group A received four weekly injections of 1/12 regular dose of "Poison Ivy Extract *Lederle*."

Group B received four weekly injections of the regular dose of "Poison Ivy Extract *Lederle*."

The shaded areas represent the number of exposed men affected with ivy dermatitis in the 6-week period.

For prevention and treatment

Social Security Board General Relief.—In telegraphic reports from thirty-five states and the District of Columbia for 107 cities show a negligible increase in the number of cases receiving general relief, and a decrease of 1 per cent in the amount of obligations incurred from February to March, according to figures made public by the Social Security Board today. In slightly more than half of the 107 urban areas there was a decrease in the number of cases receiving general relief. Although thirty-three of the cities showed decreases ranging from 1 and 10 per cent, seven showed decreases of more than 20 per cent, and fourteen others of between 10 and 19 per cent. Increases in case load amounting to more than 10 per cent occurred in only fourteen of the cities, and in only three cities the increase was as much as 20 per cent. In thirty-two cities there were small increases of between 1 and 9 per cent.

There were increases in the obligations incurred in more than half of the urban areas. In forty-three the increase was small, not exceeding 10 per cent; in only six the increase was as high as 20 per cent. Decreases not exceeding 10 per cent in the obligations incurred were reported for thirty-three cities. In two cities there were decreases of more than 50 per cent, and in eight others 15 per cent or more. With a few exceptions, the largest increases were in the East.

General relief, it was explained, includes all state and local relief in cash and in kind extended to the needy, except public assistance to the needy aged, needy blind, and dependent children under the Social Security Act, other public assistance of these special types, and aid to veterans under state and local statutes. It does not include costs incurred for services such as maternal and child health and welfare services, or costs of hospitalization, burials, or institutional or boarding-home care of children; nor earnings under the Works Program, loans and subsistence grants made by the Farm Security Administration, or Federal surplus commodities. Voluntary reports on costs and number of cases of general relief in urban areas are telegraphed to the Social Security Board each month by state agencies.

Following is a summary of the reports on relief for 107 urban areas for March, 1938:

Urban Area	Cases Receiving General Relief: Number of Cases	Cases Receiving General Relief: Percentage Increase (+) or Decrease (—) from February	Obligations Incurred for General Relief Extended to Cases: Amount of Obligations	Obligations Incurred for General Relief Extended to Cases: Percentage Increase (+) or Decrease (—) from February
Total for 107 urban areas	962,430	(2)	$27,830,646	—1
California				
Los Angeles	50,527	+6	1,641,283	+2
Oakland	12,483	—1	354,612	+2
Sacramento	3,411	—1	81,961	—9
San Diego	4,908	+6	144,473	+2
San Francisco	16,989	+4	468,208	+2

A Physician's Telephone Exchange.—In the *Journal of the American Medical Association* for April 12, there is an editorial with the above title which begins with this sentence: "In some respects, Europe is a little ahead of us." This is said in connection with a few words descriptive of physicians' telephone exchanges in Vienna and Berlin, and possibly elsewhere. There has been one such exchange in San Francisco for a number of months, and we understand that one has been started in Los Angeles and another is to be started in Oakland. . . .

* * *

Oliver D. Hamlin, M.D. (President, 1912-1913).—Doctor Hamlin was born in Alameda County, California, April 1, 1870. After going through the public schools, he entered Santa Clara College, graduating in 1890. In 1891 he entered Cooper Medical College of San Francisco, and was graduated from that institution in 1894. He began active practice immediately as resident physician of the Southern Pacific Hospital in Oakland on January 1, 1895.

* * *

President's Address. By O. D. Hamlin, M. D., Oakland. In considering the relation of medicine to the whole people, we find a most peculiar and anomalous condition. Never has scientific medicine been called upon by governments, by communities, by the thinking element of the people, for such monumental services, for such distinct advances, as during the past few years and at the present time. On the other hand, never has the art of the practice of medicine by the average practicing physician been in such disrepute. Medical science, as found in the research laboratory, the high-class teaching hospital, the properly equipped and up-to-date medical school, is in a unique position of official respect and individual admiration; medical practice of the everyday sort seems to be the storm center of a riot of attacking, warring fanatics. The two classes of medical effort seem to be occupying the extremes of favorable and unfavorable public recognition. . . .

Are You Sure?

In some cases you probably prescribe two to three teaspoons of cod liver oil daily as an antirachitic for infants six months of age or older. . . . But **are you sure** that the baby actually receives the cod liver oil? Do you not find that all too often the mother neglects this daily task, or the baby refuses to take the dosage?

In prescribing Special Morning Milk you are assured that when the full tall can (13 fluid ounces) is included in the twenty-four hour formula (and this usually is the case for infants six months of age and older) the baby is receiving at least 1¼ teaspoons of cod liver oil equivalent in Vitamin D. The "daily battle" of forcing cod liver oil upon the child is eliminated. Furthermore, Special Morning Milk is available at all leading retail grocers at no extra cost over other evaporated milks having a lesser amount of added vitamin D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA AUTHORIZED BY THE AMERICAN MEDICAL ASSOCIATION TO MAKE THE CLAIM THAT THE AMOUNT OF VITAMIN D ADDED IS GREATER THAN THAT USUALLY REQUIRED FOR THE PREVENTION OF RICKETS IN NORMAL INFANTS AND THUS THAT A MARGIN OF SAFETY IS OFFERED WHEN TAKEN IN THE QUANTITIES CUSTOMARILY PRESCRIBED BY THE PHYSICIAN.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA USING COD LIVER OIL CONCENTRATE AS ITS SOURCE OF VITAMIN D.

- SPECIAL MORNING MILK IS THE ONLY EVAPORATED MILK PRODUCED IN CALIFORNIA CONTAINING 400 U.S.P. UNITS OF ADDED VITAMIN D PER TALL (13 fluid ounces) CAN OR ANY ADDED VITAMIN A. (2000 U.S.P. UNITS VITAMIN A ADDED TO EACH TALL CAN.)

No Cod Liver Oil taste in the Milk!

(Continued from Page 13)

From Report of the Secretary and Editor.

To the President and Delegates:

Membership.—At the close of 1911 there were 2,118 members of the State Society; at the close of 1912 there were 2,278 members, an increase of 160 during the year 1912. . . .

From Report of the Council.

To the President and Delegates:

As chairman of the Council I appear before you for the eleventh time to present our annual report. At the session of 1902 the present form of our organization was adopted, and the House of Delegates and the Council, as governing and directing bodies, were created. The first meeting of the Council was held on July 18, 1902, and the sixty-eighth meeting was held on April 14, 1913; during the eleven years there has been but one meeting at which there was not a quorum present.

Our condition at present, as compared with what it was at the beginning of the work of the Council, is a matter of pride and congratulatory reflection. At the first meeting of the Council, much of our time was taken up with a discussion of whether we could or should start a journal and whether it would wreck the Society! Today this seems absurd to us, for we have seen the JOURNAL, under the management of Doctor Jones, grow steadily till it paid its way, and then keep on growing till now it pays a handsome profit—a larger actual profit than any other state journal published. And I presume to call your attention to the fact that the very first number of our JOURNAL, at Doctor *Jones's* instigation, started the fight against nostrums and dishonest proprietary remedies, and that the policy of clean advertising which was then established by your editor and your publication committee and endorsed and approved by your Council set an example which was later followed by the *Journal of the American Medical Association* and by a number of state journals and a few privately owned journals. It took a good deal of faith and confidence, and a great deal of hard work to pull through the early years, for we began with a handful of members and less than $800 in money. . . .

Medical Defense.—The most important matter of business now engaging the attention of the Council is the Medical Defense feature of our work. . . .

From Minutes of the House of Delegates of the Medical Society of the State of California.—Forty-Third Annual Session, Oakland, April 15, 16, 17, 1913.

First Session

The first session of the House of Delegates was called to order by the President, O. D. Hamlin, at 8 p. m., Tuesday, April 15.

Reference Committee on Reports and New Business. On motion of Kress, seconded and carried, a committee of three was appointed to consider all reports of officers and committees and to report to the House with recommendations at the second session. The President appointed as such committee, George H. Kress (chairman), G. G. Reinle, and Rene Bine. . . .

Second Session

Wednesday, April 16, 1913

The House of Delegates was called to order at 8:20 p. m. and the roll call disclosed the presence of fifty-six delegates.

Place of Next Meeting. Riverside and Santa Barbara were nominated and the President declared a ballot and for that purpose appointed F. B. Carpenter and Sol Hyman as tellers. Riverside received twenty-nine votes and Santa Barbara received thirty-five votes; the President announced the choice of the House as Santa Barbara.

AMNESIA

Convenientia Patientis

DIAGNOSIS: Loss of memory, usually following purchase of goods or professional services.

SYMPTOMS: Avoids the creditor; moves, leaving no forwarding address; ignores bills, statements and letters; or discovers treatment was unnecessary, or ineffective, or both; charges excessive, as neighbor got more for less from another; can't afford to pay, as must pay chiropractor who cured, and paying on new automobile.

PROGNOSIS: Usually curable in early stages; if neglected, is progressive and becomes chronic and incurable.

℞ **PRESCRIPTION:** Refer promptly when ailment discovered to competent collection specialist (Cramer Collection Service).

TREATMENT: (Administered by the C. C. S.): Tactful approach; courteous, but firm and effective argument; increase and repeat for satisfactory result.

RESULT: Complete return to mental normalcy; greatly relieved conscience; restored high regard for creditor as indicated and recommendation to all acquaintances, and prompt payment for all further services.

DISCUSSION: (By the C. C. S.): Unnecessary and unwise delay in proper use of suggested prescription results in **rigor mortis** of the bill.

TWENTY-FIVE YEARS AGO

(Continued from Preceding Page)

President. Fitch C. E. Mattison was placed in nomination by H. Bert Ellis. There being no other nominations it was moved, seconded and carried, that the Secretary cast the ballot of the House; this was done and the President declared F. C. E. Mattison elected President for the ensuing year.

First Vice-President. Barton J. Powell was nominated and there being no other nominations the Secretary was instructed to cast the ballot, which was done.

Second Vice-President. George Tucker was nominated by F. B. Carpenter, and on motion he was unanimously elected by a rising vote.

Secretary. Philip Mills Jones was nominated and there being no other nominations, on motion, the President was instructed to cast the ballot of the House, which was done, and Philip M. Jones declared elected.

All of the following officers were elected on a motion in each instance that the Secretary cast the ballot of the House:

Councilors—Second District, George H. Kress; Sixth District, C. G. Kenyon; Eighth District, James H. Parkinson; At Large, O. D. Hamlin.

Committee on Public Policy and Legislation—Two to serve for three years: F. F. Gundrum, Sacramento, and T. C. Edwards, Salinas.

Committee on Scientific Work—To serve four years: A. B. Grosse.

Committee on Arrangements—Rexwald Brown, Benjamin Bakewell, and Gilbert Hamilton.

Committee on Public Health—C. C. Browning, John C. King, W. F. Snow, G. F. Broderick, and N. K. Foster.

Delegates to the American Medical Association for two years: George Hare, Fresno, and V. G. Vecki, San Francisco.

Alternates for one year: Clarence Moore, Lem Adams, and Emmet Rixford. . . .

From Report of the California State Tuberculosis Commission by George H. Kress, M.D., Los Angeles, Chairman.—The California State Tuberculosis Commission came into being two years ago as a result of the passage by the Thirty-ninth California State Legislature of a bill appropriating the sum of $5,000 to be expended in carrying on an investigation concerning the prevalence, prevention, and treatment of tuberculosis in California. The bill provided, furthermore, that this investigation should be conducted under the supervision of a state tuberculosis commission to be appointed by the California State Board of Health.

The Commission as thus appointed consisted of an executive committee of five members and an advisory board of fifty members. The full membership consisted of physicians, legislators, sociological experts and other laymen, who had had special opportunities or reasons for being interested in the solution of the tuberculosis problem of California. The above members all served without pay or salary. A secretary, Mr. Guy P. Jones, was employed to collect and analyze the morbidity and mortality statistics of the state. . . .

It may not be out of place here, however, to enumerate the special bills prepared under the direction of the Commission and which are now before the present Legislature for consideration.

These are:

1. A Division of Tuberculosis under the State Board of Health with an appropriation of $20,000 for the two years, 1913 and 1914.

[Senate Bill No. 980, introduced by Senator Mott, and the companion Assembly Bill No. 1234, introduced by Assemblyman Guill, provide for this.]

2. A Revolving Fund for the use by the State Board of Health in providing immediate assistance to emergency or otherwise specially urgent cases; the respective counties

responsible for such cases to be required to reimburse the revolving fund for all sums expended from it.

[Senate Bill No. 984, introduced by Senator Birdsall, and the companion Assembly Bill No. 1385, introduced by Assemblyman Dower, make such provision.]

3. State Regulation of county hospital wards for advanced tuberculosis patients and State Aid for county treatment of tuberculosis patients to the extent which may be indicated by the finances of the state.

[If funds are available for this purpose, Senate Bill No. 6, introduced by Senator Boynton, can be amended in accordance with the suggestion.]

4. State Farm Colonies for early and convalescent tuberculosis to be provided if possible.

[Senate Bill No. 1094, introduced by Senator Boynton, and the companion Assembly Bill No. 1403, introduced by Assemblyman Farwell, provided for these measures.]

5. Existing laws related to tuberculosis to be amended if necessary so as to insure their enforcement, and official recognition of dispensaries should be provided, although at the present time it is deemed expedient that they should remain supported wholly by municipal and philanthropic appropriations. . . .

From Some Original Articles:

Effects of Athletics on Young People—Subreport of H. D'Arcy Power on Psychological Aspect of the Question.—This is a résumé of a detailed paper on the subject, to be read at a general meeting of the Society, on the evening of the 15th.

In seeking an answer to the question as to how and to what extent athletics has an influence on the mind, four lines of investigation were open.

First: A deductive statement based on known physiological and psychological data.

Second: Laboratory investigations as to mental conditions before, during, and after training.

Third: A statistical investigation into the records of colleges, with the view of ascertaining the scholastic status of athletic teams as compared with nonathletes.

Fourth: A critical estimate based on the opinion of a large number of instructors, reflecting their actual observation and experience.

The conclusions here presented follow all these lines, but the chief accent has been placed on the last, to which special attention has been directed.

From an Article on "Present Status of Prostatic Surgery" by Charles D. Lockwood, A. B., M. D., Pasadena.—Every new field of surgery must pass through its formative period until sufficient experience has accumulated to permit of more or less definite conclusions as to its value, technique, and mortality. Surgery of the prostate has been no exception in this rule. The discussions have not been so heated nor numerous as those regarding appendicitis, but this is due to the fact that fewer cases demanding operation are met with and a relatively small number of surgeons have interested themselves in prostatic surgery.

From an article on "An Instance of Hypersensitiveness to Homatropin" by Douglas W. Montgomery, M. D., San Francisco.—There can be no doubt that the disturbances in this case were due to the homatropin, although we have no reports of eruptions caused by this drug. It is well known, however, that atropin and the other drugs of its class can give rise to just such eruptions, and, in the case in hand, the symptoms occurred coincidentally with the dilation of the pupil and subsided with the contraction, and they were erythematous and consequently vasodilatory, and therefore in accordance with the vasodilatory eruptions of belladonna and atropin. In fact, the patches on the skin were more characteristically vasomotor in their appearance than most of the eruptions ascribed to belladonna, as they were not alone bright red but also edematous and circular, their circularity corresponding to the terminal branches of an arteriole tree. . . .

BOARD OF MEDICAL EXAMINERS

(Continued from Text Page 480)

"She stands at advantageous points around town, where the people she cannot see will see her and, more important, see the sign her courage dictates that she wear. You've seen her—seen the sign that reads: 'Dinitrophenol Made Me Blind. Please Inquire About It! No Alms!' Her name is Mrs. Edna Gibbs and her main aim in life today is to make the public so alive to the dangers of untried drugs that it will force Congress to pass a revised Federal Food and Drug Act. To this end she suffers the gaze of the curious, stands until her feet ache and burn until the pain in her eyes forces her to go to her darkened doom. The revised law will do nothing for her—five operations have been of no avail. She has only two per cent sight in one eye. But through her work she may prevent others, particularly women, from going through life sightless. It was while she was attending University of California that Mrs. Gibbs took dinitrophenol, a reducing drug, under the prescription of a doctor. She says: 'Whenever I wanted to lose three pounds, five pounds, I took the medicine as he prescribed. In my ignorance and my trust in him, I did not realize that anything powerful enough to burn up fat in my body would burn up valuable tissues. Suddenly, one day, a thin veil came across my eyes and then, a few days later, down town, the curtain dropped. I stood there, wanting to scream, yet not being the screaming kind, completely helpless. It is a tragedy only those who know can understand! . . . She was unsuccessful in her fight to obtain revised laws for California; but during the last regular session of the legislature obtained approval of Dr. Charles B. Pinkham, Secretary of the State Board of Medical Examiners, of the provisions in AB 1235 pertaining to prescription and dispensing of dinitrophenol. . . . Mrs. Gibbs is as energetic in this educational program as she was in secretarial work before she was blinded. Since January of this year, when she began appealing to the public by making street appearances, she has distributed two thousand pamphlets throughout the state. She is financing her campaign without outside aid, at great sacrifice to herself. . . . Mrs. Gibbs, a Delphian member of long standing, has been meeting club and business women both here and in San Francisco, gaining their support of her gallant program." (Sacramento *Union*, April 10, 1938.) (Previous entries, August, September, 1934; July, August, 1935; December, 1937; March, 1938.)

"A young wife lay near death in a local hospital yesterday, victim of what authorities describe as 'a terribly bungled, illegal operation.' In the city prison, charged with performing that operation, was a former doctor, a man who made national headlines four years ago. He is Clayton E. May, Minneapolis physician who treated John Dillinger when that outlaw, newly escaped from the Crown Point jail, was wounded during the hunt for first Public Enemy No. 1. May was convicted of conspiracy and sentenced to serve a four-year term. His license was revoked. After serving his sentence he came West, has been in San Francisco almost a year. . . . Police asserted that May, assisted by a nurse who is now a fugitive, operated upon Mrs. Doris Alexander in his apartment at 444 Larkin Street on Tuesday. . . . May declared that after his release from prison he found himself disgraced, came to San Francisco, and has been living 'on a few hundred dollars I had saved.' Police reported, however, that they discovered a large quantity of surgical instruments and other professional paraphernalia in his apartment." (San Francisco *Examiner*, April 15, 1938.) No one by the name of Clayton E. May holds a license entitling him to practice any system of the healing art in the State of California.

"Superior Judge Martin I. Welsh today sentenced Lawrence P. Lorraine, forty-five year old male nurse, to Folsom State Prison for a term of two to five years as the result of the latter's conviction by a jury on a charge of abortion. . . . Defense Attorneys Horace F. Frye and Robert

Huston gave oral notice of their intention to appeal. The court granted their request that Lorraine be permitted to remain in the county jail until next Monday to permit the disposal of certain business matters. Lorraine was convicted April 5 on a grand jury indictment charging he performed an illegal operation upon Sally Salverson, twenty-one, a night club entertainer, whose professional name is Sally Jeune." (Sacramento *Bee,* April 14, 1938.) (Previous entries, January, February, May, 1935.)

"Beware of endocreme, a cosmetic with a menace. *The Journal of the American Medical Association* this week broadcasts a warning against a widely advertised beauty product. . . . Endocreme is applied by many women to the face, neck, arms, and hands every night. The purchaser is cautioned on the label against omitting treatment for a single night if the best results are to be obtained. From many sources comes scientific evidence that serious harm may follow the persistent use of this product. It contains estradiol, a hormone. . . . Contrary to the manufacturer's claim, the substance may be absorbed from the skin and may thus exert systemic effects, says the medical journal. Endocreme is manufactured by Hirestra Laboratories, Inc., New York; it bears the approval of the Good Housekeeping Bureau." (San Francisco *News,* April 11, 1938.)

"Ernest G. Wollenweber was arrested in Dorris for practicing medicine without a license. Wollenweber claims he was a practicing physician in Keokuk, Iowa, but had not been properly authorized to practice in the State of California. The arrest was made by Thomas P. Hunter, agent for the Board of Medical Examiners of the State of California. Wollenweber was taken before Justice of the Peace George Otto, who imposed a sentence of ninety days in the county jail and a fine of $100. Under the circumstances the jail sentence was suspended and after he had paid $50 on the fine the remaining $50 was also suspended. . . ." (Yreka *News,* April 7, 1938.)

"Albert Best, forty, known to police as 'Doctor Fortune,' has been released on $500 bail pending his appearance in Superior Court in San Francisco next week on removal proceedings to return him to New York City, where he faces check charges. Police Inspector Charles Dullea protested release of Best. . . ." (Oakland *Tribune,* April 13, 1938.)

"City Attorney John J. O'Toole, of San Francisco, attacked constitutionality of the new socialized medicine plan for San Francisco's city employees today, before the California Supreme Court. O'Toole was representing City Comptroller Harold Boyd, who refused to authorize deduction from employees' salaries for the health insurance plan, first of its kind in the State. The city attorney declared the charter amendment, which set up the plan, deprived employees of a part of their salaries without their individual consent. . . ." (Oakland *Tribune,* April 9, 1938.)

"Jean Adams, forty-two, charged with posing as a doctor and treating Donna MacEachren, twenty-five, of 1646 Steiner Street, San Francisco, for a non-existent disease, pleaded guilty before Municipal Judge Frank W. Dunn today. So aroused was the jurist after hearing the evidence that he commented: 'This defendant is a menace. I suggest that additional charges be filed if evidence warrants it and if she is convicted, I will make the sentences consecutive.' Further testimony of the woman's guilt came from J. W. Williams, agent for the State Board of Medical Examiners, who posed as a patient, was examined, and then seized the woman's books and surgical instruments. . . ." (Oakland *Tribune,* April 7, 1938.) "Heavy penalties were imposed yesterday upon Jean Adams, forty-two, who pleaded guilty to two counts of practicing medicine without a license. Municipal Judge Frank W. Dunn, who displayed indignation when evidence against the woman was presented, passed this sentence upon her: A fine of $500. A

LIVES MAY DEPEND ON OXYGEN

That is why our service never sleeps—not even on holidays.

From four cities where there are Stuart establishments — San Francisco, Oakland, Fresno, Los Angeles—we furnish oxygen and the most approved types of tents and catheters. Trained men answer your call immediately. They install the equipment, check it to assure satisfactory performance, and give your nurses the simple instructions that are necessary.

As the largest independent manufacturer of oxygen in California, we have given this service specialized training and supervision so as to maintain it on the highest professional standard.

Manufacturers of a complete line of Medical Gases

BOARD OF MEDICAL EXAMINERS

suspended sentence of six months. Restitution of $450 to a 'patient' she treated for a non-existent disease. An order to 'go out of business.' Joseph W. Williams, special agent for the Board of Medical Examiners, who arrested the woman, declared he had evidence that she practiced medicine extensively." (San Francisco *Examiner*, April 9, 1938.)

"The law stooped to punning here today when Judge W. F. James, ruling on litigation involving the Elysium Nudist Camp, declared it No Suit. It was a test case brought by an oil company in behalf of numerous Los Gatos merchants who delivered food, medicine, lumber and drugs to the Nudist Colony, and did not get paid. The deliveries were made while George Spray was Chief Nudist. He has since become bankrupt; the camp has become the property of Dr. E. W. Laisne of San Francisco. . . ." (The records of the State Board of Optometry indicate that Dr. E. W. Laisne operates the Progressive Optical System in Oakland, San Jose, Fresno, and San Francisco.)

"Dr. Robert T. Legge, who twenty-four years ago dreamed of building the greatest student health center in the world, is retiring this spring after seeing his dream fulfilled in the Ernest V. Cowell Memorial Hospital on the Berkeley campus of the University of California. . . ." (San Francisco *News*, April 8, 1938.)

"Charging fraudulent advertising in connection with the film, 'A Baby Is Born,' now playing at the Capitol Theatre, the American Committee for Maternal Welfare today filed action against John Doe Popkin and John Doe Ringer in an attempt to stop showings of the film. Accusation was made that people have been led to believe 'A Baby Is Born,' branded as 'sensational and revolting,' is really 'The Birth of a Baby,' moving picture film made under auspices of the committee some time ago. . . . The Committee for Maternal Welfare includes the American Association of Obstetricians, the American Association of Gynecologists, the American College of Surgeons, and the American Hospital Association." (San Francisco *Call-Bulletin*, May 9, 1938.)

"Charges against Allan Mills, Paradise, who was tried on charges of violating the State Medical Practice Act, were dismissed in Paradise justice court Saturday on request of Assistant District Attorney P. M. Barceloux. The case was tried in Paradise March 30 and 31, the jury disagreeing seven to five. Mills was charged with practicing medicine without a license, and was said to have operated a magnetronic laboratory, by which he could cure patients by 'tuning' to them on an electrical machine." (Chico *Enterprise*, May 2, 1938.)

"Caryl Warner, Attorney for Dr. Leila Northrup of Los Angeles, who was charged with practicing medicine without a license, has applied to the Superior Court for a writ of prohibition to stop Judge William E. Starkey of the Whittier Township Justice Court from trying the case of *People* vs. *Doctor Northrup*. Warner declares in his request that Doctor Northrup has not been given a speedy

Try PABLUM *On Your Vacation*

VACATIONS are too often a vacation from protective foods. For optimum benefits a vacation should furnish optimum nutrition as well as relaxation, yet actually this is the time when many persons go on a spree of refined carbohydrates. Pablum is a food that "goes good" on camping trips and at the same time supplies an abundance of calcium, phosphorus, iron, and vitamins B and G. It can be prepared in a minute, *without cooking*, as a breakfast dish or used as a flour to increase the mineral and vitamin values of staple recipes. Packed dry, Pablum is light to carry, requires no refrigeration. Here are some delicious, easy-to-fix Pablum dishes for vacation meals:

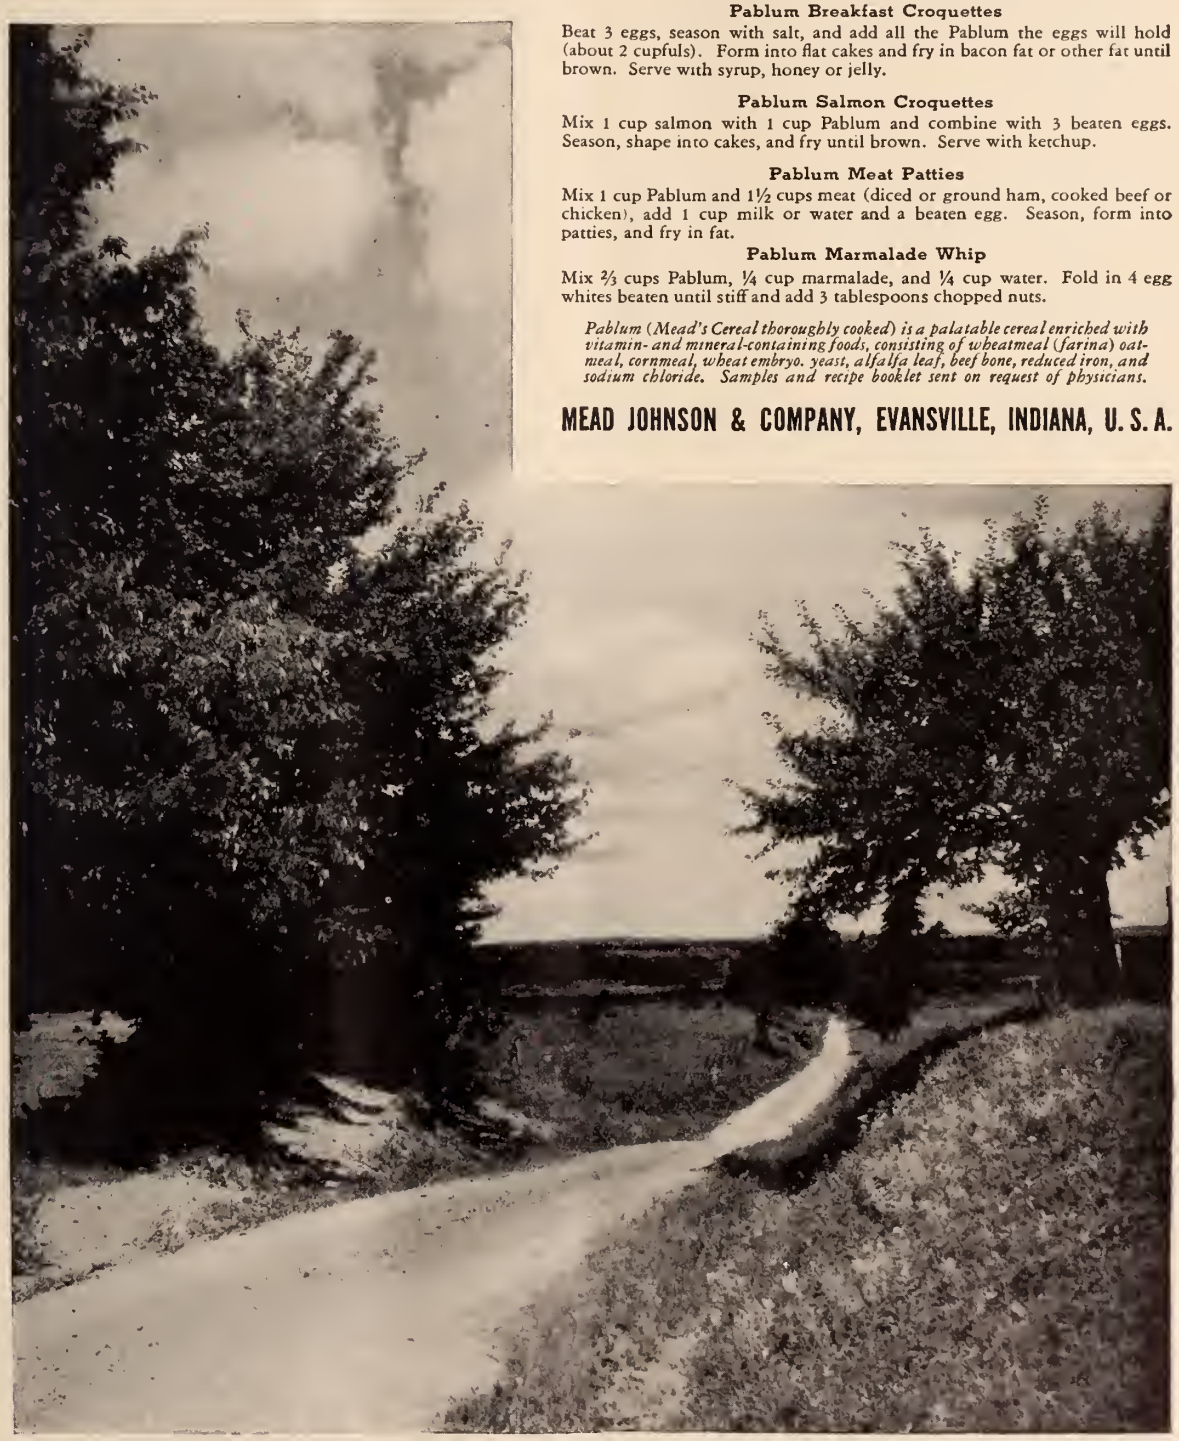
Pablum Breakfast Croquettes

Beat 3 eggs, season with salt, and add all the Pablum the eggs will hold (about 2 cupfuls). Form into flat cakes and fry in bacon fat or other fat until brown. Serve with syrup, honey or jelly.

Pablum Salmon Croquettes

Mix 1 cup salmon with 1 cup Pablum and combine with 3 beaten eggs. Season, shape into cakes, and fry until brown. Serve with ketchup.

Pablum Meat Patties



Mix 1 cup Pablum and 1½ cups meat (diced or ground ham, cooked beef or chicken), add 1 cup milk or water and a beaten egg. Season, form into patties, and fry in fat.

Pablum Marmalade Whip

Mix ⅔ cups Pablum, ¼ cup marmalade, and ¼ cup water. Fold in 4 egg whites beaten until stiff and add 3 tablespoons chopped nuts.

Pablum (Mead's Cereal thoroughly cooked) is a palatable cereal enriched with vitamin- and mineral-containing foods, consisting of wheatmeal (farina) oatmeal, cornmeal, wheat embryo, yeast, alfalfa leaf, beef bone, reduced iron, and sodium chloride. Samples and recipe booklet sent on request of physicians.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 20)

trial, which she claims she is entitled to. The Superior Court will hold a hearing on the matter May 12. Doctor Northrup was scheduled to have been tried tomorrow." (Whittier *News*, May 4, 1938.)

"Judge Frank C. Collier, after listening to testimony of five physicians testifying that Dr. Harry M. Griffith, found insane after the shooting of M. Vilas Hubbard, Pasadena banker, in 1933, had recovered his sanity sufficiently to be safely sent to the Sawtelle Veterans Hospital for care, and the testimony of Dr. Benjamin Blank, county hospital jail doctor, and Dr. E. H. Toller, of the Mendocino State Hospital for the insane, who claimed that he is still dangerously insane, found Doctor Griffith criminally insane. Judge Collier ordered the defendant recommitted to Mendocino Hospital, but granted George Carter, attorney for Doctor Griffith, a stay of ten days in which to either appeal from the decision or to ask for a further continuance. . . ." (Pasadena *Star-News*, April 7, 1938.) (Previous entry, August, 1933.)

"Charged with practicing medicine and using the title 'Dr.' without a proper license, William MacDonald, forty-one, was arrested last night by J. W. Williams, Inspector for the State Medical Board. MacDonald was released on $50 bail." (San Francisco *Chronicle*, May 4, 1938.)

"Lawrence J. Giubbini, former San Jose Chiropractor, was fined $500 in Federal Court today on a charge of failing to report income in 1934 and 1935, according to the Associated Press. Marvin Raithel, who was associated with Giubbini in San Jose, was fined $250 on a similar charge. The government charged Giubbini failed to make a report on an income of $12,439 in 1934 and $9,629 in 1935. Raithel was accused of failing to report on a 1934 income of $10,095 and a 1935 income of $4,408. Raithel now resides in Madera. Giubbini was indicted by the San Francisco grand jury in 1934 with several other persons on charges involving illegal operations, but the charge against him was dismissed." (San Jose *News*, April 9, 1938.) (Previous entries, July and August, 1936.)

"Dr. Roy E. Shipley, physician, was cleared today of charges in an indictment accusing him of participating in an 'ambulance chasing' conspiracy involving other doctors and lawyers. When the case came up before Superior Judge Frank M. Smith, a dismissal of the charge against Doctor Shipley was moved by George Stahlman, deputy

THE members of the California Sales Organization of LUZIER'S, Inc., Makers of Fine Cosmetics, sincerely hope that you, the members of the California Medical Association, will visit the Luzier Booth at the coming national convention of the American Medical Association.

We will have a large display featuring all of the preparations manufactured by LUZIER'S, Inc. Our Service will be featured as **"Individually Nonallergenic,"** by which is meant simply this: In cases where the offending substances have been determined, and should they appear in our preparations, the chances are we can substitute other ingredients, thereby making our preparations nonallergenic so far as a particular person is concerned—in other words, **individually** nonallergenic. Our preparations do not contain the common offending substances, such as orris root, rice starch, etc.

It is our wish to coöperate with the medical profession to the full extent of our limited scope, and we sincerely hope through our appeal to your profession that we may enlist your coöperation in bringing to the public fine cosmetics that are safe to use.

LUZIER'S, INC. MAKERS OF FINE COSMETICS

KANSAS CITY, MISSOURI

District attorney. Stahlman said there was no evidence upon which the physician could be prosecuted." (Los Angeles *Herald and Express,* April 19, 1938.)

"Arrested on a warrant signed by Thomas P. Hunter, special agent for the California State Medical Board, Dr. Lewis Robertson, twenty-nine, and Paul A. Girard were released on $1,000 bail yesterday pending further action. The two were taken in custody at the Santa Cruz Health Institute, Front Street, by Agent Hunter and Inspector Elmer Geyer. District Attorney Ben B. Knight said the pair would be charged with violation of Section 2141 and 2143 of the State Business and Professional Code. He said he understood the two were alleged to have done chiropodist work though only possessing chiropractic licenses. . . ." (Santa Cruz *Sentinel,* April 10, 1938.)

"Abruptly resting his case at the end of prosecution testimony without offering any defense, Eugene J. Rinaldo, fifty-one year old former Board of Education candidate, yesterday was found guilty of administering medical treatment without a license in violation of the Business and Professional Code by Municipal Judge Call. Rinaldo was accused of charging Mrs. Alice M. Roche, saleswoman, $300 for administering a series of hypodermic injections of specially made medine last September in her apartment, 1275 Westchester Place." (Los Angeles *Times,* April 22, 1938.) "Dr. Eugene J. Rinaldo, fifty-one, convicted last week of practicing medicine without a license, yesterday was sentenced either to serve 180 days in jail or leave the State of California for two years. If at any time within the next two years Rinaldo returns to the State, Municipal Judge Joseph Call ruled, he must serve the full jail sentence. Rinaldo was convicted of having treated Mrs. Alice Roche for a goiter last September, for which he assertedly collected $300 in fees. He previously paid a $500 fine and was placed on two years' probation in a similar case." (Los Angeles *Daily News,* April 29, 1938.) (Previous entries September and December, 1928; February and September, 1929; September and December, 1930; June, 1931; July and December, 1932; May, July, August, 1933; February, 1934; May, 1935; December, 1936.)

"All charges against Dr. Samuel S. Bogle, former county physician. were dismissed by Judge W. D. L. Held of Ukiah in Superior Court here yesterday following approval of a settlement in which the board of supervisors and District Attorney Toland C. McGettigan agreed to accept $9,120 cash held by the former county official. The motion for dismissal was presented by McGettigan, who informed the court that counsel for both sides had agreed upon the amount assertedly due the county treasury. Doctor Bogle was indicted on charges of misusing funds placed in his care by inmates of the county hospital while he was in charge of that institution. At the time of his indictment, the physician posted several thousands of dollars in Superior Court, asking that the court determine to whom the money should be paid. The settlement, as approved yesterday, is in line with the original offer made by Doctor Bogle through his attorneys W. Finlaw Geary and C. J. Tauzer." (Santa Rosa *Press-Democrat,* April 17, 1938.)

"Attorney Louis Fursten and Samuel Sheckman were free today of conspiracy charges in connection with an alleged fake accident case." (Press dispatch, dated Los Angeles, May 3, printed in San Francisco *Call-Bulletin,* same date.)

"L. E. Dollarhide, Long Beach Chiropractor, was found guilty by a Justice Court jury of illegally practicing medicine without a license here yesterday afternoon. . . . At the same time he was acquitted on a third charge of illegally

advertising. . . . S. S. Hahn, defense attorney, immediately filed a motion for a new trial after the receipt of the verdicts. . . . The charges related to treatment of Mrs. Theodore Crawford of this city by Dollarhide last October. . . . It was claimed by the prosecution, conducted by Deputy District Attorney John Gabbert, that ingredients of pills sold by Dollarhide to the woman were included in materia medica, which State law does not permit chiropractors to prescribe." (Riverside *Enterprise*, April 21, 1938.)

"The twenty-seventh name was added today to the list of fatalities among women workers who painted luminous numerals on watch dials some sixteen years ago. Mrs. Margaret Laudate, thirty-eight year old mother of three children, died yesterday and an autopsy established the cause as radium poisoning. Five years ago Mrs. Laudate developed a hip ailment. By November, 1936, when her third child was born, the disease had so advanced that a Caesarian operation was resorted to in a successful effort to save her and the baby. Doctor Martland said the poison from the radium developed sarcoma in the skull. Ten years ago there were legal suits for $1,250,000 damages by a group of women who became known as the 'five radium girls.' In 1928 Federal Judge William Clark, acting as private intermediary, announced the women each would be given the equivalent of a jury verdict of $48,000. Two of the five women are alive today." (Associated Press Dispatch, dated Orange, New Jersey, May 13, printed in San Francisco *Call-Bulletin*, same date.)

"Dr. M. L. Herzig, proponent of a new system for 'purifying' the blood, was under arrest in the county jail on suspicion of practicing medicine without a license. 'Other doctors have framed me,' he charged. 'I have a patent on my method, but I have treated no one here. I was merely enlightening the world.' 'The system involves the use of electroradiation,' he said, 'in the treating of blood disorders.' Doctor Herzig claims to have saved the life of General John J. Pershing and others" (Los Angeles *Herald-Express*, May 7, 1938). The laxity of our California corporation laws is indicated by a printed circular letter dated Los Angeles, April 28, 1938, headed "University of Physicians and Surgeons of Southern California, University Hall, Second Floor, Garfield Building—Office of the President M. L. Herzig, M. D., LL. B., Sc. D.," and directed "Dear Doctor." The contents indicate an attempt to lead the public to believe that the promoter has a secret method for evading the laws regulating the practice of medicine in the State of California. Therein are found such misstatements as: "Under the present laws of this state, a student regularly matriculated in an approved university may follow unlimited practice under the tutelage of the University. . . ." The 1916 Report of the Board of Medical Examiners makes the following comment: "The office of the Board of Medical Examiners is frequently impressed with the ease with which a small group of individuals in California, at a nominal expense, may organize and incorporate under any euphonic title, with purposes as boundless as infinity, profess to teach anything without restriction, or demand as to the qualification of the so-called faculty, or without providing any facilities for instruction. . . . As a concrete example, let me present to your attention the 'United States National University, Administration Headquarters, Corner Van Ness and Turk Street. (San Francisco)—College of Attorneys and Councilors-at-Law; College of Physicians and Surgeons, U. S. N. U., M. L. Herzig, M. D., D. D., LL. D., President; Prof. A. S. Tuchler, M. D., Dean, Medical Director.' A perusal of the articles of incorporation (No. 79608) discloses . . ." that said corporation is empowered to confer almost any kind of a degree, graduate students, confer diplomas, conduct hospitals, etc. This corporation, although advertising, existed on paper only and its "campus" was said to be over a grocery. The Board

Ray-Ban for Summer Glare

This year—as in past seasons—millions of people will need protection against summer discomforting glare. Many will try to buy comfort at the bargain goggle counter, not knowing that such merchandise may be actually harmful to the eyes.

Riggs has consistently restricted its "glare protection" service to optically ground and polished lenses, believing that lenses below this standard are neither safe for the patient nor acceptable to the profession.

RAY-BAN, a scientific glass for outdoor conditions, developed by Bausch & Lomb, is ready now in a series of specially designed streamline styles—in plano and for prescription ground glasses. RAY-BAN will give your patients safe and scientific protection for all their outdoor activities.

BOARD OF MEDICAL EXAMINERS

(Continued from Page 24)

of Medical Examiners has *vainly* tried (by legislative enactment) to remedy this deplorable condition. Reference to Corporation No. 80735 in the files of the Secretary of State shows that the University of Physicians and Surgeons of Southern California prior to October 14, 1935, was a corporation known as "Dr. M. L. Herzig, physician and surgeon." A writ of mandate brought August, 1930, by M. L. Herzig in the courts of Los Angeles (135 California Appellate, p. 41) to compel the Board of Medical Examiners to issue him a California medical license was *denied*. (Previous entries, October, 1930; January, 1934.)

Neglected Teeth.—How many days of school did your child miss this year because of illness? Was this due to toothache or some systemic condition resulting from an unhealthy mouth?

It cannot be denied that many maladies, such as sinus infections, rheumatic fever, heart disease, and others, have been directly caused or aggravated by infections which have gained entrance through neglected, unsound teeth. Knowing these things, many stand by and allow the heritage of the child, who is entitled to a sound and healthy body, to be encroached upon.

We are approaching the close of the school year and summer vacation. This affords a wonderful opportunity for checking the avoidable absences from school for next year.

Every child is entitled to receive a good education. This is the only thing which can be given and not taken from him. With competition so keen today, you should make every effort to see that all physical handicaps are removed in order that each child may have an equal opportunity.

Surprisingly true, too little attention is being paid to the child's baby teeth. Many facial deformities might have been prevented had early dental consultation been sought. Complete physical examination should include a thorough dental inspection, any and all defects should be properly taken care of. The mouth being the gateway of all nourishing material entering the body, you cannot expect that little body to grow and develop into strong healthy manhood or womanhood if no or too little care is given the mouth.

An outstanding penalty of neglect manifests itself in the loss of the first permanent molar. These teeth erupt just behind the last baby molar and, since no tooth has been lost, it is very likely mistaken for a baby tooth. These very important teeth come into place before the baby teeth are lost. They begin to form in the gums before birth and appear at about the sixth year just behind the temporary or baby molars. They replace no teeth. Being far back in the mouth, they need particular attention because of their comparative inaccessibility. Lacking daily care they are apt to become dirty and diseased, thus likely to be sacrificed.

Loss of the first permanent molars quite likely means irregular placement and strain on other teeth. Adjacent teeth tip forward and backward trying to fill the space. Incorrect jaw action leading to improper mastication of the food follows. Undue stress is put upon the teeth, which tends to produce injury to the tissue around the teeth roots. Therefore, the probabilities for pus pockets, bleeding gums, and other unhealthy conditions are greatly enlarged.

As a part of Public Health Day programs in every community, let us strive to impress upon the minds of the proper individuals the importance of mouth care. Let us start with the preschool child and instill early in its mind the necessity of visiting the dentist and from him receiving the correct advice on care of the mouth; also let us not forget that no physical examination is complete without a dental examination.—*Ohio Health News.*

Fungous Infections.—Fungous infections in man, until recently, have been one of the neglected studies of medicine. Bacteria have stolen the show! Since Leuwenhoek, in 1675, first saw microscopic life teeming in a drop of water, men have studied many microörganisms. It was not until late in the nineteenth century, however, that it was established that bacteria cause disease. Intense work has followed this discovery and today our knowledge of bac-

teria has overshadowed medically our study of the fungi that also cause disease.

Among the fungous diseases, actinomycosis was first described in 1877 in cattle by Bollinger, and in man by James Israel. This is a chronic infectious disease in cattle, sometimes transmitted to man, characterized by the formation of lumpy tumors on the jaws and tongue. The disease is attended by loss of strength and weight and by hectic fever, and the fungus may develop in the viscera, bone, and skin, as well as in the mouth and jaws. Because of its frequent development in the lungs it was confused with tuberculosis.

Comparatively little more was known of the fungi that cause disease until Gilchrist described the rôle played by the Blastomycetes and similar fungi in certain diseases of the skin. By these investigations, however, the study of the parasitic fungi was opened and has disclosed the causative factor of many diseases whose true cause has hitherto been unknown.

Recently we find much concerning the fungi in medical literature and have come to know that the parasitic fungi can gain access to every system of the human body; that the diagnosis after their invasion may be simple but is extremely difficult in many cases and that often treatment is of little avail if not started promptly.

Industrial physicians are well acquainted with the ravages caused by fungi. One need only to consult their writings to find many cases. Blastomycosis, already mentioned here, is quite frequently seen in paper workers. Aspergillosis, a condition also called "wheatena," is seen in agricultural workers who handle grain. It is also seen in French pigeon growers. This disease is characterized by multiple small abscesses in the lungs. When these heal and x-ray pictures are taken, they are sometimes mistaken for the nodules found in silicosis. Sporotrichosis, a disease characterized by refractory abscesses under the skin, is seen in gardeners and malt handlers. This disease may become generalized and attack the muscles, bones, joints, and mucous membranes. Herdsmen and farmers, as has been mentioned before, may contract actinomycosis from the cattle they tend.

Fungous infection of the skin, next to the common cold, is the most common disease that affects mankind. Rare indeed is the person who has traveled from birth to the grave who at some time in his life has not suffered from ringworm. Doctor Legge and his coworkers found that, of 3,105 freshmen entering the University of California, 51.5 per cent of the men and 15.3 per cent of the women were infected with ringworm of the feet (Epidermophytosis interdigitalis). These figures rose to 78.6 per cent of the men and 17.3 per cent of the women at the end of the first semester.

Scales of the hair and scales falling from infected feet are capable of transferring this disease. Surprising as it seems, the organisms actually multiply on such material as hair, wool, feathers, and silk after they are deposited there. Keeping this in mind it is easy to understand that the bare feet should never come in contact with any substance that may have been contaminated by someone who has the disease. The best way to avoid this is to:

1. Always wear bath shoes when walking in public shower rooms, and bedroom slippers in strange rooms such as hotel rooms. 2. When using public showers, if slippers are not available, step on heavy newspaper or a towel when bathing, and likewise when drying the feet. 3. Gymnasium clothes should be of cotton, as woolen clothing favors the growth of the organisms. 4. If you become infected, do not try home remedies but see your physician, as the disease is stubborn and requires expert attention.

Nutritive Value of Proteins of Nuts and Beef.—Mitchell and Beadles assessed the protein value in nutrition of English walnuts, cashew, almond, filbert, and Brazil nuts, as compared with beef protein. The nutritive values of the proteins of these nuts were studied by determining the nitrogen intake and outgo of rats under conditions standardized so that significant biologic values could be estimated. They found that while the biologic values of the other nuts fall within the range of from 50 to 60, the cashew nut possesses a value of 72, only slightly below that of beef round, 76.—*Journal of Nutrition.*

New Social Security Form Greatly Reduces Work for Employer and the Government.—A marked reduction in the number of employer reports required by the Treasury Department in connection with the administration of Federal old-age insurance will be effected through a new form which combines tax returns and wage reports. the Social Security Board announced today. The new form not only simplifies the reporting required of employers but helps the Government in its record keeping.

The new quarterly form, known as SS-1a, takes the place both of the monthly tax return and of the six-month information return previously filed by employers for 1937. On this one form, employers will hereafter report all the information previously given on monthly tax returns, Form SS-1, and six-month information returns, Forms SS-2 and SS-2a. Payment by employers of their taxes and their employees' taxes will be made quarterly when the new Form SS-1a is filed.

Under the Federal old-age insurance system, employers are required to report each employee's name, account number, and wages. This information is transmitted by the Bureau of Internal Revenue to the Social Security Board, where it is recorded in a social security account maintained for each employee for use in figuring the amount of the employee's old-age insurance benefits.

The first return on the new form will be filed in April. The return will be for January, February, and March, and must be filed with local collectors of internal revenue not later than April 30 to avoid a penalty for late filing. Other quarterly returns for 1938 on this form will be due on or before July 31, October 31, and January 31, 1939.

The new method of reporting was worked out by the Bureau of Internal Revenue and the Social Security Board to simplify the work of employers in reporting. The board pointed out that this is especially important for operators of small establishments who usually do their own bookkeeping. Returns for 1937 from over 1,700,000 employers showed that about 95 per cent had twenty or less employees. Many had only one or two employees. With this method of reporting, tax returns and wage reports will be made out at the same time. On the new form, employers will list each employee's wages for the quarter. The total of wages paid to all employees can be quickly determined, and the amount of taxes can be easily computed from this total.

The new form provides space for reporting the wages of twenty employees. For employers who have more than twenty employees a continuation sheet, known as Form SS-1b, is provided. Employers who have not received Form SS-1a or who find they need the continuation sheet can obtain these forms from local collectors of internal revenue.

Simplification of the Government's work will result from use of the new form, since tax returns and wage reports will cover the same period and be filed on the same form, and, thus the two reports must agree. The work of checking tax returns against wage reports by the Bureau of Internal Revenue will be lessened, and correspondence with employers to reconcile differences will be practically eliminated. This will enable the Bureau of Internal Revenue to transmit wage reports to the Social Security Board promptly, and posting of employee's wages to their accounts will be expedited.

Health Creed.—"My body is the temple of my soul." Therefore:

I will keep my body clean within and without.

I will breathe pure air and I will live in the sunlight.

I will do no act that might endanger the health of others.

I will try to learn and practice the rules of healthy living.

I will work, rest, and play at the right time and in the right way, that my mind may be strong, my body healthy, and that I will lead a useful life and be an honor to my parents, to my friends, and to my country.—*Bulletin of the Massachusetts Board of Health.*

1 teaspoon	15 cals.
1 tablespoon	60 cals.

Normal children frequently complain of fatigue. Careful study reveals that they do not consume enough food to provide them with necessary energy requirements, half of which are derived from carbohydrate.

The energy supply should be in the form which is easily digested, not readily fermented and which does not affect the appetite for other foods. Karo meets all these requirements.

Infant feeding practice is primarily the concern of the physician, therefore, Karo for infant feeding is advertised to the Medical Profession exclusively.

Filled Milk.—The Food and Drug Administration of the United States Department of Agriculture warns that it will institute legal action against all interstate shipments of any product falling within the statutory definition of filled milk.

The warning follows the recent decision of the United States Supreme Court in the case of *United States* vs. *Carolene Products Company*, which upheld the Federal Filled Milk Act of 1923 as constitutional.

By its terms the Filled Milk Act prohibits the interstate distribution of any combination of milk, cream, or skimmed milk, with any fat or oil, other than the milk fat so as to resemble or imitate milk or skimmed milk in any form. The legislation was enacted after a Congressional hearing. Congress determined and declared: "That filled milk, as herein defined, is an adulterated article of food injurious to public health and its sale constitutes a fraud upon the public."

The indictment in the Carolene case alleged the unlawful interstate shipment of "Milnut" and "Carolene" manufactured by Carolene Products Company of Litchfield, Illinois. Analyses by the Food and Drug Administration showed the products to be composed essentially of evaporated skim milk and cocoanut oil in semblance of evaporated whole milk. After prosecution was started, the manufacturer filed a demurrer to the indictment on the ground that the act was unconstitutional. The demurrer was sustained by the Federal Court for the Southern District of Illinois. The United States appealed to the Supreme Court of the United States which upheld the Filled Milk Act as constitutional.

Everyone should order his daily life so as to have some leisure, for it is during such parts of the day that many important decisions are made. Then a man has time to think quietly and to do some of the things, like reading, that make for his mental growth. If work tends to get him into a rut, leisure lifts him out again. If work is not carrying him to a proper goal, it is often during leisure that he discovers the fact that directs his course anew.

Fitness for Parenthood.—To be parentally fit means to be physically fit, free from disease and prepared for responsibility. Now we find that it means something more. The parents must also be physiologically fit.

The strongest babies are those who most successfully resist the forces of death during the first month of life. Such babies are born to fathers aged twenty-five to twenty-nine years. The best age for mothers is shown in the following table:

First births to mothers aged	21–26
Second births to mothers aged	23–28
Third births to mothers aged	24–29
Fourth births to mothers aged	26–31
Fifth births to mothers aged	28–33
Sixth and seventh births to mothers aged	29–34
Eighth and ninth births to mothers aged	32–37
Tenth and later births to mothers aged	36–41

These are some of the findings presented by Jacob Yerushalmy, Ph.D., of the Division of Maternity, Infancy, and Child Hygiene, New York State Department of Health, to the American Statistical Association at Atlantic City recently. The discovery that the babies of very young mothers are subject to a special risk suggests to Doctor Yerushalmy a new method of public health service. Health officers might obtain from the marriage records the names of girls married in their teens and keep them under observation so that they may be advised to consult their physicians about prenatal care on the first signs of pregnancy. Such a program is further justified by the observation that first-born babies are more likely to die than second born.

Mothers who are older than the schedule limits and mothers who have had a large number of babies also deserve special care.

The Neonatal mortality rate for first births was 32.2 per 1,000 live births; for second births it was 26.1. After that the rate began to rise again until for tenth and later births it was 54.2.

The corresponding rates for premature births were 329.4 for first births, 389.6 for second births and 644.4 for tenth and later births. This shows that a baby born prematurely is far more likely to die than is a baby born at the proper time and justifies the campaign now being undertaken to give special care to premature infants.

Premature births were found to be more frequent in urban than in rural communities. However, the mortality among the premature is higher in rural areas.—"Health News." New York State Department of Health.

Hazards at Home.—A serious injury to you at home would cause wage and other losses to you and your family. Be careful of all home hazards, including the following:

1. Slippery floors and sidewalks.
2. Defective ladders and all makeshift supports.
3. Objects left lying on floors, walks, stairways, etc.
4. Broken or loose stair-treads; torn or loose stair carpet; stairs without handrails.
5. Electric lamps, extension cords, wall plugs, lamp sockets and switches in bad condition.
6. Never touch a light switch and some grounded object, such as a kitchen sink or a bathroom fixture at the same time. You might receive a serious electric shock.
7. It is dangerous to approach a gas leak with an open flame. Call the gas company. If the leak seems serious, shut off the gas at the meter.
8. Never use gasoline or naphtha for cleaning purposes; use only noninflammable cleaning fluids.
9. It is dangerous to carry scalding water about the house in open pails.
10. Always open the garage doors wide before starting the automobile engine.—Safety Instruction Card No. 129: National Safety Council.

PERSUASION may be ever so forceful, but experience alone engenders true confidence. The Lilly Research Laboratories have reason to be glad that the doctor's memory is long, that his judgment is based on results, that his confidence in therapeutic agents depends on fact and not on hearsay. Between the medical profession and Eli Lilly and Company there exists a bond of respect that is the natural outgrowth of long years of responsible dealing with each other.

Ephedrine is one of the most acceptable vasoconstricting drugs for use in the nose. As the season for "summer colds" progresses, it is helpful to remember that Ephedrine Inhalants, Lilly, have established value in relieving the discomfort of this type of nasal congestion.

Supplied in 1-ounce, 4-ounce, and 1-pint bottles.

OFFICIAL JOURNAL OF THE CALIFORNIA MEDICAL ASSOCIATION

VOL. 48 JUNE, 1938 NO. 6

SALUTATION FROM JUNIUS B. HARRIS

OF SACRAMENTO

VICE-PRESIDENT OF THE AMERICAN MEDICAL ASSOCIATION

To Members of the California Medical Association—

Greetings:

On May 9–12, the California Medical Association held its sixty-seventh annual session at the Hotel Huntington, Pasadena, and this month in San Francisco, beginning June 13, members of our national federacy, the American Medical Association, will convene for a five-day annual session. The California Medical Association, as the constituent state unit, and the San Francisco County Medical Society will act as the home hosts. Some thoughts concerning A. M. A. membership, therefore, may be in order at this time.

The A. M. A. roster for 1938 credits the California Medical Association with 5,906 "members of the A. M. A.," but only 3,855 C. M. A. members receive the "*Journal A. M. A.*" as "Fellows of the A. M. A." It is also of interest to note that a grand total of 6,201 physicians in California receive the *Journal of the American Medical Association*, or 295 physicians more than have California Medical Association membership!

The yearly subscription price of the *Journal of the American Medical Association* is $7.00, but "A. M. A. Fellowship" also costs only that amount, and may be had by applying for the same, showing that "Fellows" of the A. M. A. receive the *Journal* without extra cost.

It is evident, therefore, that many members of the C. M. A. pay $7.00 yearly for the *Journal of the American Medical Association* alone, instead of applying for "Fellowship," while "Fellowship" is necessary for admission and participation in the scientific section of the A. M. A.

If you are a subscriber to the *Journal A. M. A.*, and not a "Fellow," we suggest that you send an air mail letter to the American Medical Association, 535 North Dearborn Street, Chicago, and ask for fellowship blanks that will permit you to become a "Fellow." It is possible that this may also be done at the A. M. A. registration booth in San Francisco. You will then be entitled to admission and participation in the scientific and other meetings of the San Francisco session.

It is the sincere hope of the officers of our national and state organizations that you will be among those in attendance at the San Francisco meetings. Preliminary announcements concerning the program, as given in the *Journal A. M. A.* of May 7, indicate a presentation of subjects of wide and important interest.

Fraternally,

JUNIUS B. HARRIS.

Subscription prices, $5 ($6 for foreign countries); single copies, 50 cents.

Volumes begin with the first of January and the first of July. Subscriptions may commence at any time.

Change of Address.—Request for change of address should give both the old and the new address. No change in any address on the mailing list will be made until such change is requested by county secretaries or by the member concerned.

Responsibility for Statements and Conclusions in Original Articles.—Authors are responsible for all statements, conclusions and methods of presenting their subjects. These may or may not be in harmony with the views of the editorial staff. It is aimed to permit authors to have as wide latitude as the general policy of the Journal and the demands on its space may permit. The right to reduce or reject any article is always reserved.

Contributions—Exclusive Publication.—Articles are accepted for publication on condition that they are contributed solely to this Journal. New copy must be sent to the editorial office not later than the fifteenth day of the month preceding the date of publication.

Contributions—Length of Articles: Extra Costs.—Original articles should not exceed three and one-half pages in lengtb. Authors who wish articles of greater length printed must pay extra costs involved. Illustrations in excess of amount allowed by the Council are also extra.

Leaflet Regarding Rules of Publication.—CALIFORNIA AND WESTERN MEDICINE has prepared a leaflet explaining its rules regarding publication. This leaflet gives suggestions on the preparation of manuscripts and of illustrations. It is suggested tbat contributors to this Journal write to its office requesting a copy of tbis leaflet.

CALIFORNIA MEETINGS OF A. M. A. AND C. M. A.

Annual Session of the California Medical Association.—The sixty-seventh annual session of the California Medical Association, held at the Hotel Huntington in Pasadena, May 9-12, has come and gone, and its events now take their place in the records of the past. The meetings began on Sunday and continued without interruption through Thursday noon. The scientific programs and exhibits, and all the social events of the occasion measured up to an excellent standard. The dinner to President Howard Morrow was made particularly enjoyable through entertainment supplied by the Alameda delegation, who brought with them several Oakland artists. The Woman's Auxiliary reported most gratifying meetings. The registration desks and commercial exhibits were housed in a specially arranged tent-like structure set up in a patio conveniently accessible. The general verdict, therefore, apparently of everyone who registered was that "a good time was had by all."

* * *

Dr. Howard Morrow Is Now the Past President, Dr. William W. Roblee Assumes the Presidency, and Dr. Charles A. Dukes Becomes President-Elect.—At this time, the appreciation of the Association is expressed to Dr. Howard Morrow of San Francisco, the retiring president, for his efficient services during the past year.

The California Medical Association also greets the incoming president, Dr. William W. Roblee of Riverside, who takes up the responsibilities laid down by his predecessors. In his many years of service, Doctor Roblee has given of himself without stint and without thought of self. Hence, he may look forward to, and will receive the generous support of every Association member.

The newly elected President-elect is Dr. Charles A. Dukes of Oakland, and it is of interest that he was a classmate of Doctor Roblee at Stanford's Cooper Medical College, both being members of the Class of '95. Confrères throughout California are familiar with the valuable work Doctor Dukes has rendered as chairman of the California Cancer Commission and the Committee on Public Relations. His continued service in this new position will add to his laurels as an efficient administrator, and as a loyal, broad-visioned disciple in the guild of physicians.

So much for the nonce concerning this year's annual session. Full reports of the meetings of the House of Delegates will appear in the July issue of CALIFORNIA AND WESTERN MEDICINE.

* * *

American Medical Association Convenes in San Francisco June 13-17.—We turn from the pleasant memories of a State Association gathering to look forward, with equal pleasure, to the

† Editorials on subjects of scientific and clinical interest, contributed by members of the California Medical Association, are printed in the Editorial Comment column which follows.

eighty-ninth annual session of the American Medical Association which will begin its five days of meetings in San Francisco on Monday, June 13. The *Journal of the American Medical Association*, in its issue of May 17, gives a comprehensive outline of the many activities in scientific and organized medicine which will then and there be considered. If you are not a subscriber of the *Journal A. M. A.*, it will be worth the while to borrow a copy from some colleague and orient yourself concerning the work of our national organization, in which the California Medical Association is one of the large constituent state units. And then, if you have in mind to go to San Francisco for the American Medical Association annual session, it would be wise to write the California Medical Association, Suite 2004, 450 Sutter Street, San Francisco, in regard to hotel reservations. The hotel rates were given on page 1573 of the *Journal A. M. A.* of May 7.

The many physicians who continue to attend meetings of the American Medical Association are unanimous in expressing a favorable opinion of their value. Inasmuch as the medical profession of California is this year's host, the registration of physicians from our state should be only such as to reflect the highest credit upon ourselves. In this connection, if you are not a "Fellow" of the American Medical Association, it would be well to write at once to the American Medical Association, 535 North Dearborn Street, Chicago, and make request for a fellowship application blank. As stated by Dr. Junius B. Harris, in his Salutation which appears in this number, the payment of the fellowship dues, of seven dollars, entitles each Fellow to a subscription to the *Journal A. M. A.*, while a subscription to the American Medical Association journal alone, and without the privileges of a fellowship, costs the same amount, namely, $7.

The officers of the California Medical Association urge you to attend this eighty-ninth annual session of the American Medical Association (and so utilize in excellent way some of your vacation days); and also recommend that if you are a subscriber to the *Journal A. M. A.*, but not a "Fellow," to write and secure such fellowship, in order to be able to register and take part in the meetings. If you send your application to the California Medical Association, 450 Sutter Street, San Francisco, the communication will be referred to the proper A. M. A. officers. You will deny yourself real inspiration and pleasure if you fail to attend the June 13-17 session of the A. M. A. in San Francisco.

"COUNTY INSTITUTIONS COMMISSIONS" FOR THE COUNTY HOSPITALS OF CALIFORNIA VERY MUCH NEEDED

How County Hospital Purposes Have Changed in Recent Years.—During the last ten years, in many of the publicly supported county hospitals of California, the functions of those institutions, regarding the group of citizens who are there eligible for hospitalization and medical care as well as financial and other factors having relation thereto, have undergone changes that are most important to patients, taxpayers, and the members of the medical profession. How far, for example, from almost generally accepted procedures in county hospital management some of these innovations can go, has been shown in recent issues of California and Western Medicine, in the discussion of serious problems that have arisen at the Los Angeles County General Hospital.*

* * *

Illegal and Injudicious Procedures in Vogue in Some County Hospitals of California.—It is not necessary again to go into detailed discussion of some of the matters previously commented upon, it being sufficient to mention the following:

1. That public moneys seemingly have been expended in unwise and perhaps illegal adventures and efforts intended to collect money from indigent patients, when, according to California law, hospitalization and medical care supposedly should be given without cost to such needy citizens;

2. That the fundamental purpose for which county hospitals were brought into being still exists, namely, to place the facilities in such institutions only at the service of those citizens who, as sick and injured, lack the financial resources to pay for needed hospital and medical care;

3. When hospitalization costs are calculated and a fee table for such service is established by a board of supervisors, that the rates shall be fair and equitable, and not in excess of the costs of hospitalization service of equal or better standard, purchasable in private hospitals of the same community;

4. When statements for hospitalization services are rendered to "medically indigent" citizens (persons able to provide shelter, food and clothing for themselves and their dependents, but with insufficient funds to cover hospital and medical care costs), the law as interpreted by the California courts shall be observed, namely, that such "partly" or "medically indigent" persons shall be called upon to pay only so much of their hospitalization costs as would represent a fair and equitable proportion of their financial resources;

5. That a patient admitted to a county hospital should himself be informed (or through a legal guardian) within, say, three days after admittance, as to what the average costs per day and week would probably be (applying here the same routine that exists in private hospitals); and that thereafter, weekly if possible, or semimonthly or monthly, in any event, a memorandum of the approximate costs would be rendered (again, as in private hospitals), in order that the patient, if partly indigent, could ask for discharge, in case the costs were mounting to heights impossible for the individual to pay, in whole or in part;

6. That the routine plan of having patients, seriously ill or otherwise, sign over in blank, as it

* See items on Los Angeles County Hospital in this issue, on page 477. Also previous articles in recent issues as follows: February, 1938, pp. 73 and 78; March, pp. 156 and 216; April, pp. 234 and 279; and May, pp. 309 and 383.

were, all rights to burial and other insurance policies or equities in small and heavily mortgaged properties, be replaced by a system with more of the human element and human individualization in evidence;

7. That when statements for hospitalization are sent out, the items should be so worded that the county operating the hospital may not be accused of having attempted to secure reimbursement under fraudulent pretenses; thus, when a county sends out bills for an item such as "Use of the Operating Room and Personnel," this fact should be so stated, instead of naming the operation and giving the impression that the charge was for the surgical operation (for which operation, if it had been performed by an attending surgeon who was giving gratuitous service, the county would have no legal right to make a charge);

8. That nonindigent citizens—viz., sick and injured citizens who are neither "indigent" nor "medically indigent"—should not be permitted to use the facilities of a county hospital, except in cases of great emergencies, such as earthquakes and fires; because, to admit such nonindigents is clearly an illegal act, for which the constituted authorities could be held liable in law, since they would in such instances be using public moneys for private purposes;

9. That if a collection bureau is established by a county for its hospital, its administration should not be permitted to waste public moneys in efforts to collect from indigent citizens (who are legally entitled to care without cost), or improper amounts from medically indigent persons, by hiring a large clerical and other personnel to send out statements in amounts aggregating thousands of dollars, of which, perhaps, only about 5 per cent or so ever could be collected.

* * *

Improper Procedures in County Hospital Administration Must Be Stopped.—If illegal and unbusinesslike methods, such as are enunciated above, exist in one or more county hospitals in California, and if in the interests of:

1. The principle of humanitarian care for sick and injured citizens who are indigent or near-indigent;

2. The rights of taxpayers to have public moneys expended only for public purposes; and

3. The maintenance of proper professional and business standards,

it is desirable to remedy administrative deficiencies such as have been outlined, what are the constructive plan or plans that may then be brought forward for consideration?

* * *

The Solution of These County Hospital Problems Is Found in "Institutions Commissions." It is our opinion, based upon experience on a county hospital medical board extending over a period of more than thirty continuous years (during which we have seen one political administration follow the other) that the answer is to be found in an "Institutions Commission" modeled after the excellent form brought into existence in 1917 for Alameda County.* That Commission came into being largely through the efforts of Dr. O. D. Hamlin, himself an ex-president of the California Medical Association, who persuaded an influential group of fellow citizens of Oakland to join with him in an effort to induce the Board of Supervisors of Alameda County to authorize an "Institutions Commission" which, by ordinance, was warranted to

"have jurisdiction over the County Hospital, the County Infirmary, and the Tuberculosis Hospital of the County of Alameda, of all employees thereof, and of all activities carried on therein, and of all institutions for the sick, injured or infirm, maintained and operated by the county of Alameda, not including therein the Emergency Hospital."

* * *

Alameda County Institutions Commission.—The foregoing ordinance was adopted on July 16, 1917, and the hospitals mentioned above have been under the jurisdiction of this "Alameda County Institutions Commission" since that year.

On August 23, 1932, the original ordinance was repealed by "An Ordinance Relating to the Powers and Duties of the Alameda County Institutions Commission and Repealing Ordinance No. 208 entitled, 'An Ordinance Creating the Alameda County Public Health Center Board and Prescribing Its Powers and Duties Pursuant to the Provisions of Section 13 of the Charter of the County of Alameda.'"

The Alameda County Institutions Commission, as at present constituted, is operating under the revised ordinance having the above title, adopted in 1932, and which, for the information of our readers, appears on page 475 of this issue, in the Special Articles section. The ordinance is commended for most careful perusal by every member of the California Medical Association, because in it we find a method that has already prevented, and can overcome and prevent procedures such as were indicated in the beginning of these comments.

In fact, the Institutions Commission plan of supervision of county hospitals and their associated activities is today, without doubt, the most logically indicated method of operation for these public institutions that have such wide scope and extended influence on the health and happiness of citizens with lower-bracket incomes, as well as on the interests and rights of taxpayers.

The Alameda County Institutions Commission plan is not 100 per cent perfect, but it can serve as an excellent model for other counties. Take the time to read or scan its provisions.

* * *

How Could the Alameda Institutions Commission Plan Be Applied, for Example, to the Large Los Angeles County General Hospital? At the beginning of these comments, references were given to articles on the Los Angeles County

* References to this Alameda Institutions Commission plan was made in articles by Dr. George G. Reinle in CALIFORNIA AND WESTERN MEDICINE, July 1913, page 1; and in the issue of November, 1933, pp. 340 and 289. Another reference appears in this issue, on page 475.

Hospital which have appeared in recent issues of California and Western Medicine. Therefore, it is not necessary to reiterate what has been previously stated concerning indicated changes for that institution. In one press clipping in this issue* commenting upon the requested budgets of the charitable institutions of the County of Los Angeles, the following estimates for maintenance costs for one year were given:

	Budget Estimate
Los Angeles County General Hospital	$5,595,511
Olive View Sanatorium (tuberculosis)	1,335,982

The above are financial amounts of little less than amazing proportions, made necessary to cover the maintenance costs of these large charitable institutions in one of the metropolitan centers of California.

* * *

Present Charitable Institutions Ordinance of Los Angeles County.—The statutes of California place the primary responsibility of expending these public moneys on the five members of the Board of Supervisors of Los Angeles. That Board, however, has many other responsibilities, and by Ordinance No. 2168 (New Series) Eff. 11-30-1932 it is provided that a county employee known as the "Superintendent of Charities" shall be vested with the authority to manage the aforementioned institutions, the exact language being as follows:

Rule 1. Subject to the direction of the Board of Supervisors and rules and regulations adopted by the Board, the Superintendent of Charities shall be the head of, and it shall be his duty to direct, supervise and control all activities of the Department of Charities, including the General Hospital, Rancho Los Amigos, Olive View Sanatorium, County Cemetery, and the Bureau of County Welfare. He shall enforce rules and regulations for the conduct and government of the various bureaus of the Department of Charities and of the charitable institutions of the county.

Rule 2. The Superintendent of Charities shall have power to appoint the Executive Superintendent of the General Hospital, Superintendent of Rancho Los Amigos, Superintendent of Olive View Sanatorium, Superintendent of the County Cemetery, and the Superintendent of the Bureau of County Welfare.

Rule 2a. Subject to the supervision and direction of the Superintendent of Charities the Executive Superintendent of the General Hospital shall have immediate charge and control of the General Hospital, and with the approval of the Superintendent of Charities shall have the power to appoint all employees of the General Hospital.

Comment.—In a plan for an Institutions Commission for Los Angeles County, the duties and powers now vested in the Superintendent of Charities would be vested in the Commission, the Commission taking over the Superintendent's major functions as to appointments and so on, and he in turn, perhaps, occupying a place in relation to the Institutions Commission similar to that which the Executive Superintendent of the General Hospital (see Rule 2a above) at present holds to himself.

How Should an Institutions Commission Be Composed?—A proposed plan for an institutions Commission would be somewhat as follows:

Number of Members.—Seven.

Term of Office.—Seven years each.

How Appointed.—One member to be appointed each year by the Board of Supervisors. (The terms of supervisors are four years each, in a staggering arrangement. Therefore, appointees in succeeding years would be responsive to the wishes of the electorate as expressed in their election of supervisors.)

Qualifications.—The seven members of the Institutions Commission to be citizens, who have had prior legal residence in the county for at least five years, and who have had special training or experience in administrative matters having to do with business, or with social welfare activities, or with professional work. The honorarium to be twenty dollars for each meeting, provided, that no more than three meetings in a single month would be entitled to such honorarium.

* * *

Institutions Commissions Can Be Created by Ordinances or by Charter Amendments.—In Alameda County, the Institutions Commission came into being through an ordinance, and it has done its work so well since 1917 that no effort has ever been made by succeeding Boards of Supervisors to repeal the enactments. However, another method, and one which could be used in counties operating under county charters—as in Los Angeles County, for instance—would be the submittal of a charter amendment that might create an Institutions Commission. An Institutions Commission, once so created, would continue to operate until such time as the electorate deemed it wise to provide otherwise.

* * *

Government of County Hospitals in California of Vital Importance.—This subject of Institutions Commissions, as above commented upon, will be referred to in future issues, but it is to be hoped that what has been stated here and elsewhere in this issue of the Official Journal may stimulate further thought and discussion. No public health problem in California has closer implications with medical practice in this state than the publicly supported county hospitals. These institutions can be potent factors in determining what the future shall bring to scientific and organized medicine. It is to be desired that even during the coming vacation months the subject will receive attention by the proper medical society committees in every county in California.

MEDICAL CARE OF MIGRATORY WORKERS

"Agricultural Workers' Health and Medical Association," a Corporation.—Under the caption, "California 'Migrants': 'Workers' and 'Rovers'," the problem of medical care for migratory workers in California received brief editorial

* For recent press clippings concerning Los Angeles County Hospital see page 477.

comment in California and Western Medicine in its issue of August, 1937, on page 74. Some public health factors having relation to these itinerant workers have become so serious that the Federal Government, through the Farm Security Administration, acting in coöperation with the California State Board of Public Health, recently brought into being a nonprofit corporation known as the "Agricultural Workers Health and Medical Association," the corporation taking up its work with an appropriation of $100,000, secured from the Federal Government.

A report, submitted by Dr. Karl L. Schaupp of San Francisco, one of the seven directors of the corporation, outlines the purposes and tentative plans under which it is proposed to work. Request is made for comments and criticisms, the plan having been previously discussed with representatives of twenty county medical societies of California, in whose districts the medical care of migratory workers has become an important problem. Members of the Association are urged to read the report of Doctor Schaupp, which appears on page 460. He and his associates will welcome your suggestions.

Other State Association and Component County Society News.—Additional news concerning the activities and work of the California Medical Association and its component county medical societies is printed in this issue, commencing on page 458.

EDITORIAL COMMENT†

CRYSTALLIZED LYSOZYME

The recent crystallization of Fleming's "lysozyme" by Doctors Abraham and Robinson[1] of Oxford University is a major victory in basic immunologic research, which may well lead in time to practical clinical results. This fat-soluble bacteriophage-like substance is present in particularly high titer in the tears and nasal secretions, and is believed by the English investigators to be the major natural defenses of the conjunctiva and nasal mucosa against certain types of bacterial infection. The defensive enzyme is apparently a protein which is particularly rich in the two amino-acids, tyrosin and tryptophan.

This natural antiseptic was discovered in 1922 by Doctor Fleming[2] of St. Mary's Hospital, London, who studied in detail its action on certain nonpathogenic cocci. Wolff,[3] of the University of Amsterdam, afterward showed the lysozyme to be almost equally effective against certain pathogenic microörganisms, such as the gonococcus, Staphylococcus aureus, Staphylococcus hemolyticus, meningococci, and tubercle bacillus.

Lysozyme is apparently widely distributed in human tissues. Tears, sputum, and nasal secretions show lytic action on susceptible cocci in dilution as high as 1 : 300,000. Blood serum, normal saliva, ascitic fluid, cystic fluids, and pus are of lower lytic titers, being rarely effective in dilutions higher than 1 : 1000. Cerebrospinal fluid, urine, and sweat are practically free from the lytic enzyme, never showing titers greater than 1 : 10. Aqueous extracts of dehydrated acetone-fixed tissues show cartilage and the gastric mucosa to contain the lytic enzyme in particularly high concentrations, with intermediary concentrations in the liver, tonsils, intestines, and meninges. Kidney and skin give particularly low yields. Traces of the lytic enzyme are demonstrable in many vegetables, *e. g.*, turnips.

Unlike the water-soluble Twort bacteriophage the Fleming fat-soluble, "lysozyme," is equally active against dead bacteria. At 37 degrees centigrade an opaque suspension of living or dead Micrococcus lysodeikticus, for example, is almost completely cleared in a few seconds. The Twort bacteriophage requires several hours to effect an equal degree of lysis.

Like the bacteriophage, however, the amount of lysozyme in a bacterial suspension increases as a result of lysis, the increase being roughly proportional with the number of bacteria dissolved. Serial transmission of the lysozyme, however, has not yet been accomplished.

Lysozyme-resisted strains of susceptible cocci are readily produced by growing the cocci in the presence of sublytic concentrations of the enzyme. Cocci which have an acquired resistance to the lysozyme in human tears are equally resistant to lysozymes from other animal or vegetable tissues. This suggests that all lysozymes thus far studied are of the same immunochemical specificity.

Lysozyme is a remarkably stable enzyme. It may be stored without appreciable deterioration for many months, with or without the addition of chemical preservatives. It can be precipitated by alcohol or acetone without loss of titer, can be desiccated and redissolved in aqueous solution without depreciation. Unlike the Twort bacteriophage, the Fleming lysozyme is not inhibited by defibrinated blood.

The fact that lysozyme has no demonstrable bactericidal effects in S. viridans, pneumococcus, diphtheria bacilli or colon bacilli, detracts but little from its practical clinical interest. Its alleged high titer against the gonococcus would in itself justify its detailed study.

The Oxford biochemists found that lysozyme may be crystallized from n/20 acetic acid extracts by concentrating the extracts in a vacuum desiccator. The initial products thus obtained are dodecahedral crystals. Purification by repeated crystallization has not yet been reported. Injected intravenously into laboratory animals, lysozyme disappears rapidly from the circulation. Wolff[3]

† This department of California and Western Medicine presents editorial comments by contributing members on items of medical progress, science and practice, and on topics from recent medical books or journals. An invitation is extended to all members of the California Medical Association to submit brief editorial discussions suitable for publication in this department. No presentation should be over five hundred words in length.

believes that this disappearance is due to its lipoid solubility. This belief is based on the fact that in the test-tube lysozyme is absorbed quantitatively by anhydrous lecithin and cannot be recovered from the lecithin by repeated washings with salt solution. If the anhydrous lecithin-lysozyme complex is dissolved by absolute methyl alcohol, however, the lysozyme can be recovered quantitatively from the undissolved salt residue.

Whether or not lysozyme is synthesized in the animal body, or, like certain vitamins, is a nutritional factor conserved by the animal tissues, has not yet been determined. Egg white, for example, contains about 0.01 milligram lysozyme per cubic centimeter. Egg yolk contains many hundred times this concentration. Many vegetables are also natural sources of this protein antiseptic.

POSTOPERATIVE TREATMENT IN PERITONITIS

This discussion is intended to apply to generalized peritonitis and not to localized intraperitoneal abscesses. After the most gentle and, usually, the most conservative operative intervention designed to remove or stop the source of contamination of the peritoneal cavity has been carried out, the surgeon is confronted with the equally important postoperative care. Much has been learned in recent years in clinical practice and the many advances which have been made in biochemistry, physiology and metabolism are applicable to this problem. In peritonitis the absorption from multiple partial obstruction due to intestinal distention is a greater lethal factor than the infection directly. It logically follows that the prevention of distention is of great importance. The campaign to this end must be started immediately after the operation.

The first step in this fight is to place a nasal duodenal tube into the stomach and connect it with a Connell suction. This should be done immediately after operation, and continued until the patient is passing gas per rectum freely without colon flushes or enemata. The importance of constant lavage of the stomach and draining off the regurgitated upper intestinal contents is urgent. In this connection it is to be remembered that over 70 per cent of the gas causing distention of the gastro-intestinal tract is swallowed air as a result of attempts on the part of the patient to belch. The tube in the stomach, with constant suction, eliminates this big factor and the collapsed stomach allows more room within the abdomen for the coils of distended gut, decreasing the degree of obstruction at points of angulation of the different loops. The upper loops can empty into the stomach making further room for the lower loops to empty upward.

The intestines are vitally involved in the inflammatory process, and the principle of providing rest for such sick or injured tissue should be strictly followed. Hot compresses to the abdomen, when properly applied and not allowed to get cold, make for comfort and probably have some beneficial effect in keeping up the muscle tone of the intestines without artificially stimulating peristalsis. Morphin given in adequate doses for comfort, but not to excess, has been shown experimentally to aid in the maintaining of normal muscle tone of the intestines. The use of eserin, pituitrin, petressin, concentrated saline, etc., to whip up the sick, distended intestines is most definitely injurious. One may secure the expulsion of gas by these drastic drugs in conjunction with flushes and enemata, but more often than not, a few hours later, the patient is more distended than ever. The pernicious practice of routine colon flushes, rectal drips and early enemas are contra-indicated. A low colon flush or small enema is of assistance only after natural peristalsis has been definitely reëstablished, but not before. A rectal tube may be inserted twice or three times daily after the first twenty-four hours, and this should be the limit of meddling with the gastro-intestinal tract until peristalsis is active. Early high colon flushes or high enemata are practically as harmful in peritonitis as early feeding by mouth, which is agreed to be detrimental. Rectal instillations cause reverse peristalsis and stirs up the pus.

In brief, the surgeon should use all agencies at his command to put the gastro-intestinal tract completely at rest until nature is ready for assistance. When the patient is ready for help a low enema of three hundred cubic centimeters is preferable to the so-called high enemata. The desire to defecate is caused by a sudden distention of the rectum and the painful contractions due to over-distention of the bowel higher up serves no useful purpose and in peritonitis does harm.

Having outlined the campaign for rest of the sick guts, the next essential is to supply fluid, salt and nourishment in the proper quantity. A sick patient with peritonitis loses from 1,500 to 2,500 cubic centimeters of fluid in each twenty-four hours by evaporation from the skin and in the expired air. This evaporation has first call on the available fluids possessed by the patient's tissues. For sick patients to adequately free the body of nitrogenous waste products, there must be excreted at least one thousand cubic centimeters of urine daily.

Thus three thousand to 3,500 cubic centimeters of fluid is required in each twenty-four hours. Patients who have peritonitis most often are emergency cases and are often dehydrated. Coller[1] and his collaborators have shown that to overcome such dehydration 3,500 cubic centimeters of fluid is required to be able to start from scratch. This seven thousand cubic centimeters of required fluid is a startling amount for the first twenty-four hours, and in most instances would be dangerous. Each case must be individualized, and it is not necessary to give all of the seven thousand cubic centimeters in the first twenty-four hours. Yet more often than not, the patient does not get enough fluid which should be given in an adequate quantity but at a slow rate of speed.

From clinical experience and physiological facts, we know the above to be the required volume of

1 Coller, Fred A.: Water Balance in Surgery, J. A. M. A., Vol. 108, No. 1 (Jan. 2), 1937.

fluid, but the kind of fluid, the amount and kind of salt, and the amount of sugar are of equal importance. Since the stomach is being constantly emptied, there is a complete loss of the chlorides secreted as hydrochloric acid in the gastric juice. These chlorides must be replaced. This can be done in the form of normal saline or Ringer's Solution. However, the patient must not receive too much sodium or his kidneys may cease to function, and he will develop edema, suppression of urine and uremia and die, not as the result of the pus in the peritoneal cavity nor to the toxic absorption from loops of obstructed gut, but a chemical death as a result of his treatment. Six to eight grams of sodium chlorid is the requirement of the average individual in normal health in each twenty-four hours. One thousand cubic centimeters of saline or Ringer's Solution will supply nine grams, which is adequate for twenty-four hours. Ringer's Solution, because of the calcium and potassium it contains, is preferable to sodium chlorid solution. If edema develops because of too much sodium, and kidneys of different people vary in their ability to cope with an excess of this element, it can be corrected by the addition of five cubic centimeters 10 per cent calcium chlorid to one of the glucose intravenous injections.

The calcium chlorid corrects the beginning alkalosis and has a remarkable effect by increasing the volume of urine and reducing the edema. The writer has used calcium chlorid in this manner for fifteen years and with gratifying results.

To prevent the development of acidosis, a sufficient amount of carbohydrates must be supplied in a usable form to furnish glycogen for the liver, and to burn completely the products of katabolism of fats. This again varies, but 5 per cent or 10 per cent glucose solution may be used alternately as indicated to supply the demand.

The facts indicate the use of the following arbitrary routine. Give one thousand cubic centimeters 10 per cent glucose in distilled water at 8 a. m., one thousand cubic centimeters Ringer's Solution intramuscularly at 1 p. m.; one thousand cubic centimeters 5 per cent glucose in distilled water at 7 p. m., and allow the patient to rest until morning. If the patient's veins are good, all fluids may be given by the intravenous routine for the benefit of comfort. Each intravenous injection of one thousand cubic centimeters should require, at least, one and one-half hours to administer to prevent the occasional occurrence of pulmonary edema from this volume of fluid if given too rapidly. In the more desperate cases and those with poor veins, continuous intravenous administration of glucose by the drop method is a more satisfactory way of furnishing the required fluids. The rate of flow should be about forty drops per minute.

This régime for from four to seven days will carry the average patient with generalized peritonitis to the point where he can again take fluids and nourishment by mouth. However, in some of the more severe cases, this procedure may have to be carried out for two to three weeks. After ten days to two weeks, the patient may develop edema due to low blood serum protein. In medical centers where laboratory facilities are available, this fall in serum protein can be detected early by blood chemistry examinations which serve as an accurate guide for proper treatment. However, not all hospitals are equipped to furnish such adequate and reliable reports and, indeed, such reports are not obligatory. The only available method of furnishing the patient who cannot eat, the required serum protein is by giving blood transfusions. Therefore, in the absence of blood chemistry examinations as a guide, a transfusion of whole blood should be given as soon as the dependent edema and a decrease in the urinary output occurs and should be repeated as often as is necessary to control edema until the patient is able to take protein by mouth.

This régime has been arrived at after trial over a period of years of water by mouth, early feeding, rectal drips, rectal instillations, colon flushes, various enemata, pituitrin, eserin, etc., and is, productive of the best results.

LeRoy Brooks,
San Francisco.

GLAUCOMA

With increase in longevity, a corresponding increase in the number of patients with simple glaucoma is to be expected. The importance of glaucoma in the practice of ophthalmology can be seen from the fact that, of the nineteen papers presented before the Section on Ophthalmology of the American Medical Association in 1936, three dealt with this subject.[1]

Glaucoma has been known from antiquity. Four centuries before Christ, Hippocrates mentioned the "glaucoses" as the known affections of advancing age. Of course, the knowledge he possessed was hazy, as he did not distinguish cataracts from eye conditions caused by increased intra-ocular pressure. The Greek and Latin writers who followed him learned one important fact, that there was a difference between the various eye conditions which took place behind the pupil and caused blindness. There were the "suffusions" which were favorable from the operative point of view, and the glaucomata which were unfavorable. Of course, it was the congestive variety that has been thus known, since the noncongestive (simple) variety can be diagnosed primarily by the ophthalmoscope. The name "glaucoma" is from the Greek word γλαύκωμα, derived from γλαυκός, meaning "sea-green or gray," and this condition was so called on account of the greenish reflex from the pupils in glaucoma.

Congestive glaucoma was usually regarded as having some connection with gout, and was called ophthalmia atritica. The noncongestive type was considered as produced by diseases of the deep structures of the eye, and with other kinds of blindness was known under the common name of

1 Weeks, W. W.: Ocular Hypertension in Glaucoma—Errors in Operative Technique Likely to Cause Failures in Operations for Its Control. Wheeler, J. M.: Iridectomy with Cyclodialysis for the Reduction of Ocular Tension. Barkan, O.: A New Operation for Chronic Glaucoma, Tr. Sect. Ophth., A. M. A., 1936.

"amaurosis." As late as 1844, in a popular textbook on diseases of the eye by Jeaffreson, the cause of glaucoma was given as due to a disease of the vitreous body.

Sir William McKenzie, in 1830, was the first to recognize increased intra-ocular tension as the essential part of glaucoma, whose work was later emphasized by von Graefe. McKenzie recommended repeated parancentesis for glaucoma.

The invention of the ophthalmoscope was the beginning of the golden age in our knowledge and clarification of various eye conditions. Although ophthalmology is the oldest medical specialty, ophthalmology as we know it today is one of the youngest, for its birth was the discovery of the ophthalmoscope by Helmholtz in 1851.

Soon after the discovery of the ophthalmoscope, Adolph Weber made the clinical observation of the cupping of the optic disc. This was quickly confirmed by Heinrich Müller's studies of the pathological anatomy of the eye. Five years later, in 1856, von Graefe introduced his iridectomy for the first time in glaucoma. It is interesting to note that von Graefe's first paper on iridectomy presented a means of treatment of chronic iritis and iridochoroiditis. It was a year later when his paper on iridectomy in glaucoma appeared.

In 1862 Sir William Bowman introduced the method of gradual digital tonometry, together with the use of the three familiar degrees, above and below the normal, respectively. Schiotz introduced his famous tonometer in 1910, and McLean his in 1919.

We owe a great deal to von Graefe's disciple, de Wecker, who fought the rising tide of opposition, which at one time threatened prematurely to engulf his master's valuable method. De Wecker has a higher claim still on our admiration for recognizing the value of a filtering scar, and the fact that he introduced Stellwag's sclerotomy.

Leber's classic work established the secretion of the intra-ocular fluid by the ciliary body, and the method of excretion of that fluid. This paved the way for Max Knies and Adolph Weber who, working independently and following the clue given by Leber, simultaneously discovered the important fact of the closure of the angle of the anterior chamber by adhesion of the iris to the cornea in cases of glaucoma.

In 1863 Argyll Robertson, of Argyll Robertson pupil fame, wrote a paper on the calabar bean, eserin, as a new agent in ophthalmic practice. Argyll Robertson did not recognize its value as a myotic. It was in 1876 that Laqueue of Strassburg introduced myotics in the treatment of glaucoma, and he, too, had to maintain his stand courageously in the teeth of opposition which it started. He was fortunate to have as a supporter the veteran Snellen.

Among pioneers in the introduction of the study of the visual fields, we owe a great deal to the three musketeers: Haffmans, a pupil of Donders, who in 1860 studied visual fields; Bjerrum, who did his studies between 1889 and 1892, and his pupil, Rönne.

Heine described his cyclodialysis in 1905, and a year later Lagrange introduced his operation of sclerotomy. Elliott followed with his trephine operation in 1909.

Although tremendous advances have been made in the treatment of glaucoma since von Graefe introduced his iridectomy, a satisfactory treatment of glaucoma still remains to be found.

Frank H. Rodin,
San Francisco.

Defective eyesight is an important contributing cause of many automobile accidents, it is pointed out by Alvhh R. Lauer, Ph.D., in a report on "Motor Vision in Safe Driving," published by the National Society for the Prevention of Blindness. Doctor Lauer is associate professor of psychology in the Iowa State College, Ames, Iowa.

Many highway accidents occur, he says, because of the following reasons:

1. Failure of the driver to see or interpret a warning signal in time to avoid danger.
2. Failure of the driver to determine the exact location of a vehicle, person, or other object in time to avoid collision.
3. Failure of the driver to see objects or persons at night.

"The first classification of failures of the driver," says Doctor Lauer, "may be due to lowered acuity or keenness of vision; restricted field of vision, namely, narrowed down from the sides; scotomata, or 'holes in vision,' in which part of the field objects will not be discerned; ocular dominance, or the tendency to use one eye more than the other; and lowered attention, which may result in temporary psychic blindness of one or both eyes.

"The second classification of weaknesses—that of localizing the object—may be due to poor distance judgment or muscle imbalance, causing diplopia or double images. Cases of double images with as slight as three degrees of exophoria—eyes tending to turn out—have been noted. The driver would see two pairs of headlights in the distance and think one car was attempting to pass another. In reality there was but one car.

"The third classification is that of blinding lights. Persons differ enormously in this respect. Older persons are usually more disturbed and more easily blinded by glaring lights than younger persons. Likewise lowered acuity is associated with inability to tolerate strong lights. Persons least disturbed by glare can stand forty times as much contrast as those most affected. We are hoping that the perfection of polarizing glass may solve the glare problem soon.

"One of the best ways to decrease accidents is to apprise the driver of his actual potentiality as a driver. This has been demonstrated in commercial companies. Most drivers think they are good. Actually, some are 15-mile-an-hour drivers. Others are 25-mile-an-hour drivers. Still others may drive safely at 35, 45, or 55 miles an hour, under favorable conditions. A very few might drive safely at 65 miles an hour. Our experience with racing drivers shows that they drive only 45 to 50 miles an hour when on the highway, yet some 25-mile-an-hour drivers have boasted to me that they do 90 miles an hour.

"A driver should go no faster than his visibility allows. If his eyes are defective, they should be made as good as possible. There will be plenty of danger from other causes at best."—*National Society for the Prevention of Blindness, Inc.*

No enterprise in the wide range of human experience can rank with training the mind. If, therefore, we have received from heaven nothing so good as the mind, what should be more worthy of exercise and cultivation? No other adventure is to be compared with it. Through it civilization and all man's higher achievements have been won. The report of a gun does not carry so far as the music of the lyre. To pursue intellectual ideals, unlike galloping with a king in a game park, is a glorious experience open to every man who cares to live richly and well.

PHYSICIANS' ACTIVITIES IN THE FIELD OF MEDICINE*

By Howard Morrow, M.D.
San Francisco

ONE outstanding achievement of the twentieth century, as far as medicine is concerned, is the change in attitude toward venereal diseases on the part of the laity and the medical profession. The campaign to stamp out these diseases was instituted only two years ago by Federal and State authorities, and has made great advances in this field. The subject of venereal disease has been brought out into the light, imparting to millions of people the real significance of these infections. The cloak of secrecy and moral stigma which has surrounded this problem from time immemorial prevented the dissemination of true knowledge to the public. It is now granted by all that venereal disease exists: that it can be prevented, and that, by proper treatment, it can be eradicated.

Much credit must be given to Surgeon-General Parran, who fostered the program of venereal disease control. He, with the United States Public Health Service, and the health agencies of the various states, in coöperation with the teachers in medical schools, have acted jointly to acquaint the medical profession and the laity with the most modern methods of the treatment of these diseases.

INCREASING KNOWLEDGE CONCERNING SYPHILIS

Before outlining the program for venereal disease control now being undertaken in California, I should like to recall briefly the tremendous changes in our knowledge of syphilis which have taken place since the late nineties, when I was a medical student. It is true that much was known of this disease from a clinical standpoint, but much confusion existed so far as many truly syphilitic manifestations were concerned. Paresis, for instance, was thought to be syphilitic; but not until the discovery of the Treponema pallidum, years later, were we certain that it was syphilitic. Treatment had not advanced for hundreds of years and we still had only mercury and iodides to combat the disease.

The modern era of syphilis began in 1905 when Schaudinn and Hoffman discovered the Treponema pallidum, and announced it as the cause of syphilis. The Wassermann test for the serologic diagnosis of syphilis followed in 1906. Then Ehrlich synthesized salvarsan in 1910. In the space of five years the etiology of syphilis had been solved, an invaluable diagnostic test had been introduced, and a specific therapeutic agent had been discovered. With this impetus great strides were made in the diagnosis and treatment of the disease.

As a result of these discoveries, a third-year medical student can demonstrate the Treponema pallidum in the secretions of the primary or secondary lesions; whereas, when I was a student we had to wait until secondary symptoms appeared before an accurate diagnosis could be made.

The next five to ten years brought out many facts concerning the proper treatment of the disease. It was soon learned that even with a potent spirocheticide, such as salvarsan, a cure could not be effected quickly, and that it required repeated attacks upon the organisms, over a period of one to three years, before cure could be obtained.

Other great discoveries in the field of syphilis followed: the dark field microscope was invented; and the necessity and value of lumbar puncture were pointed out.

In 1917, Von Juarreg announced that patients insane with general paresis frequently were restored to health and sanity by innoculating them with malarial parasites. The field of fever therapy has been greatly extended, and today we administer artificial fever by means of simple appliances.

Another great advance in the treatment of neurosyphilis was the introduction of tryparsamide in 1917 by Heidelberger of the Rockefeller Foundation. This drug with fever therapy has given a real hope of relief to thousands of unfortunate neurosyphilitics. As a result, our institutions for the insane are no longer filled with bedridden paralytic syphilitics.

Then in 1920, Levaditi introduced bismuth into syphilotherapy. This drug has replaced mercury to a large extent. Bismuth is a much more active spirocheticide, and much less toxic than mercury. It causes little pain when injected. The introduction of bismuth has made anti-syphilitic therapy much more humane than in the days of mercurial stomatitis, nephritis, painful buttocks, and similar therapeutic sequelae.

PROGNOSIS AND EARLY DIAGNOSES

With these discoveries, the prognosis in the treated syphilitic has been entirely changed from the time of my early medical days. Then few syphilitics were cured. Today the patient who starts treatment during the first few days of his infection has a 90 to 95 per cent chance of cure, and somewhat less so if he waits for a few weeks before consulting his physician. If every syphilitic could be treated in the early phase of the disease, or even in the early latent period, the late catastrophies of the disease, such as paresis, tabes, aortitis aneurysm, etc., would become a rarity. Even in the late stages of the disease, much relief is obtained by proper treatment.

PLACE OF SYPHILIS IN PUBLIC HEALTH PROGRAMS

However, it is obvious that it is our duty and aim to diagnose syphilis as early as possible and see that the proper treatment is instituted. That, in a word, is the purpose of our public health program, as it relates to venereal disease.

SUMMARY OF ONE YEAR'S ACTIVITIES IN VENEREAL DISEASE CONTROL

The Bureau of Venereal Diseases was established within the State Department of Public Health February 1, 1937, using funds allocated to the State of California by the United States Public Health Service.

*Address of President Howard Morrow. Read at the first general meeting of the sixty-seventh annual session of the California Medical Association, Hotel Huntington, Pasadena, May 9 to 12, 1938.

The movement was markedly stimulated by the adoption of special legislation and appropriation of State funds at the 1937 session of the State Legislature. This law, known as Chapter 787, Statutes of 1937, became effective August 27, 1937.

In the fifteen months since the formation of the Bureau, the control program has gradually taken form. The present activities and plans may be discussed under five headings:

First. — Information accumulated concerning the extent and nature of the problem.

Second.—Improvement of diagnostic and treatment facilities in public clinics.

Third.—Improvement of the administration of the program by local health departments.

Fourth.—Improvement in the coöperation and efficiency of physicians in private practice.

Fifth.—Informative programs for the general public.

These may now be considered in more detail.

I.—*Information concerning the extent and nature of the venereal disease problem:*

Preliminary one-day surveys in Fresno, Madera, Stanislaus, and Orange counties have indicated that there are approximately six cases per one thousand of population constantly under treatment for venereal disease in California. This represents a case load of about 40,000 patients for the entire State. Approximately 25 per cent of these patients are being treated in public clinics, 75 per cent by about 5,000 private physicians.

An unknown number of patients, perhaps an equal number, who should be receiving treatment are not under any medical care. We estimate that free clinic facilities are needed for approximately two or three patients per 1,000 of population. In a county of 100,000 population free medical care will need to be provided for from 200 to 300 patients. This number may reach four or five cases per 1,000 in the more urban centers.

Information has been accumulated as to the amount of money being expended upon control activities, and as to the cost of the diseases to the State. Even with additional funds now available, only 5 cents per capita per year is available for control measures, yet 10 cents per capita per year is being expended for the one item of care of our syphilitic insane in our State hospitals.

Statistics are being compiled on reporting, on clinic activities, on publicity methods, etc., all designed to guide us in the further development of the program. Further surveys of incidence and prevalence are being planned.

We are accumulating information with reference to the rôle of prostitution in the transmission of these diseases. A survey of most of the rural districts of the State has already been completed.

Wassermann surveys are being conducted, notably among S. R. A. applicants. Approximately 10 per cent of applicants to the S. R. A. camps at Stockton and at Pacoima have been found to have positive blood Wassermanns.

II.—*Diagnostic and treatment facilities:*

Practically all of the seventy-five clinics throughout the State are now offering free diagnostic services. Adequate treatment is fundamental in the control of venereal diseases. From one-fourth to one-third of all venereal disease patients are being cared for on a no-fee basis. Patients are being referred to private physicians for treatment whenever this is possible.

Reorganization and extension of clinic facilities are under way. Direct aid in the form of personnel, clinic record forms, drugs and consultative service is being offered to established clinics that agree to adopt the standards proposed by the State Department of Public Health. Clinics are required to admit any patient for initial diagnosis and emergency treatment, any patient referred by a private physician for consultation or special tests—such patients to be returned with examination reports to the physicians referring them, and any patient unable to pay a private physician for treatment, regardless of residency. Clinics must meet certain minimum standards of record keeping, laboratory facilities, equipment, personnel; must provide modern treatment, carry on epidemiological work or coöperate with the health department doing this work in the clinic; and carry on educational activities within the clinic.

A specific example of how this works may be given. Last October a medical officer from the Bureau was assigned to a clinic being operated by the Sacramento City Health Department. In the succeeding three months the clinic was remodeled, admission fees abolished, the entrance requirements noted above adopted, record keeping improved, and the general standard of medical care improved. The attendance at the clinic has increased by more than three times (624 visits in February, 1937, as compared with 2,020 visits in February, 1938), yet no patients have come from private physicians except as directly referred to the clinics. The same plan was recently adopted by the Fresno County Hospital Clinic. Attendance at this clinic has doubled in two months. The clinic at San Bernardino is being transferred from the County Hospital to the Health Department, and will be opened on the new basis in the near future. Almost all the seventy-five clinics now operating throughout the State have indicated a desire to coöperate. Some further clinics are being established; two clinics are now being operated at the S. R. A. camps in Stockton and at Camp Waybur. There are approximately 350 men in these camps under treatment. Of 3,600 men examined at Camp Stockton thus far, 380 positive Wassermanns were found—a prevalence of 10.6 per cent.

It is hoped that eventually a chain of clinics will be available so that the vast migratory labor population can be adequately controlled. The treatment of venereal diseases is being included as part of the medical care being provided for the migratory workers.

A comparison of clinic activities during the past twenty years is of interest. Detailed reports of the twenty-four hospitals and clinics coöperating in 1917–1918 are not available. However, records for 1919–1920 indicate that at that time there were sixteen clinics reporting activities; and using the figures for that fiscal year, July, 1919 to June,

1920, we have the following comparison for syphilis patients:

Year	*1919–20*	*1927*	*1937*
Number of clinics	16	14	75
Number of new cases of syphilis	2,870	3,538	9,099
Number of treatments for syphilis	13,865	119,557	299,084

A comparison of clinic activities for 1936 and 1937 is shown in the following table:

Year	*1936*	*1937*
Number of clinics reporting	52	75
New cases { Syphilis	6,064	9,099
{ Gonorrhea	5,172	6,365
Number of treatments { Syphilis	206,185	299,084
{ Gonorrhea	70,805	143,344
Total clinic visits	290,435	484,130

A comparison of cases of syphilis and gonorrhea reported, 1933 to 1937 inclusive, and the first three months of 1938, is as follows:

	Syphilis	*Gonorrhea*
1933	10,737	7,817
1934	11,820	10,459
1935	11,957	11,634
1936	11,725	12,118
1937	17,288	17,051
Three months of 1938	5,752	4,061
	69,279	63,140

III.—*Improvement of administration in local health departments:*

Personnel is being provided, chiefly public health nurses, laboratory equipment and supplies, drugs, pamphlets, and consultative service. The most notable contribution will be in the increased epidemiological work made possible by the added personnel. This activity is already functioning in several health departments. Ten public health nurses have thus far been assigned to local health departments. The Fresno City Health Department has been converted from part-time to full-time, a laboratory provided, and diagnostic clinics set up. Laboratory equipment, particularly microscopic and darkfield, has been provided for a number of local health departments.

IV.—*Assistance to private physicians:*

1. An attempt is being made to keep physicians informed as to what is going on. An addressograph list has been prepared in our central bureau office containing the names of all medical practitioners in the State. Periodically, the 12,000 practitioners are being circularized in outlining the objectives of the program and their part in attaining these objectives. Reporting almost doubled after the first letter was sent out, in which the new reporting system was announced. A bulletin outlining the modern treatment of syphilis was enclosed in the first letter. A companion bulletin on the treatment of gonorrhea is being prepared. Pamphlets for distribution to their patients are also being provided. Three circular letters have thus far been mailed to all physicians.

2. In an effort to develop one more point of contact with the physician, a special epidemiological card has been prepared. Upon receipt of each case report from a physician in private practice, the local health department forwards to the physician this card, together with such pamphlets as are indicated for transmission to the patient. This serves automatically to keep the physician supplied with pamphlets.

Upon these cards the physician reports lapses from treatment, sources and contacts.

3. As an additional service to physicians, free public health nursing is being provided to assist them in the epidemiological work. Nurses are being assigned to local health departments for this work. This service is already functioning smoothly in some districts.

4. In order to assist physicians in the care of marginal cases, free drugs are being provided by the State.

5. Plans are going forward to provide for the payment of physicians for the care of indigent patients in rural districts where there are no available clinics.

6. Educational programs for physicians are being developed. A series of conferences for county medical society groups will be carried on during June of this year.

7. Special training courses are being offered to young physicians, consisting of a three months' medical school course, plus nine months of field work in venereal disease clinics. Ten or more young clinicians will receive this training during the fiscal year 1938-1939.

V.—*Informative program for the general public:*

A number of industrial concerns have been contacted and provided with lecturers, motion pictures, pamphlets, and posters. Active participation of lay organizations, such as the American Social Hygiene Association, junior chambers of commerce, Federated Women's Clubs, etc., has been encouraged. We have released to the newspapers a series of articles pertaining to syphilis. We are planning radio broadcasts, and the issuing of posters. A series of seven pamphlets has been issued and thus far over one-half million pamphlets distributed. We are trying to tell the public the story in a straightforward, scientific manner. An active local educational program has been developed in Los Angeles County in coöperation with the Los Angeles Junior Chamber of Commerce. Other such projects are being planned throughout the state.

The personnel of the Bureau of Venereal Diseases has been gradually expanding, being on April 15, 1938, as follows:

Chief of the Bureau, Malcolm H. Merrill, M. D.

Medical officers, Donald G. Davy, M. D., Kenneth L. Stout, M. D., and John C. Dement, M. D.

Venereal disease trainees, James Moreland, M. D., and Edward Hirschberg, M. D.

Public Health nurses, 10; stenographers, 3; laboratory technicians, 5; laboratory helpers, 3; mailing clerk, 1.

Further additions in physician and nursing personnel will be necessary. In addition, a limited number of investigators will be added to the staff.

Throughout the year temporary personnel in the way of stenographers, investigators, publicity director and mailing clerks has been used. A WPA project, allowing for ten additional clerks, stenographers and laboratory helpers, has been granted to facilitate research work for the year 1938.

To summarize, the outline of activities in venereal disease control as just given indicates that real progress in overcoming these diseases is being made.

"REPORT ON FACTUAL DATA" OF THE CALIFORNIA MEDICAL ECONOMIC SURVEY

In my next topic, I shall comment briefly upon an enterprise to which, since the year 1934, much thought was given by members of the House of Delegates in three annual and one special session, namely, the California Medical Economic Survey, which came to a conclusion in November, 1937, when the "Report on Factual Data" was brought off the press, and copies sent to the members of the Association.

Because the Association expended almost fifty thousand dollars on that project, it is proper that it should be briefly discussed.

The California Medical Association, through action on May 3, 1934, by its House of Delegates at the annual session held in Riverside, committed itself to a survey of matters having relationship to the securing of factual data concerning the power of the people of California to purchase professional medical services, and particularly to pay the costs necessarily incident to illness.

The expressed purpose was to permit this Association to assist in meeting *current* inadequacies, should any be found to exist.

A Committee of Five was authorized and appointed, which in turn secured the services of a faculty member on the economics staff of the University of California at Los Angeles, Paul A. Dodd, Ph.D., to supervise the collection and compilation of data. Subsequently, the Committee of Five was informed it would be possible to secure federal funds to supplement money advanced by this Association and help pay the wages of field representatives (citizens who, in the depression years 1934-1935, were in need of employment) to distribute and collect questionnaire blanks to citizens, provided that a constituted state agency would make request for such allocation of moneys, be responsible for proper expenditures thereof, and assume responsibility for interpretations and conclusions contained in such survey. The California Medical Association's Committee of Five petitioned the California State Board of Public Health to request the Federal Government to make such allocation through its authority; and the State Board being interested in all data having to do with the incidence and prevention of disease, as well as the early restoration to useful citizenship of all persons incapacitated through illness and injury, approved this committee's request. It expressed its willingness to act as official sponsor of such survey for the purposes enumerated in the Association's resolution, and petitioned the proper department of the United States Government, the FERA (Federal Emergency Relief Administration), to be so designated, when such sponsorship was approved and federal moneys were made available.

The foreword of the Report on Factual Data of the California Medical Economic Survey, on pages III to XLVI of that volume which was printed at the expense of the California Medical Association, gives detailed information concerning subsequent steps. The final report of Professor Dodd, on the subject matter of the Survey, was submitted by him on January 29, 1937, with a transmittal letter containing the statement, "This material is complete within itself, and is prepared for the printer." However, owing to conditions subsequently submitted by this employee, as well as the elimination of irrelevant matters contained in this report, necessitating further delays, it was not possible to bring the report to the printed page until October, 1937.

After its printing, a copy of the "Report on Factual Data" of the California Medical Economic Survey was sent to every member of the California Medical Association, and additional copies given to the federal authorities and other parties. Six thousand copies were distributed in this manner without cost to the recipients, and additional copies were placed on sale at the price of $2.00 per copy. The California Medical Association thereby fulfilled its obligation as supporting sponsor, to give publicity to the relevant data collected and compiled.

Discretion as to what should be contained in the California Medical Economic Survey was at all times vested in the State Board of Public Health, according to an official opinion of the Attorney-General of this state, who ruled that, notwithstanding nonpublic contributions, the complete report was the property of the State of California.

That this view was correct and the project recognized as successfully terminated, was evidenced by a letter in which the federal regional director quoted the Washington authorities as looking upon the California Survey as a "completed project," in the following language:

> This reply, we believe, will officially close the correspondence on this FERA [Federal Emergency Relief Act] undertaking in so far as the WPA [Federal Works Progress Administration] is concerned.

One other reference may be alluded to, namely that which in the *Journal of the American Medical Association* of February 26, 1938, on page 117B, gave the comments of the American Medical Association Bureau of Medical Economics on tables and other data compiled by the Director of the Survey, in which attention was called to the "adequacy" of the tables, and the "inadequacy" of the statistical information contained therein.

Immediately prior to and following the publications of the report, some persons composing the so-called editorial staff of the survey made public and private representations that certain irrelevant and redundant matters eliminated from the approved report should have been included therein.

What personal or private influences motivated such representations I am not in a position to state.

Lest there be any misunderstanding concerning the statements contained in the report as submitted and before necessary editing, I feel it only fair to state that it is my understanding that the report, as submitted, did not represent the views of the noted educators who composed the advisory council of the Survey. Indeed, I have information

that the so-called completed report was never submitted to all the persons comprising such council.

It is to be hoped that this unpleasant experience will lead future Houses of Delegates of the California Medical Association to consider carefully not only the attainable end-results in any projected survey, but also the total amount of money necessary to carry through the same. Having spent almost fifty thousand dollars of its reserve funds as its share of the costs of the California Medical Economic Survey, our members may well ask themselves what important facts were garnered by the group of professors in charge to warrant the expenditure of such a large sum of money.

HOSPITALIZATION INSURANCE

During recent years there has been an intense interest in the provision of hospital and medical insurance for the underprivileged, and individual members and various groups within the Society have taken active part in discussions pertaining to the subject.

Hospital insurance is of comparatively recent origin in the United States. The first association to provide nonprofit hospital insurance in California was organized in Sacramento. Upon the enactment of the Hospital Insurance Act of 1935, similar service was organized in the East Bay, later extending over a large part of the San Francisco Bay area. Following the enactment of the 1937 Nonprofit Hospital Act, fifteen hospitals of Southern California organized the Associated Hospital Service of Southern California. Recently, employees of San Francisco City and County have organized themselves into an association that provides them with hospital and medical service whenever they may be taken ill. The payment of monthly dues enables them to secure the services of, and gives them the right to select, their own physician, who is paid according to a definite fee schedule. The experiment is being watched with keen interest. All of these organizations are flourishing, and a steady gain in membership is reported.

Most of these organizations provide members with twenty-one days of hospital service, including general nursing in a ward, use of operating room, x-ray equipment, ordinary drugs and dressings. All of them, with the exception of the San Francisco City and County Association, provide only hospital service, the provision of medical service being apart and distinct from the organization itself.

MEDICAL CARE OF MIGRATORY WORKERS

Within the past few months, the Farm Security Administration has launched a comprehensive plan for the care of the agricultural migratory worker who has not qualified legally as a resident of the state and who is not, therefore, entitled to relief. Through the provision of funds by the United States Public Health Service, the State Department of Public Health is enabled to formulate a program for the hospital and medical relief of such migratory laborers. A corporation under the Farm Security Administration has been organized to provide medical and hospital care. The funds provided for this purpose will be placed in the hands of the corporation, organized under the laws of the State of California, whose board of directors consists of four governmental representatives and three representatives from the California Medical Association. This corporation will devise the essential plans for the provision of adequate medical and hospital care, legal authority for which action is in the Nonprofit Hospital Act.

Under this scheme, each of the county medical societies will be called upon to provide a panel from which the individual patient may select his own physician, who shall receive definite compensation for his services. In this manner, the fundamental principle which guarantees the right of the patient to select his own physician will be maintained. The unique feature of this plan lies in the fact that the medical profession will be called upon to furnish care for the migratory laborers and will be paid for their services. If this plan is successful, the association should extend the program so that the doctor may receive compensation for his services whenever and wherever they may be provided through governmental agencies.

This plan would make unnecessary, as well as inadvisable, the employment of government physicians or contract medicine in any form. The time has arrived when governmental agencies that are called upon to provide medical care should turn over the provision of such service to members of the medical profession. The medical profession, in turn, should use its best efforts in always furnishing high grade medical service, obviating the possibility of extension of contract medicine in any form. By spreading the burden of hospitalization over a large group, cutting down the expense of hospitalization to individuals, and permitting them to continue the right of obtaining their own private physician without dictation or interference by any governmental agency, relief of the highest order will be given to the underprivileged.

The American people, with their inborn independence, always desire to conduct their own businesses in their own way. Americans have always indicated that they desire to select a physician of their own choosing, and no European plan of medical insurance could possibly be satisfactory to our people unless the point of regimentation has already been attained. In such a case, there is no personal choice in anything.

With regard to the individual in the lowest income class, there can be no argument or quibbling over the provision of medical care. It is the unequivocable duty of governmental agencies to give these most underprivileged individuals adequate medical care free of cost, but the physician should not be asked nor expected to carry the financial burden involved. He should always be reimbursed adequately for his services.

IN CONCLUSION

Each of the topics I have discussed has a somewhat intimate relationship to governmental activities, a fact that should not be lost sight of in a consideration of trends in present-day medical practice. The old way of several decades ago, when medical organizations were only of secondary im-

portance in the lives of physicians, has passed. Today, it behooves every member of the medical profession to be fully alert, and take an active interest in organization work; because, only through united effort will it be possible for us to preserve those methods which experience has shown to be necessary implements, in making possible the highest type of medical service for the citizens of our state and nation. I thank you.

TRAUMATIC RUPTURE OF THE SPLEEN*

By Edmund Butler, M.D.
and
Walter Birnbaum, M.D.
San Francisco

Discussion *by Alanson Weeks, M. D., San Francisco; F. Paul O'Hara, M. D., San Diego.*

THIS paper is a review of twenty-one cases of injury to the spleen. Although there are many papers appearing in the literature discussing this relatively uncommon injury, it deserves renewed attention because (1) there are not a few autopsies revealing unrecognized ruptured spleen as the major cause of death, and (2) surgeons not dealing primarily with trauma fail to allot this subject its proper importance. We must constantly keep in mind the possibilities of rupture of the spleen, rupture of the urinary bladder, and rupture of other hollow viscera in every injured person.

In this series there were seventeen males and four females, whose ages averaged twenty-three years. This predominance of younger males is undoubtedly due to the fact that they are most exposed to the types of trauma necessary to cause this injury. Thirteen of these resulted from vehicular accidents, five from penetrating wounds, and three from falls.

The interval between the time of injury and entry into the hospital varied from ten minutes to twenty-four hours, while the period of observation was from fifty minutes to fifty-five hours. These intervals were prolonged in some cases because of (1) the delay by the patient in seeking medical care, (2) the time consumed in an attempt to combat shock, (3) the time required for observation and the difficulty in making the diagnosis in the presence of multiple injuries, and (4) the fact that the ruptured spleen was overlooked because of other injuries.

DIFFICULTIES IN DIAGNOSIS

The difficulties in making a diagnosis may be due to (1) the frequent absence of visible signs of injury to the anterior abdominal wall which leads the patient, and, at times, the doctor, to disregard the early mild symptoms, believing any trauma sufficient to rupture the spleen would cause visible evidence of injury to the superficial tissues; (2) the characteristic recession of symptoms, as mentioned below; (3) the presence of shock resulting from head injuries, or alcoholism interfering with the usual reaction of the patient to injury; and (4) the presence of more obvious symptoms resulting from other injury.

PAIN

Regional pain is the most important clinical manifestation of rupture of the spleen. It is often misleading in character. Pain may be of a dull, aching type, or it may be sharp and lancinating. It may be localized to left upper quadrant early, and soon generalized throughout the abdomen. Generalization occurs as the blood spreads in the peritoneal cavity. The pain is usually more intense in the left upper quadrant or left flank. Characteristically, the pain continues during active bleeding. This recurrence of pain, due to recurring hemorrhage, is partly due to the rhythmic contractions of the spleen, which gives the following cycle: A clot forms, the patient's condition improves, blood pressure rises, contraction of the viscus dislodges the thrombus, bleeding recurs, and pain and shock once more become evident. The pain is not severe, as a rule. It does not reach the intensity of that in rupture of the stomach or duodenum. It is usually relieved by small doses of opiates. It is similar to that present in the lower abdomen following a rupture of an ectopic pregnancy.

At times, radiation of pain to the shoulders and left back occurs because of irritation of the diaphragmatic peritoneum, and attention may be erroneously attracted to the chest.

REËXAMINATIONS IMPORTANT

The injury often is not suspected in the patient who is most helped by prompt surgical intervention. Hourly examination and rechecking of the findings and laboratory work in all traumatized individuals are essential. Often by the time the resident examines the patient who has been reported in shock, the bleeding has temporarily ceased and general condition has improved, thus misleading the examiner.

In all patients where there is a history of trauma to the abdomen, the flanks or the lower chest, even if there be no visible injury and no early complaint of pain, we must be spleen-minded and not overlook the slowly developing shock, the slight distention, the mild abdominal pain and slight discomfort, which are the early signs of rupture of the spleen.

Tenderness, direct and rebound, and guarding coincide with the distribution of the pain, but they may not be remarkable. Freed blood in the peritoneal cavity is seldom demonstrable, even when a considerable quantity is present, although localized dullness may indicate a confined hemorrhage in the splenic area. This local collection of coagulated blood is sometimes visible on the roentgenogram. Rectal tenderness and a soft, resisting fullness may be present due to blood in the cul-de-sac of Douglass. Temperature, pulse, respiration, and blood pressure usually are indicative to some degree of shock. The temperature is subnormal, the pulse may be elevated to 120 or more per minute. A fact, not well known, is that early in hemorrhage the

* From the San Francisco Emergency Hospital Service, San Francisco Department of Public Health.

Read before the General Surgery Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

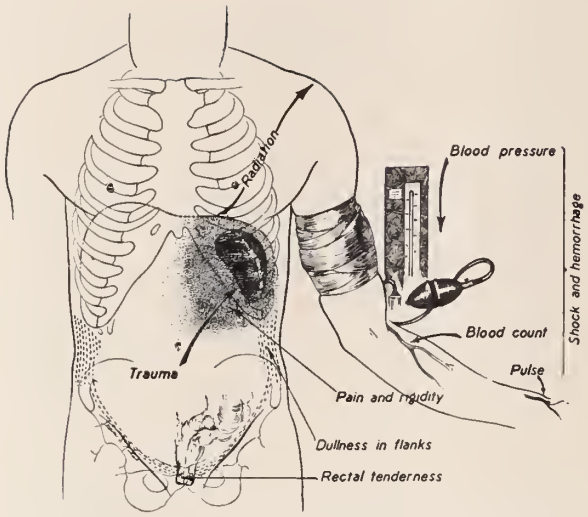

Fig. 1.—Outline of typical symptoms and findings of rupture of the spleen.

pulse slows in an attempt to encourage coagulation to lessen the amount of blood loss. The blood pressure fluctuates with the hemorrhage. The red blood cell count and percentage of hemoglobin often do not point to severe hemorrhage, but a slight gradual fall is significant. The peripheral count (ear, finger) often is deceptive because of the peripheral concentration and stasis of the blood in shock. Blood from the larger veins (the so-called "central count") is of more value. The white blood count is usually high. All but four of this series showed more than 20,000, and one 41,000 white blood cells. The polymorphonuclear count is, likewise, high. Only four in this series fell below 80 per cent, and one showed 98 per cent.

ASSOCIATED INJURIES

The majority of these patients, especially those with penetrating wounds, had severe associated injuries. In those with nonperforating injuries, five were associated with fractured skull, ribs, pelvis, femur, and forearm. One had a ruptured duodenum, one a ruptured liver, and one a ruptured kidney. It may again be emphasized that these injuries are apt to confuse the picture and draw attention to the obvious injuries, causing the symptoms of splenic injury to be overlooked.

It should not be forgotten that the spleen is within the rib-cage as well as being intra-abdominal—as are parts of the stomach, liver, and large bowel—and may be injured in penetrations of the chest. In only three of our records was any mention made of evidence of external injury in the subcutaneous splenic rupture. There may be abrasions or ecchymosis at the site of injury, but the latter, especially, is not evident at the time of early examination.

The treatment of a ruptured spleen is splenectomy. If the spleen is comminuted or completely torn from its pedicle, immediate intervention is imperative. A few hours may be disastrous. Death from exsanguination has taken place in such patients within a few hours. Ordinarily, in severe shock, it is rational not to operate upon the patient, but treat the shock first. However, if the shock is due primarily to hemorrhage from large vessels, then immediate surgery is indicated. Administration of intravenous fluids and transfusion should be reserved for the operating room or postoperative treatment. Usual quantities of intravenous fluids may so raise the blood pressure that exsanguination rapidly takes place.

EXPLORATION OF ABDOMEN

When exploring the abdomen, complete relaxation and ample incision are essential. Ether or subarachnoid block are the anesthesias of choice. The spleen must be carefully palpated. This is particularly true of palpation in the region of the junction of the pedicle and hilus posteriorly, because it is here that important injuries may escape the exploring hand. If free, uncontaminated blood is encountered it may be dipped out with a small ladle or aspirated, citrated and autotransfused. If not sufficient blood is recovered to dilute the citrate solution, normal saline may be added. Autotransfusion is at times a life-saving procedure. At operation, the spleen has been found to be ruptured in various degrees. No doubt, there are superficial tears giving few symptoms and few signs of peritoneal irritation, not often diagnosed as splenic injury, which recover rapidly with rest. The severe lacerations usually run transversely or obliquely to the long axis.

MORTALITY

The mortality in our group of patients was as follows:

Number of cases	21
Died	8
Mortality	38%
Nonpenetrating injuries	16
Died	5
Mortality	31%

Of the five that died, one also had a rupture of the duodenum; one had a ruptured spleen, which was not found at operation; two died within forty-eight hours of shock and hemorrhage; one died within ten days of peritonitis and pneumonia.

CONCLUSIONS

1. Traumatic rupture of the spleen is often not found until autopsy.
2. Many factors contribute to the frequent delays in surgical intervention.
3. Diagnosis may be difficult, although this injury presents a fairly typical course of clinical events (Fig. 1).
4. The prognosis is grave and the mortality high.
5. Splenectomy is the treatment.

490 Post Street.

DISCUSSION

ALANSON WEEKS, M. D. (384 Post Street, San Francisco).—Doctors Butler and Birnbaum's paper, presenting twenty-one cases, is certainly well worth careful consideration. The fact that ruptures of the spleen are often first found at autopsy indicates that this statement of the doctors is not analyzed as to differentiating those cases with death from splenic hemorrhage alone from those ending from associated injuries in which splenic hemorrhage was a contributory factor. Certainly, one cannot deny the need of careful examination of injured patients with the diagnosis of splenic hemorrhage in mind. In our experience the

patient does not, as a rule, show external marks which would lead one to suspect an injury of the spleen. The diagnosis is made clinically. Occasionally an injury that is apparently trivial can cause such a hemorrhage. We recall one schoolboy who jumped on a street-car. While holding an exercise book with one edge in the fold of the left elbow and the other against the flank, he received a bump on the elbow as he swung onto the car. This was sufficient to rupture the spleen. Another case, a small girl, fell off a garage roof; she received bilateral Colles's fractures and a ruptured spleen. One must, therefore, constantly keep the possibility of a ruptured spleen well in mind. When in doubt, explore. The dangers incident to a simple exploratory operation, with negative findings, are far less than the danger of overlooking some lesion, the neglect of which may be fatal.

F. Paul O'Hara, M. D. (Medico-Dental Building. San Diego).—This timely article on the very interesting subject is of an especial appeal to me, since, upon reviewing the cases of ruptured spleen in this district two years ago, I found that only one-third of the cases were diagnosed and operated upon prior to autopsy.

The difficulty of diagnosis is emphasized by the authors, and usually only a diagnosis of some ruptured viscus in the abdomen is possible. The initial shock in a ruptured spleen of any severity is out of proportion to the findings and should make one suspect the pathology. In cases that are observed longer than twenty-four hours following an injury, and in which the initial shock is overcome, the majority, if not all the cases, show a rather marked rise in blood pressure above normal, even in young people, which persists unless severe hemorrhage occurs, and lasts as long as several months following splenectomy. This interesting phenomena has not been satisfactorily explained by any investigators.

In some of the cases that I have seen, it is remarkable that the patient has gone back to his home for a period of a week or so following injury without a diagnosis being made, when the release of a blood-clot with resultant hemorrhage causes him to return with a typical picture. Another diagnostic point, which is not present, however, in all cases, is hematemesis of old blood, which possibly may occur due to the close association of the blood supply of the spleen and the stomach. The emphasis of close, continued reëxamination of these cases by the authors is to be commended, and the prompt, proper carrying out of splenectomy results in complete recovery in a surprising majority of cases. The use of autotransfusion is sometimes a life-saving procedure, but in all events transfusion or infusions should be saved until the hemorrhage is stopped by the performance of splenectomy.

IS PARESIS (DEMENTIA PARALYTICA) CURABLE?*

RESULTS IN PERSONALLY TREATED CASES

By Walter F. Schaller, M.D.
San Francisco

Discussion *by Samuel D. Ingham, M. D., Los Angeles; Benjamin W. Black, M. D., Oakland.*

THE clinical terms, general or progressive paresis of the insane, or dementia paralytica—paresis, in common parlance—given us by the older writers, describe only the final stages of this disorder, as seen in institutions and neglected cases. These terms are still applied to the earlier stages of the disease, when physical weakness or advanced mental disintegration is not evident. Our knowledge of paresis has outgrown the nomenclature, and there is need of a more descriptive term having a precise clinical and pathological foundation; however, the term is well established by usage and no descriptive terminology has satisfactorily replaced it. The disease is a pathological entity and is one of the few neuropathological conditions which may be microscopically diagnosed. To the classical description of Alzheimer [1] only a few additions have been contributed in recent years, notably the presence of the Spirochaeta in brain tissues and the characteristic iron deposits in the adventitia of the blood vessels. He had already (1904) expressed the opinion that rod cells, now classified as microglia, were of mesoblastic origin.

The usual paretic brain observed at necropsy shows a predilection of the pathologic process for the anterior parts of the brain, and thickened and adherent membranes over the shrunken cortex. Microscopically, both chronic inflammatory and degenerative cortical lesions are present. The relationship of these associated lesions has never been satisfactorily explained. Alzheimer has discussed mental symptoms in syphilitic brain lesions and classifies the nonparetic forms as vascular, gummatous, and meningiomyelitic (parenchymatous). In the latter form he particularly calls attention to the important association of the syphilitic meningitis with the essential brain changes. This writer discards the meningeal theory of paresis on the basis that in the early stages of the disease the superficial cortical lesions may be so slight and lesions in the deeper cortical layers so marked, that a causal relationship is not to be reasonably entertained. As these meningeal changes are not only hyperplastic, but also infiltrative, the reservation is made, however, that they may exert a determining influence on the manifestations of the disease.

The lack of pleocytosis in the cerebrospinal fluid, in cases where necropsy shows markedly thickened cerebral membranes, suggests that these membranes were primarily the seat of an active meningitis, and later have become sclerosed, when the active process has been arrested. If this hypothesis is valid, an appreciable pleocytosis is to be expected in the first stages of the disease, and not necessarily in the later stages. Such a condition is comparable to pathological processes observed in tabes.

A high fluid pleocytosis, associated with a paretic curve and strongly positive syphilitic serology, is frequently met with in patients with symptoms of emotionalism, nervousness, tremor, and heightened reflexes, who are often referred to a neuropsychiatrist with a Wassermann-fast blood. Symptomatology does not disturb the patient so much as consciousness of persisting syphilis. Indeed, it is quite probable that such cases, because of disregard of symptoms, often remain undiagnosed and untreated, until some definite mental or moral aberration enforces medical observation and care. Whether such early cases show a characteristic pathology of paresis is unknown, as only a chance necropsy could definitely decide this question.

If acute syphilitic meningitis affects the base of the brain, cranial nerves are involved; if it affects the cortex, lancinating headaches, tendency to somnolency, hypo-activity, and symptomatic complaints of the patient, differentiate this form from

* Read before the Neuropsychiatry Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

paresis. The question then arises whether syphilis of the convexity may be a transient pathological state of paresis of essentially meningitic form, which, when progressive, determines paresis. Acute cases of this sort which come to the attention of the physician are generally recognized and treated, and it is further conceivable that beginning paresis may thus be aborted. Surely, paresis, comparable to the Argyll Robertson pupil, does not spring from the brain in its fully developed form, as did Minerva from the forehead of Zeus when his head was split with an axe to relieve a headache.

Pathological mutation in syphilitic brain processes, following therapy, is quite possible. It is now common knowledge that a paretic type of colloidal curve, indicating a high grade of parenchymatous involvement, may be broken down to a curve of cerebrospinal syphilis type. This will be strikingly demonstrated in the cases about to be reported.

IMPORTANCE OF PROPER THERAPY

It is not the purpose of this paper to enter into a discussion concerning the determination of paresis in an individual case, whether it is due to a particular strain of spirochaeta or to a constitutional tendency, but to emphasize that in early cases of brain syphilis which are clinically and serologically paresis, sustained and adequate therapy may effect a remarkable improvement, to the degree that the disease is arrested, and for all practical purposes, cured. This leads to a consideration of what is meant by the term "cure" in syphilis. Strictly speaking, an infectious disease process is cured only when the infective agent is definitely eliminated. This would postulate, therefore, negative tests for syphilis in symptomatically arrested patients observed over a considerable period of time. The term "cure" may be used properly, I believe, in cases which show no symptomatic effects, in so far as can be determined, even in the presence of serological signs of syphilis in attenuated form. Recovery is perhaps a better term. It may be this latter use of the term on which certain institutional statistics have been given us. I would particularly refer to a report on the treatment of dementia paralytica by the Mental Hospitals Committee of the London County Council [2] of 1936. It was pointed out in this report that before the advent of modern therapy there was no real recovery from the disease. In the six years from 1930-1935, inclusive, 1,914 cases were treated with modern methods. This series was compared with 2,545 cases in a six-year period, from 1908-1913, inclusive, when modern treatment was not in use. A comparison shows that in cases treated by modern methods the mortality rate had been halved, one-fifth of the cases had been discharged, the cure in the majority being permanent, and many of the persons discharged had filled positions of responsibility.

TREATMENT

It is questioned whether any fixed therapeutic regimen can be laid down for general application. The patient, as well as the disease, must be considered and studied. From the standpoint of the patient, maintenance of weight, general physical condition, and tolerance and response to given remedies must ever be borne in mind. Anemia, infections, and concurrent debilitating factors or habits must be combated and, if possible, removed. Alcohol should be proscribed or taken in extreme moderation. Exhaustion and fatigue are to be avoided. Whereas such general indications of therapy appear obvious, there is danger of neglecting the patient by treating the disease only, expressed by positive serology, and to base indications for treatment principally on the latter findings. Because of such considerations it has been our practice to administer interrupted, rather than continuous, treatment. It is desirable, however, to make a complete serological check after each course of treatment.

Malaria, in my experience, has proved the most efficient remedy in paresis, for there is fair evidence, according to the investigations of Breutsch [3] and others, that malaria exerts a favorable biological action in addition to the hyperpyrexia. In a number of my cases malarial therapy has been repeated; in one case the malaria was mistakenly believed to be terminated, and the patient carried the latent infection over a period of months. Hyperpyrexia, by hot baths, has been used in a few cases as a substitute for malarial treatment. Other means, as by typhoid vaccine, hot-air baths, and blanket packs, have been reported as giving satisfactory results.

Next to malaria in therapeutic efficiency, I place intraspinous therapy, and the modification of the Swift-Ellis treatment devised by the late Doctor Mehrtens, is used. Although less technical methods have largely replaced this form of therapy, it has a deserved and established place in the special armamentarium of treatment of this disease. Tryparsamid is a particularly valuable remedy in conjunction with malaria or fever therapy. In doses of one gram once or twice weekly, it is a comparatively safe remedy if ordinary precautions are taken in the initial doses to note either subjective or objective involvement of the optic nerve. It is not a remedy, however, that is applicable to each and every case; cases have been observed in which results have been disappointing in the failure of the patient to respond with the usual increase in appetite and weight and sense of well-being, and improvement of serology. Patients may even react unfavorably to this drug.

Heavy metal therapy is now chiefly represented by bismuth. I favor iodobismitol, which carries in combination iodin, a remedy formerly highly regarded in neurosyphilis, but undeservedly fallen in disuse. The same may be said of mercury; indeed, mercury, the iodids, and a sea trip, were the chief measures used in neurosyphilis before the advent of arsenical remedies, and not without benefit in a proportion of cases.

The arsphenamins are of value in cases where the meninges are permeable to these drugs, which permeability is in the neighborhood of 40 per cent. Their efficiency can be objectively determined by the serological response and the effect on a high fluid pleocytosis.

In the serological control of medication a therapeutic response is considered favorable if a spinal fluid pleocytosis is reduced, the colloidal gold curve broken from paretic to middle-zone type, and the Wassermann reaction modified. If this serological improvement is effected with an associated improvement in the patient's mental and physical condition, we may confidently proceed in the majority of cases with the expectancy that the disease may be controlled and that a cure is possible. It is not contended that advanced cases with irreparable brain damage and atrophy, presenting marked dementia and debility, can ever be restored to normalcy by any treatment. However, even in such cases remarkable improvement may occasionally be observed.

REPORTS OF CASES

For obvious reasons, it is notoriously difficult to keep paretics under observation and treatment for any considerable period of time, except by an institutionally controlled regimen. Comparatively few extramural cases, therefore, have been followed a sufficient length of time to evaluate the final result of prolonged and intensive treatment. Frequently, after an initial satisfactory therapeutic response, these patients, with their characteristic optimism and lack of judgment, resist further treatment, and are, therefore, afterward inadequately treated or pass entirely from observation. Of those few cases in a considerable number, however, which have fulfilled the requirements of adequate, controlled therapy over a long period of time, four are here reported.

CASE 1.—Observation of thirteen years. A male rancher in the fourth decade was first observed in August, 1923, with symptoms of euphoria, impaired memory, mood changes, mental confusion, and paranoid ideas. His infection occurred ten years previously, following which he was inadequately treated. In the three years before consulting me, thirty to forty intravenous injections of arsphenamin had been administered; he was also given mercury. The physical and neurological examination was not remarkable, save for lack of pupillary light reaction and exaggerated tendon reflexes. His blood Wassermann was strongly positive. An analysis of the cerebrospinal fluid showed ten leukocytes per cubic millimeter, globulin increased, the

colloidal gold curve read 5554433210, the Wassermann reaction was positive in all dilutions. On hospitalization he was uncoöperative, demanded his release, and was only retained in the hospital by a ruse. Therapy was commenced by a series of ten weekly intraspinous treatments. After the fourth treatment some mental betterment was noted. Following this series of intraspinous treatments, the serology showed but little change, the colloidal curve remained paretic in type. During the period of intraspinous therapy he was also given intramuscular mercury salicylate to tolerance. In November, weekly injections of tryparsamid in one and a half to three-gram doses were commenced, and eight doses administered up to the end of 1923. In December, the first definite serological improvement was noted, the Wassermann reaction was negative in amounts of fluid less than 0.5 cubic centimeter, the colloidal gold curve was 4455431000. A mental rating at this time showed a mental age of 13.4 years, with obvious deterioration; comprehension of new situations was especially poor; the patient still showed paranoid tendencies and ideas of grandeur. He had spells of nervousness and excitability over small matters.

In the early part of 1924, after a rest period, he was given injections of leukocytic extract (Squibb), and from March to May eight injections of tryparsamid, one and a half grams each, and fourteen weekly intramuscular injections of mercury salicylate, one grain each, from March to July, when he developed a stomatitis. During this period considerable difficulty was experienced with the patient, who had left the hospital, because of paranoid ideas; threatening letters sent to former business associates were considered grounds for commitment by legal action, which, however, was deferred. These persecutory notions were such that the patient believed his life endangered, and would elaborate on experiences which showed marked ideas of reference in ordinary life situations. From September to December, 1924, he was given a second series of ten weekly intraspinous treatments, and with each treatment an intramuscular injection of mercury salicylate. The colloidal gold curve, which had remained paretic in type during the major part of this year, reverted in December to a middle-zone type, when the reading was 3334421000. In the beginning of 1925, paranoid ideas still persisted in modified degree; from April to August he was given intramuscular Bismudol [4] and nine tryparsamid injections; the colloidal gold curve again became paretic in type in April, but cerebrospinal in type in September, when the blood Wassermann first became negative and remained so permanently; he appeared mentally clear. In the early part of 1926 the Wassermann reaction in the fluid was only one plus in 1.0 cubic centimeter of fluid, and subsequent fluid Wassermanns were consistently negative. During this year the patient received but eight injections of tryparsamid in doses of one and a half grams. He had become mentally stabilized.

In the beginning of 1927, although the blood and fluid Wassermanns were completely negative, the colloidal gold curve read 3333321000. Five additional tryparsamid injections were given in January, after which he was given a course of malarial therapy. A recurrence of chills and fever followed temporary interruption of the disease by quinin. The malaria left the patient quite depressed and ill. In July his colloidal gold curve read 2223211000, and thereafter never reverted to the paretic type. From September to December, 1927, he was given bismuth injections. In the latter part of 1928 he received a course of intramuscular bichlorid and sulpharsphenamin, which latter remedy was poorly tolerated.

In June, 1929, the serology remained negative throughout; the colloidal gold curve read 1123221000. As the patient had made a mental and serological recovery, treatment was discontinued, his serology having been negative for approximately two years. He had successfully resumed occupation as a rancher, and has continued in a good state of physical and mental health up to the present. In February of this year, 1937, serological tests were repeated. The blood and fluid Wassermanns were negative, also the colloidal gold test. The globulins were reported, however, as a heavy trace, the leukocytes 38. In the light of the patient's lack of symptoms or complaints, and his occupational efficiency, I was inclined to regard these latter findings as a slip in laboratory technique. In any event, after an intensive, controlled therapy for five years, serological tests for syphilis have been negative for ten years, and no treatment has been given for eight years, during which last period there has been no recurrence of symptoms. In all, twenty-five cerebrospinal fluid examinations were made, which examinations were facilitated by the number of intraspinous injections. The tabulated list of these analyses showed a marked serological improvement following two years of intraspinous therapy and associated treatment by tryparsamid and mercury. The mental improvement fairly paralleled the serological improvement. Malaria was administered only after the disease had been controlled. This case well illustrates the interrupted type of treatment.

* * *

Case 2.—Observation of eight years. A business man in the late twenties acquired his infection in 1918. He had been treated following his initial lesion, and also for six months prior to coming under my observation in October, 1928, by arsphenamin and heavy metals. The examination revealed tremor, marked stumbling over test phrases, left facial lagging, lively tendon reflexes, slowing of cerebration and poor digit memory. The clinical diagnosis was paresis, which was verified by serological tests: The blood Wassermann was strongly positive; cerebrospinal fluid Wassermann was also positive in all amounts of fluid tested; there were seven leukocytes per cubic millimeter, the colloidal gold curve read 4434342100. Following the lumbar puncture there was considerable mental excitement and confusion. Therapy was instituted by malarial inoculation; the malaria was interrupted on December 17, 1928, after the eighth paroxysm, because of shock and collapse; the fever registered 108 degrees Fahrenheit by rectum. Toward the end of January, 1929, after upbuilding by iron in the form of Blaud's pills, he showed a remarkable improvement; tremor, previously marked in both hands, ceased in the right hand, digit memory had improved, and he was emotionally stable. From February to May, 1929, he received thirteen intramuscular injections of one and one-half grains of bismudol. In June his colloidal gold curve reverted to a middle-zone type, the fluid Wassermann reaction was less strongly positive. Eight intraspinous treatments were given from June to October; at the conclusion of this series the colloidal test read 1122110000, the fluid Wassermann reading was essentially the same as in the previous test, the blood remained strongly positive. Directly following intraspinous therapy he was given a course of intramuscular sulpharsphenamin and bismuth to the end of the year. Following this intensive treatment, covering a period of somewhat over a year, he was given a rest period, then reinoculated with quartan malaria on May 15, 1930. The temperatures in a number of the paroxysms attained 105 [4] degrees Fahrenheit by mouth. In all, he had six paroxysms. In October, 1930, iodobismitol [5] was begun in 2 cubic centimeter intramuscular injections twice weekly; this was continued until the last of April, 1931; in all, forty-two such injections were given in the series. In August, 1931, the spinal fluid Wassermann was reported faintly positive, the colloidal gold curve was of the middle-zone type, not attaining a higher figure than 2. The blood remained positive. From August, 1931, to April, 1932, he received twenty-six injections of iodobismitol, two cubic centimeters each. At the conclusion of this series the patient was mentally stable and had resumed occupation. He did not report to the office for three years. In June, 1935, a cerebrospinal fluid test was negative throughout, the blood Wassermann gave an anticomplementary reaction. A further series of twenty injections of iodobismitol was administered. In September, 1936, the fluid was again entirely negative; the blood Wassermann anticomplementary, as before; titration revealed it suspiciously positive. He was then given eight injections of neoarsphenamin with instructions to report at future intervals for Wassermann tests. The last status showed no mental disturbance, no tremors, no emotional instability. At the present time he is successfully employed.

In this case the therapeutic attack was chiefly by means of malaria, and by bismuth in conjunction with iodin. From October, 1930, to April, 1932, he received a total of sixty-eight injections of iodobismitol in two cubic centimeter doses. There was a striking and persisting improvement after the first malarial inoculation. Comparatively little arsenical treatment was employed in this case. Tryparsamid was not given.

CASE 2.—*Chart of Treatment and Tests*

September to November, 1936, neoarsphenamin, eight injections						

CASE 3.—Observation of nineteen years. A business man in the thirties was infected fourteen years previously and treated over a period of five years. The Wassermann reaction in the blood had been repeatedly negative prior to consultation with me in 1918, and but little specific therapy had been administered in recent years. He complained of neuritic-like pains in the legs. The neurological examination showed hyperactive reflexes, inversion of the right triceps reflex, and some disturbance of deep sensation in the left lower extremity. The clinical diagnosis was preataxic tabes. The Wassermann reaction in the blood at this time was positive. The cerebrospinal fluid Wassermann was also positive in 0.5 cubic centimeter of fluid and over; there were seventy-five leukocytes per cubic millimeter of fluid. The patient was not seen again until ten years later. In the interval he had been insufficiently treated, and no serological tests of the cerebrospinal fluid had been made. He complained at this time of extreme nervousness and tremor. The examination showed a suggestive Romberg, absent ankle jerks, fixed and myotic pupils, and tremor of the hands and tongue. No mental deterioration or psychotic symptoms were evident. The impression was an early form of taboparesis, which was confirmed by a serological recheck on the cerebrospinal fluid, which read: Leukocytes 45 per cent cubic millimeters of fluid, colloidal curve 5555431000, fluid Wassermann positive in amounts greater than 0.025 cubic centimeters. Six intraspinous treatments were given at intervals varying from one to two weeks. These were followed by severe constitutional reactions. Following the fifth treatment there was a slight apoplectiform seizure of the left extremities with increased reflexes on the affected side. After the intraspinous series the cerebrospinal fluid (May 29, 1928), showed a reduction of leukocytes to 24 per cubic millimeter of fluid, the colloidal gold curve read 3334321000, an indication of a break to a cerebrospinal type of curve. The fluid Wassermann remained unchanged. He was given thirty grains of potassium iodid daily. From June to November, 1928, sixteen weekly intravenous injections of one gram each of tryparsamid were administered, and during this period he was also given weekly intramuscular injections of bismudol, the dose varying from one and one-half to three grains each. A rest period was then prescribed until the latter part of March, 1929. In January, 1929, the cerebrospinal fluid tests showed marked improvement; there were but three leukocytes per cubic millimeter of fluid, globulins were within normal limits, the colloidal gold curve read 1121100000, and the fluid Wassermann reaction was positive only in amounts of fluid greater than 0.5 cubic centimeter. Clinical improvement was marked, tremor and nervousness were much less. From March to May, 1929, seven intramuscular injections of sulpharsphenamin of two-tenths gram each were given, then a rest period followed until November. From November, 1929, to February, 1930, three intraspinous treatments were given, and also sulpharsphenamin intramuscularly, following which the cerebrospinal fluid analysis remained unchanged. During the remainder of 1930 and 1931, heavy metal therapy, bismuth and mercury, was given, with frequent rest intervals; in all, but eighteen intramuscular injections were given in

this period. In March, 1932, there were no subjective complaints, tremor had disappeared, save for a slight coarse tremor of the protruded tongue. The reflexes, including pupillary reflexes, were unchanged, except for greater activity of the patellar reflexes. The cerebrospinal fluid serology remained practically the same, the blood Wassermann was slightly positive. From this time on intramuscular iodobismitol, in series of twenty injections two cubic centimeter doses each, twice weekly, has been given yearly to date. Each year a serological check has been made. The blood Wassermann became negative in 1933, and has remained so; likewise, the cerebrospinal fluid analysis this year (1937) was reported entirely negative for the first time. The patient is symptom-free of neurosyphilis, no further objective signs have developed, and he is occupationally fit. *In this patient it is significant to note that grave symptoms of central nervous system involvement developed during a ten-year period of insufficient treatment, during which time the initial pleocytosis of the fluid had receded.*

* * *

Case 4.—Observation of nine years. A lineman in the early thirties contracted his infection in 1920, following which he was treated for a period of eighteen months. In 1928 he entered a Veterans' Hospital because of a nervous breakdown, characterized by inefficiency in his work, lethargy, and forgetfulness. The records of the Veterans' Hospital state: He "received five injections of sulpharsphenamin and three of tryparsamid, also eight injections of mercury intramuscularly. On June 26, 1928, his blood Wassermann was positive, spinal fluid was positive, cells 21, gold curve 5555555431. He was inoculated with malaria on October 7, 1928, had fifteen paroxysms, maximum temperature 105 [6]. In view of the fact that he was taken out of the hospital against advice, we have no additional serological data."

The patient came under my care in November, 1928, at the request of his employers. The examination revealed a nervous-appearing man, with but little appreciation of the serious nature of his condition, and anxious to return to work. Vasomotor changes were marked in the extremities. Tendon reflexes were hyperactive, save for his ankle jerks. The left ankle jerk could not be definitely elicited. The general physical and neurological examination was otherwise quite negative, showing no abnormalities of pupils or the neuromuscular system. There were no tremors. A slight but characteristic euphoria was present, but no frank psychosis. The blood reaction at the time of this examination was strongly positive. He was given a course of eight weekly bismudol injections and kept under observation. In December, 1928, his cerebrospinal fluid serology was still strongly positive and of paretic type, but the cell count had dropped to three cells per cubic millimeter of fluid. From March to May, 1929, he was given weekly intramuscular injections of four-tenths gram of sulpharsphenamin; this was followed by eight weekly intramuscular injections of bichlorid of mercury, and a further course of eight sulpharsphenamin injections was given up to the end of 1929. During this year his condition, both physically and mentally, showed a distinct improvement. He had returned to ground work at his former occupation. In January, 1930, the blood Wassermann was reported negative, and thereafter remained so. The cerebrospinal fluid test showed two leukocytes per cubic millimeter, an increase in globulins, a persisting paretic type of curve, and a strongly positive Wassermann. A rest period until July, 1930, was followed by ten intravenous injections of tryparsamid and fourteen intramuscular injections of iodobismitol, two cubic centimeters each. In December, 1930, the cerebrospinal fluid showed no essential change. In 1931, a course of twelve sulpharsphenamin injections was given up to April; then followed a rest period of six months. Intramuscular injections of bismuth, alternating with iodobismitol, were resumed from September to December, nine injections in all. The cerebrospinal fluid analysis in December, 1931, still showed no appreciable change. Physically and mentally the patient appeared stable, tests of digit memory showed normal responses. At this period the question arose as to whether this patient might return to his original work as splicer, which necessitated working aloft. The company took the position that a man who had neurosyphilis could not ever be considered a good risk in a hazardous occupation. However, in view of this excellent occupational record and satisfactory response to treatment, he was permitted a trial, and has since been continuously working aloft as a splicer. From December, 1931, to July, 1932, there was a rest period. He was then given eight intravenous injections of silver salvarsan of two-tenths gram each. This was the only therapy administered during 1932. In January, 1933, the cerebrospinal fluid colloidal gold curve broke to a middle-zone type: 1123210000. The fluid Wassermann remained unchanged. During the year he was given two courses of iodobismitol of eight injections each. A cerebrospinal fluid test in June, 1934, showed the serological tests unchanged. During this year he received but eight injections of iodobismitol, commencing in June. In June, 1935, the Wassermann reaction in the fluid was positive only in 0.025 cubic centimeter of fluid; in this year he was given two courses of iodobismitol of eight injections each. In July, 1936, the cerebrospinal fluid showed a slight increase in the colloidal gold reaction, which still maintained a middle-zone curve; also a slight increase in the Wassermann reaction. In 1936, from July to October, he was given a course of twenty Bismarsen [6] injections of two-tenths gram each, intramuscularly. In April, 1937, the cerebrospinal fluid Wassermann was positive in 0.25 cubic centimeter of fluid, globulins two plus, there were three leukocytes per cubic millimeter, the colloidal gold curve read 0123210000. This patient is free of symptoms. He has remained continuously at work, with an excellent record of occupational performance. At his suggestion, improvements in tools used in his work have been adopted by his employers.

SUMMARY AND CONCLUSIONS

The present state of our knowledge regarding the nature and treatment of paresis is briefly reviewed. It is suggested that meningitis of the convexity is an important pathogenetic factor in the determination of this particular type of neurosyphilis.

Early stages of the disease are characterized by an appreciable pleocytosis and signs of meningoparenchymatous irritation, without evidence of any marked organic changes of essential brain tissue.

Detailed treatment of four cases—two well developed and two beginning paretics—is here reported, the duration of treatment and observation covering periods of thirteen, eight, nineteen, and nine years, respectively.

The typical fluid serology of paresis in three of these cases has been rendered negative by intensive treatment, and has remained so, with corresponding relief of symptoms for a sufficient length of time to justify the claim of a cure.

The remaining case, although not completely cleared serologically, has been transmuted to a benign cerebrospinal type.

All of these patients are symptom-free and occupationally active.

DISCUSSION

SAMUEL D. INGHAM, M. D. (727 West Seventh Street, Los Angeles).—The title of this paper suggests two possible answers corresponding to two different aspects of the question. If cure is considered to be a complete eradication of all the living organisms of syphilis from the body, we are not yet in a position to answer the question in the affirmative. If, on the other hand, we consider the question from the clinical aspect, we may be justified in stating that paresis can be cured symptomatically, even if it cannot be demonstrated that all the spirochaete of syphilis have been destroyed.

Accumulating statistics are impressive in demonstrating the fact that the modern treatment of paresis gives a higher percentage of better remissions than has ever been accomplished in the past. Of the modern methods of treatment, fever therapy is preëminent. There is still some difference of opinion in regard to the efficiency of artificial fever as compared with malaria, but I am inclined to favor the artificially induced hyperthermia for two main reasons: first, that the temperature reaction is entirely controllable at the will of the operator; second, the treatment is less exhausting to the patient and does not cause anemia—in fact, patients often gain in weight and improve physically during a course of treatments. There seems to be a definite correlation between the height of the temperature attained during the treatments and the success which follows. A series of treatments in which the temperatures are more than 106, or even 107 degrees Fahrenheit, are often necessary for best results.

Of the available drugs, bismuth has to a large extent superseded mercury. Tryparsamid is generally accepted to be the best form of arsenic. Alternate courses of intramuscular bismuth and intravenous tryparsamid are commonly used after a course of fever therapy as a matter of precaution even when the remission is already established.

The duration, as well as the character, of the remissions following modern treatment are better than the spontaneous remissions. The longest observation I have made is in the case of a patient who was given the malaria treatment twelve years ago, and has been working continuously in a responsible position and with a number of promotions in a large corporation over a period of twelve years. A recent patient treated in the acute stage received twelve fever treatments; maximum temperature, 108 degrees Fahrenheit; prompt remission; returned to work about two months after termination of treatments. The patient has continued to work with full efficiency and has received promotions since his recovery.

It seems to me that the best clinical evidence of curability of a disease like paresis is the promptness and the duration of recovery. Judged by this standard, early paresis is curable in a high percentage of cases.

*

BENJAMIN W. BLACK, M. D. (Highland Hospital, Oakland).—The paper presented by Dr. Walter F. Schaller is a distinct contribution to the newer concepts of the dreaded disease, paresis. Having his own study of these cases in mind, Doctor Schaller stresses the term "paresis" to apply only to late manifestations, and properly makes the point that the entity under consideration does not spring from the brain in its fully developed form, with the observation of the new pathology in which the questions arise whether there is a transient pathological state of paresis, when essentially in the early form it presents the signs of meningococcic parenchymatous irritation. It is an interesting observation, particularly when it presents at this stage of the disease no marked organic changes of essential brain tissue. It is also of great interest, and stress should be placed on the statement that paresis at this stage may be aborted.

Many clinicians have long recognized the stage in the diagnosis; it seems not unusually difficult, but the important thing about the discussion would make clinicians conscious of the opportunities presented for beginning treatment which must be long continued.

Doctor Schaller has presented a series of cases showing in great detail his observation, diagnostic procedures, as well as treatment rendered over a period of as many as nineteen years. He has shown remarkable results, as all of the patients presented are symptom-free at this time and are occupationally active. An optimistic note in the treatment of this dreaded disease creeps through the discussion of these patients and their care. This, too, indicates much more than the paper would indicate: the painstaking attention given, the careful treatment provided, and the necessary arduous task of follow-up over this long period of time. Doctor Schaller has made a distinct contribution to the literature in the preparation of this paper; and to all who are concerned with the treatment of such cases as well as their early diagnosis, it should be a source of encouragement and at the same time it should point to a demand for early diagnosis and continued prolonged treatment. I am glad to have had the privilege of discussing this important paper.

THE TREATMENT OF TYPHOID FEVER IN CHILDREN, BY MEANS OF LYSED VACCINE

By J. M. FRAWLEY, M.D.
Fresno

DISCUSSION *by K. F. Meyer, Ph. D., San Francisco; Gregory Shwartzman, M. D., New York City; C. O. Mitchell, M. D., Fresno.*

TYPHOID fever is a disease of considerable mortality. In sixty-five cases admitted during the past ten years to the Fresno General Hospital there were eight deaths, a mortality rate of 12.3 per cent. Any measure which offers assistance in the treatment of this infection, therefore, merits consideration. Much attention is being given at present to biological therapy. The use of vaccine in typhoid began with Wright in 1898. In the preparation of Wright's vaccine, cultures of typhoid bacilli are killed by heat. It has recently been shown that the use of heat and chemicals as a devitalizing agent in the preparation of vaccines brings about denaturation with resultant loss of antigenic activity.[1] Vaccines in which this denaturation is reduced have been prepared by various methods.

TWORT-D'HERELLE STUDIES

In 1916-1917 Twort and D'Herelle introduced bacteriophage. Its chief use was in infections caused by bacillus of dysentery, staphylococcus and colon-group infections of the urinary tract.

There has been considerable discussion as to the nature of the lytic principle responsible for the Twort-D'Herelle phenomenon. It was at first thought that it was a living parasite of bacteria, alive and ultramicroscopic. Northrop and Krueger,[2] however, showed that it obeyed definite mathematical laws, and was in effect a chemical substance related to enzymes. The mechanism of bacteriophage activity is thought to be either through the propagation of bacteriophage in the blood stream, with resultant lysis of bacteria, or through the tissue response to the antigen released from the bacteria of lysis. Krueger, Lich, and Schulze [3] found no evidence of increase in the bacteriophage titer of the blood serum following the injection of bacteriophage. Moreover, the amount of bacteriophage present was wholly insufficient to induce bacterial lysis. Therefore, they concluded

that, since bacteriophage lysates do not act through their bacteriophage content in the septicemias, the antigen fraction alone must be responsible for the therapeutic successes reported.

OTHER ANTIGEN STUDIES

Di Christina and Caronia, in 1916 and 1917, introduced another method of obtaining antigens without appreciable denaturation by inducing lysis of the organisms with immune serum. This type of antigen has chiefly been used in the treatment of typhoid and related infections.

Lysates obtained by both of these methods contain considerable quantities of materials capable of inducing marked nonspecific response of the immune mechanism. Included in this group of materials are metabolites resulting from bacterial growth, the nutrient constituents of the media, both groups being in addition to the possible specific antigens released by lysis. Consequently, it is impossible to differentiate between the effect produced by the specific antigen and those produced by the nonspecific protein which accompanies it.

LYSED VACCINE USED BY THE AUTHORS

Lysed vaccine of the Caronia type made by Dr. Karl Meyer of the Hooper Foundation, University of California, was used in the series of cases which forms the basis of the present paper.

The method of preparation is as follows:

Using a liquid medium, a culture is made from various strains of Eberth's bacillus, the typhoid organism. To every 100 cubic centimeters of this culture, 5 cubic centimeters of typhoid convalescent blood is added. The temperature is then held at 37 degrees centigrade until lysis of all, or nearly all, the bacteria is accomplished. When the liquid portion of the culture becomes clear, this is separated from the sediment, phenolized and used as vaccine. In this way most of the bacilli which have matured, together with those which are on their way to maturity, undergo lysis because of the influence of the added serum. In this way, also, there is created a vaccine of high concentration with a constant titer, and ready for use. Moreover, the vaccine is almost free from deleterious elements.

The method of administration is as follows:

Five-tenths to one cubic centimeter of adrenalin (1 to 1,000) is injected intramuscularly. Following this, 0.5 to 0.7 cubic centimeter for an adult, 0.2 to 0.5 cubic centimeters for a child, of lysed vaccine is given intravenously. The temperature, pulse, and respiration are recorded every two hours for the ensuing twenty-four hours. A second injection of vaccine is given on the alternate day, using the same technique except the injection of 0.4 to 1.0 cubic centimeter of lysed vaccine. Subsequent injections of 0.6 to 1.0 cubic centimeter of lysed vaccine given intravenously may be administered on alternate days.

This technique was followed in the case of four children seen at various stages of typhoid.

REPORT OF CASES

Case 1.—The first patient was a girl of seven years, Edith D. The infection became evident on February 3, when she was taken to Dr. E. J. Pratt of Lemoore. Her temperature at this time was 103.4 degrees Fahrenheit, rose the next day to 105.2 degrees Fahrenheit, and remained at this level. During the next week the blood culture was taken by the State laboratory, and found to be positive for typhoid. The lysed vaccine was obtained from the Hooper Foundation, and the first injection of 0.2 cubic centimeter was given intravenously on February 9. Adrenalin 1.0 cubic centimeter of 1 to 1,000 was given simultaneously with each injection. There was no great reaction and not much change in temperature. The second injection was given on February 11, 0.4 cubic centimeter intravenously. The temperature rose quickly to 107 degrees Fahrenheit, then quickly dropped to normal on the 13th. It remained normal during the next ten days and a general improvement was noted in the patient's condition. There were no toxic symptoms. About the 20th, the temperature rose again to 103 degrees. For another ten days the temperature continued to fluctuate from normal in the morning to 102 or 103 degrees by afternoon. The general condition, however, was better. The patient was bright and cheerful. By the first of March the fever dropped and there was no further elevation.

* * *

Case 2.—During this same period the brother of patient No. 1, Edwin D., a boy of nine, was in bed with typhoid. The parents had been unwilling to give lysed vaccine to both of the children, and for this reason the boy might be considered as a control. His fever began on January 10, three weeks before his sister became ill. His infection was severe, and the temperature progressed to a high level, reaching a daily maximum of 103 degrees Fahrenheit for six weeks. After six weeks of high fever there was a remission for one week. The clinical picture, however, did not improve with the drop in temperature, and he was irrational most of the time. At the end of one week the temperature began to rise again and went back to the old level of 105.2 degrees Fahrenheit. He now showed great emaciation, his abdomen was distended and tympanitic. His condition at this time was considered very grave. On the 13th of March, two months after the onset of the disease, it was decided to institute treatment with lysed vaccine; at the same time he was given subcutaneous injections of whole blood from the sister who had now been afebrile for two weeks. During the next week three injections were given. The vaccine was given in small doses of 0.2 to 0.4 cubic centimeters, along with 5 to 10 cubic centimeters of immune blood. By March 31, one week after instituting treatment, the temperature was normal and remained normal from then on. His recovery was rapid and uninterrupted.

* * *

Case 3.—Ellis T., age ten years, was admitted May 17 with a tentative diagnosis of poliomyelitis and a temperature of 103.6 degrees which went to 104 degrees Fahrenheit. The following day the temperature had come down to normal, but on May 29 it rose again to 105 degrees and went as high as 106, with an average daily range from 100 to 103 degrees during the next two weeks. The blood culture was positive for typhoid. The white blood cells numbered 6,700; red blood cells, 3,440,000; polymorphonuclears, 35 per cent; small lymphocytes, 5 per cent; large lymphocytes, 50 per cent; eosinophils, 4 per cent. Spinal fluid, one cell. Widal negative. On June 9 the first injection of lysed vaccine was given, 0.5 cubic centimeter, and the temperature rose within four hours to 106.0 degrees. The next day the temperature in the morning was 100 degrees, and in the afternoon was 102. On June 11 the second injection of lysed vaccine was given, 1.0 cubic centimeter. The next day the temperature dropped to normal, and remained normal until the child was discharged two weeks later.

* * *

Case 4.—Consuela C. was admitted December 9 as a typhoid case. The white blood count on January 5 was 3,250; red blood count, 2,360,000; hemaglobin, 41 per cent; small lymphocytes, 60 per cent; large lymphocytes, 2 per cent; polymorphonuclears, 38 per cent. On January 18 the white blood count was 12,200. Her temperature ranged from 102 to 105 degrees, and continued at this level for the first two weeks. For three weeks the average temperature ranged from 100 to 103 degrees. During these five weeks in the hospital she developed a bronchial pneumonia and she did not show any signs of improvement. On January 8 she was given the first injection of lysed vaccine, 0.5 cubic centimeter, intravenously, the second and third injections of 1.0 cubic centimeter. The temperature after each injection rose to about 106 degrees. After the third injection the temperature dropped to normal and remained normal from then on.

COMMENT

The advantages of using lysed vaccine are the following:

1. There is less denaturation of the antigen than when vaccines are heat-killed.

2. Since the killed bodies of the bacteria are removed, much larger quantities of antigen can be administered without provoking so severe a reaction as that produced by bacterial suspensions. They may be administered intravenously as well as subcutaneously.

3. Since the bacteria have been lysed, vaccine relieves the sick body as much as possible of any active reaction. During the infection the tissue cells are less responsive than during health, especially if the disease is a severe or long one. This is why an efficient serum (Passive Immunity) would be an ideal form of specific therapy.* Lysed vaccine possibly holds a position between serum therapy and ordinary vaccine treatment. In the first place, it saves the system from the strain of producing the primary antibodies for the destruction of the bacteria, since they are already lysed and endotoxins liberated. With this explanation one sees the rational basis for the employment of lysed vaccine in typhoid therapy.

The treatment of typhoid fever by means of lysed vaccine had its origin in Italy, and reports of large series of cases are found in Italian literature.[4]

It is claimed that use of vaccine shortens the course of the disease. The patients do not enter convalescence in a cachectic state. There is a sudden stimulus to the defensive mechanism, since there is leukocytosis.

Caronia [5] claims that in almost all cases the lysed vaccine prevents a fatal outcome and that its use shortens the duration of the disease.

Arcangeli believes "that the time is past when we should entrust the cure of the patient to symptomatic treatment and to the patient's own resistance."

SUMMARY

Four cases are reported in which Caronia lysed vaccine was successfully used in the treatment of typhoid fever in children.

* Such a serum has been prepared by Dr. Gregory Schwartzmann, of Mount Sinai Hospital, New York City, by injecting horses with a toxic filtrate of B typhosus cultures along with killed organisms. A recent critical case of typhoid in a child two years of age was treated by means of this serum kindly furnished by Doctor Schwartzmann. Some 300 cc. in 500 cc. of Ringer's Solution was injected slowly intramuscularly over a period of eighteen hours. Forty-eight hours later a crisis occurred, with a drop in temperature from 106 to 97 degrees Fahrenheit. Because of shock, adrenalin was administered and eventually the child made a complete recovery.

DISCUSSION

K. F. Meyer, Ph.D. (Hooper Foundation, San Francisco).—The interesting reports of vaccine therapy in typhoid fever by Doctor Frawley enhance the already notable group of successes published by others. In fact, the communications in the possession of the discussant, covering a period of seven years, leave no doubt that the Caronia lysed vaccine has quite uniformly given good results, both in adults and children. In this respect the available records compare favorably with the early observations of Gay and Chickering (1918). Unanimously, the mildness of the reaction following the intravenous administration is mentioned. In all probability this may be attributed to the relatively small amount of toxic undenatured protein which is present in the Caronia preparation. As a mild shock reagent, this lyzed antigen has great advantages over the ordinary vaccines which may induce alarmingly severe reactions, particularly when used by the inexperienced. However, it is important to emphasize that this form of intravenous therapy is essentially a nonspecific phenomenon. Similar results have followed the administration of other bacterial preparations; indeed peptone and sera, which give rise to a protein shock, have been employed. The preferential use of the Coronia vaccine rests on the ease of preparation, control of dosage, and the experience that relapses are less likely to occur when a specific agent rather than some other protein is injected.

Gregory Shwartzman, M.D. (Mount Sinai Hospital, New York City).—Doctor Frawley's report on treatment of typhoid fever with lysed vaccines of the Caronia type, made by Dr. Karl Meyer, is of considerable interest. In the past, the treatment of typhoid fever by active immunization with B. typhosus vaccines and cell-disintegrates were shown to influence favorably the course of the disease, but had to be given up because of the dangers associated with this treatment. Thus, Ichikawa[1] reported that intravenous administration of typhoid vaccine into typhoid fever patients brought about a critical drop in temperature, and not infrequently elicited bleeding in the intestines, lungs and nose, and hemorrhage in the skin. Recently, the bleedings were interpreted in the light of the work done on the phenomenon of local tissue reactivity to bacterial filtrates.[2] In this set-up the intestinal ulcers prepared by the toxins of the typhoid bacilli may react with hemorrhage and necrosis when bacteria containing toxins are introduced into the general circulation. It is significant that no hemorrhages were observed in Doctor Frawley's series of cases. It is possible, therefore, that the toxic principles capable of eliciting the above-mentioned hemorrhagic lesions were lacking in the lysed vaccines used by him. It may be important to support this possibility by experimental evidence.

C. O. Mitchell, M.D. (Pacific Southwest Building, Fresno).—The good results obtained in the series of cases here described indicates that biological therapy in typhoid fever must be given serious consideration.

In my experience the lysed typhoid vaccine has given best results in those cases which have lasted three or four weeks, and in which progress is slow and the patient's resistance is about exhausted.

There is nothing further to be gained by symptomatic treatment, and at this juncture I have seen marked response to injections of small amounts of lysed vaccine.

The patient's immunity mechanism is stimulated in a way that seems to be too prompt and effective to be accounted for by nonspecific protein therapy.

PRIMARY DYSMENORRHEA*

A LOCAL MANIFESTATION OF A CONSTITUTIONAL DISEASE AND ITS TREATMENT

By MARIAN GOLDWASSER, M.D.
Los Angeles

DISCUSSION *by C. Morley Sellery, M. D., Beverly Hills; Etta Gray, M. D., Los Angeles; N. Kavinoky, M. D., Los Angeles.*

THE unsolved problem of primary dysmenorrhea is faced today not only by the gynecologist and the general practitioner to whom the numerous sufferers apply for help, but also by the school physician, who has under supervision several thousand adolescent girls from year to year. The victims of dysmenorrhea usually feel too ill to attend school, and remain in bed for one or more days every month. Those of the girls who attempt to come to school when suffering pain are too ill to attend their classes, and spend most of the day in the nurse's room.

To the school physician these girls present not only a health problem, but also an attendance problem, for their frequent absence from school causes a considerable and unnecessary financial loss to the school system—the local school board receives its allotment from the State on the basis of attendance.

Dysmenorrhea among adolescent girls occurs rather frequently. Dr. Mary Hodge made a study of 914 healthy girls in the gymnasium classes in the Public Athletic League in Baltimore, and found that 6.3 per cent required rest in bed for one day or more. In 1927, a similar study was made by Professor Miller of the College of Medicine of the University of Iowa. He found that, among 785 young college women and nurses, 17 per cent had pain sufficiently severe to require rest in bed or limited activity. Professor Miller concludes his study with the statement that the fact cannot be evaded that dysmenorrhea remains today an important economic factor.[1]

LOS ANGELES HIGH SCHOOL STUDENTS

In 1933, I made a study of 1,606 girls who had reached maturity and who were attending high school in four different localities around Los Angeles. I found that 169 of these girls, *i. e.,* 10.5 per cent, suffered from a more or less severe form of dysmenorrhea which necessitated either their absence from school or their lying down in the rest rooms for several hours during the first and sometimes the second day of the menstrual period.

The great majority of girls do not have any pelvic pathology and suffer from the primary type of dysmenorrhea, the cause of which is almost as much of a riddle today as it was thirty years ago.

GENERAL SYMPTOMS

In observing the girls who most frequently complain of dysmenorrhea, I have noticed that the majority of them suffer also from malnutrition in one form or another; that they are usually thin, anemic, and fatigued, and suffer from visceroptosis and constipation; and that many have poor posture and poor circulation, and frequently are subject to a focal infection brought about by decayed teeth, diseased tonsils, or chronic appendicitis. Many girls are emotionally unstable and restless. A smaller number are overweight, pale, and apathetic. Many have little supervision at home, keep late hours, and do not have the proper food. They take for granted the fact that they must be subject to pain and discomfort for several days every month, since their mothers and older sisters had to face the same condition in their girlhood. They expect to suffer pain at every monthly period, go to bed when it appears, and sometimes take a home remedy to relieve it, but do not suspect that their suffering is avoidable.

In evaluating all these factors in the physical and mental make-up of the girls, I began to wonder whether or not their constitutional inferiority and morbid attitude toward menstruation are only accidental, or unrelated in many instances to the occurrences of dysmenorrhea, as cause and effect; or perhaps all three are only symptoms caused by an unknown etiological factor, of which the medical profession is still in search. In order to clarify to some extent this relationship, I thought it might be worth while to make a study of a certain number of cases and see how the menstrual condition would be affected by improvement in the physical and mental status of these girls.

RECENT LITERATURE

A review of the recent literature on the subject reveals that most of the authors, after first making the statement that dysmenorrhea is only a symptom of a pathological condition, the etiology of which is so far not known in every case, present their theories and a corresponding form of treatment which proved successful in a larger or smaller number of their cases.

There is one statement, however, which can be found in practically all the latest works on dysmenorrhea, whether gland therapy,[2] insulin,[3] calcium,[4] carbohydrates,[5] control of allergy,[6] or surgery,[7] is suggested as relief, this statement is that the general health of the patient and her mental attitude should be considered as paramount in outlining the treatment.[8]

"I have always felt," says J. Novak, "that in many instances the mothers of the dysmenorrheic young girls were in greater need of sex instruction than the patients themselves; far too often the girl at puberty is coddled into the belief that the menstrual period is a time of severe invalidism." And he further adds that psychotherapy relieves a large number of patients suffering from primary dysmenorrhea.[9] Emil Novak states that "in women who are constitutionally deficient, as in the case of thin, anemic and asthenic girls, primary dysmenorrhea is very common. . . . I have repeatedly seen cases of severe dysmenorrhea improved or cured without any local treatment whatever, simply by improving the patient's general condition through measures of general hygiene."[10]

* From the Health Section of the Los Angeles Board of Education. A preliminary report of 286 cases.

Read before the convention of the Southern Section of the California State Association of Health, Physical Education, and Recreation on September 25, 1937.

Alexander Altshul suggests the treatment of dysmenorrhea with insulin, and states that, after the war, the populations of Germany and Austria suffered from lack of food, especially vitamins and mineral-bearing elements, with resultant malnutrition and concomitant endocrinopathies. The women in these countries suffered from severe dysmenorrhea, as well as from amenorrhea. The use of insulin improved the nutrition and relieved the menstrual pain on a constitutional basis.[3]

AUTHOR'S CONCLUSIONS

The suggestions of the above-mentioned authors and others, and my own observations during the nine years in which I have served as school physician, coupled with my experience in private practice, have made me feel that the treatment of the physical defects, and of the faulty mental attitude, should be undertaken as the first step, at least, in dealing with primary dysmenorrhea in adolescent girls.

TWO HEALTH PROGRAMS

With this in mind, I have drawn up the following two health programs—one to be used by the corrective physical education teacher at school, and the other to be followed by the girls at home; these programs, I felt, had to be simple, applicable on a large scale, and within reach of the needy girls who made up the majority of my patients:

I. FOR USE IN SCHOOL BY THE TEACHERS

Rest, instead of physical education.
Excuse from extra school duties.
Help the girl to receive free milk, lunch, cod-liver oil, and transportation, if the family is not able to supply them.
Corrective physical exercise after improvement has taken place.
Regular physical training not earlier than several months after the symptoms have entirely disappeared.
Psychotherapy.

II. FOR USE BY THE GIRLS AT HOME

Rest an hour after returning from school.
Go to bed not later than nine o'clock.
Take a warm bath three times a week.
Avoid strenuous exercise and dancing.
Do not walk long distances.
Drink a cup of hot water before breakfast and before supper.
Drink two cups of milk or more daily.
Eat daily a raw apple, a raw carrot, and two oranges.
Take a tablespoonful of Maltine, with iron or iodid after breakfast and after supper.
Take a tablespoonful of karo syrup in water, twice daily, one week before the expected menstrual period.

In both programs, I have emphasized the importance of rest. Contrary to the opinion of some authors, I find that most girls who have menstrual pain and are also undernourished, nervous, and overworked at home, improve better when allowed to rest rather than when compelled to exercise.

The program suggested for use at home provides, along with rest, an ample supply of vitamins, iron, fats and carbohydrates, with an extra supply of the latter prior to the menstrual period,[5] and encourages also good elimination through the skin, kidneys, and bowels. The girls who were overweight were given corrective exercises and Blaud's pills, instead of Maltine. By providing for the betterment of the general health of the girls, this program may also bring about an improvement in many endocrinopathies, hypoglycemias, and create a better resistance to allergic factors, and also a more stable nervous system.

During the past two years, between the months of January and June, I have tried out the above-outlined programs on 215 high school girls, and on eleven mentally retarded girls attending a development school. All these girls came from poor homes, and none could afford private medical care. The attendance office and the nurse referred to me those girls who had been absent from school because of menstrual pain, or, for that reason, were spending most of the day in the rest rooms. The selected pupils were assigned to special rest classes conducted by the corrective physical education teacher. Milk, Maltine, and transportation were given gratis by the schools to those who could not afford them. Every few months I questioned these girls to find out what progress they were making. The stubborn cases were referred to the clinic for more thorough examination. At the end of each semester I interviewed all the girls who were under observation and received most gratifying reports, which were confirmed by the attendance office or the nurse.

SUMMARY CONCERNING STUDENTS UNDER OBSERVATION

The compiled studies in all the schools were as follows:

BEGINNING IN JANUARY

226 girls were under observation.
141 of these girls were absent from school because of dysmenorrhea.
85 of these girls were lying down in the rest room for the same reason.

ENDING IN JUNE

171 girls had completely recovered.
32 girls had improved, having still to lie down in the rest room, but were not absent from school.
23 girls had not improved. Eighteen of these girls were in the absent group, and five were in the lying-down group.

SUMMARY OF RESULTS

75 per cent recovered; 15 per cent improved; 10 per cent not improved.

OTHER PROCEDURES

In order to carry on my experiment on a wider scale, I devoted two hours every week during the past year to the school clinic, where teachers, school physicians, and nurses from various schools referred students who were subject to dysmenorrhea, and were usually absent from school for that reason. A physical examination was made on every girl, and laboratory work was done when necessary. If decayed teeth, diseased tonsils, defective vision, or other defects were found, the girls were referred to the corresponding clinics. No pelvic examination was made on these girls at their first visit to the clinic, unless there was a definite indication for doing so.

A health program, accompanied by a talk to the patient and her mother on the possibility and importance of getting well soon, were given to every girl. If at the second visit no improvement was reported, a rectal examination was made, but pelvic pathology was seldom revealed.

In order to give courage to the girl to go to school at a time when she never before attempted to do so, Anacin tablets were given in several instances to be used at the beginning of the following period. This study in the clinic was carried on from September, 1936, to May, 1937, when a questionnaire was sent out by the clinic to some of the schools which had referred girls for treatment. The replies followed promptly. Some were supplemented by complimentary remarks from teachers and mothers. The results were as follows:

A total of sixty-seven girls were investigated, seven left school before recheck.

A total of thirty-six girls recovered, seventeen improved (were no longer absent during the menstrual period), and eight girls did not improve.

RESULTS

Sixty per cent of the girls recovered; 28 per cent improved; 12 per cent did not improve.

COMMENTS

1. From 6.3 to 17.5 per cent of adolescent girls are subject to dysmenorrhea severe enough to require rest in bed or limited activity.

2. Constitutional inferiority and a morbid mental attitude are coexisting factors in many cases.

3. A health program which provides for abundant rest, proper exercises, correct diet, and good elimination, is beneficial in these cases.

4. Some 286 girls were treated according to the above program, with the results that 72 per cent recovered, 17 per cent improved, and 11 per cent did not improve.

IN CONCLUSION

Since simple rules of wholesome living and a normal attitude toward menstruation bring about a cure or improvement in the majority of cases, the control of dysmenorrhea among adolescent girls can be achieved to a great extent by the school physician through health education. Then only the small number who fail to improve under the health program will have to be referred for further medical study.

DISCUSSION

C. Morley Sellery, M. D. (1467 Oakhurst Drive, Beverly Hills).—Doctor Goldwasser has made a real contribution to school-health education. She has demonstrated the excellent results which can be obtained in the treatment of primary dysmenorrhea among adolescent schoolgirls by careful attention to general health measures and the education of each patient in the details of an improved personal hygiene. Doctor Goldwasser's study is a valuable reminder that much can be accomplished by adherence to the simple yet fundamental laws of health.

I am much impressed with the importance of competent medical supervision in the field of health education. Undoubtedly, the 226 girls under observation at school had received considerable health instruction through the classroom teacher and the physical education department. No doubt this teaching was of value in preparing the ground for the message of the school physician. It is important to note, however, that until the school physician outlined a definite health program and coördinated the various health facilities in the school, 141 girls out of the 226 were absent from school each month because of dysmenorrhea. As a direct result of Doctor Goldwasser's health supervision, 75 per cent of these girls recovered and 15 per cent were improved. This shows the practical results which can be obtained by health-teaching under medical direction.

Doctor Goldwasser has stressed the need for rest in the early stages of treatment for dysmenorrhea. She has quite properly urged corrective physical exercises after improvement has taken place, and regular physical training not earlier than several months after improvement. Probably this is the most difficult stage in the physical rehabilitation of these cases. The mother and daughter have believed for so long that physical exercise is harmful that it is difficult to persuade them to make the last step from semi-invalidism to normal exercise and activity. I feel that in many of these cases the permanence of cure or relief from symptoms depends on finally building up the general muscle tone of the body through big-muscle activities. With good general muscle tone, the tendency to pelvic congestion and dysmenorrhea is much lessened.

Doctor Goldwasser's study was carried on among girls from underprivileged homes. In better-class districts, similar results should be obtained by close coöperation with the family physician and the parents.

❦

Etta Gray, M.D. (649 South Olive Street, Los Angeles).—I am much interested in the simple health rules which Doctor Goldwasser has outlined for treatment, with her reports of a large percentage of cure.

To my mind, a great many such cases of dysmenorrhea may be treated by simple procedure of hygienic routine, and most satisfactory results are obtained.

Aside from these 60 per cent of persons so cured by simple methods, we find a certain number suffering from what can be definitely attributed to endocrine conditions. These individuals should be differentiated and studied. Certainly, marked success may be had in these cases of dysmenorrhea if they are given the adequate endocrine therapy. However, as stated by the writer, only a certain per cent of girls ailing from dysmenorrhea require more than simple therapy as outlined in this paper.

❦

N. Kavinoky, M.D. (1930 Wilshire Boulevard, Los Angeles).—Most thinking physicians are very conscious of the part which sexual neurosis plays in both the individual question of the health of the woman and the social question of the stability of the family. The added financial responsibility which many women are carrying today furnishes another reason for giving serious consideration to the question of dysmenorrhea.

Some of the neuroses have had their origin in the same causes which produced the dysmenorrhea, while others are in great part the result of our older methods of treatment of this condition.

In the balancing up of the diet and the development of habits of nutrition, which Doctor Goldwasser stresses in her approach to this problem, she has accomplished a great deal more than just the treatment of dysmenorrhea. The establishment of these positive health habits and attitudes

is not only a benefit to the general health of the woman, but is an important factor in the prevention of disease. Exercise, especially along the lines of the Mosher exercises, which are simply contraction of the abdominal and pelvic muscles, is a valuable therapeutic aid which can be easily learned by any girl or woman. An endocrine study of a case is of aid in making a more exact analysis of the condition, but it should come after the nutritional program has been established. Today so many women are overstimulated and are overtaxing their energies that the importance of rest cannot be too much emphasized. We need not only to allow a period for rest in the time budget, but we need to teach our women how to relax—how to rest.

The program of health education in the schools which Doctor Goldwasser has described is another step forward toward the improvement of the health of the community. Her recommendations are a valuable aid not only to the private practitioner, but especially to those of us who are interested in public-health work and in raising the level generally of woman's physical well-being.

PSYCHOPATHIC PERSONALITY: AS A HOUSEHOLD PROBLEM*

By Edward W. Twitchell, M.D.
San Francisco

Discussion *by Ross Moore, M. D., Los Angeles; Walter F. Schaller, M. D., San Francisco.*

THOSE whom we call psychopathic personalities must, of course, have been recognized for ages past, but a little more than a hundred years ago they began to attract the attention of such men as Pinel and Esquirol in France, and Prichard in England. To Prichard we owe the term "moral insanity," which is found, even today, in our literature, and in that of Germany and of France as well. Many of those once grouped under the heading "Moral Insanity" would today be called mild hypomanics, paranoids of the quieter type or occasionally early paretics. The French continued the study of these people under the names of "folie raisonante" and "dégénérés," and it must be the work of Morel and Magnan, and possibly Janet, to whom Kraepelin expresses his indebtedness, in his chapter on the Psychopathic Personalities. Morel, Magnan and, later, Koch laid much stress on the so-called stigmata of degeneration, particularly the physical stigmata. These physical stigmata were such things as facial asymmetry, abnormalities in the shape of the ear, malformations such as harelip, polydactylia and the like; then there were also tufts of white hair, cowlicks, and double crowns. One could go on at great length enumeratting such stigmata. Color blindness was a sensory stigma, and as this was known as Daltonism, those with an inherent ethical defect were known as examples of ethical Daltonism. There were even obstetrical stigmata, such as a tendency to ectopic pregnancy. These were the days of Lombroso and Max Nordau, whose work is now in large part forgotten. There was nonetheless a good deal of value in this work, and it would be wrong to ignore it completely.

KOCH'S STUDIES

In 1889, J. L. A. Koch published a short guide (Leitfaden) to Psychiatry, and in it was a chapter on the psychopathic inferiors (Minderdwerthigkeiten). This chapter was expanded, and in 1891-1893 appeared as a monograph in three sections. Most of our present work harks back to Koch, though he has now, as Kurt Schneider remarks, only an historical interest. The term currently used in all of the Government services, "constitutional psychopathic inferiority," is really but a translation of Koch's designation. For Koch almost any sort of physical peculiarity was indicative of degeneration, and one frequently finds in his histories the remark, "Flecks of pigment in the iris." This to him was highly significant. He divided all his "inferiors" into two main classes—the Permanent and the Transient—each of the two main groups being again subdivided according to severity into Psychopathic Disposition, "Belastung," and Degeneration. Kraepelin's long chapter, in the 1915 edition of his work, is today often criticized as taking a viewpoint too exclusively clinical, and the classification is objected to as purely descriptive of behavior, and Kahn makes the same criticism of Schneider, although he gives him credit for attempting to "deepen the psychological insight." Kahn's own classification, which he calls an heuristic one, may give one a better idea of the mental mechanisms involved, and one will have no great difficulty in fitting into it the grouping of Kraepelin or Schneider; still the clinical classifications are excellent working tools. As a matter of fact, classifications here, just as in other departments of psychiatry, have little worth, though they serve as a convenience in certain junctures. They are much like platforms of political parties, to be ignored when they become annoying. It is interesting to see how all-embracing some of the classifications are. In Willmann's, one may find headings for menstrual depression and for homesickness.

ENGLISH LITERATURE

When one considers how numerous these patients are and the long while they have been generally recognized, it is remarkable how little has been written in English. In Schneider's Bibliography of 304 items, dated 1922, the only article in English mentioned is Beard on Neurasthenia, and Kahn, though translated into English and published at Yale in 1931, does not cite one. Allowing for the German tendency to ignore everything done outside of Germany, worse, of course, since the war, this means that relatively little has been done in English.

Take up any of the textbooks of the day, English or American, and you will find the whole subject compressed into a few pages, sometimes into a few paragraphs. There are plenty of journal articles on this or that aspect of the question, but a systematic presentation in English has yet to appear.

THE PSYCHOPATHIC PERSONALITY IN YOUTH

The psychopathic personality is ubiquitous, but the handling of him, in his youth at least, devolves upon three agencies—the home, the school, and the courts. Many make a sort of orderly progress from home to school and thence to the court, the court either sending them back to home or school, or on

* Read before the Neuropsychiatry Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

to prison or psychopathic hospital. The problem I have set myself today is a consideration of those at home and school, and up to the time they are taken over by the court. Long before they come into court they are brought to us by anxious parents. The state institutions are constantly being appealed to by parents and guardians who want help in dealing with their problems.

What at first may seem a trifling defect in character, treated maybe with amused smiles, later gets to be deadly serious. The child who pilfers from the mother's purse, for example, later robs the grocer in the neighborhood, and before long is in the penitentiary. The small boy who makes such advances upon his nurse that she is afraid to stay alone in the room with him later becomes the terror of all of the mothers in the neighborhood.

SEXUALLY PRECOCIOUS TYPES

Warden Johnston of Alcatraz, in a recent address, said that our prisons were permanent exhibits of our failure to solve the problems of childhood. Hence, if we are to do much for these people we must start when they are very young. We cannot, as Dr. O. W. Holmes advised, begin one hundred years before they are born, but we may, if we will, begin soon after birth. Several types are brought to us over and over again; the sexually precocious, for example. It is astonishing how this type may be overlooked by the parent. One girl of twenty-five, sexually promiscuous since her menstruation at thirteen, on her own admission, was brought in by her mother, who was just beginning to be suspicious. The real reason for the consultation was the girl's misophobia; she would take a dozen baths a day if permitted. The blood Wassermann was strongly positive. Three years later the girl was in jail as a prostitute and sent to a farm for erring women, which was once maintained by the State in Sonoma. There she was a model inmate. Two years later she was reported doing well. Ten years later, still she was reported as married and living a good life—one of the occasional happy endings and not so uncommon as usually thought, as prostitution is merely an episode in the life of many a woman whose later life is quite regular. The sexual perverts do not do so well. A fetichist, when fully developed, tends to continue as such, even though he make an adjustment in marriage with a normal woman. One fetichist, who seems to have been conditioned in childhood in an orphanage, by a servant with a lame leg, whose kindness to him he ever remembered, used to roam the streets at night after his work in the orchestra was done, looking for a girl with a short leg, before he went home to his wife and family. Another, who in childhood got sexual excitement by opening and inspecting packages, still gets into trouble by opening and inspecting the contents of packages which he never keeps. Unfortunately, some of the packages are on the top of mail boxes.

INVERTS

The same is true of the inverts; one under observation for years, who but a year ago declared that he had overcome his tendency, recently went out with a sailor who robbed him, after beating him so that he spent a month in the hospital. I am skeptic when I hear of the cure of inverts. It is like changing the leopard's spots—they can, however, manage a certain control; and so live that they are not a scandal to family and friends and keep out of the clutches of the law and the blackmailer.

PERVERTS

The life of the perverts is often a secret known to but few, and their perversions may never bring them into conflict with the law; furthermore, many perversions are accepted nowadays as but trivial variations from the normal. The sadist, of course, may do things of violence which lead him to the police. They injure their victims in such a way that they are often brought to the notice of the police, particularly when the victim is a child or a prostitute who meets them in a business way. Wives are less fortunate. One sadist recently seen would impulsively attempt to thrust his entire fist up his wife's vagina. She had learned to barricade herself in her room on perceiving a certain expression come over his face.

PRESTIGE HUNGRY AND HYSTERICAL TYPES

One group is a source of great trouble to families, and that is the liar and swindler, to use Kraepelin's designation, which Schneider classes as prestige hungry (Geltungsbedürftige), and Kahn as the hysterical. They start very young. They lie to avoid trouble, but more often to put themselves in a more shining light. They steal in order to get what will enhance them in the eyes of their playmates at first, and later of their mistresses.

It would be hard to exaggerate their excesses. One mother told me of a son costing her $75,000 in two years, the greater part of her fortune; another son had brought his father to complete financial ruin.

HOUSEHOLD OR FAMILY PROBLEM TYPES

These types—the sexually precocious, the inverts, and the liars and swindlers—impress me as being household or family problems, problems that cause the greatest anxiety. There is the occasional irascible whose quarrelsome nature makes him impossible at home or in school, and who may find himself in the juvenile court before long, but is not the source of anguish that the others mentioned are; his violent temper may bring him to commit assault, or even homicide, but a homicide in the family tree is better than an invert. The cold autist, who becomes an enemy to society and may do the most cold-blooded things, usually drifts away from the family early and may pass out of their ken completely.

There are certain others, the weak-willed, the unstable, the inadequate, and the like, who are thorns in the side of ambitious parents who built high hopes upon them, and are chagrined to see the son for whom they have planned a great career turn into an amiable, third-rate organist. I generally try to console such parents by telling them that, while a well-behaved nonentity may be no source of pride to a family, at least in comparison with

a genius who is also a scandalously living homosexual, he is to be preferred. Geniuses are by no means an unmixed blessing, and a genius must be hard to live with, even the best of them.

Where drunkenness is not a chief manifestation of a psychopathic personality, as it sometimes is, it is often an associated one, and one that complicates a case that otherwise might be manageable. The gentle sot, like Rip Van Winkle, is often a village favorite, though little joy to his family; but the swindler, who is a sot to boot, is a double infliction.

THE EGO CHARACTERISTIC

A never-failing characteristic of all these people was seized upon by Koch in his early work, *i. e.*, "das ungebührlich in den Mittelpunkt gerucktes Ich"—the ego shamelessly put in the foreground. They are all selfish, and all without feeling for the sufferings of others. With tears running down his face, the boy who is saved from jail by the sacrifice of his mother's home, swears he will never do it again, yet repeats the act in a week. They are often, strangely enough, indifferent as to their own future penalties. A woman, released on parole from San Quentin where she had been sent for "paper hanging," hardly stepped off the ferryboat in San Francisco when she wrote another check. A lawyer borrowed money on the strength of a deed of property to himself; on the deed he had forged the name of a banker who was a personal acquaintance of those from whom he was borrowing.

CONCEIT ELEMENT

Conceit is another characteristic. The prestige-thirsty individual is conceited as well. One of the strangest manifestations is the superior feeling of the homosexuals, who tell you blandly that they are a superior type of creation. Not often does one see an invert who is self-depreciative, though I remember one who, on discovering what he was, wept and talked of suicide.

Taken as a general rule, then, we are dealing with those who are selfish, conceited, and unfeeling, with an intelligence that ranges from low-normal to genius. The physical characteristics, about which one could say so much, especially since the work of Kretschmer, I pass over deliberately as not pertinent to the present discussion.

Most of these people are hereditarily tainted, and while I do not underestimate environment, one so often sees such cases as L. A., a son of street-fair performers, abandoned in his infancy and adopted by well-to-do people, who provided what would be regarded as the best of care and education. In his grammar and high-school years he turns out to be a problem by reason of general untrustworthiness.

TREATMENT

What can we do to avoid the charge that our neglect fills our penitentiaries? My belief is that training is just as good for children as it is for dogs and horses. No good horse or dog trainer is brutal to his animals, but he sees to it that they are disciplined without indulgence. We need not go back to Spartan methods; anyway, the Spartans left no monuments and are known only from what others wrote of them. But a certain amount of rule is necessary. Long before Solomon said, "Spare the rod and spoil the child," an Egyptian cut on stone the following aphorism, "A boy's ears are on his back; he hearkens best when beaten." We have been living in a period of tendermindedness. Someone I seem to remember calls it "This ghastly thin-blooded time of ours," or words to that effect. Vegetarianism and antivivisectionism are products of our time. There is too much Society for the Prevention of Cruelty to Animals sentiment abroad. The hungry pioneer, working his way over the passes of the Sierra, did not hesitate to shoot because the soft eyes of the deer filled him with compassion. He thought of the wife and children who had had nothing to eat since the day before. The normal boy on a holiday wants to go out and kill something. When he grows older, grows fat and short-winded, he begins to be sorry for the deer and the dove and the duck. The older brother of a young man who had progressed through a series of embezzlements in public office, all of which had been made good by the family, said, when the young man was sent to prison for robbing a bank, "Maybe if we had let him take the rap the first time he would not be where he is." Drastic punishment for each offense would, I am sure, lessen the offenses. I have often felt that those whose habit it is to obtain money on false pretenses, whether by check, by borrowing, by running up bills and the like, would hesitate if they knew the offense would be followed by corporal punishment. They stand the sufferings of others with great fortitude, but not their own. The problem is how to accomplish this under the law. The long-suffering brother of an offender who went across the country in a stolen car, leaving a trail of bad checks behind him, said, when I broached the matter, that he thought that by reason of his connection with the district attorney's office, he could arrange the punishment in an extralegal way.

It would be well if some way could be found to deal with these individuals who seem not so much to be increasing in numbers, as growing bolder and more cynical in their behavior. If we do not, we shall quicken our national degeneration. At the present we may be on the path of the Byzantines, and eventually we may go down overwhelmed by some future Turks. Let us stay the process in what way we can.

Some of these patients need our protection; we may persuade the ambitious parents of a good-natured, well-behaved inadequate to cease driving him on to a goal which he never can attain, and let him make his way in a subordinate rôle. The parents need treatment more than the son. We may point out to the inverts the nature of their trouble, the value of control, if control be possible, and particularly the hazards of their future life. The homosexual, especially if well-to-do, is a prey for all sorts of predatory persons, and if he be warned in advance may be able to escape their traps. The homosexuals may be told that he and she may lead an orderly life in spite of the infliction with which they are burdened, for the homosexual may live a life without scandal as the heterosexual may lead

a life of debauch. There are many inverts who have kept themselves under control and lived respected in their communities. This is particularly true with women. The worst thing about these unfortunates is that when they begin to indulge their desires to any degree they are apt to be dragged down to the level of their companions.

The antisocials I am leaving out of account, as they cease to be household problems pretty early and find their way into the courts and thence to prison. They are like the cold autists above mentioned, and the irascibles, who in their rages commit deeds of such violence that they are immediately brought under control of the police.

It is particularly for the lying and swindling group that I wish to urge a stern discipline from very early years. For them the present-day tendency to let them express themselves without let or hindrance is to put a premium on their giving free rein to their selfishness and conceit. This means, of course, a complete change in the present-day system of dealing with the young. As the present method of letting them do as they please is a reaction from the stern and sometimes brutal treatment of a hundred years ago, so must there be a gradual stiffening of discipline, with an intelligence greater than shown in the past. This will come about, not only because it will be seen as the wise thing to do, but because the situation will eventually get so bad that self-preservation of society will dictate the method.

909 Hyde Street.

DISCUSSION

Ross Moore, M. D. (1930 Wilshire Boulevard, Los Angeles).—In approaching the problem of the psychopath in the home, I find myself constantly trying to evaluate him on the basis of his relative adequacy or inadequacy to life.

There are some psychopaths who can be helped to lift themselves out of the problem class. In other words, there are persons who are perfectly able to live on the psychic level of their present surroundings, provided they become relieved of certain removable handicaps.

The program of treatment for such psychopaths is clear and not complicated. It usually requires neither long and repeated psychoanalytic seances nor sanitarium regimen. Just a common-sense inquiry into discoverable causes and a rigorous elimination of the same.

The other group of psychopaths includes those pathetic personalities who are essentially or biologically inadequate for life in the sphere or on the psychic level wherein their lots are cast. They are the unfortunate ones. For neither they themselves nor their relatives are willing to admit their permanent handicaps. Thus their successful treatment has far higher hurdles to jump. Both themselves and their friends have to be forced to accept, as bitter fact, a situation they have trained themselves to strenuously deny. Frequently this acceptance cannot be forced. Thus, the poor patient shuttlecocks about among doctors and sanitaria, grasping ever vainly at a will-o'-the-wisp promise of health.

Nevertheless, such persons can, in a good proportion of cases, be helped if effort be persisted in long enough. Such therapeutic success is the result of entire honesty of attitude on the part of the doctor, which ultimately reflects itself in an honest acceptance of himself by the patient. Success of this kind is well worth the effort.

❋

Walter F. Schaller, M. D. (909 Hyde Street, San Francisco).—The psychopathic personality is most often an expression of a psychopathic constitutional state, by definition an inherent psychobiological defectiveness. These individuals from birth are poorly endowed to meet the demands of ordinary life situations from the standpoint of social, moral, and emotional standards. To the layman these deviations represent but conduct disorders; to the psychiatrist they represent inborn defects, characterized by strong impulses, weak wills, superficial emotions, and irresponsibility. The true nature of the disorder, as Doctor Twitchell points out, is often overlooked in the home and the school, and not discovered until brought to light by a social behavior which calls the patients to the attention of the psychiatrist or, more frequently, of the law. These cases are often classified as constitutional inferiors. As a rule, they are not mentally deficient, and cannot be definitely classified among the psychoses. They are, therefore, on the borderline of the mentally capable and incapable. The severer cases are not benefited by any known therapeutic approach, as is possible, for example, in the psychoneurotic reaction types, from which they must be clearly distingunshed.

In the milder types, I agree with Doctor Twitchell in the importance of early diagnosis and an attempt to strengthen the will and cultivate inhibition by deterrent methods. We are now living in an era aptly described by Aring and Bateman (*Journal of the American Medical Association,* October 2, 1937), as one characterized by a national neurosis. Unemployment and relief, the loosening of home and church ties, and the laxity of the law in minor offenses, to which may be added the popular educational idea of self-expression, cannot but further demoralize a psychopathic personality.

IONIZATION IN ALLERGIC RHINITIS*

By H. J. Hara, M.D.
Los Angeles

Discussion *by G. W. Walker, M. D., Fresno; Edward C. Donohoe, M. D., Glendale; Benton N. Colver, M. D., Glendale.*

NASAL zinc ionization concerns itself with the introduction of zinc ions into the superficial layer of the nasal mucous membrane by means of the galvanic current.

INSTRUMENTS

The instruments used in ionization are (1) a generator for galvanic current, (2) conducting wires for positive and negative poles, (3 electrolytic solution or suspension in jelly, and (4) electrodes. The galvanic current is obtained either from (1) wet- or dry-cell batteries, or (2) motor generator from house current. When the free ends of the two poles or electrodes are connected, the current flows from the positive pole to the negative pole. When a solution of zinc sulphate is employed as the conductive media, zinc molecules are dissociated from the sulphate radical, the zinc ions going to the positive pole. Zinc sulphate in the strength of one-half to two per cent is used as the electrolytic solution. Warwick's [1] "Ionode" contains 85 per cent zinc, 10 per cent tin, and 5 per cent cadmium. His electrode contains these metals in the same proportion. Cottle [2] recommends 2 per cent zinc, with 5 per cent tragacanth suspended in jelly. Earlier in my experience I used only Warwick's solution and a fresh electrode in each side of the nose. Later, one-half per cent zinc sulphate solution was substituted and more recently Cottle's jelly.

* From the Department of Otolaryngology, College of Medical Evangelists, Los Angeles.

Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

PREPARATION AND OPERATIVE TECHNIQUE

The presence of polyps and a deflected nasal septum interfere with the proper contact of the electrolytes with the nasal mucosa. Correction of such nasal pathology is made four to six weeks prior to ionization. When acute sinusitis coexists, ionization is deferred until the acute stage is over. In seasonal rhinitis, best results are obtained after the onset of hay fever. The adult receives the usual preoperative sedatives by mouth and hypodermic. Cocain and adrenalin are used for local anesthesia in the nose. Children require general anesthesia. Either one or both sides of the nose are treated at one sitting. Hurd [3] and others flood the nasal chambers during the operation, while the head is kept in the dependent position. Warwick originally insisted on packing the nasal cavities with several strips of half-inch fiber cotton, well moistened with his trimetal solution, and then placed the electrode between them. The instillation of zinc jelly greatly reduces trauma. I prefer to have the patient lying down with the head resting on a pillow. The dispersive pole, with the well-saturated felt pad, is fastened to the upper arm or back of the neck. An insulated wire, which leads from the positive pole of the generator, is attached to the electrode in the nose. The current is then turned on gradually and the treatment continued until 100 to 150 milliamperes are given to each side (10 milliamperes for ten to fifteen minutes).

At the conclusion of the treatment the nasal mucosa presents a thin, grayish coagulum on the surface to which it is firmly attached. In three to five days this coagulum is cast off, and the mucous membrane appears smooth and salmon-colored.

HISTOLOGIC TISSUE STUDY

Histologic examination of the cast shows a vast number of leukocytes enmeshed in desquamated epithelium and fibrin. During the next three months there occurs an infiltration, chiefly of monocytes and lymphocytes, with a generalized increase in the density of the tunica propria. The mucous glands atrophy, goblet cells disappear, and eosinophiles persist. The picture is that of true fibrosis. The surface epithelium remains cuboidal for months. According to Smit,[4] these cells eventually regenerate into ciliated columnar type when no chronic inflammatory process is present. A specimen removed from the middle turbinate of one of my patients two years after ionization revealed complete regeneration of the normal ciliated cells.

ANALYSIS OF ONE HUNDRED CASES

My experience in the treatment of allergic rhinitis by the use of ionization began in the fall of 1934. Sixty of the one hundred cases herein reported were treated during 1935, and forty during the first half of 1936. There were thirty-six cases of hay fever, seven of which were complicated with bronchial asthma. Among sixty-four cases of chronic vasomotor rhinitis, thirteen patients suffered from bronchial asthma. There were fifty-four males and forty-six females. Thirty-seven had nasal surgery done prior to being seen by me. Three were five years of age and one was sixty-five years old, the majority being in the third and fourth decades. All came because of unsatisfactory results from previous treatments. Twelve patients were given a second treatment after the lapse of from four weeks to fourteen months. Three of these received no benefit from either the first or second treatment. One gardener with hay fever took three treatments, but the results were far from satisfactory. One patient with vasomotor rhinitis, complicated by bronchial asthma, took three treatments at intervals of six months. His nasal condition improved, but he suffered recurrent attacks of bronchial asthma. Following each ionization, he was relieved of the asthma for a period of from four to six months. Ionization apparently produced no change in other cases which were complicated with bronchial asthma. Four patients complained of anosmia, three of whom regained their sense of smell in from four to twelve weeks following treatment. The fourth, a physician, still has impaired olfactory sensation five months after his second ionization.

Follow-up reports, after ten to thirty months, showed failure to give any relief in about 20 per cent of hay fever cases and 14 per cent of vasomotor rhinitis. One ionization controlled 50 to 60 per cent of hay fever, and 66 per cent of vasomotor rhinitis cases; but in the course of time it appeared that the shrinking effects produced on the nasal tissue gradually disappeared, and it returned to its previously waterlogged, boggy, inelastic condition; the nose being more or less wet.

To study the comparative efficiency of the various modalities now in vogue in the control of allergic rhinitis, a small number of patients were selected. The first group was treated by cauterization of both lower and middle turbinates with 50 per cent solution of trichloracetic acid. The entire nasal mucosa of the patients in the second group was coated with pure phenol. In the third group the nasal mucosa was painted with 50 per cent solution of silver nitrate, and the fourth group had the turbinates and nasal septum injected with 50 per cent alcohol. No other treatment was given to these groups. They have been under observation from twelve to twenty-four months. Time does not permit a detailed report on each series, but none of the above methods has given as lasting palliation as has ionization.

INDICATIONS AND LIMITATIONS

It should be remembered that ionization does not alter the allergic state of the individual. The Alexanders [5] have shown that when active reagents are present in the blood of hay fever patients, ionization yields no relief. This is to be expected. Another drawback is the possibility of permanent injury to the nasal mucosa, but Alden [6] thinks that the relief obtained more than compensates for the tissue damage. Dean [7] states that ionization is helpful in patients with a maximum of chronic vasomotor rhinitis and a minimum of allergy. He is of the opinion that it is not necessary for the control of hay fever. This is probably true in St. Louis, where a large number of hay fever patients suffer from ragweed pollen during six to eight weeks in

the autumn. In the semitropical State of California, pollinization occurs nearly throughout the entire year. Multiple sensitivity is the rule rather than the exception. The majority of seasonal cases sooner or later become perennial. Thus, the problem presents decidedly different and difficult aspects.

In the light of present knowledge the sane and sensible approach to the management of all cases of allergic rhinitis is first to break the contact with the active allergen and next to desensitize. In actual practice, however, this may be impossible. It is necessary, therefore, that an appropriate nonspecific treatment be tried. Dietetic errors must be corrected, endocrine imbalance regulated, and every focus of infection eradicated. In addition, the nasal chambers must be kept as near the normal state as possible. Some time in the course of their ailment nearly all allergic rhinitis patients seek the services of one or more rhinologists. The allergist, endocrinologist, internist, roentgenologist, dietitian, and others, may be called in as consultants whenever their services are deemed necessary in the best interest of the patient, but the rhinologist must carry the full responsibility for the adequate management of these cases. One who depends on only a single modality for the relief of all the symptoms present in such a complex disorder as allergic rhinitis, is almost certain to be disappointed. Ionization is no exception to this rule. It is no more than a therapeutic adjunct.

SUMMARY

It may be stated, in summarizing, that the result of ionization for hay fever patients over a period of from ten to thirty months was good in from 50 to 60 per cent of patients, failed in 20 per cent, and over the same period a single ionization controlled 66 per cent of chronic vasomotor rhinitis patients, moderately helpful in 20 per cent, and failed in 14 per cent when no other treatment was given.

DISCUSSION

G. W. Walker, M. D. (533 T. W. Patterson Building, Fresno).—This subject has been well written and much discussed previously. Possibly there has been overenthusiasm in the work of some who presented the subject, but far greater errors have been made, in my opinion, in the criticisms expressed by opponents who have condemned the whole procedure—I think without sufficiently careful investigation—but I think others speak more from prejudice or from seeing nasal ionization poorly done.

Doctor Hara has ably presented the case of intranasal ionization for hay fever—I do not say case for ionization—but he has presented it just as the facts warrant, giving both sides—and there are two sides.

I think there is a tendency by some to accept a new method with undue enthusiasm, and that others are unduly critical, each without sufficient knowledge of the new method in question. Probably all of those who are too easily won as friends will too easily drop the method as useless when they encounter some difficult situations. If there were not an enormous number of sufferers who, like Doctor Hara's patients, had been treated with very little benefit by other methods, and had suffered so badly—as they do suffer here in the West by unrelieved hay fever—there might be little or no place for ionization. They suffer too much in the six hours following ionization to lightly consider it as a remedy; but the pain can be pretty well taken care of by sedatives. Their nasal breathing being completely shut off for the next four days is objectionable. Their slightly crusty nose for two weeks is another objection. Cases need to be very carefully selected. If I had only a little trouble from hay fever, I would not have ionization; but if I suffered as many of these patients do, I certainly would have it done. Those who object that the nose is permanently damaged from ionization are, I think, mistaken. I have watched these noses for about four years with as much follow-up as I think one can hope to do. I am intensely interested in the follow-up. So far as I can see about the macroscopic appearance of the nasal mucosa after two or three months following ionization, there is no appearance of any destructive result.

One candid and able critic has expressed fear that atrophic rhinitis might result from intranasal ionization. That would be a serious result, so I have very carefully examined about one hundred cases I have treated, dating back to three or four years ago, yet failed to find any evidence of any undue shrinking of tissue such as occurs in atrophic rhinitis.

I note that Doctor Hara has used one-half of one per cent zinc sulphate in some of his cases, and jelly more recently. I have always used the two per cent solution, with the exception of just a few cases where I tried jelly. It seemed to me that I did not get the jelly applied to all parts as I should, and I went back to the solution-saturated cotton.

I have not tried Doctor Hurd's method. It may be a good one. I have had some failures, but I have had such encouraging percentage of cases that did well that I still speak for intranasal ionization. I think there is ample place for its use. Some tell us that the same results can be expected from application of phenol, trichloracetic acid, strong solution of silver nitrate and other topical application. I do not believe they can be compared in result with ionization. Some think it might succeed in vasomotor rhinitis, but not be helpful in proved allergic cases—that is, oculonasal pollenosis. I have gotten my best results in definite allergic rhinitis.

❦

Edward C. Donohoe, M. D. (229 North Central Avenue, Glendale).—Beginning the use of ionization long after Doctor Hara's early investigation, it was our understanding that the zinc ions penetrated deeply into the tissues, bringing about a foreign body reaction with resultant fibrosis. Because of this, we have used quite weak current for shorter periods than usually employed, hoping to cause less interference with the vascular supply and minimize any consequent atrophy.

When anesthesia is employed we make use of pontocain, but in some cases no anesthesia is used. We shrink the tissues with ephedrin, and then endeavor to fill the nasal fossa with a zinc containing jelly. Only one fossa is ionized at any one time. The electrode is placed on the forearm.

Ionization is used by us only in elderly individuals with anosmia and considerable polypoid tissue in the nose. These people are usually given some relief, often for a short time only. The brief duration in some cases may be due to the moderate dosage which then often does not exceed fifteen milliamperes. Treatments are repeated as symptoms recur.

It has been a question with us as to whether the relief experienced would excuse the use of an agent which de-

stroys the glands and might permanently impair the function of the nasal mucosa. It is not unlikely that the relief our patients receive is due to the same factors which apparently bring about temporary relief following acute infections or after trauma to the nose.

We believe, with Doctor Hara, that ionization is merely a therapeutic adjunct and that its use should be very limited.

Benton N. Colver, M. D. (1650 Melwood Drive, Glendale).—Doctor Hara has quite fairly stated the problem of handling cases which are clinically diagnosed as allergic rhinitis. Primarily, the patient must be taken into consideration as a whole, and have necessary consultation and care as may be indicated by his individual findings. Secondly, the ideal approach is to ascertain the allergens which are effective in his case. When this determination is made, steps should be taken to desensitize specifically. The impossibility of successfully carrying out this step in every case compels the rhinologist to seek some other form of help for a considerable number of his patients.

Finally, these cases, where failure to really solve the problem has resulted in continuance of the annoying symptoms, compel the rhinologist to resort to "symptomatic relief." Among the means employed is zinc ionization. This modality is admittedly a last resort after specific therapy has failed. So far as the patient is concerned, anything which will give him relief of his symptoms is acceptable. The use of the ionization does not preclude further study along the more desirable line of specific therapy.

Zinc ionization has been decried because of the suspension of certain normal functions of the nose. Experience and patience have revealed, however, that functional activity is not permanently lost. It might be compared to a massive dose of deep x-ray therapy which causes depilation and suspension of secretory function of glands in the neighborhood. Both of these effects are undesirable, but are not permanent, so that in due time hair growth is resumed and normal secretion begins. I believe that this is true of ionization in the nose so that any unpleasant symptoms can be tolerated in exchange for a relief from the annoyance of the allergic symptoms.

I feel that the careful selection of cases and accurate technique of ionization merits a continued "trial" and a careful tabulation of results in sizeable series of cases by a good number of dependable observers and clinicians.

INFECTIONS IN THE DANGER AREA OF THE LIPS, FACE AND NOSE*

By G. W. Walker, M.D.
AND
Hugh Awtrey, M.D.
Fresno

Discussion *by Harry Wiley, M. D., Huntington Park; Rea E. Ashley, M. D., San Francisco; Charles William Brown, M. D., San Diego.*

IN this article we do not expect to go deeply into the question of pathology, for it is well covered in the literature by Fraser,[1] Koslin,[2] Ayers [4] et al., Totten,[3] and numerous other authors.

NATURE OF A FURUNCLE

Briefly, a furuncle is confined to the hair follicle and immediately near-by tissue. If not traumatized, it usually stays so confined. If traumatized, and possibly at times without it, it may extend to the adipose tissue and escape all confines near to the hair follicle, erode veins, only slightly deeper, and spread along horizontal connective tissue layers in all directions, little unhampered by any successful attempt at protective walling off; and in places it may come to the surface along vertical structures, causing multiple openings, when the process is termed a carbuncle.

The skin in this region is thin, in intimate relation with underlying muscles, and the veins are valveless and communicate freely through the angular vein with the superior ophthalmic, and through the inferior ophthalmic and pterygoid plexus with the cavernous sinus. The process may erode veins, or thrombi may form, thus pouring the infection into the blood stream, and may extend to the meninges. The fact that the system has ordinarily no protective immunity against the Staphylococcus aureus, and little time to prepare it, admits of disastrous results with overwhelming rapidity.

At the last meeting of the Academy of Ophthalmology and Otolaryngology in New York, Batson had an exhibit which demonstrated the futility of trying to interfere with the condition by ligation of the communicating veins with the deeper ones, there being such an extensive and irregular anastomosis that, except with major surgery, inadvisable at the time, the process could not be cut off and thereby confined, even if one could know they were early enough.

Infections in this region occur much more frequently after puberty, as the hair follicles and sebaceous glands are much more developed after this period, though some have occurred at an earlier age. It seems to occur more frequently in the male than in the female, and on the lips and cheek.

THERAPY, AS REPORTED IN THE LITERATURE

Advice in the literature as to treatment runs all the way from strictly leaving the pus there, and using flaxseed poultices, through the use of vaccines, x-rays, heat, cautious incision, to the extreme radical of crucial incision, or radical exsection of the affected area.

Many suggest no surgery be done, and Dittrich [5] says that surgically treated cases have produced about twice as great fatality as nonsurgical. Probably more grave cases have been operated than minor ones because of desperation, etc., and that might partly account for the greater mortality. But there are fatal cases reported when conservative nonsurgical treatment was used, though no trauma had been inflicted.

Surgeons usually advise where pus is found, evacuate it. One, condemning sole reliance on poultices, although he was considering abscess in another area, but would apply here, too, remarked that "the doctor might often have to depend on the abscess to rupture three days after death." The crucial incision of wide and deep extent produces a horrible cosmetic result. The incision that goes wider and deeper than it should invites disaster by completing the way for fatal extension. Where pus is found, evacuate it, but the incision should be confined to making simply an adequate opening to evacuate it, and only deep enough to do so. Such incisions are compatible with a perfect cosmetic end-result, with best safety and the shortest possible recovery period when combined with the proper application of pure phenol, melted crystals, and no

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

dilution; not even with the popular addition of 5 per cent water, which admittedly makes the drug more convenient to use, as then it is liquid at ordinary temperatures.

METHOD OF USING PHENOL

One writer, Koch,[6] says, "The sooner we forget the notion that phenol and other drugs are helpful the better," but we are strongly persuaded to believe that such a statement concerning phenol emanates from a lack of experience with the proper use of it. Before this Society, in 1914, one of us (G. W. W.) read a paper on certain uses of pure phenol, and in the discussion I was surprised that some of the leaders of our profession failed to grasp that I was talking about the use of pure phenol, and spoke of experiences with the use of various dilutions. I was talking about pure phenol. If they had not spoken of dilutions less than 95 per cent, I might have paid little critical attention to their discussion, but they seemed to think of dilution anywhere down to 5 per cent, and dressings being bound on the skin saturated with various dilutions, while I was talking of application of pure phenol as mentioned above, followed in two minutes by alcohol to stop its action. Consequently, we believe that even good surgeons might sometimes fail to grasp the proper method of using phenol. However, two authors do make favorable mention of the use of pure phenol, one of the best descriptions of its use being by Totten.[3]

Sometimes there is destruction of the epidermis over the area of the carbuncle, with minute fistulae opening from the deeper area. If the integrity of the superficial structures of the skin is not good, remove it and paint the area with pure phenol, following in two minutes by washing off with alcohol to stop the action of the phenol. After the diseased cutaneous surface has been removed, in cases where it is already abraded somewhat, one will usually find sinuses, sometimes minute, which can be followed with a metal applicator on which is tightly twisted absorbent cotton; applying the cotton in one continuous wrapping on the wetted applicator so that it will stay on better, the cotton being twisted along the applicator to a greater length than the depth of the cavity. If the sinus size is ample, or is made so by judicious incision, make the pledget bigger. We should not cut through the infected into healthy area in deeper tissue, but in any event follow by phenol. If no sinus can be found, open with a narrow-bladed knife to the subcutaneous area of destruction and follow with phenol. When one wishes the opening larger, cautiously widen the incision, all the time keeping near the center of the diseased mass and promptly applying phenol wherever the incision goes. The multiple openings of carbuncles must be found and followed to their limits, without trauma deeper than the pyogenic process has gone. With the phenol applicator, one can usually break down septa and connective tissue and open a carbuncle into fewer, or into one cavity.

Cases do not become grave if properly treated before the carbuncle stage.

We have followed this out in six carbuncle cases: three in the cheek near the nose; one in the cheek, spreading from the side of the nose; and two in the upper lip and cheek, as well as in many less grave cases.

In those which have become grave, search for the center of the infected area and make application of phenol to areas a few millimeters apart. If no pus cavity is present, the carbuncle development stops.

Of course, if a pus cavity originating in a hair follicle preceded, at least that one pus center is discoverable, and pathologic processes therefrom can be attacked, not by one continuous line of incision or excision, but if careful search finds no other pus yet formed, frequent narrow incisions, of only proper depth should be made. These to be spaced only about four millimeters apart, each well phenolized. Such frequently placed incisions and gentle insinuation with cotton-wound applicator and phenol will often break into pus cavities, and from these leads lateral extensions can be found and followed to destination.

Watchful waiting allows the possibility of intracranial involvement. Careful incision and phenol, such as outlined here, arrests the process.

There is some sting from the application of the phenol, but that sting stops in about six seconds and the area becomes anesthetic. Local anesthetics should not be used for obvious reasons. The phenol anesthetizes. Manipulation done as gently as it must be, will not hurt from then on. After the application of phenol on the surface, the area needs to be covered and protected from outside temperature for about two hours, for there will be some burning sensation for about that time that is greater if exposed to room temperature. Drains should be inserted as needed to keep sinuses open, and careful and frequent cleansing to keep crusts from sealing openings until débris separates and allows healing.

Many mention the good from vaccines or x-rays and emphasize that they must be begun early. Sometimes you do not encounter the case early, but whatever the stage of the local focus, phenol stops it at once, if properly applied, and you do not have to delay a day or two for improvement.

Totten says "clinical results are not to be measured by only recovery or fatality, but also by results of treatment shown in twenty-four to forty-eight hours from beginning it, and to know the severity and presence of complications." That is certainly correct. He advises hot boric or magnesium sulphate solution applications until pus forms.

COMMENT

This is not something that we have used simply for two or three cases over a period of a few months and about which we have become greatly enthusiastic only to drop all after a season. One of us (G. W. W.) has used this in such manner since A. M. Phelps's description of its use in 1898. Phelps stated that it had been applied for years by Seneca D. Powell in the Postgraduate Hospital of New York. Phelps was a frequent writer on the

subject of joint affections. He advised the use of pure phenol, followed in two minutes by alcohol in abscesses in joints; also in erysipelas, painting it liberally on the skin over the area affected. Then, in general practice I so used it, painting it over an area of erysipelatous inflammation of the skin, and for about three inches beyond the area apparently affected. I learned that if I had a large area to be painted, that I must paint patches no greater than from three to four inches square, or less in case of an infant, neutralizing with alcohol after two minutes before proceeding further; that is, not to paint a large area of the body at one time before neutralizing, or there would probably be shock from an overdose of phenol.

I recall using it in a case of extensive metastatic abscesses involving one hip joint, one shoulder joint, and back over the whole of the scapula, one elbow and wrist joint, with a large sinus communicating in the interosseous space between the ulna and radius, from the elbow to the wrist, in which case I cut into all of the joints and diseased cavities, using pure phenol throughout all of them. The patient, though violently sick, promptly got well, the temperature falling at once. Perfect function of all parts resulted, except some tendency of one hand to contract, requiring mobilization for a time.

So I have used this in abscesses from whatever organism, and carried this over from my general surgery experiences and through my otolaryngology, and have never seen it fail to stop the process when the pyogenic process was followed throughout. In one case of erysipelas with phlegmon and pus burrowing throughout the length of the upper and lower eyelids, which were enormously thickened by the process, there was a common opening at the inner end of each lid, also at the outer end of each; thence the sinus extended to the ramus of the lower jaw, where it was opened and down subcutaneously to below the clavicle. Through four openings in the skin, cotton pledgets were passed on hemostats throughout the whole subcutaneous abscesses. Also, the patient had cutaneous erysipelas over both sides of the face, neck, and most of his head. This patient, an attorney, though then violently sick, was promptly made well, and there is almost no mark today to show where he was treated.

Of course, erysipelas and other suppurations than in the title are not under discussion primarily in this paper, but instead staphylococcus infection. This diversion was only to say more about application of phenol.

Of course, too, if the patient is moribund from cavernous sinus thrombosis and meningitis and we stop the original focus, he still may die from the cavernous sinus affection and meningitis although the primary focus be blotted out. Some patients have recovered from cavernous sinus thrombosis, so the original focus should be blotted out as soon as found, if possible, for either prevention of extension or to relieve the load. We are confident no other treatment will blot it out so promptly as the proper application of pure phenol throughout the area where pus is forming.

Do not hesitate to open to the pus, for the incision is promptly sterilized by the phenol. Do not carry the surgical trauma beyond affected area. We have used this in all cases, both mild and severe, with uniform good results, and so far have not had the misfortune to deal with a case of infection in this danger area in which we have come in charge of the case so late as to find sinus thrombosis and meningitis already developed, but following this method will prevent extension. Such a treatment, followed since Phelps's writing in the late nineties, bears that out in our experience.

To be sure, these cases are grave from early in the carbuncle stage, and the patient should be treated accordingly as to bed confinement, etc. The simple furuncle may require little or no treatment, although phenol properly applied will greatly hasten its complete recovery; but no trauma of its environment is safe.

IN CONCLUSION

We have only briefly reviewed the pathology. There are many articles in the literature, parts of which are good, some more nearly all the way through than others. Some advice we think bad. Evacute pus. Make incisions only wide and deep enough, no more. Apply pure phenol to all incisions, find all pus cavities, and phenolize. Incise and phenolize at near-placed intervals in infected area, if big. It will not necrose and cause bad cosmetic result. It stops the pathologic process. Interlying tissue not already necrotic will live and preserve form. It saves life. It is compatible with speediest recovery.

DISCUSSION

Harry Wiley, M.D. (2701 Florence Avenue, Huntington Park).—To me the title of this paper is somewhat ambiguous and not wholly germane to the subject matter. When I first read it I expected a discussion of that time-honored subject of infections of the face and nose, particularly above the lip line. While this subject has been written about and discussed freely for years, I cannot believe there has ever been enough said about it. I am sure that each one of us has at some time in his life seen a simple little "pimple" on or near the nose develop into a raging infection that resulted in death. Since the author is not discussing this particular phase of infections, I can only say in passing that I would emphasize that injunction to the patient, which should be repeated over and over to everyone having this disturbance, "Do not squeeze."

It seems to be the intention of the author to bring out and emphasize the use of phenol in pustular infections, particularly those of streptococcic origin. He has covered the ground so thoroughly and well that there is little left for me to do except to commend his paper. Most of us remember that before the days of vaccines, S. T. 37, mercresin, mercurochrome, and a host of other dyes and germ-killing applications, phenol and bichlorid of mercury were

practically the only two things used for this purpose. Phenol was the *sine qua non*. It did the work just as the author has described it would, and it will still do it if you will use it as he tells us to—that is, in its pure and undiluted form. When used in its pure state it precipitates the albumins in the tissues and prevents its own absorption, but when diluted in any degree whatever there is more or less absorption, danger of poison and of local gangrene around the parts where it is applied. I do not agree with the author in the necessity of neutralizing with alcohol unless the phenol is used to excess and invades some of the surrounding healthy tissue. Although no harm is done if the alcohol is used, it is not necessary, as the phenol will only penetrate a certain distance in any event.

Again, I want to commend the author for once more bringing to our attention this worth while drug which has somewhat fallen into disuse in recent years.

❦

Rea E. Ashley, M. D. (384 Post Street, San Francisco).—Several years ago I had the pleasure of hearing Doctor Walker discuss the phenol treatment of furunculosis of the external auditory canal. The treatment which he outlined at that time was similar to the one which he now presents for the treatment of infections about the face.

Since that time I have had several opportunities to test the antiseptic properties of pure phenol in infections about the ears, nose, and throat. The results have been so uniformly good that for several years I have also used pure phenol following incision of peritonsillar and retropharyngeal abscesses.

The advantages of phenol, as I see them, are:

1. It is highly antiseptic.

2. It is readily neutralized by alcohol, and thus its action can be accurately controlled.

3. It has escharotic properties which prevent the sealing of the abscess after incision, thus providing free drainage.

In my experience no bad results have been encountered in the phenol method of treatment as described by Doctor Walker. It deserves wider use in infections about the face.

❦

Charles William Brown, M. D. (Bank of America Building, San Diego).—Doctor Walker has adequately described the nature of a furuncle, and this should be deeply impressed upon the laity as well as the doctors. Too many are inclined to squeeze and thus bruise the tissues external to the natural protective wall that the body attempts to form for localizing the infection.

The adolescent is one in particular that does so much of this damage, and rightly so, for youth desires rapidly to do away with such a face blemish, when in reality the worst thing that could be done has happened in this bruising of the protective wall, thereby allowing the infection to spread rapidly, especially if it comes in contact with one of the larger veins.

I have many cases to show the damage done in not properly treating the "boils" or infections above the line marked by the angle of the mouth.

The infections in the hair follicles in the nasal vestibule are very trying to many, and I wish to state that many of these furuncles are due to allergic disturbances. In the past year I treated a woman who would have these pimples in the vestibule each time she ate lettuce.

Just last year a boy, sixteen years of age, squeezed a pimple near his nose and lip and it cleared up with treatment, but he developed shortly a perinephritic abscess that necessitated opening and prompt recovery ensued. This case was in the San Diego County General Hospital.

Doctor Walker has given a thorough outline of the treatment of infections of the face, and I am in hearty accord with his method of treatment:

1. Diagnose.

2. Liberate pus, if present, by incision; do not traumatize by pressure, but clean by swab or applicator.

3. Phenol applied as directed. I do not wait two minutes, as Doctor Walker states. The reason is probably fear. When area is deep gray in color, apply pure alcohol and leave in pack or applicator for two or three minutes.

4. Apply loose dressings and give general supportive treatment.

5. In suspected streptococcic infection, sulfanilamid in form of prontolyn or prontosil. Dosage depends on size of the patient and severity of the disease. This is but recently an added treatment, but one I think we should not overlook in giving our patients every opportunity for speedy recovery.

It has been my pleasure to treat many erysipelas and erysipeloid cases of nose and ear, as well as small abscesses, furuncles, fissures; and even the frequent and simple fever blisters respond readily to phenol and alcohol treatment.

In closing, may I urge that this paper be read not only by ear, nose and throat specialists but by men in general practice, who will benefit by using such treatment in general use.

HANDWRITING A NEUROLOGICAL STUDY*

By H. Douglas Eaton, M.D.
Los Angeles

Discussion *by Samuel D. Ingham, M. D., Los Angeles; Walter F. Schaller, M. D., San Francisco; Joseph Catton, M. D., San Francisco.*

IN 1622, Baldo, an Italian professor of philosophy, stated: "The study of an intimate letter discloses the thoughts, the moods, and the dispositions of the writer."[1] Notwithstanding this early observation, handwriting has been a subject little studied from the medical standpoint. Handwriting disorders, present in many neurological diseases, and often valuable diagnostic aids, receive but slight mention in foreign neurological literature and still less in our own. This neglect is due to a number of factors. The value of such a study in diagnosis is often only confirmatory—the clinical diagnostic picture may be present before or at least coincident with the handwriting changes. Furthermore, the determination of deviations from normal is made extremely difficult because of the lack of normal standards. Speed of writing production may be measured accurately and a comparison made with normal averages. Style and legibility, on the other hand, do not lend themselves readily to estimation and comparison, save perhaps from a medico-legal standpoint, as in determining a forgery.

In graphology, or the study of handwriting, departures from the normal may occur in form or content; we may have, as Joffrey suggests, calligraphic or psychographic disorders.

Disorders of the content of handwriting, psychographic disorders, are of interest solely from the psychiatric standpoint and do not come within the scope of this paper. I may mention, in passing, that the written productions of a psychotic patient frequently give sufficient information to make possible a diagnosis of the type as well as the presence of a psychosis. Some years ago, in a study of 1,500 letters, comprising the so-called "Nut File" of the Los Angeles Police Department,[2] this was clearly demonstrated. Automatic writings may yield much subconscious material of value in a psychoanalysis of their author.[3]

HANDWRITING DISORDERS IN NEUROLOGICAL CONDITIONS

The purpose of this paper is to present and discuss some of the recognized types of handwriting disorders found in neurological conditions.

The acquirement and production of normal handwriting is obviously dependent on (1) an intact central nervous system and (2) correct training of an organically sound central nervous system. As normal writing results from the interaction of a visual, a kinesthetic, and an auditory record—disorders in any or all of these or in their interrelationships may presumably result in handwriting disorders. The acquirement of visual records may be interfered with through gross refractive errors. There may be marked individual variations in muscle sense, both in health and disease. Sound association disturbances probably occur, but have not been proved as yet to be of primary importance.

CHILDHOOD TYPES

In childhood, delays in learning to write, or handwriting disorders, may be due to lack of cerebral or cord tissue and to toxemias, inflammations, traumas, lacerations, or hemorrhages affecting the central nervous system. Here lack of or actual destruction of nerve tissue results in absolute or partial inability to write. In such conditions associated evidence of other motor dysfunction is usually present, as in the spastics and dystonias. This is a fairly obvious group. Mild types must be borne in mind and ruled out before making the diagnosis of a purely functional disorder.

Another type occurring in childhood is called congenital apraxia. These children with normal intelligence, without definitely demonstrable motor or sensory lesions, and without evidence of organic pathology, yet show difficulty in learning all motor patterns which require a high degree of complexity of muscular movements. They show fair skill in the simpler, phylogenetically older, movements such as walking, running, or grasping, yet are poor in sewing, dancing, or tennis. In this group, writing sometimes remains a difficult problem throughout life.

Incorrect training of an essentially sound nervous system usually arises from errors in the use and development of the dominant hemisphere as indicated by the work of Orton and others.[4] Children forced to use the right hand in writing when

dominately left-handed, or allowed to use the left in writing but forced to use it in right-handed positions, frequently show persistent slowness and disability in writing. Such writing disability may also be associated with definite developmental disorders. Children taught to write with the right hand, but allowed to use the left for all other activities, may show writing disorders due to lack of clear-cut hemisphere dominance. In this group are also found reading and spelling disabilities, cases of so-called strephosymbolia. The early recognition of these cases is important to permit early special training; to guard against their being classed as mentally defective and to prevent the development of psychoneuroses. Some years ago I examined such a patient, now in college, whose history discloses repeated psychoneurotic episodes occurring during the period of his life when, though dominately left-handed, he was being forced to write right-handed. Correction of this error, together with proper training, eliminated the psychoneurotic episodes and resulted in markedly improved academic standing.

This group of early functional handwriting disorders which I have just discussed are found much more commonly in males than in females—approximately in the ratio of six to one. Evidence of similar writing disabilities is found in the family histories of these cases, and it is, therefore, believed that there is a sex-influenced hereditary factor present.

HANDWRITING DISORDERS IN ADULTS

In adults the types of handwriting disorders just discussed are relatively unimportant, and the disorders caused by acquired diseases are of more interest. As in childhood, diseases resulting in organic central nervous system changes are of prime importance. Cerebral hemorrhage, associated with cardiovascular disease, or trauma, involving motor areas and pathways, results in varying degrees of handwriting disturbances, from slight tremor with wavy up-and-down strokes and cramping to complete agraphia. Without gross or demonstrable lesions we see the tremulous cramped writing of the senile.

Tremor and uncertainty are present in encephalitis. Multiple sclerosis is said by one author to be characterized by "wild scrawls." In my own experience, either no definite changes or tremor and uncertainty, as found in encephalitis, is more common. Paralysis agitans shows typically a micrographia and tremor, which grows progressively worse in proportion to the length of the production. Paresis has received more attention from the handwriting standpoint than any other neurological condition, probably because the changes in this disease are so easily demonstrated. The omitted letters or words, with the extreme tremor and illegibility, are readily recognized.

The various toxemias often make themselves apparent in the written word. The handwriting disturbance caused by excessive indulgence in alcohol is familiar to us all, at least in others. Some years ago Berg called attention to the tremor of toxic goiter and its improvement postoperatively.[5] In the group of toxemias we find disturbances in the finer movements, carelessness in form, tremor; and in the severer alcoholic toxemias especially, omission of words or sentences, needless repetition, and increasing illegibility.

WRITING DISORDERS OF FUNCTIONAL ORIGIN

The classical example of writing disorder of functional origin is to be found in so-called writer's cramp—here we see demonstrated in the early stages an extremely cramped micrographia; in the latter stages an illegible scrawl.

The one case of Huntington's chorea studied resembles the production of a paretic with marked tremor, illegibility, omitted words and letters, and extremely faulty aligment.

In summary, the study of handwriting disorders in childhood often result in the recognition of organic or developmental disturbances of definite educational value. A similar study of adult productions may be of definite diagnostic value. Further study is warranted.

DISCUSSION

Samuel D. Ingham, M. D. (727 West Seventh Street, Los Angeles).—The material presented by Doctor Eaton is very interesting and suggests a field of diagnosis that has not been sufficiently developed in the neurological direction, although certain handwriting experts have studied the subject extensively.

In connection with the applications which Doctor Eaton has suggested, the variations in handwriting which occur with organic nervous diseases might be considered in relation to the location of the pathology in the nervous system. Thus, lesions of the spinal cord causing weakness or incoördination of movement in the hands, lesions in the cerebellum causing dysmetria, lesions of the mid-brain causing intention tremors, lesions in the diencephalon causing nonintention tremors, and lesions in the cerebral cortex causing different types of paragraphia, each give a different and characteristic change in the handwriting from that which is normal to the individual.

Study of a large number of cases, and an analysis of the different abnormalities in writing, would no doubt be of aid in neurological diagnosis and localization.

Walter F. Schaller, M. D. (909 Hyde Street, San Francisco).—Doctor Eaton has given us, in a concise manner, the pathological aspect of handwriting, which is quite as important in clinical diagnosis as other signs of abnormal motor behavior, such as gaits, attitudes, disturbance of associated movements, and uncontrolled motor acts. Excluding cases of mental defectiveness, lack of training

in writing, carelessness, those due to brain lesions or other structural changes, there remains a definite group of specific handwriting difficulties, frequently unrecognized as such in school children. This may exist in rare cases as an isolated defect, but is more frequently found in developmental alexia, the strephosymbolia (or twisted symbols) of Orton, in which spelling and writing are likewise affected, to even a greater degree than reading, because recognition is easier than recall. A sample of handwriting, therefore, may lead to the diagnosis of developmental alexia. The writing of these children is fairly characteristic in the reversals of words and letters, especially the letters *d* and *b*, *p* and *q*. They frequently show other evidences of mirror reading and writing. Children with this hindrance find it exceedingly difficult or impossible to learn to read by the flash-card method, as opposed to the phonetic system; instruction in the latter method often aids greatly in their ability to read as well as to write. Individuals who are dominantly left-handed should not be forced to write right-handed, and when left-handedness exists as a biological deviation in the nature of a regressive character, especially when accompanied by other such signs, the handicap imposed on these children by switching, even when they are not markedly left-handed, is such that they cannot readily adapt, and they may develop psychoneurotic reactions, including stuttering.

❦

Joseph Catton, M.D. (490 Post Street, San Francisco). Neurological, psychological, and psychiatric studies of handwriting will always be important. I share Doctor Eaton's chagrin that so little authoritative work has been reported in the literature, both here and abroad. Doctor Eaton's paper concerns itself with those aspects of handwriting where one's feet may be kept on the ground; it deals with factual, solid stuff. I hope he may continue his researches into more dangerous fields, for I am one who believes there are important findings to be made where gross neurological disorder is not present.

Without "the will to believe" (I hope) I have recently submitted six specimens of handwriting to a so-called "graphologist." She holds an important position in the American Institute of Grapho-Analysis. All identification data were deleted from the letters sent. Here are my estimates of her analyses, compared with full medical and psychological records in my possession.

Specimen	Analysis Per Cent
A killer in death row at San Quentin	20
A radio personality; alcoholic, unadjusted	95
A woman, homosexual, artist, taking drugs to alleviate distress of larynx carcinoma	85
A dramatic editor of a newspaper, three days before committing suicide	70
A paranoid praecox, killer, residing in State Hospital	80
A member of the California Medical Association Council	90

Average estimate, 73 per cent.

This "analyst" has for years read handwriting for the National Board of Fire Underwriters; their general manager wrote her during March, 1938: "Received analyses, and we find them, as usual, 100 per cent correct." I report this only to suggest that before final "yes" or "no" may be given to the value of "graphology," it would be well to take a thousand specimens of norms, psychotics, neurotics, etc. Eliminate all identification data; have competent persons take clinical records to which numbers have been assigned, and make cold comparisons with "analysts" reports, and . . .

Back to earth! Content of manuscript, time, and lineage factors are important and must be understood. Quinan (I have seen his blind approach to final analysis of data) picked out the executives, small department heads, and men in lower positions on police force and in industry by time and lineage readings of the test written sentence, "He protested that he couldn't eat the twenty-two tarts; and the truth is that he ate twenty." Quinan, again, found that the crossed types (one eye dominant and the heterolateral hand being used for writing) were present in much higher percentages in speeders, reckless drivers, dementia praecox, constitutional psychopathy, artists, musicians, and preachers.

THE NUTRITIONAL PROBLEM IN TOXEMIAS OF CONTAGIOUS DISEASES*

By Milton Tobias, M.D.
Los Angeles

Discussion *by John C. Ruddock, M. D., Los Angeles; Albert G. Bower, M. D., Hollywood; George M. Stevens, M. D., Los Angeles.*

In toxemias, accompanying contagious diseases, the dietary regimen is too often a casual addendum to a carefully planned treatment. Fluids are forced; glucose is introduced parenterally in conjunction with a high carbohydrate, a maintenance or low protein, and an abundant vitamin intake. We challenge the competency of such generalities; in their stead, we suggest the physiological determination of metabolic needs and of gastro-intestinal misbehavior.

In disease, as in health, nutrition is correct and its balance is positive when all requirements for maintenance and growth are fulfilled. These requirements are established by the unique physical, chemical, and energy phenomena peculiar to the current metabolic situation. Conditioned by an increased metabolic rate, by an increased catabolic activity (cellular wear and tear), the previously positive becomes a negative metabolic balance. To paraphrase, "The metabolic balance is in the red." The toxic patient must have correspondingly abnormal and augmented nutritional demands. These increased demands, ordinarily, are satisfied by reserve depots whose sufficiency makes autogenous convalescence possible.

NUCLEOPROTEINS AND PHOSPHOLIPIDS

From the manifold ramifications of the nutritional problem in toxemias, the inclusion of abundant nucleoproteins and phospholipids was selected for clinical study. Insulin administration was included in our procedure.

A schematic discussion of both cell and liver will make our hypothesis more intelligible. The vital structure of every cell is a colloidal system in which nucleoproteins and phospholipids participate.[1-4] The source of energy for cellular activity is primarily the utilization of glycogen; and the control of cellular behavior is affected by the interchange of substances with its immediate environment. There occurs, in nice equilibrium, a constant flux of electrolytes, hormones, enzymes, and nutritional elements to and from the cell. The introduction of any toxic irritant into this extracellular medium, disturbs protoplasmic chemistry; interferes with the precise mechanism of cellular function; provokes cellular sacrifice; and, commensurately, destroys nucleoproteins and phospholipids.[5,6] Since the nucleoprotein and phospholipid content of normal tissue is fairly constant,[7] their increased destruction should necessitate a compensatorily increased intake, replacement sufficient to convert their negative into a positive balance.[9]

The liver, like all body tissues, is probably profoundly and unfavorably influenced by a severe

* Read before the General Medicine Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

toxemia.[13] Its normal complex activities, consequently, are altered. Such impaired function disturbs its metabolic responsibility in isolating unsaturated fatty acids from the blood stream; in synthesizing phospholipids and supplying them to the body tissues at need;[8] in regulating glycogen metabolism;[13] in preparing amino-acids and other nutritional elements for subsequent utilization in the body tissues.

During a toxemia the increased tissue requirement for phospholipids and nucleoproteins constitutes a correspondingly increased demand upon this already dysfunctioning liver.[9] It is relevant that the most constant postmortem finding in toxemias is fatty infiltration of the liver. Such fatty infiltration suggests a causative alteration in the function of liver cells related, possibly, to a deficiency in lecithin (a phospholipid), or in cholin (an amin incorporated in lecithin).[14]

A strikingly similar fatty liver was described by Hershey and Soskins in depancreatized dogs that died with symptoms of liver failure.[10] By lecithin feeding, one dog remained alive two and one-half years, to die later of a terminal illness unrelated to any failure of liver function.[11] The addition of lecithin to the diet of these diabetic animals alleviated frequent critical episodes characterized by signs of liver failure. Fatty infiltration in the liver was produced, also, by the feeding of small quantities of cholesterol, and was prevented by the addition of cholin[12] (an amin incorporated in lecithin). This experimental data suggests that phospholipid intake may play a considerable rôle in preventing an abnormal deposition of neutral fat in the liver; a fatty infiltration analogous to that seen in toxemias.

From the preceding discussion we may imply—to be adequate—nutrition for the toxic patient must provide an ample phospholipid and nucleoprotein intake.

Time and text prevent the discussion of additional factors such as ferments, vitamins, activators, and catalysts.

CLINICAL MATERIAL OF THE STUDY

Nucleoproteins, phospholipids, and insulin administration were, for the first time, deliberately included in the nutrition of a toxemia in the case of V. P., age twenty months, admitted into the California Hospital on January 1, 1930, and discharged on January 19 of the same year. The diagnosis was severe acrodynia. Despite the application of every then known therapeutic measure, her clinical career included progressively increasing anorexia, muscular hypotonicity, cold beefy hands, loose teeth, repeated eruptions and conjunctivitis. On admission, her condition was critical, semi-comatose, and gavage was necessary. The diet prescribed contained liver 50 grams, brain 15 grams, two egg yolks, and represented 5 grams of lecithin; four units of insulin were administered three times daily. On her seventh hospital day, she ate voluntarily, sat erect, attempted to walk, and stopped pulling out her hair. The patient was discharged on her eighteenth hospital day, happy, walking, and eating without coercion.

Unusually toxic children were chosen as subjects for our investigation. Included in this series were septic scarlet fever with complications, bull-neck diphtheria, universal erysipelas during infancy, septicemia, sepsis of undetermined origin, nephrosis, pertussis pneumonia in infancy, and severe typhoid fever. In aggregate, according to our experience, such entities have an approximate mortality rate of 30 per cent.

Since 1931 one hundred such patients have received a soft high carbohydrate, high vitamin diet, rich in nucleoproteins and phospholipids. In this group rather dramatic clinical improvement was not uncommon, but the most consistent response to our procedure was the one most difficult to record—the intangible factor, a beneficent change in clinical personality. Regardless of etiology or complications, however, such nutritional tactics were at no time injurious. Our mortality rate was 8 per cent.

Three case reports have been selected from the above series to describe the illness treated, the dietary regimen instituted, and the clinical response obtained.

REPORT OF CASES

Case 1.—D. B., seven years old, admitted on July 15, 1935; discharged on July 30, 1935. Diagnosis: Nephrosis.

The patient, on admission, had an edema involving the lower abdomen and extremities, and a brownish area of discoloration extending from the right labia majora to the right thigh. Her blood pressure was 95/70; temperature was 103 degrees. Many fine granular and hyaline casts; two plus albumin and many pus cells were found in the urine. Blood chemistry was the following: NPN 27, cholesterol 222, NaCl 495, serum albumin 1.5, serum globulin 2.1. The edema spread over the face and entire body. On July 18, 100 grams of liver, 6 egg yolks, 5 cubic centimeters of bioplastina intramuscularly, and 5 units of insulin three times daily, were included in her regimen. Two days later, on July 20, her fluid intake was 350 cubic centimeters and the output 850 cubic centimeters. The patient's blood chemistry on the following day was: NPN 27, NaCl 412, cholesterol 278, serum albumin 2.4, serum globulin 2.3. An uneventful recovery ensued, and she was discharged as cured on July 20, 1935.

* * *

Case 2.—E. C., five months old, admitted on March 29, 1935; discharged on April 14, 1935. Diagnosis: Erysipelas.

On admission, after twelve days' illness, the patient was extremely toxic, had a temperature of 105 degrees, neck was rigid, and the erysipelas extended from the back of the neck over both shoulders anteriorly to the clavicle. Despite continuous cold magnesium sulphate compresses, antitoxin, and daily introduction of intramuscular blood, the erysipelas, now edematous and vesicular, descended below the navel to the buttocks, and included the upper extremities and the entire back. The patient's temperature varied between 104 and 105 degrees, and her condition was critical. On April 7, 1935, we added 60 grams of liver, 6 egg yolks, 5 cubic centimeters of bioplastina, and 5 units of insuin three times daily to her regimen. Two days later her temperature was normal and the erysipelas subsequently rapidly disappeared. She was discharged as cured on April 14, 1935.

* * *

Case 3.—D. W., seven and one-half years of age, admitted on July 6, 1933; discharged on September 12, 1933.

Prior to admission, the patient had a sore throat for a week; scanty urine for two days, swelling of face for two days. On admission, his skin was desquamating; cervical adenopathy and a raspberry tongue were found; blood pressure was 142/90; one plus albumin was determined on urine examination; NPN was 68 and creatin was 1.5. The diagnosis of postscarlet nephritis was made, and a nephritic low protein, low salt diet was prescribed. Five hundred

cubic centimeters of 10 per cent glucose were administered intravenously twice daily, to be replaced on July 15 by 50 cubic centimeters of a 50 per cent solution twice daily.

On July 12, six days after admission, his rather placid course became suddenly critical with all findings of acute myocardial failure. Streptococcus hemolyticus was isolated on blood culture. The patient's condition remained critical, and on July 21, the urine was smoky-red and petechiae were observed. His treatment, during this period, included stimulants, daily intramuscular blood injections and intravenous glucose. The introduction of 70 cubic centimeters of blood intravenously was followed one hour later by severe cramp-like precordial pains, vomiting, weak fluctuating pulse with a rate of 200. On August 6, the right arm and leg became paralyzed. All preceding therapy was discontinued on August 8, and to his dietary regimen were added 100 grams of liver, 8 egg yolks, 5 units of insulin three times daily, and 5 cubic centimeters of bioplastina intramuscularly.

Between August 9 and date of discharge the patient's temperature, pulse, and respiration were normal, with few exceptions; urine examination and blood chemistry was, likewise, normal; his hemiplegia and general condition were much improved.

COMMENT

Good nutrition, satisfactory immunological response to disease, and a positive nutritional balance are inseparable. With the advent of a toxemia, catabolic cellular activity surmounts the anabolic, and the nutritional balance, positive during eutrophy, becomes negative. To promote optimum cellular behavior in the toxic patient, we must provide a nutritional intake compatible with the now altered, the peculiar, physical, chemical and energy phenomena. The interpretation of physiological data described suggests a deficiency in nucleoproteins and phospholipids. These substances were added to the orthodox regimen of heterogeneous toxemias.

Liver was selected as the source of proteins. Its content in lipoprotein and other factors, many as yet undetermined, were considered essential for normal metabolism and for adequate gastro-intestinal function. Phospholipids were administered enterally, as egg yolks, and parenterally, as bioplastina (Serono).

Insulin was found clinically of advantage, and with its administration gastro-intestinal behavior appeared more sufficient. Three cases were described, and they portray the clinical response frequently obtained.

SUMMARY

1. Clinical experience suggests the probable value of nucleoproteins, phospholipids, and insulin, as adjuncts to orthodox therapy in severe toxemias.

2. The results obtained in one hundred cases, reviewed with circumspection, suggest that the frequent coincidence of clinical improvement is no therapeutic mirage.

3. The mortality rate was reduced from 30 to 8 per cent.

4. The improvement so elicited justifies additional experimentation—an intimate contemporary collaboration between internist and physiologist.

DISCUSSION

JOHN C. RUDDOCK, M.D. (1930 Wilshire Boulevard, Los Angeles).—"There is no panacea for all ills," although one may be led to believe that this is so after reading the case reports by Doctor Tobias in the treatment of toxemias. However, I do not believe that even he needs to intimate that nutritional disturbances when corrected are the panacea for toxemias. It is my opinion that Doctor Tobias has brought to our attention in this paper certain facts which we all know but which we often neglect. Custom has caused us to apply formulas for the dietary treatment of toxic patients. Too often all we do is force fluids and load the patient up with intravenous glucose. Doctor Tobias has brought out the fact that a close coöperation between the internist and the physiologist is necessary. He has shown how it is possible to supply the physiological needs of the patient when the metabolism of that patient has been upset by toxin. His series is small but his results are good, and it devolves upon us all to give his methods a trial in the treatment of our toxic patients.

*

ALBERT G. BOWER, M.D. (6777 Hollywood Boulevard, Hollywood).—While some advance is to be anticipated in future in the treatment of the acute infectious diseases by yet undiscovered specific agents, or by the coming into more general usage of factors already established but not generally available, it would appear to the clinician, who has seen many thousands of such cases, that the most urgent need at present unfulfilled in their care is for a more forward-looking handling of the involved problems of nutrition.

When scarlet fever cases began to be handled early in the disease with sweetened beverages, and little else, there was a marked lessening of the incidence of kidney involvment formerly observed. However, due to its too long continuance, and the lack of consideration of the additional factors involved, other sequelae appeared. If convalescence were successfully achieved, the patient was usually exhausted, in a poor state of nutrition and resistance, and had lost considerable weight. Under the program outlined by Doctor Tobias, mitigation of the above conditions has been pronounced.

What has been said about scarlet fever applies equally well to the other continued fevers. The change in the dietary regimen of typhoid fever, with its attendant benefit, over the past three decades is at present so well known as hardly to merit comment.

The next great advance in the handling of these diseases must result from an understanding and fulfillment of their metabolic requirements and the coöperative teamwork of the physiologist, the biochemist, the clinician, the dietitian, and the hospital director. The surface has hardly been scratched in such investigation, and from observation of the results achieved from the small beginnings so far noted, when it becomes a more intelligible and living part of our armamentarium, many lives will be saved that otherwise would be lost.

To save these lives we shall have to have enthusiastic, tireless and painstaking clinicians who approach each case as an individual nutritional problem. Also, we shall have to throw overboard the present standardized hospital diets and soft-pedal the clamor originating in the finance departments of hospitals regarding the economic phase of greatly increased costs.

I hope Doctor Tobias' paper will stimulate others to assist in blazing new trails into this more or less unexplored field, and that they may be persuaded to report their results and progress from year to year.

❀

George M. Stevens, M.D. (Epidemiologist, Los Angeles City Health Department, Los Angeles).—The subject discussed by Doctor Tobias is of vital importance in the management of the acute infectious diseases. The principles cited need not necessarily be confined to pediatrics, but readily lend themselves to similar conditions in the adolescent and older age groups.

The author's theoretical aspect of this subject has a sound physiological basis. He has succinctly summarized his principles of successful management by stating that "the nutrition for the toxic patient must provide an ample phospholipid and nucleoprotein intake." During my many years of service at the Communicable Disease Unit of the Los Angeles County Hospital it has been my privilege to have witnessed these principles applied to practical use. The results have been most gratifying. The principles of dietetics are often confusing. Frequently we continue with our regimen of therapeutic and dietetic management solely on the basis of precedent, and not on sound physiological knowledge. I have observed many patients who had received adequate specific medication but who clinically continued to retrogress. This, despite the fact that their diets were presumed to be adequate. Subsequently, the principles advocated by Doctor Tobias were instituted and, much to my surprise and pleasure, I noted many a dramatic and rapid convalescence, which terminated in complete clinical recovery.

I cannot overemphasize the correlation as to the value of good nutrition based on the principles of modern-day physiology and medication. These factors are essential for the satisfactory immunological response of the patient to the toxemias of the acute infections. The two are closely interwoven and are of equal importance. The principles evaluated in this article are readily applicable to our every-day practice with the most encouraging clinical results.

MAXILLARY SINUS IRRIGATION THROUGH THE OSTIA*

WITH ANATOMICAL AND CLINICAL DEMONSTRATIONS

By Charles E. Futch, M.D.
Los Angeles

Discussion *by Jay Randolph Sharpsteen, M. D., Oakland; Rea E. Ashley, M. D., San Francisco; Ben L. Bryant, M. D., Los Angeles.*

Nathaniel Highmore,[1] in 1651, described a suppurative disease of the nasal accessory sinus which bears his name. Since Highmore there have been innumerable treatises upon the anatomy and pathology of the maxillary sinus. Today the fundamentals of diagnosis and treatment are based upon a consideration of the work of these past teachers.

Irrigation of the maxillary sinus has long been an established procedure in diagnosis and treatment. Five methods of irrigation are recognized: (1) Cowper's[2] method; (2) approach by way of the canine fossa; (3) puncture of the middle meatus; (4) puncture of the inferior meatus; (5) cannulization of the ostia of the middle meatus. These methods are all familiar to rhinologists. This discussion, however, will be limited to irrigation by way of the ostia of the maxillary sinus. While this method is now widely used, some rhinologists may not have experienced the advantages of this approach without puncture.

HISTORY

Jourdain,[3] a dentist of Bordeaux in 1765, is said to have been the first to use the approach to the maxillary sinus through the middle meatus. The shape of the instrument used by Jourdain indicates strongly that the membrane of the middle meatus was punctured. Although the patient was relieved by this procedure, Jourdain[3] and his method were condemned as dangerous and unsafe by the French Council of Medicine. Stoerk,[4] as early as 1886, preferred the ostium technique to the then newly introduced puncture through the inferior meatus. Hartmann[5] also endorsed this method, and was able to irrigate twenty-three out of thirty-two maxillary sinuses with this approach.

LITERATURE

The literature of more recent years shows a wide variance of opinion by rhinologists of wide clinical experience. Favoring this approach, Meyerson[6] stated: "It would appear from this study that irrigation of the maxillary sinus through its ostium is a feasible procedure, in a sufficiently large percentage of cases, to make it worthy of a trial." Dintenfass,[7] likewise, states that "in the diagnosis of disease of the maxillary antrum, ostial catheterization should always be attempted before resorting to the puncture of the inferior meatus."

On the contrary, Ross Skillern[8] does not think that this method is practical, and Mosher,[9] in 1929, said: "It is difficult, if not impossible, in the majority of cases to catheterize the ostium of the antrum. From the surgical standpoint, however, this makes but little difference, because it is easy to break into the antrum near the ostium through the membranous area in which the ostium is placed." Also supporting the negative view, Sieur and Jacob[10] stated that "since the ostium opens into the lowermost portion of the infundibulum, one must agree with Zuckerkandl that 'it is entirely superfluous to tire oneself in sounding it.'" The use of the ostia for cannulization of the maxillary sinus must have some value to have merited so much consideration. The fact that the views are controversial should stimulate to further study of this problem.

ANATOMY

A review of the anatomy of the middle meatus will clarify the possibilities of approach through the natural or accessory ostia. Under the middle turbinate, anteriorly and below, there is the uncinate process, which forms the anterior inferior lip of the hiatus semilunaris. The superior posterior lip of the hiatus is formed by the bulla ethmoidalis. The divergence of these two structures, the bulla ethmoidalis and the hiatus semilunaris, is the bullo-uncinate angle. The infundibulum is the groove bounded by the hiatus semilunaris, bulla ethmoidalis and the bullo-uncinate angle posteriorly.

In this series of twenty dissections, accessory ostia were found in approximately 30 per cent.

* Read before the Eye, Ear, Nose and Throat Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

The most usual location of these accessory ostia was the bullo-uncinate angle. Variability in size was observed to range from 6 by 4 millimeters to 1 by 1½ millimeters. Double accessory ostia were found in three specimens. The natural ostium, unlike the accessory ostia, was found to be a canal.

Van Alyea[11] has recently made an anatomical study of the accessibility of the ostium. In his specimens, these studies showed an accessibility of the ostia of 54.6 per cent. M. C. Meyerson,[12] in a similar series, stated that only fifteen of one hundred and fourteen (approximately 13 per cent) of his studies were inaccessible. This is a much higher percentage of accessibility than was found in my dissections, as follows: The natural ostium, in the fixed specimen, was found to be accessible in only 40 per cent of the dissections without forcing or tearing the fixed tissues. Accessory ostia made accessible an additional 30 per cent—a total accessibility of 70 per cent. This 40 per cent accessibility of the natural ostium in these dissections does not compare favorably with the accessibility stated by Meyerson.[13] The total accessibility, however, by way of the middle meatus, did approach this percentage more closely.

CLINICAL EXPERIENCE

Clinically, Lee Hurd[14] states that he has sounded the natural ostium in practically 70 per cent of his patients. Undoubtedly, a reasonable percentage of this cannulization was done through the accessory ostia. Schaeffer[15] made further clinical observations and stated that "clinically, in a vast majority of cases it is impossible to sound a maxillary sinus through its ostium." My clinical experience, embracing some 1,200 cases over a period of the past four years, does not support such a statement. In my experience, it has been possible to irrigate the maxillary sinus through the middle meatus, without puncture, in 72 per cent. By observing the position of the cannula, it is my conclusion that approximately one-third of these cases were irrigated by way of an accessory ostium. These clinical observations coincide closely with the anatomical facts of accessibility in my dissections. Meyerson[16] stated, clinically, a high accessibility of 81 per cent, which is far beyond my conclusions of accessibility by way of the natural ostium alone.

INDICATIONS

The indications for irrigation of the maxillary sinus, by way of the natural or accessory ostia, are the same indications as for other methods. This technique should never be forced, and in those cases where it is used with ease the experience is gratifying to the patient, particularly when a puncture has previously been experienced.

ADVANTAGES

The advantages of irrigation without puncture can be summarized as follows: (1) Danger of air embolism is reduced. (2) Hemorrhage is not experienced. (3) The unpleasantness of pressure is greatly eliminated. (4) Infiltration, or emphysema of soft parts, in less liable with a dull instrument. (5) Nervous patients experience less shock than when a sharp needle is forced through bone, or even membrane. (6) Where the ostium is inaccessible, anesthesia is complete for puncture through the middle meatus. (7) Shrinking the tissues of the middle meatus, even when puncture has to be performed, has the benefit of an improved aeration and drainage of the sinuses emptying into the middle meatus. (8) A patient who has experienced irrigation through the natural opening will not permit puncture.

LIMITATIONS

There are certain limitations to the approach of the maxillary sinus through the natural ostia. Most of these limitations are due to anatomical or pathological inaccessibility, such as: Anatomical—(1) Middle turbinate hypertrophied; (2) deviated septum filling the middle meatus; (3) a high uncinate process; (4) an overhanging bulla ethmoidalis; (5) an exceptionally deep infundibulum; (6) a natural ostium less than 1½ millimeters in diameter (which precludes proper exit for maxillary content). Pathological—(1) Middle meatus filled with polyps; (2) acute or chronic inflammation of ostia, resulting in contracture or closure (which usually yields to shrinking) (3) closure due to irritation of repeated cannulizations (which occurs in small ostia of marginal accessibility).

CONTRAINDICATIONS

The chief contraindication for irrigation through the natural ostium is where an ostium is found with difficulty by the operator for any reason. The prolonged manipulation of the tissues of the middle meatus cause inflammation and swelling of the tissues in that region, which swelling may block the ostia of the other sinuses emptying into this area. Some judgment must be exercised in using this method, or the benefits will be more than neutralized.

INSTRUMENTS

The number of instruments which have been devised for irrigation through the middle meatus without puncture gives further proof of the interest rhinology has long shown in this problem. The first instrument of Jourdain was a clumsy cannula, not suited by size or curve. The number of instruments collected by M. C. Meyerson[17] show a progressive refinement, and reflect further anatomical adaptation. The cannula first made by Pierce has become the model upon which most instruments used for this work are based. Early in my efforts in this field, it was observed that the choice of instruments was very limited, particularly in size and flexibility. This technique demands a wide choice of size, flexibility, and a variable angle of the tip is essential. The natural ostium, which is actually a canal, as demonstrated by myself, and even more extensively by others, may be either vertical, horizontal, or oblique in position. The silver cannula, fitted to a steel shank with a thumb rest, and made up in sizes from 1½ to 2½ millimeters, has been found in my work to be well adapted to this technique. The thumb rest has assisted in applying gentle pressure and in guiding the tip into the ostium.

TECHNIQUE

An exact knowledge of the anatomy and its variations in the region of the ostium is essential to successful passage of the cannula without trauma. Experience and observation of the nasal anatomy in each case dictates the choice of instrument. A hypertrophied middle turbinate, a deviated septum, a deep middle meatus or infundibulum, or both, and other factors as have been mentioned, must be considered. The length of the curved silver tip should be shortened in children and small noses. It is not unusual to pass a medium or even large cannula with ease in a child. This experience with children confirms that of Yankhauer and Goldman,[18] who were able to cannulize infants in the first year of life. A good anesthesia must be secured well anteriorly in the middle meatus and superiorly over the edge of the uncinate process into the infundibulum.

The cannula is used in the left hand for the left side, and in the right hand for the opposite side. The use of either hand may seem a bit awkward to the occasional operator, but the advantage of persistence in this effort will soon be appreciated. The instrument is first passed along the floor of the nose, tip upward, pointing into the middle meatus well posteriorly. It is then moved gently forward and laterally until it is felt to drop into the infundibulum, and not unusually into an accessory ostium. Manipulating the cannula further forward into the bullo-uncinate angle, the tip may be felt to engage the natural ostium, and with only gentle pressure the tip should fall into the antrum if accessible by this route. It must here be remembered that the ostium is actually a canal, and may be vertical, horizontal, or oblique. The patient should experience no pain and little pressure.

COMPLICATIONS

There have been no complications where the technique as outlined has been observed. In two cases over a period of four years, and during the first two years of my experience, too much pressure was applied and the blunt tip was passed through the naso-orbital angle of a narrow antrum into the orbit. In one of these cases there was some emphysema of the soft tissues of the orbit, and the other case showed a slight infiltration of these tissues. No pain was experienced in either case, only a sense of fullness in the region of the eye. Fortunately there was no resultant infection. Intra-antral hemorrhage was experienced in one case. Great pain was experienced by this patient for two days following the irrigation.

Resistance to pressure was noted in another case after the tip had entered the ostium with ease. This patient experienced much discomfort for thirty-six hours, when there was a sudden gush of yellow pus from the nose, with immediate relief. There was probably a purulent cyst punctured with even the dull tip, or the pressure in the antrum was so increased around the cyst, which blocked the exit of the fluid that the pressure caused it to rupture. Acutely inflamed sinuses are not irrigated unless the pressure symptoms definitely indicate such procedure.

CONCLUSION

During the first year only selected cases were attempted. The last three years, all cases which did not show distinct contraindications as mentioned, have been attempted through the ostia where irrigation was indicated. Irrigation by this method has been successful, as stated, in 72 per cent of these cases. Many cases showed profuse, granular and floccular pus in the return fluid, and cleared up with no further treatment than irrigation by this method. Where there was a persistence of purulent return without improvement in quality, or a mucoid tendency of the discharge, antrotomy or further surgery was recommended, according to indications.

Irrigation of the maxillary sinus by way of the ostia, when accomplished without extensive manipulation, is a valuable procedure, and has a distinct advantage over other methods of sinus irrigation.

SUMMARY

Irrigation of the maxillary sinus through the ostia is not a new procedure. Regardless of this fact, there is a difference of opinion by authorities as to its value, which should stimulate further investigation.

A consideration of the anatomical work presented shows a total accessibility of 70 per cent by way of the ostia; accessibility of the natural ostium, 40 per cent; accessibility of the accessory ostia, 30 per cent.

Approximately 1200 cases have been cannulized, without puncture, by way of the middle meatus in the past four years. Clinically, 72 per cent of the irrigations have been accomplished by this technique.

There are advantages of irrigation by means of the ostia which make it a valuable procedure in cases to which it is suited. There are certain anatomical and pathological conditions which contraindicate the use of this technique.

The choice of instrument and a certain skill, acquired with practice, are essential to accomplishment without excessive manipulation. The use of either hand must be developed for skillful cannulization.

Complications are unusual and less serious than those seen after puncture.

DISCUSSION

Jay Randolph Sharpsteen, M.D. (3115 Webster Street, Oakland).—We, all of us, welcome a method whereby the maxillary sinuses may be irrigated with the least possible trauma or discomfort to the poor miserable individual who presents himself with an acutely congested nasal mucous membrane and an antrum overloaded with pus.

As Doctor Futch has pointed out, the shrinkage of the middle meatus, coincident with its anesthetizing, provokes and facilitates drainage not attainable otherwise.

That Doctor Futch is successful in applying this method in 72 per cent of his attempts would seem to indicate that the native of Iowa and his Southern California descendants have much more roomy meati than narrow-nosed, gray-bound individuals so common in the more northerly portions of this great and glorious State.

I have not accurately checked my own records in this regard, but should unhesitatingly state that were I able to introduce a cannula in as many as 40 per cent of the patients, my problems would be much less difficult.

It always seems my especial misfortune to find that the patient upon whom I would particularly want to use this procedure has a host of bad nasal anatomy, which simply means two strikes called on me before I have a chance to swing at the ball.

It might very well be that, had I an assortment of middle-meatus cannulae such as the author possesses, my batting average would thereby be increased, but I merely have one size of the Yankhauer instrument.

My experience has been that when this procedure is possible, it is perfect; but I have had to resort, all too frequently, to a puncture of the lower meatus.

An important and very satisfactory use of this procedure, and one which was not mentioned, is for the purpose of filling the sinuses with radio-opaque solutions for x-ray examination. It is in this connection that I find it most valuable.

The other advantages of this method have been enumerated by the author. The disadvantages which have been my lot to observe are: (1) It is time-consuming; (2) It frequently produces more trauma in the middle meatus than is justifiable because, after all, this is the region through which drainage occurs, and the swelling, which all too frequently follows the manipulation of these already insulted tissues, often counteracts the advantages.

Both methods have been used upon me, and I cannot say that I have much choice; but I can say that I recovered more quickly and with less discomfort by puncture of the inferior meatus.

Rea E. Ashley, M.D. (384 Post Street, San Francisco). Doctor Futch's review of the subject, and his high percentage of success will undoubtedly stimulate others in an effort to obtain equally good results. After trying a method several times and failing, we are apt to condemn it, or at least discard it as a routine procedure. The paper will, I am sure, serve as a reminder to those of us who use another technique routinely, that the normal ostium method is possible in many cases.

In our office we prefer to wash the antrum by actual puncture under the inferior turbinate. We have tried both methods, and, while our experience in the normal opening technique has not been as great as that of Doctor Futch, we believe that, in our hands at least, puncture through the lateral wall has certain advantages. Some of the more important ones are: (1) the puncture method is applicable to a far greater number of cases; (2) the danger is slight; (3) with the puncture method we are sure that we have actually washed the antrum and not just washed in the general locality of the ostium; (4) the ostium is frequently so small that the cannula may almost completely close it, thus preventing free return of the solution. Solution forced into the antrum by the needle method has the advantage of the entire ostium as an exit.

We do attempt, however, the irrigation through the normal ostium in certain selected cases, *i. e.*, in those patients with heavy lateral walls where needle puncture is difficult, and also where patients have acute antra and irrigation is indicated.

Yet I must admit that the percentage of times we have been able to catheterize the normal ostium is far below the experience of Doctor Futch.

Ben L. Bryant, M. D. (2007 Wilshire Boulevard, Los Angeles).—Doctor Futch has presented a clear and interesting consideration of antrum irrigation through the natural orifice, and I have enjoyed the motion pictures particularly. They are excellent, technically, and must be enlightening to anyone who has felt that the ostium irrigation of the antrum is an unusually difficult procedure. As a matter of fact, those of us who are accustomed to using this procedure frequently feel that, with sufficient knowledge of the anatomy of the part and a certain amount of training and experience, it is certainly no more awesome to the physician than puncture through the inferior meatus and decidedly less so for the patient.

The first several hundred antra which I irrigated were done by means of a trocar introduced through the inferior meatus. I soon changed, however, to the middle meatal approach which I have used exclusively for the past seven years. In a series of several thousand antrum irrigations, it has been necessary to resort to the use of the trocar on only two occasions. I realize that this may seem to be a startling statement, particularly since I have heard a number of erudite discussions at medical meetings as to whether the natural orifice can be entered in 47 per cent, or 53 per cent, or 61 per cent of patients. Of course, I do not feel that my cannula has entered the natural ostium in every instance. In many cases, the accessory ostium was utilized and, in some, the neighboring membrane was punctured. Sufficiently exhaustive and painstaking anatomical studies have been made of the region in question to show that there is a wide variation in the size, form and relative location of both natural and accessory ostia, and a knowledge of the usual and of the unusual locations of these openings is naturally a prerequisite for the use of this method. A further requisite is a careful and complete anesthesia of the part.

My technique has been to shrink the membranes of the middle meatus and the adjacent area first with a pledget impregnated with 2 per cent cocain solution, following this with 20 per cent cocain locally on a small cotton-wrapped applicator, the cocain in both instances being replaced by pontacain in patients who are known to possess a sensitivity to the former. When this has been done to the point where the patient is entirely free of sensation in this region, a small Ritter frontal sound is used as a probe to locate the ostium, or accessory ostium if it is more accessible. If, as is sometimes true, neither can be located without displacing the middle turbinate, a surprisingly slight pressure on the

Ritter sound will carry it through the membrane. After the opening has been located, the blunt cannula of the Killian type can be introduced. In certain cases, due to the topography of the surrounding area, a Spilberg blunt cannula can be used more easily.

Regardless of whether the cannula passes through one of the ostia, as it does in the majority of the cases, or through the middle meatal membrane, as it does in a small percentage of cases, the advantage of this method over the inferior meatal puncture with the consequent trauma, hemorrhage, and opening of new lymphatic and vascular pathways is obvious. One still hears the idea propounded occasionally that the inferior meatal irrigation is better because it affords drainage in the dependent portion of the antrum. This idea is nebulous at best, for the opening made by the trocar closes almost immediately, and even if it did remain open, the experimental work done by Hilding and others has shown conclusively that the ciliary activity of the antrum membrane continues to carry the secretions to the natural ostium in the middle meatus regardless of what has been done in the inferior meatus.

In addition to this, there is the matter of comfort to the patient. That there is a great difference in this respect I can bear witness personally, having had my own antrum irrigated in the past by both methods. I find that it is most unusual to have a patient dread an antrum lavage after the middle meatal approach has been used, even though he feared it greatly on the basis of former experiences with the inferior meatal approach.

Emphasis should be placed on the importance of avoiding any form of antrum irrigation in the presence of acute inflammation. If this rule is observed, and acutely inflamed membranes or an elevation in temperature are considered steadfastly as contraindications for antrum lavage, there will be no need to fear a general constitutional reaction. If this is not observed, high fever, chills, and severe consequences may result.

PRIMARY TUMORS OF THE URETER*

By Jay J. Crane, M.D.
Los Angeles

Discussion *by A. J. Scholl, M. D., Los Angeles; Charles Pierre Mathé, M. D., San Francisco; Paul A. Ferrier, M. D., Pasadena.*

PRIMARY tumors of the ureter are seldom encountered. Snyder and Wood, reviewing the literature in 1933, placed the number of proved cases at seventy. O'Brien, this year, added a case, bringing the total to seventy-one. The case I have to report not only makes the total seventy-two, but furnishes a classical description of this unusual pathological lesion.

REPORT OF CASE

Mr. H. E., Case No. 164136, age fifty-four, married, white, and a meat cutter by occupation, was first seen April 18, 1935, complaining that he had noticed mass growing in the left side of the abdomen for the past one and one-half years. During the week previous to our examination, he had become nauseated and had suffered with general aching, for which he consulted a chiropractor who had given him a spinal adjustment, which was followed by a severe pain in the lower part of the back and abdomen. Upon further questioning, the patient stated that he had not been inconvenienced by the growth or pain to the extent that he could not carry on his work as a meat cutter. However, he did mention that he was progressively having more difficulty with his bowels in that he was constipated and suffered considerably with flatulence; yet he denied ever having noticed bloody urine and said he was not having any bladder disturbance to speak of, except a little more frequency night and day than usual. He thought that his symptoms, as just mentioned, had become more noticeable as the tumor grew larger.

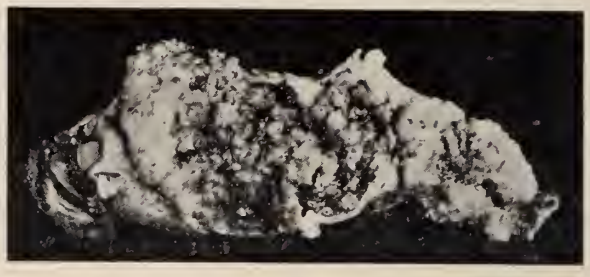

Fig. 1.—Primary tumor of left ureter.

Examination.—On April 24, 1935, at the time the cystoscopic examination and kidney study was first done, the abdomen was filled with a very large tumor mass which was smooth, firm and tender, and which, upon palpation, felt to be full of fluid. The size of the abdomen resembled that of a person suffering with a far-advanced ascites in that the skin was glistening and the abdomen extremely distended. The external genitalia and prostate were normal.

A No. 24 French cystoscope passed readily into the bladder, which was normal yet difficult to distend because of the pressure of the mass above. The ureteral orifice was readily visualized and appeared to be normal. Clear jets of urine were seen spurting from the right orifice, while from the left ureteral orifice several small papillary growths were seen protruding. Indigocarmin was given intravenously before attempting to catheterize the ureters; it appeared from the right side in three and one-half minutes in exceptionally concentrated jets, which were vigorous and forceful, while on the left side no dye appeared at the end of thirty minutes. A No. 6 French ureteral catheter passed to the kidney pelvis on the right side, the urine dripped through the catheter spontaneously and clear, while on the left side the catheter was obstructed at 10 centimeters and with each attempt to pass the cather further a gush of fresh blood poured out of the ureteral orifice alongside the ureteral catheter.

Bilateral ureteropyelograms were taken. Those of the right side represented a normal ureter and kidney, while those on the left disclosed a filling defect in the lower end of the ureter. (See Figure 3, which was not unlike the filling defect produced in a ureter by a tumor.) Unsuccessful attempts to obtain biopsies of the protruding papillary tumors were made. From the above findings of a tumor in the abdomen and a filling defect in the left ureter, a diagnosis of a large hydronephrosis was made. It was thought at this time that probably the kidney was full of papillary tumors.

Operation.—At operation, on April 26, 1935, the large hydronephrosis was drained through the left costovertebral angle. At the same time the abdomen was explored and 3,500 cubic centimeters of fluid was removed, and a biopsy of the wall of the hydronephrosis proved not to be malignant.

The patient left the hospital in two weeks, and ignored further advice and treatment until, one year later, the drainage had ceased and the hydronephrosis had refilled approximately to its former size.

Course.—A second cystoscopic examination on April 26, 1936, a year later, disclosed the filling defect to be present, and also a papillary tumor growth situated on the tip of the left ureteral orifice, a biopsy of which proved to be a papillary tumor with no essential malignant features. A few days after the second cystoscopic examination the hydronephrotic sac was removed with great difficulty. The ureter was sectioned at junction of the middle and upper third. At this point no tumor was encountered in the ureter.

Pathological Report.—The pathological report of the hydronephrotic sac was as follows: "Specimen consists of a hydronephrotic sac or mass of tissue which weighs 545 grams. Microscopically, areas of old hemorrhage and hemosiderin and cholesterin crystals with foreign body

*Read before the Urology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2-6, 1937.

Fig. 2.—Partially filled hydronephrosis of the left kidney caused by obstructing tumor in the ureter.

Fig. 3.—Filling defect at lower end of the left ureter caused by tumor.

giant cell formation are seen. There is no evidence of malignancy of tubercles present."

A month later the remaining part of the ureter with a section of the bladder was removed, the pathological report which is as follows: "The specimen consists of a tumor mass of ureter 12.5 by 5 centimeters in diameter. The tumor mass is well circumscribed, is yellow and friable. The tumor projects 10 millimeters within the wall of the ureter.

Microscopic Diagnosis.—Infiltrating epidermoid carcinoma of the ureter, grade three.

SUMMARY

The findings, which lead to the diagnosis of a ureteral tumor in this case and which I consider as classical, were:

1. Papillary growth seen at the left ureteral orifice.

2. Free bleeding with each attempt to catheterize the left ureter.

3. Filling defect in the left ureter, which was present on two occasions one year apart.

4. Palpable tumor in the abdomen.

Early ureteral tumors are easily overlooked unless one or more of the above findings are found, for hematuria and ureteral colic are not pathognomonic. Good, clear ureterograms are as important as pyelograms, and should be routinely made at the time of each kidney study. By so doing, I am sure more of these seldom encountered tumors will be found.

1921 Wilshire Boulevard.

DISCUSSION

A. J. Scholl, M.D. (523 West Sixth Street, Los Angeles).—Carcinoma of the ureter occurs at a relatively early age, compared with malignant tumors of the other organs. In reported cases, about one-third were in persons under fifty years of age. Many of these tumors, as in Doctor Crane's case, are found in the lower part of the ureter, as more than one-half are localized there. They not infrequently occur at the normal points of ureteral constriction, namely, the two extremities and the brim of the pelvis. Doctor Crane's case was one of epidermoid carcinoma, with a high grade of malignancy. Histopathologic data given in a recent series of seventy-five cases, reported by Bergendal, are of interest: there were 38 cases of papillary carcinoma, 12 of squamous-cell carcinoma, 20 of carcinoma simplex solidum medullare, 3 of adenocarcinoma, and 2 of transition-cell carcinoma.

There are three common types of ureteral carcinoma. The first is the sharply outlined tumor which varies in size from that of a pea or cherry up to that of a pigeon's egg, and which fills the lumen and springs from the ureteral wall by a not infrequently narrow pedicle; the surface may be smooth, moderately uneven, split up or papillomatous and cauliflower-like. In the second, or the infiltrative, type the growth invades the ureteral wall for a shorter or longer distance, mostly circularly, constricting the lumen to a greater or lesser degree. If only a short part of the ureter is involved, it may be difficult to determine macroscopically whether a benign stricture or a malignant process is the source of the trouble. On the other hand, cases have been described in which the tumor tissue advances and infiltrates a large portion of the ureter. In the third, or multiple, type, the gross appearance may so nearly resemble the picture of multiple papilloma that it is surprising when the malignant nature of the process is discovered at the microscopic examination or manifests itself by metastasizing via the lymph passages. The microscopic structure of carcinoma of the ureter may vary.

✲

Charles Pierre Mathé, M.D. (450 Sutter Street, San Francisco).—Doctor Crane has added a case of primary carcinoma of the ureter to the literature, thereby emphasizing the importance in recognizing this rare and obscure condition which offers such difficulty in diagnosis. In 1934 I had the pleasure of presenting a paper on primary carci-

noma of the ureter before the Urological Section of the California Medical Association, reporting a case which was diagnosed prior to surgical intervention consisting of nephro-ureterectomy, unfortunately too late, as the patient died seven months later from generalized metastases.

Early diagnosis of primary carcinoma of the ureter is a well worth while objective, as surgical removal offers the only chance of cure. In reviewing the literature in 1934, I found that Crane and Knickerbocker reported an eight-year cure, and Kraft an eleven-year cure, both by employing complete nephro-ureterectomy. Most of the patients treated by nephrectomy and subsequent ureterectomy died later from metastasis. In view of these statistics, one should always attempt to employ complete nephro-ureterectomy as the method of surgical attack for carcinoma of the ureter.

One should always think of primary carcinoma of the ureter in patients presenting general symptoms of cancer, and who present a triad of symptoms consisting of hematuria, lumbar pain, and tumefaction of the kidney, in whom ureteral obstruction is encountered, and in whom one can reasonably rule out stone, ureteral stricture and tumor of the kidney. The hematuria of primary cancer of the ureter, as of other cancers of the urological tract, is often microscopical in nature, but is usually present. Doctor Crane has covered the salient points in establishing a positive diagnosis. Unfortunately, in some patients in whom the tumor has occluded the lumen of the ureter, one is unable to pass by the obstructing growth in order to perform retrograde pyelography, and advanced destructive hydronephrosis will not permit secretion of opaque media injected intravenously, and in these patients the characteristic filling defect of the ureter is not to be obtained.

Additional reports of these rare cases of cancer of the ureter will keep us cancer-minded and make us be on the lookout for these obscure conditions.

❦

Paul A. Ferrier, M. D. (65 North Madison Avenue, Pasadena).—Primary carcinoma of the ureter has been regarded as so rare that it is not often considered in diagnosis.

Doctor Crane mentions seventy-one proved cases. In the last four years Dr. A. G. Foord has encountered four additional cases at autopsy at the Huntington Memorial Hospital, Pasadena. These will be reported in detail later. They had not been seen by a urologist, and some of them had been diagnosed as ovarian tumors. I have operated on one further unreported case which proved to be a squamous-cell type, originating about midway in the right ureter. It had encircled the lumen, causing a complete closure. It blocked the venous return of the lower half of the ureter so that there were varicosities under the mucosa, causing profuse bleeding. The pyelographic media could not be injected beyond the carcinoma. All that could be diagnosed about the kidney was that it was not large to palpation and not tender. No intravenous dye was secreted. The preoperative diagnosis was tumor of the ureter, possibly secondary to tumor of the kidney. This being suspected at the primary operation, a complete nephro-ureterectomy was done. The ureter was adherent to the common iliac vessels at the brim of the pelvis, and it was with some trepidation that they were freed. It was realized that carcinomatous tissue had extended beyond the ureter. The patient lived two years and died of generalized carcinoma.

In a large number of reported cases a nephrectomy has been done primarily and later a ureterectomy. While the nature of the case will often prevent a preoperative diagnosis of carcinoma of the ureter, such diagnoses have been made and substantiated, as in one case which I saw with Doctors Carl Rusche and S. K. Bacon. This was later proved at operation. In this case a filling defect in the ureter was observed, with rapidly advancing hydronephrosis.

One naturally thinks of papillary tumor of the renal pelvis with implants down the ureter, and in many cases this cannot be excluded. It is at least worth while to be prepared to do a complete nephro-ureterectomy in case of suspected tumor of the ureter.

I observed Doctor Crane's case in surgery. The dense perirenal adhesions and infiltrating growth made surgery extremely difficult.

STOMACH MUCOSAL CHANGES IN A-AVITAMINOSIS*

By Alvin J. Cox, Jr., M.D.
San Francisco

Discussion *by Garnett Cheney, San Francisco; A. G. Foord, M. D., Pasadena.*

FOR a number of years there have been reports in the literature concerning lesions in the stomach in some way related to dietary deficiencies, but there has been little correlation between the type of deficiency and the type of lesion produced. Clinically, this subject has been discussed by Stepp, who pointed out that there need not necessarily be a deficiency in the diet, since destruction of the vitamin in the gastro-intestinal tract, or failure of absorption, may produce deficiency in the body.

STUDIES ON ANIMALS

Of the many observations on different kinds of animals suffering from the effects of vitamin deficiencies of various sorts, most of the studies of the stomach have been made on the rat. Here the bulk of the reported changes have occurred in the fore-stomach, or squamous epithelium-lined rumen portion, and so have no counterpart in the stomach of man. Pappenheimer and Larimore, in 1923, thought ulcers in this region were due to ingested hair. A number of authors have found gastric ulcers in rats on diets deficient in vitamin B, and a few have been convinced that vitamin A deficiency was the cause of similar lesions, though in the complete study of vitamin A deficiency by Wolbach and Howe, in 1925, no gastric lesions are mentioned. Recently, Howes and Vivier have reported evidence to indicate that some substance present in whole yeast, but not in yeast extracts, is important in preventing development of ulcers in the rat stomach. Of importance in this connection are the current reports of frequent ulcers in the gizzards of chickens fed diets deficient in a newly separated fat soluble dietary factor referred to as vitamin K.

In short, there is evidence that ulcers develop in the stomach of animals of various species more readily when the diet is not adequate, but the type of deficiency is not agreed upon by the different authors.

VITAMIN A DEFICIENCY

My relatively few experiments have been confined to the study of vitamin A deficiency, and the positive evidence derived from carefully controlled experiments indicates that deficiency of this, or some closely associated substance, in the diet of albino rats is of etiological importance in the production of ulcers, not only in the rumen portion, but in the glandular portion of the stomach toward

* From the Department of Pathology, Stanford University School of Medicine.

The experiments reported in this communication were carried out in the Pathological Institute of the University of Freiburg, Germany. Further details, as well as microphotographs of the tissue changes, may be found in Ziegler's Beiträge zur path. Anat. u. z. allg. Path. 98:362, 1937.

Read before the Pathology and Bacteriology Section of the California Medical Association at the sixty-sixth annual session, Del Monte, May 2–6, 1937.

the pylorus and along the lesser curvature; in other words, in the parts of the stomach commonly the site of peptic ulcers in man.

EXPERIMENTAL STUDIES

White rats of two different age groups (seven and fourteen weeks) were used, and each group control and test groups of four animals were selected. Individual cages were used, and a vitamin A-free diet, prepared according to Wolbach and Howe, was administered in controlled quantities. The control diet differed from the experimental diet only in that it contained butter instead of lard as a source of fat. The older animals were killed after seven weeks on the diet, and the younger ones were allowed to live (approximately ten weeks) until they would no longer take the prescribed quantity of food. They were then killed before they had been without food more than twenty-four hours. In the first group of animals no lesions were found in any organs; but in the second, aside from the well-known epithelial changes characteristic of vitamin A deficiency, all of the experimental animals showed small ulcers in the pyloric portion of the stomach, particularly at the lesser curvature. These ulcers were tiny, not over one millimeter in diameter, had elevated margins, and microscopically, although there was a surrounding inflammatory reaction, they showed no evidence of chronicity in any portion. They were certainly acute lesions. One animal showed eight such lesions, and all ulcers found were confined to the portion of the stomach lined by mucus-secreting pyloric glands, where there was also an increase in visible intra- and extracellular mucus. The fundus mucosa showed no changes of any kind, and the rumen portion showed only small nodular proliferations of the epithelium except for several small ulcers in one animal.

COMMENT

These mucosal lesions cannot be considered specific for vitamin A deficiency, in the first place, because other things may produce ulcers in this portion of the stomach, and, secondly, since the ulcers were all very recent, perhaps occurring during the terminal period of starvation before the animals were killed. The control rats were also starved before being killed, so it is concluded that, although in themselves the ulcers are not specific, the circumstances under which they appeared were not adequate to produce ulcers in the control rats—with the exception of one very tiny erosion in the stomach of one control animal, seen only during routine serial sectioning of the stomach.

These findings in the vitamin A-free rats might be interpreted in one of two ways: as results of injury to a normal mucosa by something abnormal in the environment, such as an increased HCl content of the gastric juice, or as the effect of injury to an abnormally susceptible mucosa by substances normally present—in my experiments augmented by the terminal period of starvation.

The first possibility is made less attractive by the clinical data of Stepp, Boller, Will, and others, indicating that, in man, vitamin A deficiency is associated with a decrease in gastric acidity, and by experimental work of Verder and Petran in monkeys which showed no change in the gastric secretion during periods of vitamin A deficiency.

Evidence of change in the cells of the stomach mucosa of my animals were demonstrable only in the mucus-secreting cells. In every case the acid-secreting portions of the mucosa were structurally normal. Only the mucus-producing pyloric glands showed evidence which might indicate increased susceptibility to injury. In addition to the ulcers, the mucosa in this area showed the increase in intra- and extracellular mucus above referred to. In considering the question of whether this increase in mucus is related directly to an increased vulnerability of the cells, one must, of course, consider the possibility that it represents merely an accumulation due to decreased digestion by the gastric juice. This, however, would not explain the accumulation within the cells. It seems more likely that an actual increase in mucus secretion existed. With special staining reactions I was unable to detect any difference in character of this mucus from that normally covering the mucosa of the rat stomach, so there is no reason to believe that the mucus was deficient in its protective action. I think it more likely that the increased mucus production is a compensatory mechanism on the part of the less-resistant mucosal cells.

Whether this change in the rat stomach has any counterpart in man is difficult to say, but it is possible that the reports by von Bergmann and others, of an increased incidence of peptic ulcer, during the spring, represents a result of decreased vitamin A intake during the winter months. A relationship between this incidence of human peptic ulcers and ulcers in the rat is suggested by the results of Siebert's observation that histamin more readily produces peptic ulcer in the rat in the spring than at other times.

IN CONCLUSION

Apart from such speculation, I believe the reported experiments have demonstrated a definite change in the glandular mucosa of the stomach of rats on a vitamin A-free diet predisposing it to injury by the gastric juice. Presumably, the exciting cause in my animals was a twenty-four-hour period of partial starvation, with failure of neutralization of the gastric juice in this period. Possibly other irritating substances might have acted similarly. As nearly as could be determined, the dietary substance protecting against these changes was vitamin A, though the possibility of some other vitamin in butter being important has not been absolutely ruled out.

Stanford University Hospital.

DISCUSSION

Garnett Cheney, M.D. (210 Post Street, San Francisco).—Any experiments attempting to correlate pathological changes in the gastric mucosa with a dietary deficiency are most welcome. Evidence is gradually accruing that such a deficiency is one important factor and, perhaps, a basic factor, in the development of certain types of gastritis and of peptic ulcer formation. Improvement in atrophic gastritis coincident with liver therapy is an established clinical fact. The seasonal variation in the incidence

of peptic ulcer may well be due to changes in diet, and a number of authors have stated that "the vital resistance" of the gastric mucosa is dependent upon an adequate vitamin intake. The nature of this vitamin is unknown to date.

In the chick experiments referred to by Doctor Cox, an erosive gastritis is an almost constant finding when the birds are fed on a diet lacking in fresh greens, but containing adequate amounts of vitamins A, B, C, and D. The gastric lesions may be prevented by the addition of certain fresh greens and cereals to the diet, or cleared up by the subsequent administration of these same substances. The antierosion substance is not vitamin K, the antihemorrhagic vitamin, but is also fat-soluble, and has its origin in the same foods as vitamin K. It has not yet been satisfactorily isolated.

It is not unlikely that the gastric lesions produced in rats may, in reality, be due to a deficiency of this unknown antierosion factor. It, as well as vitamin A, is apparently lacking in the diet used by Doctor Cox. Such an explanation of the development of these ulcers in rats would account for the confusion which has heretofore existed in this field of research. Further experiments directed toward clarifying this important subject are urgently needed.

A. G. Foord, M.D. (749 Fairfax Avenue, Pasadena).—Doctor Cox's paper is of interest chiefly because of the almost negative results obtained by extreme deprivation of vitamin A, even to the point of producing characteristic epithelial changes in other organs. The author shows good judgment in not overemphasizing the minute ulcers, or rather acute erosions, found in these badly diseased animals. In human beings superficial erosions of the stomach mucosa are not uncommonly found in a variety of conditions, especially following minute hemorrhages in the mucosa, interpreted usually as preagonal in origin. Possibly the ulcers in these rats are the consequence of similar small hemorrhages, or, as the other states, due to some effect apart from the specific avitaminosis. The fact that they are acute ulcers leads one to believe that vitamin deficiency plays little rôle in their formation. Were they specific, one should expect ulcers of varying ages and sizes.

THE LURE OF MEDICAL HISTORY†

STATE MEDICAL ASSOCIATION AND OTHER REMINISCENCES

By Douglass W. Montgomery, M.D.
San Francisco

PART I*

IT is indeed a pleasure to receive this testimonial‡ from my colleagues, and it is well worth while to have lived seventy-eight years and to have practiced medicine for fifty in order to receive it.

EARLY MEETING PLACES OF THE SAN FRANCISCO COUNTY MEDICAL SOCIETY

The honor taking place in such delightful surroundings accentuates its value. We may fittingly recall in this, our annual meeting, the energy and foresight of the late Reginald Knight Smith and his comrades who secured this beautiful home for us.

Our meetings used to be held in Shiels Hall on O'Farrell Street, where is now the City of Paris store. We were there but for the evening; it was no home; and it was the meeting place of some secret society, I do not know which. It did not furnish, through its professional atmosphere, much medical inspiration. We had, however, many a good meeting in it.

ON BOOKS

The few books and magazines received were taken care of by Mr. Duncombe, who kept a medical bookstore on Sutter Street. Duncombe afterward established an ambulance service.

After a time, with the natural accumulation of journals, the space available by Duncombe became too narrow, and I took the library until we secured quarters in the Spring Valley Building, now the City of Paris.

I recall an amusing instance showing the temperament and the relationship of two interesting men of that time. Dr. Harry M. Sherman occupied offices with Dr. George Chismore. Sherman was a bit masterful and in some ways took charge of Chismore, who was amenable and long-suffering with the vagaries of his friend. It occurred to Sherman that Chismore had not enough genitourinary literature for a man whose practice was rapidly tending that way, so he went to Duncombe's bookstore and ordered all available books. On their arrival he stacked them beside Chismore's bed, and Chismore dutifully read down through the pile.

AN EARLY MEDICAL OFFICE

When I came to San Francisco I rented two rooms in a two-story frame building on the northwest corner of Sutter and Mason streets. The rooms were a front and back parlor, the usual type of medical office at that time. They had none of the conveniences such as running water, etc.; they were just furnished rooms. There was a row of such residences on the south line of Geary Street between Powell and Stockton, all occupied by doctors' offices. It was called Murderers' Row, and the old surgery, with its heavy death rate, deserved the epithet.

SAN FRANCISCO DURING MY EARLY DAYS

The sidewalks were of wood. When those on Market Street were torn up, gangs of youngsters followed the workmen to pick up the coins that had dropped through the cracks during years of use.

The streets were cobbled. Recently, on visiting Mexico, I met with this kind of pavement and it gave me a homey feeling. The street-cars were horse-drawn, as were all the vehicles of the town; and the horses were, of course, accompanied by swarms of flies, which were excellent carriers for streptococci, furnishing the medical profession with lots of impetigo cases.

It was a dusty city, clouds of which blew about, and we did not have to prescribe calcium—we swallowed amounts of it.

The west wind, the horse droppings, and the sand, were an enduring plague only conquered on the arrival of the bitumen pavement; and with the sand came the fleas. To these latter many people were exquisitely sensitive, and one of my friends,

† A Twenty-Five Years Ago column, made up of excerpts from the official journal of the California Medical Association of twenty-five years ago, is printed in each issue of California and Western Medicine. The column is one of the regular features of the Miscellany department, and its page number will be found on the front cover.

* Editor's Note.—This paper will appear in two parts.

‡ For tribute to Dr. Douglass W. Montgomery, and resolution unanimously voted at the meeting of the San Francisco County Medical Society, on December 14, 1937, see California and Western Medicine, January, 1938, p. 63.

Dr. Alec Whittell, used to take to the theater a bottle of ether. On feeling a flea he would remove the cork and press the mouth of the bottle over the tingling locality. Iron sleep would descend upon that flea.

The defective sewers gave us plenty of typhoid fever, and its care furnished a good living for many physicians. There were localities where this disease was more frequent. I remember one on Powell Street between Sutter and Post.

THE DRESS AND ROLLING EQUIPMENT OF MEDICAL MEN

I have seen the equipage, dress, and demeanor of medical men change. The tall hat that disappeared from London with the Great War had, in San Francisco, been previously eliminated by the earthquake. The frock coat accompanied the high hat, and the dress and deportment of the physician became indistinguishable from that of the business man, leaving the clergyman the only uniformed professional. The automobile displaced the doctor's carriage, his most striking equipment. Those variations from the dull democracy in dress of our male population can never return. We shall never again see Doctor von Hoffman's beautiful coach with his coachman in livery on the box, driving a span of prize horses; nor McNutt, with his tall white hat of striking shape, seated in his carriage and accompanied by his spotted coach dogs. He was often called Doctor McHat, and the nickname did not need explanation. Doctor Parsons, austerely seated in his lofty carriage, dressed in his London-tailored clothes and with a shirt collar that buttoned nearly as low as an ordinary vest, is a memory of the unreturnable past. Dr. J. H. Stallard was another Englishman, and it occurred to him to send home for a hansom. It was a unique vehicle, and resembled an upright coffin on trunnions. It was drawn by a powerful horse, a gift to the doctor from George Hearst, the father of the proprietor of the *San Francisco Examiner*. Instead of having a coachman perched high in the rear over the roof of the carriage, it was driven by the doctor himself, the reins passing through a slit in the front of the "coffin." When the doctor, with his white flowing side whiskers, his black frock coat, his stovepipe hat, and his saucy lap dog seated beside him, drove forth in his peculiar showcase, he was one of the sights of the town.

Once, while standing on the corner of Fourth and Market streets, and seeing carriage after carriage drive by, I inquired what it meant. Some well-to-do person, I learned, was ill in one of the swell districts of the city—Rincon Hill. There is a small nub of this hill still remaining. First a street was cut through, destroying its fine lines, and recently the San Francisco-Oakland Bridge has finished it off, except for the aforesaid nub.

LISTERIAN THERAPY

When I came to San Francisco the Listerian therapy was just arriving, and its arrival meant a major disaster to the older surgeons. The human being, especially when elderly, is intolerant of new ideas. Many of these surgeons were competent men and good workmen, but they could not grasp the relevance of the minutiae and excessive cleanliness required by the new technique. Now the idea of this cleanliness has become generalized among the laity, and leads often into the most ridiculous byways.

A surgeon's income, when in full practice, may be large, but with the years this naturally decreases. Formerly an elderly surgeon often made a comfortable living by consultation, but this source of income has no longer the vogue it used to have.

450 Sutter Street.

(TO BE CONTINUED)

A HARVEIAN PILGRIMAGE

By GEORGE H. EVANS, M.D.
Berkeley

ON a hill overlooking the quaint old village of Hempstead, in Essex, England, seven miles distant from the nearest railroad station (Saffron Waldon), stands a picturesque little parish church. The first church there was built in the twelfth century, with walls and some pillars in the chancel of Norman architecture; and now that the tower crumbled and fell to the ground in 1882, these are all that is left of the old edifice. The nave is early Gothic. This church is of particular interest to medical men because within it lie the mortal remains of William Harvey, the world's greatest physiologist—the discoverer of the circulation of the blood.

The Harvey Chapel is situated in the left transept of the church. It contains the marble sarcophagus provided by the Royal College of Physicians, into which, on October 18, 1883, in the presence of several Fellows of the College, Harvey's lead coffin and its contents—which had been removed from the vault beneath the church where they had rested for 226 years—were reverently placed, together with a copy of a large edition of Harvey's works and a Roll recounting the incidents of the transposition of the remains.

The Chapel also contains a bust of Harvey, attributed to Scheemakers, and memorial tablets of other members of the Harvey family.

Fig. 1.—Burial place of William Harvey, Parish Church at Hempstead, Essex, England.

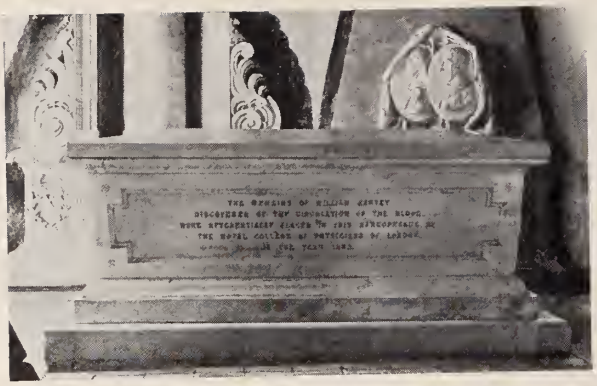

Fig. 2.—Sarcophagus in the "Harvey Chapel," Church at Hempstead. Contains the remains of Harvey.

Fig. 3.—Marble bust of William Harvey in the Harvey Chapel. Bust ascribed to Scheemakers.

It must have been a sad group of mourners who, on that day in June, 1657, set out from London on their dreary journey of almost fifty miles, accompanying the mortal remains of their beloved Fellow to their last resting place in the family vault under the parish church at Hempstead. At that time the prevailing method of burial was the encasement of the body in a lead coffin. These coffins resembled Egyptian mummy cases; the bodies were simply lapped in lead and provided a poor protection against the disintegrating forces of time and unfavorable climatic conditions. It was here in this vault, immediately under an open-grated window, that the remains of the Master were placed at rest with his ancestors. It was not until 1859, however, that a Committee of the Royal College of Physicians, among whom were Quain and Stewart, visited the burial place in Hempstead. They found forty-six coffins in the vault, several of which had collapsed in part, leaving concave upper surfaces filled with water, which seeped into the interior of the coffins through fissures in the lead. Ventilation in this vault was attained by three open-grated windows, which offered no protection from rain. Harvey's coffin, situated immediately under one of these windows, was in a particularly bad state of preservation. The concavity was filled with dirty water and there was a large rent in the lead cover.

The president of the College requested permission of the family to be allowed to make necessary repairs for the better preservation of the remains. This was refused, though he was later informed that the family had made such repairs.

In April, 1937, I visited Hempstead, and was well repaid for the rather tiresome journey from London for the privilege of standing beside the remains of the great physiologist, whose achievements have meant so much to the science of medicine.

Through the courtesy of the vicar, the Reverend T. P. Conyes Barker, and his wife, I was given the opportunity of visiting the church and the vault underneath. A trap door and a staircase situated outside the church afford entrance to the vault. The recent rains had flooded the flooring, and in places one waded ankle-deep in water. The coffins, all in a bad state of preservation, were lying directly on the floor. The brick walls directly supporting the Harvey Chapel above were water-soaked. One coffin, badly broken, exposed its contents, which consisted of a few bones and a dark, dirty-looking gelatinous granular mass. The body was entirely disintegrated. It is doubtful if a better state of preservation exists in the contents of the lead coffin in the Harvey sarcophagus.

I feared that the supports in the vault, probably damaged by time and exposure, were not sufficient to safely support the weight of the sarcophagus in the chapel immediately above. This was communicated to officials of the Royal College of Physicians, who, however, assured me that regular inspections are made by the College from time to time.

It is not intended here to go in detail into the life and achievements of Harvey. These are well known to the student of medical history. Twenty-six years had elapsed since Harvey, inspired by the teaching of his illustrious master, the anatomist, Fabricius ab Aquapendente, left Padua, before he published, in Frankfort, 1628, his immortal treatise, "Exercitatio Anatomica de Mortu Cordis et Sanguinis." Padua, at the end of the sixteenth century, was the world's center of medical learning

and accomplishment. The great Vesalius had done much to tear down Galenical dogma and had laid the foundation for the development of modern medical science. His successors, Realdo Columbo and Andrea Cesalpino, had each made contributions to blood circulation, as had Servetus previously in Paris. Falloppio, first at Pisa, then at Padua, enriched anatomical knowledge by his description of the fallopian tubes, the oculomotor muscles, the cerebral nerves, the chorda tympani, the semicircular canals, and the aqueduct. Padua had become a great medical school. A brilliant coterie of men surrounded Fabricius when Harvey entered the halls of Padua in 1598.

There is some doubt that the preliminary work of Cesalpino and Columbo on the circulation made a deep impression upon Harvey, then only twenty years of age. In the manuscript room of the British Museum exist some original notes of Harvey's for his lectures on Universal Anatomy, delivered on April 16, 17, and 18, 1616. In these lectures he made his first public statement of his discovery of the circulation of the blood, twelve years before the publication of the Frankfort treatise. Priority for the credit of the discovery of the circulation of the blood has been bitterly contested in Italy, but the advocates of Cesalpino, Columbo, and Servetus have tried in vain to snatch the laurel wreath from the brow of Harvey. During the passage of almost three hundred years since his death the convincing records of eminent historians clearly place to Harvey the credit for his epochal demonstration. Of these many contributors should be particularly mentioned the treatise of Prof. Max Neuburger of Vienna, published in 1930.[1]

The published works of Harvey are comparatively few. Aside from his great treatise, the most important is his work on the generation of animals, "Exercitationes de Generatione Animalium, quibus accedunt quædam de Partu de Membranis ac Tumoribus Uteri, et de Conceptione," published in 1651. Aside from these, his published writings are: "Two Disquisitions to Riolanus"; "A Short Report of the Postmortem Examination of Thomas Parr"; and a few letters to Caspar Hofman, Slegel, Nardi, Morison, and Horstius in explanation or defense of his views.

In the Sloane collection in the British Museum, there is a portion of an unpublished manuscript of 121 leaves devoted to "Anatomy of Muscles: Their Functions and Diseases"; also his original notes of lectures on Universal Anatomy, to which reference has already been made. In all probability some of his works were lost when his lodgings in Whitehall were plundered during the civil wars, and when the home of the Royal College of Physicians, to whom he had bequeathed all his books and papers, was destroyed in the great fire of 1666.

CLINICAL NOTES AND CASE REPORTS

WHAT DOES "NEUROTIC" MEAN?

By R. P. Little, M.D.
Santa Paula

WHAT is a neurotic? The dictionary says it is one who is afflicted with a neurosis, and that a neurosis is a functional type of nervous disorder, or one without an evident organic or structural basis. But this is a mere classification for convenience, and befogs thought, for there is really no fundamental distinction. We believe that structure conditions function. Thus the term merely denotes a difference in the degree of structural change. The gross and readily perceivable changes being known as organic, and the obscure as functional, and physicians often infer that the patient can change his composition by an effort of will and that all he needs to do is think he is well and he will be so. This is indeed mysticism. The doctor, in his helplessness, may even become exasperated and relieve his feelings by adopting the attitude of contempt, which is merely a defense for ignorance.

Let us consider neurotics at greater length. As used the term is not specific, but is a pigeon-hole for odds and ends of nervous disorders. It is a wastebasket term for which there is no specific criterion except that it relates to the nervous system. The cause must be obscure, for, if it is evident, troubles are classified under that heading. Neurasthenia and epilepsy have little in common, yet if they occur in the "family tree" it is said to have a neurotic taint. Neurasthenia is characterized by a lack of energy, and epilepsy by fits.

Let me tell of a few neurotics that I have known. They were classified as such by medical men:

Case 1.—An interne was once awakened at about 2 a. m. to see someone who was complaining. On the fourth floor he found an old lady who was "cutting up," as the nurse said. He examined her and found no obvious cause for her doing so, so he assumed that she was a neurotic and ordered a "sterile" hypodermic given. He then went back to bed quite pleased with himself. He had hardly fallen asleep when the nurse called him back to pronounce his patient dead. He received quite a shock, and the word "neurotic" had taken on a new meaning.

* * *

Case 2.—There was another lady on the fourth floor who was always complaining, and no one found an adequate cause. The internes and nurses treated her with restrained contempt. She got sterile hypodermics, bromids, and ammoniated tincture of valerian. Finally, someone sent her to the gynecological ward, when it was decided to open her abdomen. It was found that her belly was full of adhesions, the aftermath of an old operation. These were freed, and she made a wonderful recovery. She no longer complained. She was grateful and appreciative. She gained weight and became another woman.

COMMENT

Let us assume that the Freudians, or who you will, had psychoanalyzed this woman and found some evidences of sex in her which can be found in most anyone by enough search, just as one can find water with a "forked stick" most anywhere in Ohio. Suppose that they had talked to her, and

filled her full of their explanations or system of psychology, and had gotten her to "shut up" or to grin and bear it—would she have been cured? Then, may I ask, what are the criteria of cure, absence of symptoms? But the only way we can know of many nervous symptoms is by what the patient says and does. If he stops complaining and acts normally, we are prone to assume a cure; yet the underlying condition may be there just the same.

What of these so-called cures? Do they stay cured? At St. Anne De Beaupré one can see a pile of crutches and wheel chairs, wooden legs, and what not, twenty feet high. How many do you suppose would like to return for them? Do they have a follow-up system—a visiting nurse or social worker to see if the old man buys another cane? What of the epileptic who takes bromid and has no fits—is he cured? What of the neurasthenic who so orders his life that he gets nine hours' sleep and does not overwork. Is he cured or is he only "living within his means"? The eye doctor who cures epilepsy by correcting astigmatism or hyperopia may not have really changed the nervous system, and an impacted tooth might bring back the whole picture. This nervous defect may be beyond our reach—perhaps it is hereditary, and that eugenics is the only real cure for society. Perhaps the clinical picture of neurasthenia is merely the symptom-complex resulting from an insufficiently energized nervous system. We know little of nervous energy—what it is, and where and how it is generated. Its lack of quantity may be due to systemic poisoning, such as influenza or tuberculosis. It may be that it is expended faster than it is generated, as in overwork. It may be conditioned by some hereditary defect, for it is obvious that the flame of life burns brighter in some than in others. It may be that it is due to illness or improper feeding in infancy. Man is a suggestible animal as well as being an automatic machine; and nature often repairs damage while our attention is distracted by some hocus-pocus which is then deemed to be the cause of the cure.

There is gross structure which helps to determine the larger activities, such as intestinal and heart function; and there is microscopic structure, which is a factor in the function of muscle nerve and gland; and then there is ultra-microscopic chemical structure, which we think must determine chemical and physical change, heredity, memory, and psychological processes. Then, according to our definition, a neurosis being a nervous disorder minus a structural change, and if, as seems probable, there is no function without a structural basis, then we must arrive at a new definition of neurosis, or else abandon it for a more definite classification. Used in the light of knowledge, it may be permissible to differentiate between gross and evident lesions, and the ultra-microscopic kind. As it is, it covers a multitude of sins and is an excuse for impatience, which, by rights, should be directed toward medical ignorance rather than the patient. The very fact that they often end up with dealers in magic, hypnotism, and theology is evidence enough of that.

We are beginning to believe that we think and act the way we do because of our structure and environment, and that even our thoughts are the result of, rather than the cause of these things. Behavioristic psychology is making a worthy effort to redeem the study of human behavior from the swamps and morasses in which it finds itself after centuries of darkness. Let us hope that their studies will throw light upon this side of human ignorance. The whole thing resolves itself into a question of psychology. Is, or is not man an ever-growing and changing machine? I, for one, believe that this assumption is the more useful concept. We all admit that it does no good to either swear or pray over such machinery as a gas engine, but words are adequate stimuli for man, and here is where the joker comes in: to a limited extent minute structural change may be reversible.

Life is a form of motion, and its direction and velocity depend upon the form of the structure, the amount of energy generated within, and the external environment. These are three variables, and in diagnosing deviations from the normal especially so-called nervous troubles, one should consider each with extreme care.

AN EPIDEMIOLOGICAL STUDY OF AN OUTBREAK OF SYPHILIS

By R. L. Kaufman, M.D.
Whittier

IN the great majority of instances the health officer doing epidemiological work in the venereal diseases is confronted with but one contact of an infectious case. Far too often does the individual affected in presenting himself for diagnosis and treatment "fail" to remember the name or address of the person to whom he or she was exposed. The statement is frequently volunteered that the exposure was to an individual who happened to be passing through town on his way East or North, or any other convenient direction. The physician administering the treatment in a health department clinic will find that to threaten or scold patients into revealing the identity of their infected partners will very often drive them away. It is much better to reason with them and explain the mode of spread of these infections, and to stress the point that their partners may even be unaware of being infected and deserve having medical check-up. The general public has the mistaken notion that the discovery of venereal disease is equivalent to loss of a job, as a punishment meted out by the health department. This fallacy also impairs complete identification of contacts. Very often, after an individual has visited the clinic or office a number of times, and has gained confidence in his doctor or nurse, he will give the name and address of the contact, or even arrange to have him or her come in for examination.

For every patient who presents himself to a health department or physician's office for antivenereal therapy, there are usually others infected from the same source who go elsewhere for treatment. And it is uncommon for more than one

Name	Age	Color	Marital Status	Week of Exposure	Appearance of Lesion	Appearance at Clinic	Darkfield	Wassermann

victim to come to one office. Consequently, the following report on the transmission of syphilis by one woman to six men, all of whom came to the Whittier district office of the Los Angeles County Health Department, may be of interest from the epidemiological and sociological viewpoints.

These six men presented themselves to the health office within a period of five weeks; the first one on April 24, 1935, and the last one on May 23, 1935. Examination showed single or multiple penile lesions, subsequently proved to be hard chancres, and each one volunteered the name of one woman (name) of Whittier as being the one to whom he was exposed. From this point we will take our story back several weeks to April 5, 1935.

REPORT OF CASE

On this date (name) came to the office and wanted treatment for a generalized rash. As the health officer was out, the nurse sent her home and told her to remain in bed, promising that the health officer would visit her later in the day. A home call that day revealed a white woman, age forty-four years, a divorcée, living alone in a one-room flat in Whittier. Her complaint dated from March 31, 1935, when she developed fever, headache, and generalized aches and pains. On Tuesday, April 2, a generalized, raised, salmon-colored rash appeared, coinciding with an increase in her symptoms. On Thursday, April 4, her back began to ache and her eyes became suffused and reddened. This was the picture on April 5, when the writer examined her. The original impression of severe German measles in an adult had to give way to a suspicion of secondary lues, when a call on April 6 demonstrated an exacerbation of symptoms and a fever of 102 degrees Fahrenheit. A Wassermann taken that day returned four plus, and the patient was immediately sent by ambulance to the Los Angeles County General Hospital contagious ward, with the diagnosis of secondary lues. The source of her infection could not be determined, inasmuch as she had had more than one etiological possibility. At the hospital another blood Wassermann was taken, following which she was given three intravenous injections.

She was released from the hospital on May 1, 1935, although still in an infectious state, and returned to Whittier, where she came each week to the venereal disease clinic for therapy until she moved out of our jurisdiction. Treatment was refused her on May 15 because she appeared at the clinic in a very drunken state, barely able to walk straight. Upon being told that she was too ill to receive an injection, she became belligerent and threatened to go out and "infect every man in town," as she put it. However, no treatment was given in her state of alcoholic intoxication, but she appeared the very next day, somewhat more sober, and apologized for her previous day's actions.

Of the six men who named her, all are single, fortunately, except one. The first one appeared while (name) was in the General Hospital, on April 24, 1935. The accompanying table shows the sequence of events for each individual. The ages of these six men ranged from twenty-one to fifty-nine, the youngest being a Mexican. All of the chancres were accompanied by bilateral inguinal adenopathy of the discrete type, with some edema of the glans and foreskin. Therapy was not instituted in any case before laboratory confirmation by either darkfield or Wassermann had been obtained.

Thus far three blood Wassermanns on the wife of A. W. have returned negative. She has no lesions or symptoms and is still under our observation. She presents a typical example of the dangers innocent contacts undergo from irresponsible individuals.

In addition to these six infected individuals, another man, H. R., age twenty-three, was exposed to (name) the week of March 25. However, he had been under our care for syphilis since July 18, 1934, getting thirty-six treatments up to the time of this exposure. He used no prophylaxis of any sort, and did not develop any lesions.

All the chancres cleared up immediately following therapy, accompanied by cessation of associated symptoms. No other possible source of infection has thus far been ascertained in this series of cases.

SUMMARY

Aside from the physical, mental, and sociological damage done by this lone fountain of infection, the economic cost to the community is of some concern. If we can say that it costs approximately $300 to treat a case of syphilis to its conclusion, we reach a total of $1,800 for these cases as the price the taxpayer has to pay. And this sum represents only the cases that have come under our control. The actual cost, therefore, is probably higher.

IN CONCLUSION

A series of six cases of syphilis is presented because of the interest created by their all naming a common source of infection. A true understanding of our national venereal disease problem can be easily pictured from this distinct epidemic.

GONORRHEA IN PREGNANCY

ITS TREATMENT AND RELATIONSHIP TO OPHTHALMIA NEONATORUM

By S. I. Movitt, M.D.
Los Angeles

CONSIDERING its prevalence and far-reaching influence on health and bodily resistance, gonorrhea in the female is of utmost importance; and during pregnancy its importance is far greater, since it affects not only the mother, but also the child. According to J. Johnston Abrahams,[1] 40 per cent of the sterility in women, 50 per cent of all gynecological operations, and 20 per cent of the total blindness of the world are the direct consequences of unsuccessfully treated gonococcal infection. It is important and fitting, therefore, that physicians should acquaint the public with the general and widespread evil effects of gonorrhea. Neisser at one time stated that, with the exception of measles, gonorrhea was the most widespread of all diseases. This may be an exaggeration; nevertheless, the disease is by no means rare.

Mode of Infection.—Except in the case of young children, where gonorrhea is transferred indirectly, it is transmitted almost exclusively by sexual intercourse. In rare instances it may be spread by towels, napkins, douche nozzles, or by an infected person. A frequent mode of infection is that of the wife by a husband who has had gonorrhea, but was supposedly cured. The most important characteristic of the gonococcus from the clinical viewpoint is its power of latency. The organism remains living in the human tissues, but is temporarily inactive; that is, the patient has gonorrhea, but presents no symptoms. The disease may remain latent and suddenly light up into active virulence because of local hyperemia—from excessive intercourse, menstruation, childbirth, or ill-advised pelvic operations. The latent germ may be aroused into acute activity in two ways: It may either produce a fresh gonorrheal attack in the individual in whom it has been residing as a latent parasite, or it may be transferred to another individual and, finding there a fresh soil more congenial to its growth, incite an acute process.

Gonorrhea and pregnancy may coexist under three conditions: (1) the gonorrheal infection may antedate the occurrence of impregnation; (2) the gonorrhea may have been acquired during coitus, which also resulted in conception; and (3) the gonorrhea may have been contracted after conception has occurred.

Most cases that one has to deal with belong to Group 1. The infection, having passed the acute stage, becomes chronic. The two other groups usually present the acute and subacute forms of the disease.

The influence of pregnancy upon a preëxisting gonorrhea is usually quite pronounced. The marked congestion of the tissues, incident to the gravid state, furnishes abundant stimulus for the multiplication of the gonococci, which thus causes an exacerbation of a latent gonorrhea. It seems that pregnancy predisposes to widespread upward extension, occasionally causing endometritis and deciduitis, and even involving the tubes. However, gonorrhea is not such an important causative factor in abortion as formerly supposed. A study of Bernstine and Castallo's[2] statistics, extended over a period of five years and including 3,586 deliveries at Jefferson Maternity Hospital, shows that eighty-four patients had *positive* finding for gonococci during pregnancy and received the following treatment, which was adapted to the stage of infection and was continued until the time of delivery. In acute gonorrhea, rest is most beneficial. After the symptoms gradually subside, a simple cleansing douche and sedative measures are all that is employed. Later a douche, containing one teaspoonful of Lugol's solution to two quarts of warm water, may be used. When the acute symptoms have entirely subsided, the patient is treated more vigorously along the same lines as chronic cases. The treatment of chronic cases is divided into two parts: those measures that the patient uses at home, and those that the physician carries out.

Home treatment consists of daily vaginal douches under low pressure, using one teaspoonful of Lugol's solution to two quarts of boiled water. The office or hospital treatment consists of exposing the cervix with a vaginal speculum. The discharge is carefully wiped away from the cervix. A pledget of cotton, saturated with aqueous solution of metaphen 1 : 1000, is placed in the cervical canal and left *in situ* for five minutes. The vagina is then swabbed with the metaphen solution; if there is urethral involvement, about fifteen drops of 10 per cent argyrol are instilled into the urethra.

Out of the above-mentioned 3,856 deliveries at Jefferson Maternity Hospital (Philadelphia), eighty-four cases were complicated by gonorrhea and treated for it during the prenatal period in the way outlined above.

The children born of mothers in the treated group were free from gonorrheal ophthalmia. The babies of both groups received exactly the same prophylactic eye treatment when delivered, yet there were fifteen cases of gonorrheal ophthalmia born of mothers who did not receive prenatal treatment (who apparently did not give evidence of gonorrhea, thus escaping treatment which they should have received).

This would show that the prenatal treatment of mothers afflicted with gonorrhea is a more important prophylactic measure against gonorrheal ophthalmia than Crede's prophylactic instillation of silver nitrate in the eyes of the new-born child.

BEDSIDE MEDICINE FOR BEDSIDE DOCTORS

An Open Forum for brief discussions of the workaday problems of the bedside doctor. Suggestions of subjects for discussions invited.

INTRA-ORAL LESIONS

I. ETIOLOGY

George V. Kulchar, M.D. (450 Sutter Street, San Francisco).—The oral mucous membrane and the skin are closely related. In many dermatoses, lesions also are present in the oral cavity. The etiology of lesions occurring within the mouth is varied and multiple, as in diseases of the skin. The cause in some instances has not as yet been determined. Bacterial virus, spirochetal and mycotic infections, dietary deficiencies, systemic and metabolic disorders, trauma, neoplasm, nevi, allergic and drug reactions, are the most commonly known causes.

The most common cutaneous diseases having oral manifestations are lupus erythematosus, lichen planus, pemphigus, and erythema multiforme. At times the oral lesions may be the only phenomena observed and may be present for weeks or months before the appearance of the cutaneous lesions. Oral lesions occasionally occur in dermatitis herpetiformis, keratosis follicularis, scleroderma, and acanthosis nigricans. Occasionally, impetigo, erysipelas, rhinoscleroma, lupus vulgaris, and leprosy may extend from the skin on to the oral mucous membrane. In exfoliative dermatitis, eczema, hydroa-estevale, mycosis fungoides, psoriasis, tinea corporis and zoster, intra-oral lesions are uncommon, but may be seen. Eruptions from various drugs may occur simultaneously on the skin and mucous membrane. These will be discussed later.

Infections due to bacteria of various types may occur in the mouth primarily, in addition to those secondarily extending from foci on the skin. Severe streptococcic infections rapidly extending down the faucial planes toward the pharynx may be seen (Ludwig's angina). Streptococcal impetigo may occur occasionally. Chancroidal infections due to streptobaccilus of Ducrey, either in association with genital lesions or alone, are at times seen. Gonococcal stomatitis, while rare, has been reported. Infectious stomatitis, the lesions resembling aphthae, may be produced by staphylococci or streptococci. Oral diphtheria, resulting from an extension of faucial infection, occasionally may occur. Likewise pseudodiphtheria infections, which can be diagnosed only by bacteriological examination, at times may be encountered. More rarely, infections, such as glanders and anthrax, may have oral manifestations. In addition to extension from facial focus, erysipelas may originate as a primary infection, usually beginning about the socket of a recently extracted tooth. Stomatitis, presumably due to infection, may be seen in influenza. The simultaneous occurrence of oral and vulvar lesions (ulcus acutum vulvum) caused by the bacillus crassus, is observed occasionally.

In addition to the extension of lupus vulgaris from the skin, tuberculosis may occur primarily within the oral cavity. Inoculation tuberculosis, the so-called tuberculous chancre with satellite lymphadenopathy, while uncommon, is occasionally seen. Infections may be from a focus elsewhere in the body or from external sources. In addition to a tuberculous chancre, fissures and papillomatous or ulcerative vegetative forms as the result of systemic tuberculosis are frequent. In addition to zoster, other virus diseases, such as herpes simplex and verrucae, are found in the mouth. The former is more commonly seen on the lips, although intra-oral lesions resembling aphthae or a generalized stomatitis are not uncommon. Systemic virus diseases, including the exanthem, may have oral manifestations.

Acute or chronic ulceromembranous gingivitis or stomatitis (Plaut-Vincent) are frequently seen. While fusiform bacilli and spirochetes can usually be found in the smears, whether these are the primary cause or secondary invaders, has not as yet been determined. Infestation of the fusospirillary group is not uncommon in other oral lesions. Gangrenous gingivitis and stomatitis (noma) are regarded by some as a severe form of acute ulcerative gingivitis, often following slight trauma or as a complication of debility, usually in children and the aged. In addition to fusiform bacilli and spirochetes, numerous other pathogenic organisms may be present. Gummatous nodules, occurring in the nasopharyngeal region, may be a late manifestation of yaws. Primary syphilis is a common cause of intra-oral lesions. The lesions may occur anywhere within the oral cavity, excepting the teeth. Secondary lesions may be seen in the oral mucosae, tonsils, or tongue. Destructive late lesions are common in the nasopharynx and tongue. In addition to gummatous infiltration of the tongue, a sclerous or interstitial glossitis may occur.

A variety of mycotic organisms may cause intra-oral lesions. The most common is mycotic stomatitis (thrush). From the lesions, Monilia albicans is most commonly recovered. Occasionally, other members of the same group are the cause. The etiology of black hairy tongue is variously reported. A streptothrix, which may play some part in its production, is at the present time the most accepted cause. Actinomycosis most frequently originates in the mouth and may be primary in the tongue. Coccidioidal and deep blastomycotic infections are rare, as is sporotrichosis.

Oral lesions are common in some of the exanthem, particularly varicelli, measles, scarlet fever and variola, and are frequently of aid in diagnosis. Ulcers and stomatitis are common in typhoid fever, while herpes is frequently seen in meningitis, malaria, and pneumonia.

Dietary deficiencies, particularly vitamins, may be followed by oral lesions. Erosive stomatitis, gingivitis, and glossitis are common in pellagra. Gingivitis and edema occur in beriberi. Hemorrhages from the gums are seen in scurvy.

In many systemic diseases oral manifestations are common. A stomatitis, characterized by dryness and a deep-red color of the mucous membrane, occurs at times in diabetics. A similar or an ulcerative stomatitis may be seen in uremia. The smooth, brightly erythematous tongue and papillary atrophy is part of the diagnostic picture in primary anemia. Hemorrhagic stomatitis, often with secondary invasion of the fusospirillary organisms, may occur in the leukemias. In agranulocytosis, gingivitis, stomatitis, or combinations of these, necrotic ulcers and gangrene about the tonsils, pharynx, palate, or tongue are common, from which the Klebs-Löffler bacillus, fusospirillary organisms, and a variety of other bacteria, have been isolated. Hypertrophic gingivitis occurs during pregnancy. Macroglossia may be found in acromegaly, in syphilis, and myxedema. Pigmentation of the oral mucosa is noted in Addison's disease, cirrhosis of the liver, hemachromatosis, and occasionally following melanotic tumors. Xanthomatous infiltrates and lesions may be seen intra-orally in the lipoidoses. Bluish-gray deposits of lead along the gingival margin are noted in lead poisoning.

Factitial lesions in the mouth are not uncommon. Traumatic ulcerations and anesthesias may be found in hysteria. Oral neuroses and phobias usually referred to the tongue are seen, the underlying mechanism generally being a cancer phobia.

Dermatitis venenata (contact dermatitis) may occur in the mouth, either as a result of irritants or sensitization from vulcanite in dental plates, mouth washes, tooth paste, etc., or on the lips, as a result of lipstick.

Drugs are a frequent cause of oral lesions, usually accompanied by a cutaneous eruption. It is impossible to enumerate all the drugs which may be the cause. The most common, however, are the acetanilid-antipyrin group, producing erythema multiforme-like lesions or angioneurotic edema of the mucosa. Similar eruptions, usually cyanotic in color, may be produced by phenolphthalein. Salicylates, including aspirin, may cause erythema, edema, and vesiculation. Bullous and vesicular lesions are seen after barbital and its derivatives. Bullous and hemorrhagic lesions from iodids and hypertrophic vegetating lesions from bromids may occur. Urticarial edema, erythema, and vesiculation may follow the use of quinin and its combinations. Severe gingivitis and stomatitis may be complications of the prolonged use of mercury. Similar stomatitis, with deposits of bismuth about the gingiva, tongue, and cheeks, is seen following bismuth therapy. A bluish-gray discoloration of the oral mucous membrane and tongue may be noted in generalized agyria, or in small patches following the prolonged local application of silver compounds.

As a result of chronic irritation of the mucous membrane and tongue, leukoplakia may develop. The etiology can be established in the great majority of cases. Trauma or chronic irritation from poorly fitting dentures, ill-shaped or malposed teeth, may be the cause. Ill-kept or poorly fitting plates, or prolonged chemical irritation, also may be factors. The relation of syphilis to leukoplakia is not established, although it is seen frequently on the oral mucous membrane at the site of secondary syphilides or on the tongue following late syphilis. Syphilis is also thought to be an indirect cause in some way predisposing the mucous membrane to leukoplakia.

Nevi are not uncommon in the oral cavity. Pigmented lesions are seen more frequently on the lip. Hemangiomata and lymphangioma likewise are often seen. Lesions of neurofibromatosis may occur in the mouth or on the tongue. Numerous benign new growths, such as papillomata, pyogenic granuloma, adenoma, lipomata, myxomata, myomata, and keloids, are frequent. Adenomatous hyperplasia of the mucous glands of the lip and buccal mucous membrane may be found (Fordyce's disease). Retention cysts of the mucous gland may occur, producing mucoceles. Epithelioma of the lip, buccal mucous membrane, or tongue, almost always of squamous-cell type, originating in areas of leukoplakia, is, of course, well known. Neoplasms of the gingiva, grouped under the general term of "epulis," may occur. Sarcoma is relatively rare in the mouth.

Urticaria, due to food or drugs, may be accompanied by angioneurotic edema of the lips, tongue, and palate.

The most common lesion occurring within the mouth is the aphthous ulcer, often multiple, the etiology of which is varied. Vitamin B deficiency is claimed by some to be the principal cause. The lesions appear sometimes to be allergic, due to foods or drugs. Digestive disturbances have been frequently observed accompanying aphthae, and are regarded by some as the cause. In many cases the etiology cannot be established. The virus of herpes simplex and staphylococci may produce lesions frequently mistaken for aphthae. Geographic tongue is another frequent condition in which the etiology is still obscure. While occasionally associated with organic disease and debility, it is frequently seen in healthy individuals and may be regarded as a constitutional neuropathic anomaly.

The multiple, varied, and often obscure etiology of intra-oral lesions makes necessary a thorough examination of the patient, utilizing all the laboratory facilities. Even with these measures, in some instances the etiology cannot be established.

* * *

II. SYMPTOMS AND DIAGNOSIS

H. P. Jacobson, M.D. (520 Westlake Professional Building, Los Angeles).—It is somewhat of a task to attempt a discussion of the diagnosis of oral pathology in the limited space at my disposal. The subject matter is extensive and fairly embraces in miniature the entire domain of general pathology. Like the cutaneous envelope, the oral mucosa may serve as a reflecting mirror and portray reactions to local insults, and, in greater

measure, the presence of systemic infection, intoxication, or other biological disturbances in distant parts of the body. Unlike the skin surface, however, the oral mucosa has not the protective advantages of the corneous and granular layers of the skin epidermis. The absence of these two epithelial layers, together with the peculiar environmental conditions of the oral cavity, such as increased temperature and moisture, render the mucous covering of the cavity not only more vulnerable to chemical, mechanical, and biological irritants, but also serve to modify the morphology of primary lesions to such an extent as to make their recognition and diagnosis more difficult.

In a general way, the different eruptions occurring within the oral cavity may, for purposes of definition and diagnosis, be divided into four major categories as follows:

1. *Lesions Due to Local Causes.*—Under this heading are included all oral lesions produced or caused by any and all physical, thermal, electrical, chemical, and biological agencies working locally, or *in situ*. As representative members of this group may be cited, for instance, the lingual fissures, erosions, and superficial ulcerations caused by jagged teeth, or by the epileptic bite. Also, the erythematous, purpuric, vesicular and bullous eruptions produced by chemical caustics (usually in attempted suicides), and those caused by exceptionally hot drinks, such as coffee, tea. etc. Here, too, may be included the leukoplakial-like lesions caused by electrical discharges of two different metals in dental fillings.

Important members of this category of eruptions are the different lesions produced by the local presence and activity of certain bacterial and fungous parasites. The morphology of these lesions varies considerably according to the type and virulence of the causative parasites, as well as according to the patient's immunity. On the one hand there are the fairly superficial vesicular and ulcerative lesions of aphthous stomatitis, which most authorities attribute to a staphylococcic organism. Again, we have the fairly superficial, somewhat infiltrated, ulcerative or fissured lesion of the primary stage of syphilis; also the somewhat deeper, rapidly spreading and more destructive ulcerative gingival lesions of trench mouth or acute ulcerative membranous gingivitis. This eruption is caused by a mixed infection represented by the fusiform bacillus acting in symbiosis with the Spirocheta dentium. The disorder belongs to the acute infectious destructive inflammatory diseases of the gingivae, usually starting at the buccal surface about one or more teeth and spreading rapidly. Here, too, belongs the well-known clinical entity of thrush, a membranous stomatitis and glossitis, caused by a yeastlike fungus, M. albicans, and usually occurring in the poorly nourished or the feeble—in the very young or very old.

A marked morphological variation of the above simple inflammatory, more or less superficial types of lesions are the deep-seated, tumor-like granulomatous masses caused respectively by the tubercle bacillus, Treponema pallidum, Actinomyces, and C. immitis.

2. *Sensitization Eruptions.*—Here one may include all intra-oral eruptions that are expressions of hypersensitivity to various kinds of food, drugs, medicaments, etc. The various foods or chemicals that may serve as sensitizing agents in certain individuals are legion, and different persons may be sensitive to different substances. A diagnostic characteristic of the primary eruptive elements that enter into the composition of these eruptions is their usually evanescent and superficial character, and their tendency to spontaneous involution upon the withdrawal of the sensitizing agent. The lesions may consist of erythematous macules or plaques, vesicles or bullae, or urticarial elements.

3. *Lesions Secondary to Systemic Infections and Intoxications.*—This group embraces all oral eruptions that are secondary to, or associated with systemic or cutaneous syndromes, as well as metallic intoxication—especially bismuth, mercury, gold, and the arsenicals. Representative members of this group are the vesicular or bullous lesions of erythema multiforme, dermatitis herpetiformis, pemphigus vulgaris, epidermolysis bullosa, acute disseminated lupus erythematosus, the hemorrhagic and erosive lesions of hemorrhagic sarcoma, and of some of the leukemias. Also, the variously sized and shaped plaques of psoriasis, lichen planus, chronic lupus erythematosus, and the classical leukoplakia.

4. *Neoplastic Growths of the Oral Cavity.*—This group includes all new growths, benign and malignant, and comprises the epithelial, endothelial, connective tissue, and the mixed tumors. Their gross appearance depends upon their histological structure and age, as well as upon the character and state of immunity of the patient.

Diagnosis.—Diagnostic differentiation of one eruption from another may, in occasional instances, be achieved by mere inspection of the primary component elements and examination of their morphological architecture. The characteristic cluster of vesicles situated upon or within erythematous and/or inflammatory areas of herpes simplex, or herpes zoster, characterized by varying degrees of pain (preceding, accompanying, or following the onset of the eruption) and, in the latter instance by a unilateral distribution after the course of a nerve; or the fairly pathognomonic fungating, ulcerating, infiltrating lesions of advanced carcinoma should offer no particular diagnostic difficulty to the experienced clinician.

For the most part, however, eruptions of the oral cavity do not lend themselves to easy recognition, but require clinical and, frequently, laboratory studies, and an evaluation of these in the light of associated existing pathology in other tissues and organs. A very essential preliminary to diagnosis is a pertinent case history. This need not consume much time or space, but should stress the mode of onset, duration, subjective symptoms, history of antecedent or associated diseases, including allergic disorders, and previous treatment. The question of drugs and chemicals—either applied locally (especially dentrifices) or taken internally as laxatives, sedatives, or tonics—should receive special attention in all history-taking, as these will

be found responsible for presenting oral eruptions rather frequently.

Important, too, is a good source of illumination. Diffused daylight is best for the purpose, but an electric flashlight or a small electric dental lamp may serve just as usefully.

With the oral cavity exposed to inspection in a good light, and with a pertinent history as a background, one may then proceed to study the morphology of the elements composing the eruption, and note especially their character (whether vesicular, macular, nodular, etc.), arrangement, configuration, color, and consistency. Information thus obtained frequently suffices to establish a clinical diagnosis, especially in early cases before environmental influences succeed in affecting secondary changes in the lesions. The fairly typical picture, for instance, presented by the geographic tongue, consisting of sharply defined, variously sized and shaped, smooth-surfaced, shiny plaques, usually limited to the dorsum of the tongue and arranged in "map-like" fashion; or the characteristically grooved surface of the grooved or scrotal tongue, with a median, fairly deep furrow, and radiating symmetrically placed parallel grooves resembling the ribs of a leaf, which when interpreted in the light of their clinical histories, should offer no particular difficulties in diagnosis.

If in spite of a careful history and an adequate oral examination, diagnostic difficulties should present themselves, one may often obtain additional helpful information from an examination of the cutaneous surface. The differentiation of sharply marginated, slightly elevated, irregularly sized and shaped, somewhat thickened grayish plaques of oral psoriasis from those of oral lichen planus, and both of these from leukoplakia, may be facilitated materially by an examination of the skin, and the discovery thereon of the typical, easily diagnosable lesions of the first two entities. The same may be said of the diagnostic difficulties surrounding the attempted differentiation of oral bullae of erythema multiforme from those of pemphigus vulgaris. An examination of the skin in these instances usually yields sufficient information to establish a correct diagnosis.

Now and then one meets with instances of oral pathology which, in spite of pertinent histories, adequate facilities for oral examination, and a thorough cutaneous inspection, require additional laboratory help for the establishment of a correct diagnosis. Limitation of space prevents a consideration of the many clinico-pathological entities and their differential, diagnostic characteristics that would come within the purview of this category. As representative members of this group may be mentioned the specific infectious granulomas, which comprise the tuberculomas, the nodular, fibrotic and/or gummatous tertiary syphilitic lesions, the actinomycotic and coccidioidal granulomas.

These granulomatous lesions may resemble each other grossly and microscopically fairly closely, but differ totally etiologically and in their response to different therapeutic procedures. A correct evaluation of these lesions, and their differentiation from some pyogenic granulomas, lingual amyloidosis, and the various benign and malignant neoplastic lesions (especially the epidermoid carcinomas), may require all the diagnostic procedures detailed above plus serological, bacteriological, mycological (microscopic and cultural), and tissue microscopic studies.

As guiding-posts to a clinical diagnosis it might be mentioned here that the tuberculous ulcerated granulomas are usually secondary to systemic tuberculosis, are more rapid in their evolution, softer, and much more tender and painful than are the tertiary lesions of syphilis, or actinomycosis. The actinomycotic tongue, for instance, has periods of exacerbations and remissions and increased local pain at the height of the former period. Coccidioidal granuloma of the oral cavity is rare, but when present is usually secondary to systemic coccidioides; the evolution of the lesions is fairly rapid and the pus is characteristically stringy, etc. The pyogenic granulomas are usually secondary to gingival or dental infections, which may be determined by x-ray and other studies.

The epidermoid carcinomas are commonly slower in their evolution than are the granulomas; they have a characteristic hard, infiltrating consistency, are fairly painless, and usually occur past middle life.

In brief, successful diagnosis of oral lesions depends upon knowledge of and ability to recognize distinguishing morphological characteristics of a given eruption. Some oral lesions lend themselves to clinical recognition and differentiation, while others may require laboratory investigations as aids in diagnosis. Viewing presenting eruptions in the light of group relationships, based upon related etiological factors, as suggested at the outset of this discussion, should prove helpful from the standpoint of orderly classification and should, therefore, facilitate differential diagnosis.

* * *

III. TREATMENT

H. J. Templeton, M.D. (3115 Webster Street, Oakland).—Whole books have been written dealing with diseases of the oral cavity. It is, therefore, obviously impossible to comment on more than a few of the fairly common mouth disorders in such a symposium as this.

Diseases of the mouth may be secondary to systemic disorders or may be purely local. If the former, they are treated primarily by controlling the systemic factor. If purely local, they are dealt with by appropriate local treatment plus, possibly, attention to the patient's general health.

The dry, reddish, parched mouth and tongue of the diabetic should be treated by diet or by insulin. The pale, buccal mucosa and the reddened, atrophic burning tongue of pernicious anemia will generally improve following the administration of the extrinsic and intrinsic anti-anemic extracts plus hydrochloric acid. The beefy-red mouth and tongue of pellagra can be combated with a well-balanced diet heavy in vitamin G (B2). Specifically, I order six cakes of yeast, a can of tomatoes, rare beef or liver, fresh vegetables, and milk daily. The several cases of leukemic stomatitis that I have seen have

been so fulminating that they yielded to nothing. However, in milder chronic leukemia the stomatitis should improve following Röntgen therapy directed to the general disease. Purpuric areas in the mouth disappear when the generalized purpura is controlled by appropriate transfusions, splenectomy, etc. A stomatitis from aplastic anemia, which I saw recently, recovered when the patient was repeatedly transfused. The intensely acute, swollen throat of agranulocytic angina will sometimes yield to repeated small transfusions or pentonucleotid. Of course, one should be certain to interdict the use of any drugs of the benzene ring series, especially amidopyrin and allurate. Scurvy, with its classical bluish-red swollen, bleeding interdental papillae will promptly disappear when vitamin C, in the form of orange or tomato juice or cevitamic acid, is given. It has been recently emphasized that subclinical scurvy is not infrequent. Hence it might be well to give an abundance of vitamin C in cases of swollen gums of obscure etiology.

The mouth lesions of syphilis, running the whole gamut from the chancre of the lip or tongue, on through the mucous patches of the secondary period up to the late gummas of the tongue or palate, literally melt away under the influence of the arsphenamins or bismuth plus iodids. Leukoplakia is sometimes caused by syphilis, so the first step in its management is a search for syphilis elsewhere. Unfortunately, even if syphilis is found, specific therapy does not influence the leukoplakia. The next step is to absolutely forbid the use of tobacco, because there is plenty of evidence that its use predisposes to the development and malignant degeneration of leukoplakia spots. Next, have the dentist get rid of all jagged teeth or snags. Next, observe the patches frequently. If they remain stationary, treatment is not demanded; but if they show any signs of erosion or fissuring, they must be destroyed at once with the actual cautery or electrodesiccation.

Tuberculosis of the mouth is practically always secondary to pulmonary or laryngeal tuberculosis, and responds very poorly to treatment. If the ulcers are small they can be destroyed with the actual cautery. The intense pain and dysphagia can be relieved, and the patient's nourishment facilitated by painting the ulcers with cocain or anesthesin before eating.

The lace-like reticular eruption on the buccal mucosae or tongue, which is the oral manifestation of lichen planus, does not yield to treatment and, since it produces no symptoms, should be left alone.

Extensive bullae and erosions of the oral cavity are seen in pemphigus, and practically invariably indicate early death. Treatment, save for local palliative measures, is hopeless. Similar bullae are also seen in the benign disorder erythema multiforme. The immediate attack yields to time, to calcium, and to autoblood injections, while recurrences can be prevented often by eliminating the causative factor whether it be food allergy, foci of infection, or drug ingestion.

Drugs may produce mouth lesions either following absorption from the gastro-intestinal tract or because of their local action on the mucous membranes of the mouth. Phenolphthalein laxatives, quinin, anacin, aspirin, etc., may cause mouth lesions. Several years ago, C. J. Lundsford and I reported a series of cases of stomatitis following the use of S. T. 37 toothpaste. Similarly, other mouth washes or dentrifices may produce local irritation.

"Burning tongue" is a distressing complaint of varied etiology. The Mayo Clinic, in analyzing a large series, found that a high percentage of cases was of unknown etiology or on a neurosis basis. Psychotherapy would seem to be in order. Sluder reported cures following removal of the lingual tonsils.

"Canker sores," in my opinion, are often precipitated by foods, particularly walnuts, to which the patient is sensitive. Scratch or intradermal tests have not helped in solving the problem; but by having the patient keep a food diary of all foods eaten during the twenty-four hours preceding a number of attacks, the physician often can locate the offender.

At the recent meeting of the American Medical Association, an exhibit demonstrated that many cases of stomatitis were due to food allergy and were controlled by elimination.

Fusospirillosis, or Vincent's disease, can be treated by having the patient rinse the mouth repeatedly with hot hydrogen peroxid solution. Once daily the physician should paint the areas with 5 per cent chromic acid in distilled water. After the acute phase has subsided a dentist should scale and clean the teeth.

Nonhealing fissures of the lip can be cured by freshening the edges with a scalpel and introducing a single suture.

Thrush in infants does well with one per cent gentian violet in acqueous solution.

Lastly, the disease of the mouth that interests me most, namely, cancer. In general, I prefer actual destruction of the lesion by means of electrocoagulation or the actual cautery, whenever the lesion is accessible to such treatment, to either x-ray or radium. However, there are cases in which the location of the lesion (for example, floor of mouth) or a poor condition of the patient causes radium seeds or needles to be preferred. The treatment must be individualized according to the demands of the case and the skill of the operator. Biopsies are essential. Cancer of the lip can be treated very successfully as an office procedure by means of electrocoagulation or cautery removal. If there are no palpable glands, they should be left alone. If glands can be felt, a thorough neck dissection or deep therapy is in order. Cancer of the tongue, in our experience, is best treated by wide destruction with electrocoagulation. In extensive cases, where a large part of the tongue has to be destroyed, it is safer to do a preliminary ligation of the blood supply. Small cancers of the floor of the mouth can be destroyed with electrocoagulation, but more extensive lesions are best treated with radium needle or seed implants.

CALIFORNIA MEDICAL ASSOCIATION

This department contains official notices, reports of county society proceedings and other information having to do with the State Association and its component county societies. The copy for the department is submitted by the State Association Secretary, to whom communications for this department should be sent. Rosters of State Association officers and committees and of component county societies and affiliated organizations, are printed in the front advertising section on pages 2, 4 and 6.

TO THE NEW GRADUATE

To the graduate just entering practice—yes, to all engaged in practice—the reflecting upon the following is commended.

TRIBUTE TO THE MEDICAL PROFESSION

"Following the banquet of the Southeastern Surgical Congress, Dr. Irvin Abell, the president of the American Medical Association, presented the following:

" 'I know of no calling which offers such a wide diversity of intellectual pleasure as that of medicine, not alone in its art and science, with an ever-increasing range of new developments, but in human behavior, psychology, sociology, economics and related activities; we follow a most useful calling; an interesting occupation filled with new and striking problems and one of the best because its only aim is the benefit of man. Medicine is the most ancient of professions, being older than Christianity and antedating the inception of civil law. It has its own system of rewards and punishments, its own disappointments and its own glories. It is a profession that has a broadening influence on the human mind and is characterized by a most splendid charity. It is an acquisition in the best tendencies and a protection against the worst tendencies. It constructs no trusts; it founds no monopolies; it excludes no qualified practitioner; it retains for its profit no valuable discovery and it has no standing room for the quack, the scoundrel, and the charlatan. Its best work is not done in the light which beats upon the throne, not in the arena of politics encouraged by the cheers of thousands, not in the seclusion of the cloister sustained by the hope of eternal joy, but in the storm- and wind-swept country, in the strects of the village, in the boulevards of the city, on the desolate field of battle where pain and pestilence, illness and misery are combated often with none but God to see it. It furnishes a curiously checkered life, a life in which storm clouds alternate with sunbeams. With the exception of the ministry it stands closer than any other calling to the secret of eternity and watches death ever busy with her shuttle as she weaves her somber threads into the woof and warp of the affairs of men. It seeks to mitigate human suffering, to prolong human life. These have ever been its watchwords, are still, and always will be, constituting its cloud of smoke by day and its pillar of fire by night. One should enter such a profession with properly exalted ideals; with a belief in its greatness, its dignity, its stability, its real importance, its essential strength. One should resolve to learn to observe, to compare, to analyze, to study, to think, to avoid formulas, to cast out sordid thoughts, to repudiate shallowness, advertising, and vain pretensions. In short, to be a worthy disciple of Aesculapius, reflecting honor and credit on the profession and deriving from it the happiness that makes life worth while, being held in grateful remembrance by those whom one has served and in respect and esteem by the confrères with and among whom one has lived and worked.' "

*All articles listed under the caption, "This Month's Topics," have been written and sent to the Editor by the Association Secretary, Dr. Frederick C. Warnshuis.

ASSOCIATION NIGHTS

On April 12, President Morrow, Councilors Schaupp and Kelly, and Secretary Warnshuis discussed Association activities and problems before the monthly general meeting of the San Francisco County Medical Society. While the attendance was small, those present evidenced interest. It was regretted that a greater number did not embrace this opportunity to gain a more intimate insight to the functioning of their state organization that is their guardian.

On April 20, Councilors Phillips and Schaupp and Secretary Warnshuis appeared before a well-attended and actively interested meeting of the Santa Clara County Society in San Jose. This society is composed of 185 members, has its own quarters and library, issues a well-edited bulletin, and assumes an active rôle in community affairs. Its officers and committees accept, commendably, their respective responsibilities and retain the interest and support of their members. For these reasons Santa Clara County has an alert, progressive profession.

ETHICAL ADVERTISERS

This publication accepts advertising contracts from advertisers whose products are approved and conform to ethical standards. Advertisements for nonapproved products are not accepted. Members may, therefore, enter into business dealings with our advertisers with confidence. This assurance should be appreciated by members and, in turn, members should give preference to those advertisers who buy space in your official journal.

When detail men call upon you, inquire whether his firm advertises in your journal. You will save yourself much annoyance if you instruct your secretary or receptionist to make this inquiry and tell the detail man that you only grant interviews to representatives of firms who advertise in your journal.

There are firms whose products are unapproved, who seek space in county bulletins because they cannot obtain space in our state journal. In some instances they are successful in having their advertisement accepted. The suggestion is made that careful scrutiny be given to acceptance of copy for county bulletins. Ethical firms merit patronage. Please give it.

AUXILIARY

This comment proposes but one question to be answered by members and to be accorded consideration by county societies. It is quite a simple question: Why are women today, who apparently have so much power, using that power so little?

This is a direct challenge to Woman's Auxiliaries and counties without Auxiliary organizations. In the April *Courier,* the official organ of the Woman's Auxiliary to the California Medical Association, four avenues of activity and accomplishments were cited. The work and power of the members of the Woman's Auxiliary can cause those four activities to produce tremendous wholesome, constructive results for good in our state. Will Auxiliary members use their power?

PASSING COMMENT

It is often amusing to read the comments and inquiries in eastern publications whose authors are California medical men. Apparently, these correspondents fail to read this Association's official journal that published the information sought well in advance of the date when the inquiry was sent East.

* * *

June! That means vacations and the wide, open spaces, or at any rate a change of environment and relief from daily routine. Are you planning yours? You should.

* * *

"Our organized efforts and our conception of the profession's duty to the public has been, is, and always will be, an evolution. Our history is an ever-unfolding scroll of development, expansion, progress. To this altar of medicine with its changing, evolving service, we bring our dreams, our hopes, our fears, our ambitions, our studied visions, and plans for the future. We are confronted with numerous opportunities for service, dedicated to detract from physical pain and infirmities and to add to the joy and efficiency of individual lives. To that end every physician must dedicate his life. What greater privilege is there than to be a respected member of the organized profession of medicine?"

* * *

You toss your money away when you pay for listing or a card in the so-called special directories. These special directories are published solely for the profit of the promoter. The Directory of the American Medical Association is the only dependable directory consulted by insurance and industrial concerns. Your name is listed in that official directory without charge to you. Why fall for flattery, rosy promises, and misuse of your money? Buy a fishing pole or a mashie instead.

* * *

You do well to protect your patients and their children against typhoid and smallpox, also diphtheria, ere they set out for vacationland or other points for their annual outing. They will appreciate your advice and suggestions that they employ these preventive means.

* * *

Many medical men, with years of active practice experience, continue to wonder as to why this harangue, discussions, declarations, and hubbub about 30 to 60 per cent of the people not having adequate medical care. They are of the opinion that if more thought, effort and consideration were given to more adequate shelter, more adequate clothing, more adequate food, more adequate education, and more adequate employment, then adequate medical care would not be a problem.

Underfed, undersheltered, underclothed, and unemployment are basic factors that demand first consideration. When these needs become adequate there then arises the needs of more adequate education and intelligence in order that people will seek and obtain the adequate medical care that is already available but which, because of ignorance, is not sought and not employed.

Economists and propagandists might better concern themselves with the supplying of these basic needs of peoples before devising ill-advised plans for medical care that can never be made adequate when individuals and families are deprived of adequate food, fuel, clothing, and shelter. Is the reason possibly that the spoils from bureaucratic systems providing medical care are greater and more lucrative than those obtainable in providing basic needs of peoples? One wonders, and will continue to wonder until these facts are clarified. If more employment, better food, adequate shelter and clothing, and adequate education fails to better health welfare, then the medical profession will fill any need there may be for medical care.

The following may apply to those who seek to tell medicine that it is an obstructionist: "The householder was awakened by someone trying to fit a key into the front door of his house. Looking out the window, he saw that it was his neighbor, about three sheets in the wind."

"Go away, you fool," cried the householder. "You are trying to get into the wrong house."

"Shay," mumbled the neighbor, "whaddaya mean, wrong house? You're looking out of the wrong window."

Points of vision do alter opinions.

* * *

We encourage members to send their inquiries to their central office. When in San Francisco a cordial invitation to call is extended. Your central office desires to be most helpful and render every possible service to all members.

* * *

Conversation anywhere: "So your insurance company and you settled that suit for blank dollars?" "Yes, there was no merit to it and I didn't want the publicity, and the company felt that settlement could be made cheaper than cost of trial." Conversation at neighborhood bridge club three days later: "Mary, why are you late?" Mary: "I had to see Doctor Blank about Mother." First Party: "Oh, you have Doctor Blank? Did you hear that he settled that suit Mrs. Doe brought against him for blank dollars? He must have made a terrible mistake if he paid that much and settled out of court. I would be afraid to have my mother under his care." Next day (Mary phoning to Doctor Blank): "Doctor, I guess you need not call to see Mother."

Moral: Publicity of a suit is far less damaging to your practice than settlement.

C. M. A. DEPARTMENT OF PUBLIC RELATIONS†

COMMITTEE ON PUBLIC RELATIONS OF THE CALIFORNIA MEDICAL ASSOCIATION MINUTES

Held in the offices of the Association, Room 2004, 450 Sutter Street, San Francisco, Saturday, April 23, 1938, at 9:30 a. m.

1. **Call to Order.**—The meeting was called to order by the chairman, Charles A. Dukes, with the following members present: President Howard Morrow; Fred B. Clarke, Committee on Health and Public Instruction; Daniel Crosby, Committee on Hospitals, Dispensaries and Clinics; Morton R. Gibbons, Committee on Industrial Practice; John H. Graves, Committee on Medical Economics; Junius B. Harris, Committee on Public Policy and Legislation; Frederick C. Warnshuis, Secretary.

Absent: Doctors Askey, Ruddock, and Roblee.

2. **Fee Schedule for Department of Employment.**—The Secretary presented a letter from the Department of Employment, State of California, asking that a fee schedule be provided for use in medical examinations in connection with hearings before the Department, which had been considered by the Council and referred to the Committee on Public Relations for action.

It was moved by Morton Gibbons, seconded by Daniel Crosby, that the Secretary advise the Department of Employment that the preparation of a fee schedule for use in hearings before the Board was being studied and would be considered during the annual session in May and that in the meantime additional data and definite circumstances be presented by the Board in order that full information may be on hand for consideration. Carried.

3. **Intercoast Hospitalization Insurance Association.** The Secretary read a letter from the Pacific Roentgen Club calling attention to the fact that the policy of the Intercoast Hospitalization Insurance Association had not yet been revised to agree with the principles laid down by the Association; and that an objectionable phrase was con-

† The complete roster of the Committee on Public Relations is printed on page 2 of the front advertising section of each issue. Dr. Charles A. Dukes of Oakland is the chairman, and Dr. F. C. Warnshuis is the secretary. Component county societies and California Medical Association members are invited to present their problems to the committee. All communications should be sent to the director of the department, Dr. F. C. Warnshuis, Room 2004, Four Fifty Sutter Street, San Francisco.

tained in the literature disseminated to the public by the Association Hospital Service of Southern California.

It was moved by Morton Gibbons, seconded by Daniel Crosby, that the Secretary write to the Intercoast Hospitalization Insurance Association requesting that the wording of their policy be changed to conform to the interpretation laid down by the California Medical Association in regard to x-ray services. Carried.

Dr. L. H. Garland, Secretary of the Pacific Roentgen Club, was granted the privilege of the floor and explained the features objected to by his organization.

It was moved by Daniel Crosby, seconded by Fred B. Clarke, that the Secretary be instructed to write a letter to Mr. Heerman calling his attention to the objectionable matter in the folders being distributed by the Associated Hospitals of Southern California and that he be requested to make corrections in the copy and furnish this Association with the draft of the corrected copy. Carried.

4. **United Hospital Service.**—A request from the United Hospital Service of the Physicians' Life Insurance Company for approval of its policy was presented, having been referred to the Committee by the Council. The Secretary reported that additional data had been requested, but to the present date had not been received. Available data being insufficient to justify recommendation, action was deferred.

5. **Standard Oil Company.**—Messrs. Monasch, Holman and Scott, representatives of the employees of the Standard Oil Company, appeared before the committee on behalf of the suggested plan for indemnity against hospital, medical and surgical expenses incurred by reason of nonoccupational accidents and illnesses for the employees of the Standard Oil Company of California.

The Secretary read excerpts from the outline of the plan giving fee schedule and coverage and provisions.

Mr. Monasch explained that the plan contemplated the division of employees into three groups according to income and included three different premiums and three different fee schedules; provided for free choice of physician and hospital; and that at the present time the employees were considering carrying on the plan (1) by reinsurance in an established insurance company; (2) by self-insurance administered by employees; (3) by using service of medical groups.

After consideration, it was moved by Morton Gibbons, seconded by Daniel Crosby, that a committee be appointed to go over the plan and work out a fee schedule and offer other suggestions and report at the Pasadena session, and that the committee be authorized to appoint an advisory committee and consult with recognized men in the various fields of medicine. Carried.

The committee appointed consisted of Doctors Gibbons, Crosby, Clarke, and Warnshuis.

6. **Health Service System of San Francisco.**—The Secretary reported that all activity in regard to the plan of the employees of the city of San Francisco for furnishing medical and hospital care through the Health Service System of San Francisco was being held up pending the decision of the Supreme Court.

It was moved by Morton Gibbons, seconded by Howard Morrow, that further consideration be deferred until such time as the plan becomes operative. Carried.

7. **American Medical Association Survey.**—The difficulties encountered in carrying on the survey proposed by the American Medical Association were discussed, and it was suggested that further consideration be given the matter at the time of the Pasadena session.

8. **Industrial Practice.**—The Secretary stated that various inquiries and correspondence had been received in regard to certain practices carried on by insurance companies in industrial practice.

It was the sense of the committee that the entire situation be inquired into and that facts be secured from physicians who have cited specific instances, and later a conference with carriers, insurance commissioners, and other interested parties be held.

It was moved by Morton Gibbons, seconded by Fred Clarke, that a special committee be appointed to lay the groundwork for such conference, that available information be secured and that the conference be held prior to the American Medical Association meeting in San Francisco. Carried.

The committee appointed consisted of Doctors Gibbons, Crosby, Clarke, and Warnshuis.

9. **Adjournment.**—There being no further business to come before the committee the meeting adjourned.

CHARLES A. DUKES, *Chairman.*
F. C. WARNSHUIS, *Secretary.*

ADVISORY COMMITTEE FOR FURNISHING CARE TO MIGRATORY WORKERS*

Minutes of Meeting Held on April 24, 1938

At the Council Meeting, February 26, President Howard Morrow brought to the attention of the Council a request from the Farm Security Administration for coöperation of the Medical Association in the care of the migratory farm worker of California.

He stated that the Farm Security Administration expected to secure funds to provide medical care for this group, and the local administrator desired to give care to these people through the already existing channels, that is, through the general practitioner of medicine, through existing hospitals, and other facilities for the care of the sick.

The Council approved the appointment of an Advisory Committee, which was to consist of Past President Edward Pallette; A. E. Larsen, local Medical Director of State Relief Administration; W. R. P. Clark, representing the State Board of Public Health; and Karl L. Schaupp, representing the California Medical Association.

At a meeting of local members of the Advisory Committee with the officers of the Farm Security Administration at the office of the State Board of Public Health, a corporation, which is known as Agricultural Workers' Health and Medical Association, was formed under California law. Seven directors were selected for the purpose of providing medical care to the migratory agricultural worker. The seven directors are: Jonathan Garst, Regional Director of Farm Security Administration; Omer Mills, Robert J. Graves, and R. W. Hollinberg, representing the Farm Security Administration; W. R. P. Clark, M. D., representing the State Board of Public Health; A. E. Larsen, M. D., representing the State Relief Administration; and Karl L. Schaupp, M. D., representing the California Medical Association.

This Association then secured a grant of $100,000 from the Federal Government for the purpose described above.

It was the attitude of the federal members of this Board that the medical care of the migratory worker should be directed mainly by the medical members of the Board and that the provision of funds, accounting, and financial responsibility have to lie with representatives of the Farm Security Administration, and following this procedure a tentative plan has been developed which the Board feels should be subject to modifications according to the experiences and development in its earlier operation.

At the ~~February~~ April 2 meeting of the Executive Committee, Dr. Karl L. Schaupp was authorized to act for the California Medical Association on this Board. At the request of President Morrow a meeting was called of representatives from the following twenty counties in California: Imperial, Kern, Tulare, Kings, Fresno, Madera, Merced, Stanislaus, San Joaquin, Sacramento, Santa Barbara, San Luis Obispo, Monterey, Santa Clara, Sutter, Yuba, Yolo, Solano, Riverside, and Butte.

On Sunday, April 24, 1938, the following representatives from these counties met at the Sir Francis Drake Hotel for the purpose of hearing the plan as developed to this point and to make suggestions and criticisms, and to help in any manner possible the further development of a successful plan: L. R. Nielson, Fresno; John W. Green Solano; G. H. Rohrbacher, San Joaquin; William A. Clarke, Imperial; Karl F. Weiss, Tulare; Denver D. Roos, Riverside; Ed. D. Anderson, San Luis Obispo; L. P. Davlin, Monterey; Charles A. Preuss, Santa Barbara; H. A. Randel, Fresno; Hoyt R. Gant, Stanislaus; C. S. Compton, Kern; W. J. Blevins, Jr., Yolo-Colusa-Glenn; W. J. Van Den Berg, Sacramento; J. W. Linstrum, Yuba-Sutter; C. S. Compton, Kern; Elmo R. Zumwalt, Tulare; Leslie B. Magoon, Santa Clara.

* For editorial comment, see page 397. For press items, see page 476.

Also present were: Jonathan Garst, Howard Hill, Karl L. Schaupp, M. D., Richard Lyons, and A. E. Larsen, M. D.

At the meeting the procedure developed to date was explained as follows to the members present:

There shall be thorough social service investigation to determine whether or not applicants for care are actually migratory farm workers and that they have not sufficient funds for their own medical care. When their eligibility has been determined they may choose a local physician or may be referred to one if they have no choice, for the purpose of medical care. After his visit and report on a simple form, the physician may be authorized to proceed with further care. This form is then returned to the regional office and the physician will be promptly paid for the said service. It is hoped that the payment shall not be delayed beyond two weeks from the rendering of the first service.

The compensation for service at the present time will be under the fee schedule, for the basis is $2 for the first office visit, and $1.25 subsequently; $2.50 for the first home visit, and $1.75 subsequently. At the present time, a mileage rate of five cents per mile has been suggested. The present fee schedule is not finally adopted, and is open for changes that may be shown to be necessary by the experiences of the operation of this plan.

Hospital services will be rendered where nccessary preferably through existing private institutions. Payment for these services will be made through the Association at what shall be determined as a reasonable charge for patients of this class at conferences between the director and the hospitals.

It is the intention of the directors of this Association that so far as possible there shall be a free choice of physicians and a free choice of hospital by physicians and patient.

Your representative on this Board feels that the set-up at the present time is not complete nor is it adequate, and can only express to you this hope that the experience of the county societies involved will bring constructive criticism and suggestions which will develop this plan into a sound one for the purposes for which it is formed.

It is well to remember that this is the first time in California when an effort has been made to care for this class of patients with the coöperation of the California Medical Association. May I, therefore, ask that all your comments or criticisms be directed to Frederick C. Warnshuis, Secretary of the California Medical Association, 450 Sutter Strcet, San Francisco, who will refer such suggestions and criticisms to the Medical Advisory Committee.

Karl L. Schaupp, M. D.

COMPONENT COUNTY MEDICAL SOCIETIES

KERN COUNTY

The Kern County Medical Society met at the Mercy Hospital in Bakersfield on Thursday evening, April 21.

Dr. A. Stampar of Yugoslavia, associated with public health work of the League of Nations, was introduced by Dr. Charles E. Smith of Stanford Medical School. Doctor Stampar spoke informally of his experiences as a public heath pioneer in Yugoslavia and in China. During his two-day stay in Kern County, Doctor Stampar studied rural health conditions, especially in the migratory labor camps.

The speaker of the evening was Dr. L. H. Garland of San Francisco, whose subject was *The Medico-Legal Aspects of Roentgenology*. An important point in his talk concerned the proper designation of x-ray examinations as roentgenograms and not as "pictures." He demonstrated common and uncommon errors of interpretation of roentgenograms by means of slides.

Dr. L. A. Packard commented on malpractice insurance policies issued by Lloyd's underwriters.

On the evening of May 4 members of the Society met at a dinner meeting at the El Tejon Hotel, with Dr. Udo Wile of the University of Michigan as guest of honor and speaker. Doctor Wile gave an informative talk on *The Treatment of Early and Prenatal Syphilis*. Many questions were asked by those present about points of doubt in diagnosis and treatment.

C. S. Compton, *Secretary*.

SACRAMENTO COUNTY

The regular meeting of the Sacramento Society for Medical Improvement was called to order by the president, Dr. Dave Dozier, on Tuesday, April 19, at the Auditorium on Twenty-ninth and L streets.

A speaker from the Chamber of Commerce asked for the support of the medical profession in backing the coming Forty-niner program.

The speaker of the evening, Francis Scott Smyth, Professor of Pediatrics at the University of California Medical School, was introduced. The subject was the *Care of the Juvenile Diabetic*. The paper was very well presented, and elicited discussion and questions from Doctors Babcock, Sevier, Gourse, Scatena, Reardan, and Hilding Johnson.

Under new business, Doctor Dozier discussed the medical survey being undertaken by the American Medical Association. The following members were appointed to act as a committee locally: Drs. W. Pollock (chairman), Wallerius, Soutar, O. Johnson, and L. Farrell.

G. E. Millar, *Secretary*.

*

SAN BERNARDINO COUNTY

The special meeting of the San Bernardino County Medical Society was held before the evening session of the Tri-County Postgraduate Conference on Thursday, April 7. About eighty-five members and guests attended the afternoon session of the Conference, and one hundred fifty members and guests were present for the evening meeting.

The meeting was called to order by the president, Dr. Delbert B. Williams, at 7:30 p. m. Doctor Williams explained that the meeting was necessary to bring before the Society the recommendations for the conduct of the Venereal Clinic made by the Committee on Public Relations and Public Policy, and the Advisory Committee to the County Health Officer. The recommendations had been accepted by the Council, but the Council felt that the Society as a whole should have the final vote in such an important matter.

The Secretary then read the report of these committees as follows:

1. That social service in the venereal clinic be on the same basis as now in practice at the County Charity Hospital except that: (*a*) Initial diagnosis to be free to everyone applying to the clinic for the first time (Social Service record to be made at this first visit and status for future visits, if necessary, determined). (*b*) County residence requirement waived, according to the federal plan; and, furthermore, that all existing information of other Social Service agencies be made use of when necessary.

2. It was further recommended by a motion that a minimum fee be set at $1.50 per treatment (drugs to be furnished by the clinic and accurate records of their use be kept by the physician). Also follow-up laboratory work to be done by the clinic if desired.

To further explain the purpose of this fee, the following is the feeling of the committee: That the meaning of this minimum fee of $1.50 is in no way to be construed to dictate the price a physician must charge, since this is the physician's right in dealing with his patient to set the fee, either higher or lower, as the physician sees fit, by the patient's ability to pay and is mutually agreed upon, but is set only as a basis or "yardstick" to guide the Social Service investigator in her judgment to segregate the purely clinic or free cases from the part-pay patients who are to be referred to the private physician for treatment. And that the patient is not to be told the amount of a fee to be charged by the private physician, as this is a matter to be settled mutually between the doctor and the patient in the usual manner.

It is also to be pointed out that the law provides that those infected patients forced to take treatment who refuse to pay, must be treated by the clinic free of charge, regardless of their ability to pay.

In the matter of consultants for the clinic the committee recommends that the present clinical staff of the San Bernardino County Charity Hospital be made consultants to the Venereal Clinic, with the same classification, rank and capacity as obtains in the Hospital, and that only members of the Hospital staff, having been duly elected to the staff in the usual manner of procedure required for appoint-

ment to the staff, are eligible to serve as consultants to the Venereal Clinic.

The variations and complications of venereal disease prompted the committee to make this recommendation as the only solution to an adequate consultation staff.

The County Health Officer will be the direct head of the clinic's full-time staff.

It was also further recommended that the Interne Committee of the County Hospital so arrange the interne service to include some time for service by internes in the Venereal Clinic so that they will receive this important part of their training.

It was generally conceded that further details and problems would have to be considered at a later date, as time, information, and experience will unfold.

Doctor Hilliard asked what provision had been made for referring patients to physicians. There will be a panel made up of the names of physicians willing to do the work, and that patients will be sent to them in rotation when the patient has no choice of physician.

After some discussion it was moved and seconded that the Society accept the report of the committee.

* * *

The regular meeting of the San Bernardino County Medical Society was held at the Loma Linda Sanitarium on Tuesday, May 3.

Dinner was served at 7:30 p. m. in the main dining room of the Sanitarium.

Members of the Riverside and San Bernardino County Medical Societies attended as guests of the medical staff of the hospital.

Eighty members and guests were present for dinner, and 150 were present for the program that followed.

The meeting was called to order by the president, Dr. Delbert B. Williams, at 8:30 p. m.

It was moved and seconded that the applications for membership would be voted on as a group rather than individually. The following applications were approved: Nile I. Reeves, Carrol S. Small, Milo O. Schroeder, Loma Linda; J. Needham Martin, Colton; Russell E. Atkinson, San Bernardino.

The program of the evening was as follows:

Practical Aspects of Vitamin Therapy: A Review of the Latest Developments in Vitamin Research—Henry Borsook, M.D., Ph.D., Professor of Biochemistry, California Institute of Technology.

The President, on behalf of the Society, thanked the medical staff for a profitable and enjoyable evening.

ARTHUR E. VARDEN, *Secretary.*

SAN JOAQUIN COUNTY

The regular monthly meeting of the San Joaquin County Medical Society was held on May 5 at the Hotel Wolf. The meeting was called to order by the president A. C. Boehmer, at 7:30 p. m. We had as our guest speaker, Dr. Udo J. Wile of Ann Arbor, Michigan, whose paper was on *The Management of Early and Prenatal Syphilis as They Relate to Public Health Control.* We had as guests, members from the surrounding counties. Doctor Wile's paper was illustrated by lantern slides, and caused considerable discussion from the floor.

Dr. Eugene Gay's application for membership in the San Joaquin County Medical Society being acted on favorably by the Admissions Committee, he was declared elected to membership.

G. H. ROHRBACHER, *Secretary.*

SAN MATEO COUNTY

The meeting of the Board of Directors of the San Mateo County Medical Society was held in the Library of Mills Memorial Hospital on Friday, April 15.

The applications of Drs. Thomas E. Bivins and Norman C: Fox were presented to the Board for vote. Both applicants were unanimously elected to membership in the Society. The application of Dr. W. C. Lynch was presented to the Board without official clearance from the State Association offices. The Board unanimously elected Doctor Lynch to membership, pending official approval from the state offices.

The Secretary announced that the dues of all members had been paid and that the Society now had a membership of seventy.

The Secretary requested that in view of the increasing amount of work connected with Society business coincident with its increase in size, certain work be allocated to committees which would carry out their duties to completion without throwing the bulk of committee work on the office of the Secretary. A motion was made, and unanimously carried, that where any committee failed to render a report in connection with work requested of the committee within a reasonable period of time that a new committee would be appointed to increase the efficiency of the administrative duties connected with the Society.

A letter from the Cancer Commission of the California Medical Association approving the program of the Women's Field Army was read. The matter was to be referred to the Cancer Committee of the Society with the request that it coöperate with the local branch of the Women's Field Army.

The Secretary made an announcement concerning the present status of the investigation now being carried out. It was felt that in view of the seriousness of the evidence accumulated by State Narcotic officials, the Board, at an early meeting, should act upon a complaint filed against this member. This action would take the form of preferring formal charges against this member.

In connection with disciplinary procedure, the Secretary made a report on the action recently adopted by the Los Angeles County Medical Society whereby in any disciplinary procedure a complaint is submitted to the Committee on Professional Conduct which, in this county society is the Board of Directors, and that following the filing of this complaint the Board either disposes of the complaint as unwarranted or prefers formal charges signed by the Board members acting as a Committee on Professional Conduct. This report was submitted by the Secretary with the feeling that it removed the personal element from the filing of charges against a member. A motion was made, seconded and carried, to approve the report of the Secretary and adopt the same as a policy to be followed in future disciplinary action. A copy of this report is attached to the minutes of this meeting.

* * *

The San Mateo County Medical Society met in the Staff Room at Mills Memorial Hospital on Wednesday evening, April 20.

Dr. Carl Hoag read an interesting paper entitled *Obstruction Following Gastro-enterostomy and Gastric Resection: A New and Simple Operation for Its Relief.* The paper was discussed by Dr. Kirk Prindle and Dr. Franz Gehrels.

Dr. John B. DeC. M. Saunders of the University of California Medical School closed the discussion. The paper was enthusiastically received by a large audience.

* * *

The regular April meeting of the San Mateo County Medical Society was held jointly with the Medical Society of the Veterans' Administration Facility in Palo Alto on Wednesday evening, April 27.

Following dinner in the nurses' home, a symposium on the *Neuropsychiatric Aspects of Syphilitic Meningoencephalitis* was presented by members of the staff. Dr. Chester M. Carlisle, President of the Medical Society, presented several interesting cases.

* * *

The Board of Directors of the San Mateo County Medical Society met in the library of Mills Memorial Hospital on Friday, May 6.

The following applicants were elected to membership: Dr. Werner Glaser of San Bruno and Dr. Leslie J. Seeley of San Carlos.

The Secretary read a letter from the Judicial Council of the American Medical Association in which a request was made that component county societies base disciplinary action against members only upon violations of the consti-

tution or by-laws or of the principles of medical ethics of the American Medical Association, and not upon rules of conduct or resolutions adopted at some particular meeting. The Secretary was directed to draw up a resolution calling for an amendment to the by-laws of the county society to clarify this point.

The Secretary announced that the Woman's Auxiliary to the San Mateo County Medical Society desired to have a joint meeting with the Society in May. The Board approved such a meeting for May 25, the Woman's Auxiliary to prepare the program.

A report from Dr. William F. Murphy, concerning the Committee on Public Health recently formed by Doctor Gans, County Director of Public Health, and the work of the Subcommittee on Consolidation of Health Units, was presented. The subcommittee recommended consolidation of all health units, including the school nurses, by one of the following two methods: (1) The voluntary turning over of all health units to the county department as provided for by the county charter. (2) The creation of a health district somewhat on the lines of that operated in San Joaquin County. The Board approved the action of the committee and recommended that consolidation might be better carried out according to the first method of approach under the county charter.

The Secretary read a summary of the work so far accomplished by the Medical Survey Committee and made a request of the Board for funds to continue this survey. A motion was made, seconded, and unanimously carried, that the Committee on Medical Survey should employ such funds of the county society as would be necessary to complete the survey. J. Garwood Bridgman, Secretary.

STANISLAUS COUNTY

The regular monthly meeting of the Stanislaus County Medical Society was held on May 10 at the Hotel Modesto.

Dr. Joseph Azevedo demonstrated a form of advertisement in the telephone directory of a certain county medical society in defense of that society against nonmembers. After considerable discussion the Society thought it best not to have any such form of advertising in our local directory.

Mr. Lyon, field director for the Agriculture Workers' Health and Medical Association, completely outlined this program and answered questions. There followed a long discussion, main opposition to the program being by Doctors Morris and Cooper. Finally, it was moved by Doctor Collins, seconded by Doctor Porter, that the program be tolerated as one of charity with the payment to be considered as expense money rather than money for service.

It was moved by Doctor Cooper that doctors doing lodge work contrary to a measure recently passed be reprimanded. If such doctors are not willing to coöperate, that they lose their membership in the Society and the right to use local hospitals. This measure was seconded and passed. It was also suggested by Doctor Cooper that there be no consultation of members in good standing with nonmembers.

Finally, Dr. F. Harold Downing of Fresno gave an interesting talk on *Pitfalls of the Treatment of Fractures.*

Hoyt R. Gant, *Secretary.*

TULARE COUNTY

A regular meeting of the Tulare County Medical Society was held on April 24 in Porterville at Taylor's Café.

Dr. Phil Barber, Vice-President, presided in the absence of Doctor Zumwalt, who was representing this Society at the Council meeting in San Francisco.

Dr. James F. Rinehart of the Department of Pathology at the University of California, was the guest speaker of the evening and spoke on *Differential Diagnosis and Etiologic Factors in Arthritis.* The talk was illustrated by lantern slides.

Dr. I. H. Betts reported on the University of California postgraduate course, which presented a symposium on the digestive system.

Dr. Karl Weiss reviewed a series of normal x-ray findings by lantern-slide projection.

Karl F. Weiss, *Secretary.*

In Memoriam

Lavery, William Andrew. Died at Belmont, April 15, 1938, age 65. Graduate of California Eclectic Medical College, Los Angeles, 1899, and licensed in California the same year. Doctor Lavery was a member of the Placer County Medical Society, the California Medical Association, and a Fellow of the American Medical Association.

✝

McArthur, Peter R. Died at Los Angeles April 5, 1938, age 69. Graduate of the University of Toronto Faculty of Medicine, 1899. Licensed in California in 1900. Doctor McArthur was a member of the Los Angeles County Medical Association, the California Medical Association, and the American Medical Association.

✝

Sloan, Orville Joseph. Died at Glendale, April 30, 1938, age 54. Graduate of the University of Nashville Medical Department, 1907. Licensed in California in 1925. Doctor Sloan was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

✝

Spiegel, Maurice Joseph. Died at Los Angeles, April 22, 1938, age 39. Graduate of the University of Illinois College of Medicine, Chicago, 1932. Licensed in California in 1935. Doctor Spiegel was a member of the Los Angeles County Medical Association, the California Medical Association, and a Fellow of the American Medical Association.

THE WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION†

MRS. CLIFFORD A. WRIGHT.....President
MRS. FRED ZUMWALT.....Chairman on Publicity

News Letter

Dear Auxiliary Members:

As I write this I recall with what trepidation I undertook this task last June, I look back upon the year and realize that some of you made the work, play. I want you to know that I am deeply appreciative of the splendid coöperation you gave to me. To those of you who have hesitated about sending in your reports, your chairman wants *every county represented every month*; the pages allotted us in the state Journal are for that purpose. Help her to help you. Give her of your best and then watch results. Five of our county auxiliaries are new; several are already responding in a manner that speaks well for the future.

From the recommendations below you will see that this department is to have an assistant who will be in charge of these pages. Upon my return the appointment will be made and county publicity chairmen notified.

The Convention report will be published shortly in California and Western Medicine. Some of the more intimate phases of the Convention are published just below.

Cordially yours,

Mrs. Fred H. Zumwalt.

† As county auxiliaries of the Woman's Auxiliary to the California Medical Association are formed, the names of their officers should be forwarded to Mrs. Fred Zumwalt, Chairman of the Publicity and Publications Committee, 3880 Clay Street, San Francisco. Brief reports of county auxiliary meetings will be welcomed by Mrs. Zumwalt and must be sent to her before publication takes place in this column. For lists of state and county officers, see advertising page 6. The Council of the California Medical Association has instructed the Editor to allocate two pages in every issue to Woman's Auxiliary notes.

Report

Because of the arduous duties as editor and publicity chairman, it is our contention that it is asking too much of one person to assume the responsibility of two positions.

We submit the recommendation below to the Board for consideration.

The duties of the editor and publicity chairman are as follows:

1. Preparation of all copy monthly for California and Western Medicine (typing and correcting).
2. Monthly reports to national chairman of publicity.
3. State publicity for newspapers.
4. The making and care of "Auxiliary Log Book."
5. Making of all exhibits to be used at State and National conventions.
6. Editing of semiannual publication, *Courier*.

Due to the growth of the *Courier* it has been the duty of this chairman not only to edit and publish this magazine, but she has had to assume the responsibility of financing it.

Therefore, we recommend that the editor and publicity chairman be given an assistant, whose sole duty shall be the complete charge of the monthly department in California and Western Medicine.

Doane Membership Trophy

We recommend that a definite date be set beyond which the enrollment of members will not be considered in the awarding of the Doane Membership Trophy for the current year and that this date be in advance of the annual convention. (It is suggested that the reports of the county treasurers to the state treasurer, as of March 15, be made a basis of this award.)

We further recommend that a definite policy be established as to whether this award shall be made upon the basis of total enrollment or for new members only, and if the latter, then whether reinstated members shall be counted as new members. (We, the State Board, recommend that the award be made upon the basis of total enrollment.) These recommendations were approved by the House of Delegates.

This Year's Annual Session

A glimpse into a happy past

The Ninth Annual Convention of the Woman's Auxiliary to the California Medical Association has passed (as one figures time), but in memory lives and will linger always. The hospitality of our hostess Auxiliary—that of Los Angeles—can never be forgotten. For our comfort, our pleasure, plans had been made long in advance. Nothing was left undone to make us welcome, and those of us fortunate enough to be their guests heartily say, "Thank you."

Tea on Sunday afternoon—picture a table, beautifully and artistically decorated, presided over by our charming new president, Mrs. Clifford Andrews Wright of Los Angeles, and by Mrs. Eliot Alden, outgoing president of the Los Angeles Auxiliary. (We like to feel that Mrs. Alden belongs to us all, so generous has she been.) At other times during the afternoon Mrs. Robert O'Neal of Santa Monica and Mesdames R. C. Olmstead and Edward W. Jones of Pasadena graciously presided. And we will not forget the pretty young girls who served us. Music was furnished by Pat Dunn and his Manhattans. In the evening the motion picture "Victoria the Great" was shown.

On Monday, May 9, at nine o'clock, the pre-convention Board meeting was held. Then we were whisked away in buses and private cars. Guess where? Have you ever had the privilege of seeing how pictures are made? We did! The studios opened their gates for us and showed us their interesting secrets, and some of us even saw Clarke Gable at luncheon! Then back to the hotel for dinner and the musicale and reception in honor of Mrs. Howard Morrow, wife of the president of the California Medical Association. This was an evening we shall not forget. The Noack Quartet needs no introduction. Sylvian Noack, leader and founder, was concert master of both the Philharmonic and the Hollywood Bowl orchestras for seventeen years. The other members of the quartet are equally well known. The soloist was San Francisco's own *so* beloved, Eva Grunenger Gibson. She is the new president of the San Francisco Auxiliary, and are we proud of her! To those of you who

know her glorious voice mere words are meaningless, and to those of you who have not been so fortunate, you have yet to hear a truly *great* artist.

On Tuesday, May 10, the first general session of the Auxiliary was held at the Hotel Vista del Arroyo. Mrs. Hobart Rogers of Oakland presided in a dignified, gracious manner. A luncheon followed in honor of Mrs. Rogers, presided over by Mrs. Frank Edwin Coulter. Members of the State Advisory Board were guests of honor. Dr. Lowell S. Goin of Los Angeles spoke on *Crux Medicorum*. Mrs. William Henry Sargent of Oakland presented the Doane Trophy to Lassen-Plumas-Modoc County; they have an 80 per cent increase in membership.

In the afternoon a private lecture and demonstration was given at the Planetarium at Griffith Park Observatory by Dr. Dinsmore Alter, after which we were taken to Columbia Square (the new Radio City of the West) to listen in on a national hookup. Those wishing remained and were shown the latest scientific radio apparatus.

In the evening the *President's Ball*. Ask anyone who was there to give you the details—a general good time and dancing to the dawn.

At the meeting of the Auxiliary on Wednesday, the Nominating Committee brought in their report. The following were elected to serve for the coming year: Mrs. Clifford A. Wright of Los Angeles, president; Mrs. Frederick N. Scatena of Sacramento, president-elect; Mrs. A. E. Anderson of Fresno, first vice-president; Mrs. George Calvin of Oakland, second vice-president; Mrs. E. Eric Larson of Los Angeles, corresponding secretary; Mrs. G .Wendell Olson of Fullerton, recording secretary; Mrs. Harry O. Hund of San Rafael, treasurer; Mrs. T. A. Card of Riverside, Mrs. R. Stanley Kneeshaw of San Jose, Mrs. Arthur T. Newcomb of Pasadena, and Mrs. Fred H. Zumwalt of San Francisco, councilors-at-large.

Mrs. Clifford Andrews Wright of Los Angeles, our incoming president, was honored at the luncheon which followed. Mrs. Hobart Rogers presided. The guest speaker was Dr. E. Eric Larson of Los Angeles, his subject being *The Status of Medicine Today*. The honored guests were Dr. John P. Barrow, Dr. Clifford Andrews Wright and the past presidents of the Auxiliary.

The Convention closed with one of the most beautiful and touching ceremonies I have ever witnessed—an old Polynesian Lei ceremony was adapted to our purposes. The lei was likened to the work of our Auxiliary, which had a beginning but no end, whose work is unbounded and whose unity is unquestioned. Mrs. Arthur T. Newcomb, our able Convention chairman, moved us to tears—in fact, there was not a dry eye in that room when three lovely girls, bearing lighted candles, stood silently before the speaker's table while others placed leis of white carnations around the throats of the past presidents, who were standing, symbolizing love sent to the absent ones.

In the afternoon the Huntington Library, with its exhibits and gardens, was visited and later we were taken to Forest Lawn to view the noted art window, "The Lord's Supper."

Will you answer me just these two questions?

How Mrs. Arthur Newcomb managed to maintain such composure after the arduous duties that had been hers during these past months?

Why Mrs. Hobart Rogers looked *so relieved* when she turned over the duties of president?

Mrs. Fred H. Zumwalt.

Component County Auxiliaries

Alameda County

The April meeting of the Woman's Auxiliary to the Alameda County Medical Association was held in honor of our state president, Mrs. Hobart Rogers. At this meeting we had several State Board members as our guests: Mesdames Harry O. Hund, Fred H. Zumwalt, Robert M. Furlong, William H. Sargent, and Harold Trimble.

After a delightful luncheon, Dr. Helen McKnight Doyle gave us a very interesting review of her book, "A Child Went Forth." Our program continued with a lovely group of violin selections given by one of our talented members, Mrs. Chelsea Eaton, accompanied by her sister, Miss Margaret Rubino. The afternoon closed with an informal get-together of the attending 125 members.

❊

Butte County

The Butte County Auxiliary was hostess to the wives and guests of the members of the Northern California Medical Association when that group met in Chico on April 16. About twenty guests from the surrounding country were present.

Mrs. J. H. White, President of the Butte County Auxiliary, welcomed members and their friends at a tea given at her home in Mansion Park. A drive through Bidwell Park and through fields brilliant with wild flowers followed. Later Mrs. N. T. Enloe opened her lovely home for a delightful buffet supper. Mrs. P. L. Hamilton, a Chico Auxiliary member, entertained with a group of songs. Mrs. Enloe was assisted in receiving by Mrs. C. C. Landis, Mrs. E. L. Meyers, and Mrs. J. P. Fabian. It was a very enjoyable day.

The Chico women decorated the tables for the doctors' dinner, held that night at the Hotel Oaks. The speakers' table was very beautiful, with its profusion of flowers artistically arranged.

Several of our members may attend the State Convention and later the National Convention. We hope to gain knowledge that will prove of benefit to the local unit.

Mrs. J. H. White, *President.*

❊

Los Angeles County

The Woman's Auxiliary to the Los Angeles County Medical Association held its regular luncheon meeting at twelve o'clock at the Annandale Country Club in Pasadena, with 145 members present. The program was in charge of the newly formed Pasadena branch.

This is always one of the most delightful meetings of the year, and attracts a large attendance. The tables were a profusion of flowers, beautifully arranged, and the buffet luncheon very attractive and lavish.

Mrs. Edward Winslow Jones of Altadena acted as hostess and opened the meeting, then turned the gavel over to the president, Mrs. Eliot Alden.

The guest speaker was Dr. Lester Brooks Rogers, Executive Director, Associated Hospital Service of Southern California, who spoke on group hospitalization. Several guest artists gave a splendid musical program.

Mrs. Robert L. Carroll, *Corresponding Secretary.*

❊

Marin County

Miss Rose Resnick, blind concert pianist, and her Seeing Eye dog were the special guests of the Marin County Woman's Auxiliary at its dinner meeting on Thursday, April 28, at the Marin Golf and Country Club.

Miss Resnick played several brilliant request numbers. She then spoke to the Auxiliary, giving a very enlightening discussion concerning the training school in New Jersey for Seeing Eye dogs. She explained also that there is a great need for Braille music, especially among those blind who make music their means of support. Short selections for radio presentation are particularly scarce.

At the business meeting, the Nominating Committee gave its selection of officers for the following year, which will be voted on at the next meeting.

Maylon Conroy, *Secretary.*

❊

Orange County

The May meeting of the Woman's Auxiliary to the Orange County Medical Society was held at Long Beach's Pacific Coast Club, following a delightful luncheon and program.

Officers who were nominated at the April meeting were elected to office. They were: Mrs. Hiram Currey of Santa Ana, president; Mrs. E. H. Kersten of Anaheim, vice-president; Mrs. J. B. Price of Santa Ana, secretary; and Mrs. E. J. Steen of Anaheim, treasurer.

Mrs. E. T. McFadden of Santa Ana, who reviewed the *Life of Madame Curie* as the program feature of the afternoon, was introduced by Mrs. Dexter Ball. Hostesses for the day were the Mesdames D. C. Cowles of Fullerton, H. E. Robbins of Garden Grove, Arthur Nies of Orange, Mrs. Lawrence Whittaker of Huntington Beach, and Mrs. L. Wilson of Anaheim.

❧

Riverside County

The April meeting of the Woman's Auxiliary to the Riverside County Medical Society was held at the home of Dr. and Mrs. Ralph Smith, with a very good attendance. Reports show dues very well paid and enough money in the treasury to meet local obligations, such as our yearly contribution to the Community Settlement House, *Hygeia* in the schools, etc.

Plans were made for a tea to be held at the home of Dr. and Mrs. Ray B. McCarty as a last meeting for the season.

Mr. Donald H. Biery of Sherman Institute gave an educational and entertaining talk on the Indians and their health problems, indicating that the Government has really done marvels for the health of the redman.

Later, husbands came in for refreshments and we were entertained by a musical program given by Dr. Ben Garrison and Mrs. E. G. Miller.

❧

San Diego County

The May luncheon meeting of the Woman's Auxiliary to the San Diego County Medical Society was held at the Men's University Club on May 17, the meeting having been changed because of the State Convention in Pasadena.

Mrs. Eaton MacKay gave a most interesting talk upon the *History of Hospitals.* This appropriately followed Hospital Day on May 12 preceding.

Mrs. Hiram J. Newton gave the monthly March of Medicine talk from *Hygeia.*

Brief annual committee and convention reports were given.

Representatives for the American Medical Association Convention in June were anounced as follows: Mrs. C. O. Tanner, Mrs. W. H. Newman, and Mrs. Elliott G. Colby.

The annual election of officers took place: Mrs. C. O. Tanner, president; Mrs. R. Emerson Bond, first vice-president; Mrs. T. M. Cuningham, second vice-president; Mrs. Hiram Newton, secretary; Mrs. Alex Lesem, treasurer; Mrs. Edwin H. Kelly and Mrs. Alfred J. Cooper, members-at-large.

The San Diego Auxiliary is planning to do definite legislative work in the fall. They have also been coöperating closely with the Women's Field Army for the Control of Cancer, headed by Mrs. R. A. Schneiders, City Captain.

At the State Convention, San Diego County had an exhibit of the pages in the County Medical Bulletin, arranged by Mrs. A. J. Hoefer. It is hoped that this may be exhibited in the American Medical Association Convention in June.

The June meeting will be in the form of a tea honoring the new Board. This affair is a most delightful tradition of the San Diego Auxiliary. Mrs. R. Emerson Bond.

❧

San Francisco County

The 1937-1938 fiscal year closed with the annual session on April 19, with the president, Mrs. Hans Barkan, retiring. Six general meetings were held at the home of the San Francisco County Medical Society, 2180 Washington Street, on the third Tuesdays of September, October, November, January, March, and April. The meetings were devoted to hearing major health problems discussed by the following speakers:

Present Status of Bovine Tuberculosis and Its Relationship to Public Health, Philip H. Pierson, M. D.

Campaign for the Control of Venereal Diseases, Russell V. A. Lee, M. D.

Recent Advances in Our Knowledge of the Treatment of Infantile Paralysis, Harold K. Faber, M. D.

Effect of Motion Pictures on Children, Mary H. Layman, M. D.

The Medical Profession's Present-Day Problems, William C. Voorsanger, M. D.

Organization and Functions of the Public Health Department, J. C. Geiger, M. D.

The study group, under the leadership of Mrs. Julius Sherman, met on the first and third Monday afternoons throughout the current year. The history of medicine, public health, and other allied matters furnished the topics for these meetings. Mrs. Frank H. Rodin was chairman of arrangements. Mrs. Rodin also served as county *Hygeia* chairman.

Mrs. Hobart Rogers, State President of the Woman's Auxiliary to the California Medical Association, made an official visit to the Auxiliary at the regular meeting on November 16, at which time she gave a most inspiring talk. The purposes of our organization were clearly outlined, and the importance of the membership supporting the county, state, and national auxiliaries emphasized.

A formal tea for members and guests was given by the officers and directors on November 29 at the society's headquarters, in honor of Mrs. Hobart Rogers. The program consisted of travelogue pictures of Mexico.

Honoring their national president, Mrs. Augustus S. Kech of Altoona, Pennsylvania, members and guests assembled at a formal luncheon on Tuesday, February 8, at the Western Women's Club. Several state officers and county presidents attended. Mrs. Kech delivered a brilliant address, and called attention to the national convention of the Woman's Auxiliary to the American Medical Association, set for June 13 to 17, in San Francisco. Mrs. J. C. Geiger is chairman of arrangements, with Mrs. William H. Sargent serving as vice-chairman.

The evening function of the year was a formal Valentine dinner on February 14 at the beautiful home of the Society, which had been transformed into a perfect setting for the occasion. A musical program and dancing constituted the entertainment of the evening.

Honoring the new members, an informal reception was held on the afternoon of March 15, following the business session of the general meeting. Tea was served in the library. The new members for the year number seventy, making a total of 190 members.

The Nominating Committee, consisting of Mrs. Howard B. Dixon (chairman), Mrs. Ernest C. Dickson, Mrs. Philip H. Pierson, Mrs. John J. Sampson, and Mrs. A. G. Folte, submitted their report on March 15. There being no nominations from the floor, the report was accepted in full.

New officers and directors, installed on April 19 are the following: Mrs. Thomas E. Gibson, president; Mrs. Edmund J. Morrissey, first vice-president; Mrs. A. Lincoln Brown, second vice-president; Mrs. Fred D. Fellows, recording secretary; Mrs. Wilber F. Swett, corresponding secretary; Mrs. William C. Voorsanger, Mrs. E. S. Kilgore, and Mrs. Rea E. Ashley, directors. Mrs. William H. Sargent of Oakland, a past state president, presided as installing officer.

Following the business session of April 19, Miss Helen Zumwalt rendered a beautiful selection of songs. An informal tea, given by the officers and directors for the retiring and incoming presidents, completed the afternoon's program. Mrs. Harry R. Oliver, *Publicity Chairman.*

❧

San Mateo County

The organization meeting was called for April 7. Mrs. Hobart Rogers acted as chairman, and told us of the reasons for and the aims of the organization. At the meeting held on April 20, the following officers were elected: Mrs. Carl Benninghoven, president; Mrs. George W. Sevenman, vice-president; Mrs. James Warburton, recording secretary; Mrs. J. G. Bridgman, Corresponding Secretary; Mrs. Ralph D. Howe, treasurer.

At this meeting twenty-three of the doctors' wives—all of whom were present—joined the Auxiliary.

A meeting of the Board of Directors has been called for May 4, at which time plans for the future will be discussed.

Mrs. J. G. Bridgman, *Corresponding Secretary.*

MISCELLANY

Under this department are ordinarily grouped: News Items; Letters; Special Articles; Twenty-five Years Ago column; California Board of Medical Examiners; and other columns as occasion may warrant. Items for the News column must be furnished by the fifteenth of the preceding month. For Book Reviews, see index on the front cover, under Miscellany.

NEWS

Coming Meetings

American Medical Association, San Francisco, June 13–17, 1938. Olin West, M. D., 535 North Dearborn Street, Chicago, Secretary.

American Academy of Pediatrics, Del Monte, June 9–11. Clifford G. Grulee, M. D., 636 Church Street, Evanston, Illinois, Secretary.

American Academy of Tuberculosis Physicians, San Francisco, June 17–18. Arnold Minnig, M. D., 638 Metropolitan Building, Denver, Secretary.

American Association of Medical Milk Commissions, San Francisco, June 13–14. Paul B. Cassidy, M. D., 2037 Pine Street, Philadelphia, Secretary.

American Dermatological Association, Del Monte, June 9–11. Fred D. Weidman, M. D., 36 Hamilton Walk, Philadelphia, Secretary.

American Heart Association, San Francisco, June 10–11. Howard B. Sprague, M. D., 50 West Fiftieth Street, New York, Secretary.

American Medical Women's Association, San Francisco, June 12–14. Helen A. Cary, M. D., 1634 N. E. Halsey Street, Portland, Oregon, Secretary.

American Ophthalmological Society, San Francisco, June 9–11. Eugene M. Blake, M. D., 303 Whitney Avenue, New Haven, Connecticut, Secretary.

American Proctologic Society, San Francisco, June 11–13. Curtice Rosser, M. D., 710 Medical Arts Building, Dallas, Texas, Secretary.

American Psychiatric Association, San Francisco, June 6–10. W. C. Sandy, M. D., State Education Building, Harrisburg, Pennsylvania, Secretary.

American Radium Society, San Francisco, June 13–14. F. W. O'Brien, M. D., 465 Beaon Street, Boston, Secretary.

American Rheumatism Association, San Francisco, June 13. Loring T. Swain, M. D., 372 Marlborough Street, Boston, Secretary.

American Society of Clinical Pathologists, San Francisco, June 9–11. A. S. Giordano, M. D., 531 North Main Street, South Bend, Indiana, Secretary.

Association for the Study of Allergy, San Francisco, June 9–10. J. Harvey Black, M. D., 1405 Medical Arts Building, Dallas, Texas, Secretary.

Association for the Study of Internal Secretions, San Francisco, June 13–14. E. Kost Shelton, M. D., 921 Westwood Boulevard, Los Angeles, Secretary.

National Tuberculosis Association, Los Angeles, June 20–23. Charles J. Hatfield, M. D., Seventh and Lombard Streets, Philadelphia, Secretary.

Western Branch of American Public Health Association, Portland, Oregon, June 6–8. William P. Shepard, M. D., 600 Stockton Street, San Francisco, Secretary.

Medical Broadcasts*

Los Angeles County Medical Association

The radio broadcast program for the Los Angeles County Medical Association for the month of June is as follows:

Thursday, June 2—KECA, 11:00 a. m., The Road to Health.
Saturday, June 4—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, June 9—KECA, 11:00 a. m., The Road to Health.
Saturday, June 11—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, June 16—KECA, 11:00 a. m., The Road to Health.
Saturday, June 18—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, June 23—KECA, 11:00 a. m., The Road to Health.
Saturday, June 25—KFI, 9:00 a. m., The Road to Health; KFAC, 11:30 a. m., Your Doctor and You.
Thursday, June 30—KECA, 11:00 a. m., The Road to Health.

* County societies giving medical broadcasts are requested to send information as soon as arranged (stating station, day, date and hour, and subject) to CALIFORNIA AND WESTERN MEDICINE, 450 Sutter Street, San Francisco, for inclusion in this column.

Los Angeles County Grand Jury Votes Audit.—County grand jurors recently voted authorization for three special audits. They are as follows:

1. An audit of the expenses of the General Hospital, designed to determine the cost to the taxpayer in the care of indigent sick. . . .

First Syphilis and Tuberculosis Control Health Contests.—This year, as a part of the City Health Conservation Contest conducted annually by the Chamber of Commerce of the United States in coöperation with the American Public Health Association, awards are being made for the most effective community-wide programs for syphilis control and tuberculosis control. . . .

A few of the items considered by the committee were:

The comprehensiveness of case-finding and follow-up services in connection with tuberculosis and syphilis;

The facilities provided for diagnostic and treatment purposes;

And the extent of group participation in programs of education and control.

These and many other items were carefully considered by the committee of health experts in judging the effectiveness of a city's efforts to combat tuberculosis and syphilis.

Fourth Annual Rural Health Conservation Contest Announces Winners.—The Rural Health Conservation Contest, conducted annually by the Chamber of Commerce of the United States in coöperation with the American Public Health Association and financed by the W. K. Kellogg Foundation of Battle Creek, Michigan, announces, among others, the following winner for the 1937 contest:

In the Western Division, the winner is Clallam County, Wash., and awards of merit go to Spokane County, Wash., Yakima County, Wash., and Bannock County, Idaho.

This year, for the first time, the rural health units of Canada were included in a contest sponsored by the Canadian Public Health Association in coöperation with the American Public Health Association. The response in the Canadian contest has been most gratifying. There are at present only forty-one full-time health units eligible for competition. Of these, thirty-five entered and thirty-two of them submitted schedules for grading. In the contest in the United States there were 241 entries.

Some of the points considered by the committee of health experts entrusted with making the awards are:

1. The extent to which the water supply is protected.
2. The point at which sanitation has advanced in rural homes.
3. The safety of the milk supply.
4. Adequate care of prenatal cases.
5. Medical supervision of infants.
6. The availability of well-trained nursing service.
7. The degree in which local physicians and dentists aid in the public health program.
8. Activities to control tuberculosis and syphilis.

These and many other points are used in grading a county or district competing in the contest.

University of Southern California Medical Alumni Association. — The University of Southern California Medical Alumni Association announces a dinner meeting during the American Medical Association session at San Francisco, to be held at the Hotel St. Francis, Room 210, on Wednesday evening, June 15.

All University of Southern California Alumni who are planning to attend the American Medical Association Convention are urged to attend and renew old friendships. An excellent menu and evening of entertainment have been planned. For further information, address Anton Laubersheimer, M. D., Secretary, 1930 Wilshire Boulevard, Los Angeles.

American Medical Golfing Association.— You are cordially invited to play in the Twenty-fourth Tournament of the American Medical Golfing Association on Monday, June 13.

Place—The very smart San Francisco Golf and Country Club, San Francisco. The Club is reserved for the American Medical Golfing Association exclusively on June 13.

Hours for teeing off—7:30 a. m. to 2:30 p. m.

Dinner—At the Club, 7 p. m. Positively no speeches! By-laws state no trophy or prize may be awarded a Fellow who is absent from the annual banquet. Those who remain will be well repaid.

Prizes—Fifty beautiful trophies and prizes—for experts, dubs, beginners—in nine events, both gross and net. Only active Fellows of the American Medical Golfing Association may compete for prizes.

Cost—Seven dollars covers green fee, dinner, tournament fee, refreshments, exceptional entertainment, and prizes. (New Fellows pay an additional enrollment fee of $3.)

Handicaps—At the first tee, present your official handicap, certified by your home club secretary; otherwise the Committee on Handicaps has the right to set your handicap. No handicap over 30, except in the Kickers (Blind Bogey), which is unlimited.

Starting—Foursomes with starting time will be arranged on request. Write Dr. James W. Morgan, Chairman, 384 Post Street, San Francisco.

An Extraordinary Party is being arranged by the San Francisco Committee. Come to see your old friends, make new ones, and, incidentally, try for a nice prize.

Additional information follows:

Local Committee, Dr. James W. Morgan, Chairman, 384 Post Street; Drs. George A. Gray, Ernest D. Chipman, William G. Moore, and George McClure.

FIXED COMPETITION

Morning and Afternoon

1. Association Championship, 36 holes gross. The "Will Walter" Trophy (perpetual), donated and named by the American Medical Golf Association in 1922.
2. Association Handicap, 36 holes net. The "Detroit" Trophy. Donated by the Detroit hosts of 1916.
3. Championship Flight, first gross, 36 holes (formerly Choice Score Championship). The "St. Louis" Trophy (perpetual). Donated by the St. Louis hosts of 1922.
4. Championship Flight, first net, 36 holes. The President's Trophy. Donated by Dr. Walt P. Conaway, Atlantic City, New Jersey.

Afternoon or Morning

5. Low Gross, 18 Hole Gross Championship (first 18 holes played). The "Golden State" Trophy (perpetual). Donated by the San Francisco hosts of 1923.
6. Low Net, 18 Hole Handicap Championship. The "Ben Thomas" Trophy (perpetual). Donated by Philadelphia hosts of 1931.
7. Maturity Event. Limited to Fellows over sixty years of age. The "Minneapolis" Trophy. Donated by the Minneapolis hosts of 1928.
8. The "Oldguard" Championship. The "Wendell Phillips" Trophy (perpetual). Eighteen-hole handicap, limited to competition of past presidents. Donated and named by the American Medical Golf Association in 1930.
9. Kickers' Handicap. The "Atlantic City" Trophy (perpetual). Donated by the Atlantic City hosts of 1937.
10. Other events and prizes to be announced at the first tee.

Medical Alumni of Northwestern University. — In connection with the American Medical Association meeting in San Francisco, the Medical Alumni of Northwestern University Medical School will hold a luncheon on June 15 at twelve o'clock at the Whitcomb Hotel, 1231 Market Street. Dr. James G. Carr will be the speaker. Please make your reservation early by calling the Whitcomb Hotel. For further information, address F. J. Carlson, M. D., 371 Thirtieth Street, Oakland, California.

Development of Public Health Organization.—The progress achieved in the organization of public health departments in California during the past twenty years is shown in the following data:

In 1918 there was but one full-time county health department in California. This comprised only the rural territory of Los Angeles County. There were three cities in 1918 that maintained full-time public health service. They were Los Angeles City, San Francisco, and Palo Alto. These four units comprised 35.9 per cent of the total population of the state.

In 1928 there were ten counties maintaining full-time public health service and, in addition, four cities which provided similar service. Altogether, they constituted 64.5 per cent of the state's total population.

In 1938, there are twenty counties and four additional cities which maintain full-time public health service. These constitute 81 per cent of the total population of the state.

San Jose Controls Dogs.—No less than 2,900 stray dogs were captured in San Jose last year, according to the annual report of the city health department, H. C. Brown, M. D., Health Officer. During the year ninety-four persons were bitten by dogs, 103 dogs were placed under spot quarantine, twenty-three heads suspicious of rabies were sent to the laboratory (sixteen of which proved positive for rabies), three persons were bitten by rabid dogs and two persons by rabid cats, and two persons had wounds contaminated through contact with rabid animals. The Pasteur treatment was administered to seven individuals. This constitutes a most commendable record in the control of a most dangerous and devastating disease. It is largely through activities of this sort that rabies is held in check. Doctor Brown deserves high praise for conducting a successful program in the control of rabies within his community.

American Public Health Association Annual Session. "Public Health in the World of Tomorrow" is the central theme of the sixty-seventh annual meeting of the American Public Health Association to be held in Kansas City, Missouri, October 25–28.

Recognizing that the responsibilities of the health official have expanded by sheer force of necessity into fields of diagnosis and treatment, considered in the very recent past as beyond the circle of health department obligations, the program of the Association's sixty-seventh convention will attempt to look around the corner and see what is ahead for the career man or woman in the public health profession.

It is agreed in Association councils that the advance in public health has been so rapid in the last half-dozen years that a clarification of current objectives and policies is urgently needed. The convention will sound that note at the beginning of its deliberations, getting under way with a session devoted to a discussion of the present state of the health of the nation. Thereafter, the central theme, "Public Health in the World of Tomorrow," will be emphasized throughout the several days of meetings.

The American Public Health Association is a society of professional public health workers. Its membership numbers nearly six thousand and includes health officers, laboratory workers, vital statisticians, industrial hygienists, child hygienists, public health engineers, food and drug experts, health education authorities, nurses, epidemiologists, and others, who specialize in disease prevention and health promotion.

An attendance of three thousand is expected at the Kansas City annual meeting, drawn from every state in the Union, from Canada, Cuba, Mexico, and from abroad.

Another Human Death from Rabies.—A dairyman of Kings County, about the middle of March, noticed that one of his cows did not give milk. On the following day, he observed that the cow was obviously ill and that there was considerable ropy saliva; also that the animal was experiencing difficulty in swallowing. In attempting to treat the cow, he placed his hand deep in the animal's mouth. In so doing, the skin on his knuckles was abraded considerably through contact with the cow's teeth. The animal did not bite, but his hand was scratched on the animal's teeth. No attention was paid to the injury, and the cow died that night. A veterinarian sent the head of the animal to the state laboratory because the animal had died of symptoms typical of dumb rabies.

On the following day, word was received of positive findings in the laboratory. On that afternoon, the dairyman visited his physician and the Pasteur treatment for the prevention of rabies was instituted. At least twelve doses of vaccine were administered, the last two having been given in the patient's home because he was too ill to go to the doctor's office. On March 29 he came for treatment, complaining of headache and discomfort. He remained in bed the following day, March 30, and on the 31st was unable to leave his bed. His temperature rose, and on April 1 he had diminished reflexes, a slight stiff neck, high temperature, and was somewhat lethargic. Death came on April 3. At no time was the patient highly excitable and at no time did he have convulsive seizures. There was no particular difficulty in swallowing.

A postmortem examination was made and the brain was sent intact to the Stanford Medical School at San Francisco, where Negri bodies were found, confirming diagnosis of rabies.

It would appear that about March 1 a pack of dogs killed and partially ate one of the calves on the ranch. During the past few months, two coyotes within the area were found to be rabid, and a number of rabid dogs have been discovered within a few miles of the ranch. While the case is rather atypical of rabies, there can be no question relative to the diagnosis.

Sacramento Wins Health Award.—The city of Sacramento, Dr. Herbert F. True, City Health Officer, has been awarded first place among cities from 50,000 to 150,000 population in the 1937 Inter-Chamber of Commerce City Health Conservation Contest. This award is based upon safety of the water supply, satisfactory sewage disposal, adequate supervision over milk supplies, medical and nursing service for mothers and infants, safeguarding of the community by recognized preventive measures with special emphasis on school health, control of tuberculosis and venereal diseases, together with many other activities that have to do with the conservation of the public health.

A few weeks ago Sacramento was also awarded first place among cities having similar populations for making the best safety record among such cities in the United States.

The Inter-Chamber of Commerce Contest is sponsored by the United States Chamber of Commerce and the American Public Health Association. Sacramento was first entered in the contest in 1931, when its health department ranked twentieth; in 1932 it stood fifteenth; in 1933, twelfth; in 1934, ninth; in 1935, sixth; in 1936, fourth; and in 1938, first.

Some of the 1937 achievements of this department are the establishment of a venereal disease clinic which is a model of efficiency, improvement in laboratory equipment, tuberculin testing in the schools with the assistance of the Sacramento Tuberculosis Association, a campaign for better care of children's teeth sponsored by the Sacramento Dental Society, and the provision of increased and better services for maternal care.

The Sacramento Chamber of Commerce committee that has been instrumental in the development of Sacramento's place in the contest is composed of Dr. Herbert F. True, Dr. Nathan G. Hale, and Dr. Frederick N. Scatena. The City Council, as well as the city manager of Sacramento, James S. Dean, deserve credit for the excellent record made by the Sacramento City Health Department. Mr. Dean has at all times provided the essential support that makes possible the activities of a modern full-time public health administration.

Alpha Epsilon Iota at American Medical Association Session.—Alpha Epsilon Iota Fraternity will meet on Wednesday, June 15, 12:15 p. m., on the roof dining room of the Whitcomb Hotel.

Alpha Epsilon Iota is the national medical women's fraternity, with local chapters at both Stanford and University of California Medical Schools.

For further information, address Mary H. Layman, M.D., 2156 Pacific Avenue, San Francisco.

Ninth Annual City Health Contest Announces Winners.—The Chamber of Commerce of the United States, in coöperation with the American Public Health Association, recently announced the following awards for the 1937 City Health Conservation Contest:

In Group IV (cities of 50,000 to 100,000 population) Sacramento gets the first award, and other awards go to Evanston, Ill., Newton, Mass., Greensboro, N. C., and Saginaw, Mich.

The 1937 contest had 263 entries.

The City Health Contest is conducted anually by the Chamber of Commerce of the United States in coöperation with the American Public Health Association. Awards are given, in each of the six population groups, to those competing cities which, in the opinion of a committee of health experts, have during the past year dealt most effectively with their local health problems.

The committee made it clear that these are *not* prizes for the healthiest cities; they are prizes for the most effective efforts to meet local health problems. Awards are not based on health department programs alone, but rather on the community-wide efforts of all agencies and groups including the work of private practitioners of medicine and dentistry.

Some of the activities considered in judging the contest are: Safety of water supply, satisfactory sewage disposal, adequate supervision of milk supply, planned medical and nursing service for mothers and infants, safeguarding the community by recognized preventive measures, with special emphasis on school health and control of tuberculosis and venereal disease.

These and many other activities are considered in judging a city's health program.

Medical School Plans Camp for Diabetic Children.—The University of California is to attempt something new in the way of recreation—a summer camp for diabetic children—provided negotiations now under way are successfully concluded. Keenly aware of the fact that a number of these children, particularly among the poorer classes, are being denied the delights of vacationland, with its hiking, swimming and kindred sports, merely because of a digestive derangement, the Department of Pediatrics of the University's medical school is attempting to remedy the situation. Provided the proper financial support can be arranged, the first camp will be opened this year, to run for the last two weeks in July and the first two weeks in August. The site of the camp will be announced later.

According to Dr. Francis S. Smyth, Professor of Pediatrics, and Dr. Mary B. Olney, Instructor in Pediatrics, there is no reason why diabetic children should be denied this recreation. With the exception of their single complaint, the children selected would be as fit in every way to enjoy the recreational pursuits that other children enjoy. Boy Scout, Girl Scout, and other recreational and character-building agencies have been interested in these children, but have not been able to supply the careful periodic treatment and special diets that would be necessary, in addition to their camp routine. The physicians state that the problem can be easily solved through the presence in the camp of a trained pediatrician and a small staff of assistants.

It is proposed that Doctor Olney take charge of the camp, together with a voluntary interne, two nurses, and a dietitian. As the diabetic, who is not suffering from any communicable disease, can mix freely with other children, the camp would possibly give them the added pleasure of such associations, under the most wholesome and healthful influences. According to Doctor Olney, such camps have been operated with great success in the states of New York and Ohio, proving not only a great relief to the child but to the parents as well.

Medical Book-Plate Contest in Los Angeles.—The "Library Associates" of the Medical Library of the Los Angeles County Medical Library have offered a $25 prize for a book-plate design for "Library Memorial Fund" books. The Library Associates recently brought that fund into existence. Conditions of the contest follow:

1. Designs may be submitted by any member of the Los Angeles County Medical Association or other individual.
2. Designs must be original.
3. A single individual may submit any number of designs.
4. Designs must be complete and ready for reproduction.
5. All designs submitted shall become the sole property of the Library Associates, but may not be utilized without the payment of $25 to the designer.
6. The contest will close on July 1. Further information may be obtained from the secretary of the Library Associates, Hyman Miller, M. D., 672 South Westlake Avenue, Los Angeles.

Stockton Student Wins Gorgas Essay Contest.—Dr. George Crile, President of the Gorgas Memorial Institute, has advised the Director of the California State Department of Public Health that Marguerite Lujan of Stockton High School, Stockton, has won the California state prize in the Ninth Gorgas Essay Contest. Her essay, together with those from forty-seven other states and the District of Columbia, will be judged by a national committee in the national essay contest conducted by the Institute.

The Gorgas Essay Contest has been conducted annually under the direction of the late Admiral Carey T. Grayson, who was for many years chairman of the Executive Committee of the Institute. Following his recent death, Dr. George Crile, President, has directed the contest.

More than 18,000 high school juniors and seniors competed in the present competition, in which were included public, private, and parochial schools from every state in the Union. The subject assigned was "The Achievements of William Crawford Gorgas and Their Relation to Our Health." The winner of the national contest will receive $500 in cash, with a travel allowance of $200 for a trip to Washington to receive the prize, which is customarily presented by the President of the United States at the White House.

Growth Hormone Isolated Further at University.—An important step toward the final, complete purification of the growth hormone, a substance controlling growth which is secreted by the anterior pituitary gland, has been announced by Dr. Herbert M. Evans, Professor of Biology, and three colleagues, Drs. Miriam E. Simpson, Quentin Bartz, and N. Uyei, at the University of California.

In a scientific paper published recently, the scientists declared, "An approximate 70 per cent increase in yield of the growth hormone and five-fold increase in potency has been obtained." This is the greatest concentration and purification of this substance that has ever been achieved.

The hormone is one of several produced by the anterior pituitary gland, situated at the base of the brain and commonly known as the master gland in man and animals. The growth hormone controls the general development of the entire body. Where there is an overproduction of this hormone by the pituitary gland, giants are produced. On the other hand, if there is a deficiency of the hormone, dwarf-like men and animals are produced.

Up to the present time the isolated hormone has been used in treating only a very few cases of arrested human development due to the fact that impurities still exist in the best concentrations it has been possible to obtain. Doctor Evans' announcement of the great increase in concentration and potency of the hormone achieved at the University indicates that the day may not be far distant when it will be produced in its pure state. Once this purification process is successfully completed, Doctor Evans believes, it will be possible to produce spectacular improvement in children who are stunted because of a pituitary deficiency.

The hormone was first isolated at the University of California by Doctor Evans and a colleague, Dr. J. A. Long, associate professor of embryology. Since that time every effort has been made to obtain greater concentrations of the substance, and experiments will continue until it is finally purified.

Visual Defects in College Students.—Approximately three hundred thousand students in American colleges and universities—or nearly 25 per cent of the entire enrollment—are handicapped in their studies by serious visual defects, it was disclosed in a recent report of the Eye Health Committee of the American Student Health Association.

Surveys of students' vision reveal that the principal defects are astigmatism, farsightedness, and a lack of eye coördination, according to the report, prepared for the committee by Anette M. Phelan, Ph.D., Associate in Health Education, National Society for the Prevention of Blindness. R. W. Bradshaw, M. D., Director of Student Health at Oberlin College, is chairman of the committee.

Pointing out that the discovery and correction of visual defects is of vital concern to college administrators, the report urges a full ophthalmic examination for all students. It calls attention also to the fact that not only do students enter college with twice as many visual defects as their contemporaries who go into industry, but that one in six entering with presumably good vision will need glasses or treatment before graduation, and one in eleven will suffer a serious loss of visual acuity.

Visiting Doctor Tells Adventures in Monkey Quest. Tales of thrilling adventure are not often made part of the calm, quiet routine of a great medical center, but one such tale was told in the University of California Medical School here recently that will not soon be forgotten. The narrator was Professor John Fulton, Sterling Professor of Physiology at Yale University, recently returned from the Philippine Islands in a quest for the rare Tarsius monkey. The brain structure of this monkey bears a close resemblance to that of man, and science has placed a particularly high value on it on that account.

In order to track down the monkey, Professor Fulton was compelled to go to its retreat in the jungle fastnesses of the Island of Bohol. The island, which claims a population of 50,000 natives and only two whites, presents a challenge to the hardiest explorer, but Professor Fulton was equal to the situation. After varying adventures he was able to capture two of the monkeys, and he also captured five lemurs. As the monkeys subsist chiefly on insects, the professor was hard-pressed to get a sufficient supply to last through the long ship voyage to the United States.

The professor's hard work was to go for naught, however. One of the monkeys and three of the lemurs died before the ship reached Honolulu. The other monkey partook of a big Honolulu spider, and a few hours thereafter expired. Professor Fulton ascribes the death of the monkeys to differences in atmospheric pressures particularly. In spite of his bad fortune, he says he is going back again to search for more monkeys as soon as the big Clipper airplanes can provide an air-conditioned room for him. He is sure then that he will be able to "bring 'em back alive."

While here Professor Fulton lectured to the students and staff of the Medical School on nerve coördination.

Physical Upsets Can Be Caused by Worry Alone.—Any individual who indulges in worry of one sort or another over a long period of time will invariably develop changes in the gastro-intestinal tract. Many of those who feel "all upset" in their digestive processes are usually upset in their minds only, and are speedily cured as soon as their minds are set aright.

This is the statement of Dr. Paul A. Gliebe, assistant clinical professor of neuropsychiatry in the University of California Medical School, made after a study of many patients offering themselves for treatment for ills of the digestive organs. Doctor Gliebe related the case of one man who worried so much and so long over the fact that his wife was ill of stomach ulcers that he developed the same type of ulcers himself. His wife was cured under treatment. He ceased to worry about her, and his own disorder thereupon disappeared in due time with little or no attention.

Doctor Gliebe states that, in the hands of a physician trained to utilize the close relationship between mental and physical ailments, many a patient can "talk himself well." Illnesses that are the result of emotional stress and strain usually show marked improvement as soon as the cause is

removed and the patient can achieve some measure of mental discipline.

"The patient with a neurotic illness suffers as much, if not more, than the individual with a structural disease," Doctor Gliebe states. "To the physician these complaints must be considered real and not imaginary. Patients are frequently made worse by repeated x-ray examinations or by other examinations that are done solely to impress him. These patients cannot be hurried. If given sufficient time and the patient is permitted to talk about things other than his symptoms, there is a remarkable shifting of interests and a corresponding change for the better."

Medical Men Help Puncture Old Tradition.—The hide-bound tradition that life ends at forty—or perhaps fifty—as far as industrial and business fitness, productiveness and efficiency are concerned, has now been publicly challenged by one of the very best authorities on the subject—the medical profession. Not only is that tradition being questioned in the ranks of the medical fraternities, but the movement to keep older persons in productive employment, either on a piecework or full-time basis, is being strongly backed by the profession from one end of the country to the other.

These developments were brought out in sharp relief at the recent annual meeting of the American College of Physicians, according to Dr. William J. Kerr, Professor of Medicine in the University of California Medical School and president of the College. As the convention was held in New York, Doctor Kerr had an excellent opportunity to see how that state was refusing to accept the tradition regarding the supposedly decrepit and unfit forties. As a guest of the city, he was taken to Welfare Island, where, in a great hospital, the community is not only returning many of its old folks to gainful employment, but is helping overcome many of the bugaboos regarding the disabling effects of the diseases of the aged. San Francisco is planning a similar hospital at the Laguna Honda Home, the plans for which are in the hands of Dr. J. C. Geiger, Health Officer.

Press Clippings.—Some news items from the lay press, on matters related to medical practice, follow:

Boy Bitten by Mad Dog Sought

Health Officials Trying to Learn Identity of Unknown Victim

Somewhere in Los Angeles a newsboy may be infected with rabies and not yet know it.

Health authorities want that unidentified newsboy to come to the city health department at the City Hall at once for treatment.

The boy was bitten two days ago by a brown mongrel dog at 211 South Fickett Street. The dog was found on a laboratory test to have rabies.

The appeal for the boy to appear was made yesterday by Dr. George Parrish, City Health Officer, who received a report on the incident from Dr. F. B. Gage, in charge of the rabies division of the department.—Los Angeles *Examiner*, May 20.

"Licensed Dog, If Rabid, Safe from Catcher"

"County Unprotected," Health Head Tells Frank Davis

Even if they are suffering from rabies licensed dogs running the streets in Altadena, Monrovia, Arcadia, San Marino, and other territory, not including Pasadena, affected by the recent quarantine cannot be impounded or taken into custody by county or city health authorities. Any officer who impounds a licensed dog, regardless of its condition, is subject to contempt-of-court under the temporary injunction which is effective until Wednesday, April 27.

Such was the interpretation of the injunction given by Dr. J. L. Pomeroy, county health officer, to Frank Foster Davis, Altadenan, who has been leader in the movement for a directed quarantine as the best method of rabies control.

Old County Law

The injunction, secured by James Lindsay, secretary of the Tailwagger Foundation of America, places into effect a county ordinance adopted in 1921 which makes it impossible for any officer to pick up a dog wearing the proper license.

"While we are still able to pick up all unlicensed dogs, we are helpless to do anything if the dog wears a license," Doctor Pomeroy told Mr. Davis yesterday. "This holds good whether the dog has rabies or not."

"If an officer catches a rabid dog and finds that the dog has a license tag, then under the injunction the dog must be released," the health officer told Mr. Davis.

"This has done more harm for dogs and dog owners than anything that could possibly have happened," Mr. Davis quoted Doctor Pomeroy as saying.

Hearing on whether or not the injunction will be made permanent will be held before Superior Judge Emmet Wilson Wednesday.

Will Press "Victory"

A meeting for all dog owners has been called by Mr. Lindsay, who secured the injunction, at 8 p. m. Tuesday in the American Legion Hall, 2035 North Highland Avenue, Hollywood.

"This will be an open forum and we will discuss ways and means of making the temporary order permanent," Mr. Lindsay said.—Pasadena *Post*, April 23.

* * *

Assemblyman Boyle Seeks Colden Seat*

Assemblyman Boyle yesterday announced his candidacy for the Democratic nomination in the Seventeenth Congressional District to succeed the late Representative Colden.

Boyle was first elected to the Legislature in 1932 and served three terms, last year being chairman of the Revenue and Taxation Committee. He lives at 1918 West Seventy-third Street, and is a druggist.

By thus announcing for Congress, Boyle ended rumors that he might contest for the Board of Equalization.—Los Angeles *Times*, May 20.

Parrot Quarantine

Looms After San Francisco Man's Death

Another "parrot quarantine" loomed for San Francisco yesterday, as health officials investigated the death at San Francisco Hospital of sixty-one-year-old Adelbert Henri Houyez, watchmaker, of 3508 Mission Street.

Houyez lived with his pets—a dog, a cat, and "Petit Fille," his parrot, in back of his little shop . For a week or so, he has lamented to neighbors that his parrot, "she is sick!" On Monday, Houyez, too, fell sick and was sent to the hospital, where he died yesterday.

Fearing he was a victim of psitticosis, known as "parrot fever," Health Officer Dr. J. C. Geiger ordered an examination, and had the parrot sent to Hooper Foundation, University of California, for observation. — San Francisco *Examiner*, May 18, 1938.

Social Work Conference in Pasadena

Twenty-five Hundred Delegates Told Security Act Here to Stay by Federal Agent; Health Discussed

"Social Security is here to stay."

That was the assertion last night of Ewan Claque, director of the Federal Bureau of Research and Statistics of the Social Security Board, as he addressed 2,500 delegates to the California Conference of Social Workers in session at Pasadena.

"The program may in the future he modified in certain respects," he said, "and undoubtedly many improvements have yet to be made. However, essential features as set forth in the Social Security Act have been found by experience to be workable and sound.

California Leader

Richard M. Neustadt, director of the twelfth region of the Social Security Board in San Francisco, revealed California was a pioneer in essential public social services now brought together in the title of Social Security Act.

Health by education instead of medicine was promised by Dr. Harry H. Wilson, Los Angeles physician, who addressed a morning group.

Flaying the public for its "apathy" on health questions, Dr. E. F. Penrose of the University of California pointed to the San Francisco Bay, where sewage was disposed of

*Assemblyman James J. Boyle is the author of the article "As a Pharmacist Views the Proposed California Humane Pound Law," which appeared in the April, 1938, issue of CALIFORNIA AND WESTERN MEDICINE, on page 257, having been read at the Los Angeles County Medical Association's joint meeting of physicians and pharmacists.

without previous treatment. He said, "It's the most unattractive waterfront outside of Asia."

Lynn Mowat, general manager of the local Community Welfare Association, considering social and economic planning, said:

"Separate administration of Los Angeles County by state, county and Federal agencies with their fifty million dollar a year bill is unhearable to the business man because of its inefficiency."—Los Angeles *Examiner*, April 26.

American Red Cross Meet Opens in San Francisco

San Francisco, May 2.—(UP)—First annual national convention of the American Red Cross, held west of the Mississippi in thirty-five years opened today with three thousand delegates assembled in huge Civic Auditorium here.

Keynote of the convention was sounded by Norman H. Davis, new chairman of the organization, who paid deep tribute at the opening plenary session to the "far-sighted wisdom of the founders of the Red Cross," and added:

"In this troubled world of today the people of our nation and of every nation on the globe have at least one thing in common. Amidst all the strife, they are at least united by one flag—the Red Cross on a white field—which all people love and respect.

"Today," Davis said, "there is no boundary line in the world which erects a barrier to this heroic emblem of humanity."

The American ambassador-at-large, making his first official speech as chairman of the national organization, expressed gratification that the league of Red Cross societies, representative of sixty-two nations, "is becoming a potent influence for good will, understanding and peace between nations." . . .

Mayor Angelo J. Rossi of San Francisco followed Davis to the speaker's rostrum and welcomed the delegates in the name of the city.

"We hail with the greatest pride and satisfaction, the convening here of representatives of a body of over five million of adult members and nearly nine millions of boys and girls—the flower of our coming manhood and womanhood," the mayor said.

Miss Ruth Ellis, of Stockton, spokesman for the Junior Red Cross at the opening plenary session, outlined the activities of the younger group in "building up a common defense based upon friendship and mutual understanding with all."

"On the youth of the world the peace of the future must rest, not on a few, but on all working together for a common end," she said.

James L. Feiser, vice-chairman in charge of domestic operations, said there never has been a time when there was greater need for "Red Cross strength, courage and purpose than today."

"Fortunately, the Red Cross has never been in stronger position," he said. Feiser estimated a total membership gain in the last three annual roll calls of more than 1,500,000. At the end of 1938, he said, the total adult enrollment should be approximately 5,479,000.

"The Red Cross in the world is seventy-five years old this year. It has gone far with its practical idealism since it was launched into the world as a result of the suffering witnessed by Henri Dunant on the battlefields of Europe," he said.—Los Angeles *Evening News*, May 2.

Functions and Responsibilities of a "Delegate"

A Delegate.—"A delegate is a person appointed and sent to represent another, or others, or to transact business for them; a person who is given authority to vote in a convention, regardless of how or by whom her expenses are paid.

"In the biennial convention of the American Nurses' Association a delegate represents fifty members of the state association of which she is a member.

"She has definite responsibilities and duties.

"She may be instructed by the association as to how to vote on certain questions, or she may not be, but she is expected to have read and studied and to have an intelligent opinion on the business of the convention.

"She is expected to wear her delegate's badge, to attend all business sessions, to be on time and sit through the meetings, and to sit with the other delegates from her state.

"She should report the convention to the unit asking for such report.

"She should be willing to give her wholehearted interest and best thinking to the vital problems discussed in the convention, and to contribute her share in solving them. If she is not willing she should not accept a delegate's credentials. The business of nursing and of nurses is too important not to be taken seriously."—*Minnesota Registered Nurse*, April, 1938.

Criminal Insane Discussed by Doctors and Lawyers

The subject of the criminal insane, from a medical and legal standpoint, was discussed by attorneys and physicians at a joint meeting of the Los Angeles Bar Association and the Los Angeles County Medical Association last night at the Elks Temple.

Fred Belcher, president of the Bar Association, and Dr. George H. Kress, president of the Los Angeles County Medical Association, introduced various speakers. Medical phases of the question were discussed by Dr. Glenn E. Myers, who said:

"There are many flaws in the present procedure in determining guilt or innocence. I take issue with the contention that if a man knows the difference between right and wrong he is actually responsible for his acts. There are many things which can impair a man's judgment, and the present test is a very weak one. There is much work to be done in this respect. In this work our best legal and medical minds should coöperate."

Frederic H. Vercoe, public defender, spoke on the legal aspects. He said: "Although society, as a whole, does not know what goes on in most of our courts, I feel that society itself is amply protected in the matter of insanity pleas in court.

"Figures taken from the Los Angeles county records for the fiscal year 1936–37 show that out of 4,200 cases, only eighty-six men or women pleaded guilty by reason of insanity. Of the eighty-six I found that forty-two pleas were withdrawn. Twenty-four were found actually insane and of this number twenty-three were sent to asylums. From this I conclude that the present law is working successfully."—Los Angeles *Times*, May 20.

Dr. J. D. Dunshee to Face Idaho Charge

Phoenix, Ariz., May 24.—(AP)—Dr. J. D. Dunshee, formerly Pasadena health officer and now local health administrator of the State Department of Public Health, was arrested here today on an indictment returned in Boise, Idaho, yesterday, charging "misuse of state funds."

Also named in the indictment returned by the Ada County Grand Jury was Miss Echo Dell Watson, 24-year-old secretary to Dr. H. L. McMartin, Idaho public health director.

Dunshee was state director of public health in California and city health officer of Pasadena before coming here. Several years ago he organized the Idaho public health service.—Los Angeles *Herald-Express*, May 24, 1938.

LOS ANGELES CHAMBER OF COMMERCE

FIFTY YEARS OF SERVICE: "VISION TO SEE, FAITH TO BELIEVE, COURAGE TO DO"

Los Angeles, California,
May 14, 1938.

To the Editor:—We have received your very interesting letter of May 5, with a copy of the May issue of the official journal of the California State Medical Association calling attention to the rabies situation in Los Angeles.

We believe you are handling the matter in a very fair and sensible way. This Chamber is certainly interested in this matter because it is one of those many things which deter people from coming here, not only for a visit, but to locate permanently.

Oftentimes such a situation can be magnified to such an extent back East that we would have an even worse scare than we periodically have when there is an outbreak of foot-and-mouth disease or an occasional outbreak of plague, serious as they are.

We believe the constituted authorities should proceed in every way to eliminate the stray dogs. These dogs appear to be the chief menace to the proper control of rabies.

With appreciation of your interest and with kind regards, I am

Very truly yours,

LOS ANGELES CHAMBER OF COMMERCE.
Arthur G. Arnoll,
Secretary and General Manager.

† See also press items concerning rabies on page 471.

Concerning court decision of interest to doctors, hospitals, and special nurses.

(COPY)

May 3, 1938.

To the Members of the Attending Staff of the California Hospital:

A knowledge of important points may assist you in avoiding liability.

A Recent Case

Plaintiff, a former hospital patient, brought action for $25,000 damages against the doctor, special nurses, and the hospital for alleged hot water bottle burns.

The following facts were brought out at the trial:

The patient entered the hospital for urological surgery. Special nurses were called by a surgeon from District No. 5 list. After surgery he was in extreme shock and a special nurse placed a hot water bottle between his knees. Thereafter a small red area appeared under one leg, above the knee. After leaving the hospital, this area on his leg showed a necrosis. The doctor had quoted a total price of $300 to cover hospital, special nurses, and doctors. The money was deposited at the hospital, which acted as disbursing agent, and paid the doctor $225.

The judge granted a nonsuit as to the hospital and two of three special nurses.

The jury in its verdict decided the injury was due to the hot water bottle placed by the special nurse. The doctor, however, was held for $5,000 damages, as they decided the special nurse was the agent of the doctor due to contract of $300.

Suggestions

We feel these suggestions are important:

1. Do not make flat-rate contracts to include hospital and special nurses.
2. Do not agree to pay the hospital or the special nurses.
3. The patient or relatives should understand that when a special nurse is needed they may choose their own nurse, or that nurses will be called from the register as an accommodation for the patient; and nurses must be paid directly by the patient, or by hospital for the patient, upon patient's written authority.
4. If the patient is to deposit the money at the hospital for payment of doctors and nurses, explain that this is an accommodation only.
5. Let the patients know that the hospital is a nonprofit charitable institution.

Very truly yours,

THE CALIFORNIA HOSPITAL.
Mr. R. E. Heerman,
Superintendent.

Concerning conditions in China.*

To the Editor:—We are still here in Hong Kong trying to learn Chinese. It is slow to acquire, but is interesting. Dr. and Mrs. Stanton May are studying Mandarin, but Mrs. Wagner and I are studying Cantonese. We expect to spend full time in language study for about three months yet. Perhaps I shall go to Canton then to be with Dr. Floyd Bates for a time before he leaves on furlough. I have spent two days with him in Canton. He has been doing a good work there, particularly in tuberculosis, but it has been greatly hindered by the present conflict.

Doctor May and I visited the Hong Kong University and met the dean of the medical faculty and the professors of anatomy and surgery. I plan to attend the surgical rounds of Doctor Digby and his laboratory classes in operative surgery, and if my language study schedule can be arranged, may spend some time in anatomical dissection.

There is much illness among the Chinese, and a person does not wonder at it when he sees their living habits. Their living quarters are small, dirty, and unheated. Some of them cannot afford rooms and sleep on the pavement with a mat for a mattress and a block of wood for a pillow. The weather at times is quite cool and we have had fire in

* From a letter received by the *Journal of the Alumni Association of the College of Medical Evangelists* from Dr. Ernest Wagner bearing the date of January 17. Doctor Wagner was formerly a resident at the White Memorial Hospital, Los Angeles.

our house for over a month. Many of the people look as if they had not had a bath for many months or years. Their eating habits are remarkable. Most of them look undernourished and probably are. Some of their delicacies are snails, cockroaches, beetles, snakes, field mice, and anything that is eatable. I have seen persons walking up the streets selling snails, and others with baskets of cockroaches. One day a fellow carrying a couple of cats in a basket tried to sell us one. I suppose he thought we wanted a feast. Pig fetuses are a great delicacy.

Tuberculosis is very common. I noticed in the paper that there were eighty-one and eighty-two deaths in Hong Kong in two consecutive weeks. At present there is a smallpox epidemic on. A Chinese doctor told us that 80 per cent of the third-class patients have lues. Nasopharyngeal carcinoma is common and in a younger age group than one usually expects carcinoma. Intrahepatic calculi are more common that gall-bladder calculi.

Dr. Harry Miller was here several weeks ago and I saw him do a subtotal thyroidectomy, a lobectomy, and a ligation. He is taking care of a hundred wounded soldiers at the Wuhan Sanitarium in Hankow. Drs. Carl Wang, Herbert Liu, and Samuel Phang work with him. I have seen them and also Dr. Leslie Butka, who is attending the Division Council. Dr. Herbert Honor was through here last week on his way to Manila. He was appalled by the filth, particularly the spitting on the sidewalks. We are more accustomed to it, but it did bother us at first.

There are a large number of missionaries in Hong Kong who have had to flee from China because of the hostilities. Some of them have lost many of their belongings. It is unfortunate to lose a great deal because a mission salary does not allow one to replace things very fast. We are impressed with the uncertainty of the times, but hope that peace will soon be established so that the work can go on. Some of the men will leave their families here and return to their stations.

We have been receiving the *Journal of the Alumni Association* and enjoy reading it even though the news is a month late when it arrives.

There is much more that could be written, but time and space prevent. Give my greetings to the friends at the College of Medical Evangelists.

ERNEST WAGNER, '34.

Concerning United States Public Health Service Booklet on Syphilis.

TREASURY DEPARTMENT
U. S. PUBLIC HEALTH SERVICE

Washington, May 10, 1938.

Dear Sir:

"The Diagnosis of Syphilis by the General Practitioner"* by Joseph Earle Moore, M. D., was written in response to dozens of inquiries and letters from physicians asking for advice on problems of diagnosis.

Case finding and case treatment, writes Doctor Moore, represent the physician's share in fighting syphilis. "On the whole, experience has convinced me that, in spite of all present-day shortcomings, the treatment element is better performed than case finding. . . . That a decrease in the incidence of syphilis is not yet apparent is due, I believe, largely to the fact that so many syphilitic patients pass completely unrecognized until the damage of infection of others or the ultimate breakdown of the individual has already occurred."

This, then, is Doctor Moore's purpose—to give the general practitioner a handy, clearly written manual of diagnosis. Many tables are used throughout to assist the physician in the distinguishing between actual manifestations of syphilis and other diseases with which they may be confused.

"Who is concerned with diagnosis?" asks Doctor Moore. He answers, "Everyone!"—the urologist, gynecologist, dermatologist, ophthalmologist, laryngologist, orthopedist, neurosurgeon, general surgeon, internist, obstetrician, neurologist, psychiatrist, and pediatrician. "In short," he says, "no special branch of medicine, unless it be the allergist (and even he would find syphilis if he deliberately searched for it) is exempt from having to decide, not infrequently but often, whether his patient has syphilis or some other disease."

Doctor Moore's booklet is divided into the following chapters: "The Diagnosis of Syphillis: General Considerations," "The Diagnosis of Early Syphilis," "The Diagnosis of Latent, Prenatal and Congenital Syphilis," and "The Diagnosis of Late Syphilis."

Sincerely yours,

R. A. VONDERLEHR,
Assistant Surgeon-General, Division of Venereal Diseases.

MEDICAL JURISPRUDENCE †

By HARTLEY F. PEART, ESQ.
San Francisco

Compensation for Professional Services Where Patient Has Died, Becomes Bankrupt, Incompetent or Is Under Some Other Legal Disability

Claims Against Decedent's Estates.—Upon the death of a person on whose behalf a physician has rendered professional services, it is necessary to seek compensation from the estate of such deceased person. The California Probate Code specifies in detail the exact procedure that must be followed in such cases. Failure to follow the Code requirements is likely to result in inability to secure payment.

After the death of a person possessing real or personal property, the first step required by law is the probate of such person's will, if there is a will, or application for letters of administration, if there is no will. As soon as an executor or administrator is appointed, a "Notice to Creditors" must be published in a newspaper at least once a week for a period of four weeks. At any time within six months from the date of the first publication, persons having claims against the estate of the deceased may file such claims with the executor or administrator or the clerk of the Superior Court. *Anyone to whom the deceased was indebted who fails to present a claim in the form required by law within this six months' period thereby forfeits his right to payment from the estate.* Hence, it is absolutely essential upon the death of a person from whom compensation is due to ascertain the date of first publication of notice to creditors and file a proper creditor's claim within six months thereafter.

Creditors' claims must be in writing and must set forth with reasonable particularity the nature of the claim. Further, they must set forth the amount due and must be accompanied by an affidavit of the claimant or someone on his behalf that the amount is justly due, that no payments have been made thereon by the decedent which are not credited and that there are no offsets to the claim to the knowledge of the claimant (Probate Code, Sec. 705). After a creditor's claim is prepared and sworn to before a notary public, it must then be presented either to the executor or administrator or the clerk of the Superior Court wherein the estate is pending.

After a creditor's claim is presented to the executor, administrator or clerk of the court, it may then be allowed or it may be rejected in part and allowed in part. It may also be wholly rejected by the executor or administrator. If it is allowed, it is then submitted for approval by the court and, if approved, it must be paid before any assets may be distributed to the heirs, devisees, or legatees. If allowed for only a portion of the claim, or entirely rejected, the claimant may acquiesce or commence action against the estate on the rejected claim within *three months* after the date of service upon the claimant of notice of rejection (Probate Code, Sec. 714). If the executor or adminis-

† Editor's Note.—This department of CALIFORNIA AND WESTERN MEDICINE, presenting copy submitted by Hartley F. Peart, Esq., will contain excerpts from and syllabi of recent decisions and analyses of legal points and procedures of interest to the profession.

trator fails to act on the claim, such neglect is deemed equivalent to a rejection (Probate Code, Sec. 712).

Bankruptcy Claims.—If a patient either voluntarily or through action of creditors is adjudged bankrupt after professional services have been rendered, but before payment therefor, it is necessary for the physician, if payment is desired, to present a claim against the patient's estate in bankruptcy. A claim in bankruptcy must be established by filing with the trustee or referee in bankruptcy appointed by the court a written statement under oath, signed by the claimant, setting forth the nature of the claim, the consideration therefor (*i. e.*, medical services rendered, consisting of, etc.), whether or not any security is held by the claimant and that the sum claimed is justly owing from the bankrupt to the claimant (Bankruptcy Act, Sec. 57, subdv. A).

Forms for establishing proof of claim in bankruptcy have been promulgated by the Supreme Court of the United States and in making proof the form prescribed by the Supreme Court should be used. Claims against a bankrupt's estate *may* be filed at any time within one year after the adjudication of bankruptcy (Bankruptcy Act, Sec. 57, subdv. N), but should be filed as soon as possible after notice is received of the bankruptcy petition. The earlier a claim is filed the better, because prior to filing of a claim the creditor has no right to participate or share in the bankruptcy proceedings.

If a person goes into voluntary bankruptcy and lists as one of his creditors a physician who has performed professional services on his behalf and such physician does not, within one year from the date of adjudication of bankruptcy, file a claim in the proper manner, all legal right to secure any compensation for such services is lost.

Estates of Incompetent Persons.—When professional services are rendered for a person who is or subsequently becomes incompetent, it is necessary to look to the guardian of such person's estate for compensation. In using the word "incompetent," we are using it in the sense defined in the Probate Code, which is:

> The phrase "incompetent" shall be construed to mean or refer to any person, whether insane or not, who by reason of old age, disease, weakness of mind or other cause is unable, unassisted, properly to manage and take care of himself or his property, and by reason thereof is likely to be deceived or imposed upon by artful or designing persons.

Such a person is supposed to be under the care of a guardian of his person and estate, appointed by the Superior Court (Probate Code, Sec. 1460). Professional services rendered to such a person to be compensable should be rendered at the request of the guardian, if one has been appointed by the Superior Court, and if services are so rendered the guardian is responsible therefor, but only out of the estate of the incompetent. That is to say, a guardian may not be required to resort to his own resources to pay for professional services rendered unless he has previously agreed so to do.

Compensation for Services Rendered to Minors.—When services are rendered to a person under the age of twenty-one years at the request of either parent, or, if the parents be dead, a guardian appointed by the Superior Court, compensation therefor is recoverable from such parent or guardian. If professional services are rendered to a minor without the direction or authorization of his parent or guardian, it is possible that compensation therefor may be recoverable from such minor. Civil Code, Sec. 36, provides that:

> A minor cannot disaffirm a contract, otherwise valid, to pay the reasonable value of things necessary for his support, or that of his family, entered into by him when not under the care of a parent or guardian able to provide for him or them; provided, that these things have been actually furnished to him or to his family.

Under this section it must be noted that:

1. An agreement by a minor alone to pay for professional services rendered to him may be enforceable against him;
2. Whether enforceable or not as against the minor, it is not enforceable against his parents (unless they expressly or impliedly request the services), and hence may only be collectible if such minor has property of his own; and
3. A contract on the part of a minor to pay the reasonable value of things necessary for his support is only valid and enforceable when he is not under the care of a parent or guardian able to provide for him.

SPECIAL ARTICLES

ALAMEDA COUNTY INSTITUTIONS COMMISSION*

Copy of Ordinance No. 250 (Adopted in 1932)

An ordinance relating to the powers and duties of the Alameda County Institutions' Commission, and repealing Ordinance No. 208, entitled "An ordinance creating the Alameda County Public Health Center Board and Prescribing its powers and duties pursuant to the provisions of Section 13 of the charter of the county of Alameda."

The Board of Supervisors of the County of Alameda, State of California, do ordain as follows:

Section 1. Subject to the direction and control of the Board of Supervisors, the Alameda County Institutions' Commission shall have the following powers and duties in addition to those which it now has:

(*a*) It shall organize, supervise, coördinate and administer all of the medical and/or dental services, including the supply of glasses, artificial eyes, limbs, braces and such other appliances as may be required and furnished to the dependent poor and/or indigent sick on behalf of the county of Alameda.

(*b*) It shall determine the services to be rendered through hospitals, health centers and/or clinics throughout the county and it shall determine the location of such clinics and health centers as may be necessary and shall establish such clinics and health centers which may be necessary to supply the service to the indigent sick or dependent poor of the county.

(*c*) It shall direct and supervise the county health and disease prevention program and shall coöperate with all of the agencies, both public and private, engaged in such work in the county of Alameda. It may recommend to the Board of Supervisors contracts under which the county may contract with incorporated areas to assume public health work throughout the county, and when such contracts have been made it may establish such organization as may be required to carry out the prevention and control of disease throughout Alameda County.

(*d*) It shall supervise the expenditure of all funds appropriated by the county of Alameda for said medical and/or dental services and/or prosthetic appliances for the prevention and control of disease and for promotion of public health.

Section 2. All persons who furnish and all county employees employed in agencies and institutions which furnish said medical and/or dental and/or prosthetic appliances shall be appointed, promoted, and removed by the Board of Supervisors upon the recommendation of said Commission, subject to the laws and ordinances relating to Civil Service.

Section 3. The Medical Director shall be the executive officer of the County Institutions Commission and be in immediate charge of all of said persons, agencies and institutions furnishing said medical and/or dental and/or prosthetic appliances, and shall perform his duties under the supervision of said commissions.

Section 4. Ordinance No. 208, entitled "An Ordinance Creating the Alameda County Public Health Center Board and prescribing its powers and duties pursuant to the provisions of Section 13 of the charter of the county of Alameda" is hereby repealed; provided, however, that the persons occupying the positions designated as Items 1K-1 to 1K-7, inclusive, and as Items 1V-1 to 1V-2, inclusive, in Ordinance No. 247 of this county shall continue to hold their respective positions in accordance with the terms of said Ordinance No. 247, until such time as this service is reorganized by said Commission, subject to the laws and ordinances relating to Civil Service, and the persons oc-

* See editorial comment in this issue, on page 396.

cupying said positions shall from the time this ordinance takes effect be under the supervision and direction of said Commission and the Medical Director, and said positions shall, when vacancies occur therein. be filled by appointment of the Board of Supervisors upon the recommendation of said Commission.

Section 5. This ordinance shall take effect and be in force immediately. This Board finds and declares this is an ordinance for the immediate preservation of the public peace, health, and safety, for the reason that the county of Alameda is confronted with a grave problem of unemployment and that it is necessary in order that the unemployed may receive proper medical and other relief and the public peace, health and safety be maintained, that this ordinance shall go into effect immediately. Before the expiration of fifteen (15) days after its passage it shall be published with the names of those voting for and against the same for one week in the Oakland *Post-Enquirer*, a newspaper published in said county of Alameda.

Adopted by the Board of Supervisors of the county of Alameda on the twenty-third day of August, 1932, by the following vote:

Ayes: Supervisors Davis, Richmond, Staats, and Chairman Hamilton—4.

Noes: Supervisors, none.

Absent: Supervisor Heyer—1.

WILLIAM J. HAMILTON,
Chairman of the Board of Supervisors of the County of Alameda, State of California.

Attest:

G. E. GROSS
County Clerk and Ex-officio Clerk of the Board of Supervisors of the County of Alameda, State of California.

MIGRATION OF LABORERS TO CALIFORNIA*

The Los Angeles office of the United States Farm Placement Service has issued a report on outside people seeking manual employment, from the drought states, who have entered California through border checking stations in 1937. The source of the data is the Bureau of Plant Quarantine, Department of Agriculture, of the State of California, through the office of the Farm Security Administration, of the United States Department of Agriculture, San Francisco.

The drought states are specified as Arizona, Arkansas, Colorado, Idaho, Iowa, Kansas, Minnesota, Missouri, Montana, Nebraska, Nevada, New Mexico, Mississippi, Oklahoma, South Dakota, Texas, Utah, Wisconsin, and Wyoming. The report shows that out of 104,976 passengers who entered California by automobile from all states, 78,332 were from the nineteen states designated as drought states. This indicates that 26,644 individuals, seeking manual labor, entered from the remaining twenty-nine states. From Oklahoma came 21,709 individuals seeking manual labor; from Arizona 10,613; from Texas 8,723; from Arkansas, 7,232, from Missouri 6,316; from Kansas 4,484. From Oklahoma, Texas, Arkansas, Arizona, Missouri, and Kansas came a total of 59,077 of these migratory laborers—75.4 per cent of the entire number. The numbers of these workers segregated by single men and by families for the nineteen drought states are as follows:

Drought States	Single Men	Families	Totals
Arizona	1,045	9,568	10,613
Arkansas	660	6,572	7,232
Colorado	733	2,969	3,702
Idaho	497	1,515	2,012
Iowa	270	754	1,024
Kansas	688	3,796	4,484
Minnesota	233	475	708
Missouri	681	5,635	6,316
Montana	348	754	1,102
Nebraska	765	2,259	3,024
Nevada	308	615	923
New Mexico	263	2,417	2,680
North Dakota	171	663	834
Oklahoma	1,755	19,954	21,709
South Dakota	206	958	1,164
Texas	681	8,042	8,723
Utah	347	715	1,062
Wisconsin	110	251	361
Wyoming	153	506	659
Totals	9,914	68,418	78,332

Out of the total of 78,332 migratory laborers who entered the state last year, 73,692 were white; 3,076 were Mexican, 1,126 were colored; 246 were Filipino, and 192 were members of other races.

It is apparent, therefore, that a preponderance of these workers were white people from the South Central states. It is also apparent that the migration of individuals seeking manual labor who migrated to California from other states is almost negligible as compared with the migration of such people from the drought states.

It would seem that most of these 78,332 upon arrival in California settled in the lower San Joaquin Valley. It is in that section of the state where the most acute health problems associated with migratory laborers have been discovered.

The report as released by the Farm Placement Service confirms the informal reports that have been received from the agricultural districts of California. Heretofore, there have been no official statistical summaries issued. This report, however, provides material upon which to base opinions and decisions relative to the proper handling of the health of migratory laborers and to institute proper measures for control of migration into California.

Pomeroy Tells Big Jump in California Relief Load

Sacramento, May 24.—(UP)—Failure of the federal housing program to stimulate residential building, continued influx of migratory workers and widely publicized advantages of California have combined to make an alarming increase in the state relief load, State Relief Administrator Harold Pomeroy said today.

Pomeroy pointed to the unprecedented doubling of the relief load in the San Joaquin Valley as an example of what faces California taxpayers.

"The 1938 unemployment situation is as bad as during the depths of the depression," he declared.

Figures cited by Pomeroy included:

There are 7,500 to 10,000 persons entering California each month, many without adequate funds or gainful occupation.

Six Per Cent Increase

The total load of the State Relief Administration, Works Progress Administration and Farm Security Administration has jumped 6 per cent from 154,000 cases at this time last year to 164,500 this month.

The five San Joaquin Valley counties of Fresno, Madera, Kern, Merced, and Tulare have a total of 16,880 relief cases as compared to only 6,325 a year ago.

The WPA is carrying a larger load each week and is now up to 108,000 cases, about the same as last year.

Despite housing programs, residential building was down 22 per cent in March as against the same month last year.

The *Farm Security Administration*, entering the California relief picture for the first time this year, already has 5,720 cases in the five counties.

Pomeroy explained that California persons needing relief probably are supported more adequately than in any other state. In addition to an average relief allowance of $34.60 per month, second highest in the nation, an average of $3.90 in surplus food commodities was distributed to 20,000 relief cases during April and an average of $9.18 per family was distributed in relief clothing. More than 12,500 women are employed on sewing projects.

Fall Back on Relief

"Seventy-five per cent of migrants entering California come from the states of Arkansas, Oklahoma, Texas, New Mexico, and Arizona, where relief allowances average $4.09 to $8.19 per month." Pomeroy said. "To these workers, California is a land of plenty when you consider that state relief averages start with Mississippi at $3.18 per month, a total of $31.42 less than offered here.

"These migrants often are unable to find steady work, particularly in agriculture, and fall back on relief rolls."

* See also items on pages 397 and 460.

Pomeroy declared unemployment benefits removed 866 persons from the relief rolls in April.

Measures being taken to rehabilitate single unemployed men in cities were explained by the director. Mountain camps have been established where men are given outdoor work until they are physically able to accept WPA or private jobs.

Pomeroy said of the 4,000 single men on relief in San Francisco, 2,500 were physically unable to take jobs. In addition, 12 per cent of the men have venereal disease and are given free and compulsory treatment. Only free board and lodging is offered, but hundreds of the men have been turned back into paying jobs, he said.—Los Angeles *Evening Herald-Express*, May 24, 1938.

Kern County Migrant Relief Rush Stirs Protest

With Thirty-six Thousand on Rolls, Move Starts to Stem Tide: United States Administration Method Hit

Bakersfield, May 24.—(Special to The Los Angeles Examiner.)—With 36,000 persons on various relief rolls in Kern County, citizens have launched a movement to stem the tide of an inrush of penniless farm workers to this area, where workers already number three for every one available farm job.

A citizens' committee of sixty, which has been studying the problem, decided today to appeal to the Federal Government to stop administering relief as it is now being administered by the Farm Security Administration to any migrant who applies for aid. The committee holds that this ready relief acts as a lure and is chiefly responsible for continued arrival of new flocks of penniless families into the San Joaquin Valley, particularly into Kern County.

At Sources

The contention will be made by the committee that the federal agency should discourage this migration at its sources instead of providing, in effect, this encouragement. The ever-increasing influx, curtailment of crop acreages, and the activities of a half-dozen relief agencies have made the situation here one which is threatening the county's financial structure, officials declare.

The migrant labor and relief problem has become so pressing that it imperils every working man and woman, their homes and livelihood, in the opinion of the citizens' committee. . . .

5,179 Seek Jobs

Robert W. Evans, manager of the California State Employment Service, told the group that there are now 5,179 people on file in his office as seeking work, and that with migrants and others not registered the true figure of the unemployed is more than 10,000.

Welfare Director Skelton reviewed the growth of the county's relief budget from $74,000 ten years ago to $800,000 this year, with the prospect of $1,300,000 being required from the county alone in the coming fiscal year.—Los Angeles *Examiner*, May 25, 1938.

LOS ANGELES COUNTY HOSPITAL*

(Continued)

Cut in Hospital Load Sought

Supervisors Discuss Limitations to Reduce Tentative Budget Total

Prospect of establishing limitations on the General Hospital case load, now averaging 2,613 cases, was discussed recently by the Supervisors as a hospital budget of $5,642,359 for 1938-1939 was given tentative approval.

The budget represents an increase of $422,930 over the $5,219,429 allowed in 1937-1938, but the increase is subject to possible further reduction of $111,972, representing group advance salary increases.

WILL OPPOSE ITEM

Chairman Jessup and Supervisor McDonough both declared they will oppose the $111,972 item, so that the hospital budget may likely be reduced to a net increase of $310,958 over last year's budget allowances.

Furthermore, as expenditures in 1937-1938 exceeded by $90,000 budget allowances, the actual hospital increase over last year's expenditures, if salary increases are denied, will be $220,958.

Setting of a "ceiling" for General Hospital cases was discussed, but action was deferred on whether the present case load, or the 3 per cent increase asked by Superintendent Everett Gray, will be granted. The 3 per cent would allow an average increase of seventy-eight cases.

OLIVE VIEW BUDGET

In discussing the Olive View Sanatorium budget with Superintendent Arthur J. Will, however, the Board set a case load for tuberculosis patients of 2,017.

Shift of part of the hospital load on Los Angeles City was discussed when Deputy Counsel McFadden informed the Board he believed General Hospital need not accept the city's contagious nonindigent cases except at city expense.

TOTALS APPROVED

General Hospital budget totals tentatively approved were:

Salaries and wages, $4,781,296, up $443,522.

Maintenance and operation, $814,215, up $25,510.

Capital outlay, $46,848, down $46,102.

Olive View Sanatorium:

Salaries and wages, $1,016,977, up $66,718.

Maintenance and operation, $319,005, up $192,160, all of which will be met by revenue.

Capital outlay, $30,284, down, $64,859.

Total, $1,366,266, for an increase, after deduction of revenue, of $1,019.

Supervisor Jessup Urges Manager for Los Angeles County

Only Way to Curb Mounting Expenditures, Says Chairman of Board of Supervisors

Would Not Be Legislator: Plan Gives Administrative, Financial Problems to One Man; Will Launch Drive

Government costs for Los Angeles County, with a base tax rate which has risen from 88 cents to $1.41 since 1930, with even higher expenditures looming for 1938-1939, can be curbed only by operating under a county manager as business executive.

Roger W. Jessup, Chairman of the Board of Supervisors, made this statement yesterday as he and his colleagues began the task of attempting to cut the county's current preliminary budget of $87,905,741 by departmental slashes.

System Assailed

"The present system makes it possible for any extravagant member of the Board to dodge individual responsibility and at the same time make it virtually impossible for economically minded members to produce results."

Uttering this declaration, Jessup stated handling of county financial and administrative problems "should be placed in the hands of one man," with the five supervisors retaining legislative authority.

Jessup indicated he would immediately launch campaign to achieve his plan, which would entail material changes in the county charter and existing state laws.

Yesterday, the Supervisors considered preliminary budget requests of fourteen county departments.

Budget for principal departments as allowed were: Superintendent of Schools, $146,585, an increase of $5,251 over last year; County Clerk, $508,845, an increase of $15,627; Juvenile Hall, $263,979, increase of $7,849; livestock inspector, $83,704, increase of $17,270, and purchasing department, $77,675, increase of $5,713.—Los Angeles *Examiner*, May 6.

Medical Care Bill Change Expected: Supervisors Back New Hospital Plan

Ability to Pay to Be Factor

Revision Result of Medical Society Complaint

Los Angeles, May 3.—(CNS)—Revision of the method of billing patients at the General Hospital, as a result of the recent attacks made upon the system by Dr. George H. Kress, President of the County Medical Association, were virtually assured today when Supervisor Herbert C. Legg obtained support of Supervisors John Anson Ford and Leland M. Ford in a proposal for modification.

Under Legg's plan, the ability of the patients to pay the time of hospitalization would decide whether he should be billed for the services.

* For other articles dealing with the Los Angeles County Hospital see CALIFORNIA AND WESTERN MEDICINE, as follows: February, 1938, pp. 73 and 78; March, pp. 156 and 216; April, pp. 234 and 297; and May, pp. 309 and 383. In this issue, see page 395.

At present the charities department maintains contact with patients who are rendered hospitalization service and should they at any time be deemed able to pay for treatment, they have the alternative of voluntarily discharging the obligation or being sued in court.

Tells Kern Decision

Legg said that the much-discussed Kern County decision that required uniform billing of county hospital patients definitely "fixes the time for determining ability of the patient to pay as the time when the treatment is rendered and the county should not hound the unfortunate man or woman the rest of his life for payment of these bills."

He said he had asked the county counsel for an opinion as to legality of the proposed modification of billing and collection methods.

Recommendation Due

Supervisor Gordon L. McDonough, Chairman of the Institutions Committee of the Board, said the Medical Advisory Committee of the Hospital had the question under consideration and would make a recommendation to him within a few days.

Supervisor Leland M. Ford said:

"I, too, believe we should not work a hardship on the needy by hounding them for years after they leave the hospital, but of course we should take every precaution against chiselers."

Supervisor John Anson Ford urged that when the changes were made they should include provisions for billing of patients in accordance with their circumstances instead of under the present standardized schedule of charges.—Pasadena *Star-News*, May 3.

* * *

City Urged to Rent Tuberculosis Hospital

Tentative steps toward accepting the offer of private owners to erect a 940-bed tuberculosis hospital and lease it to the county for $108,000 a year were taken by the Board of Supervisors yesterday.

Although delaying definite decision on the proposal, the Board instructed Rex Thomson, Superintendent of Charities, to make a budget request of $468,000 for the project.

The hospital would be erected adjacent to Olive View Sanitarium. Its construction would enable the county to obtain $130,000 a year in tuberculosis aid from the state, officials said.

Marshall Stimson, representing the private owners, said the county would only have to install utilities and equipment, estimated to cost $366,000.

The Board also ordered included in the preliminary budget an item of $45,000 for erection of a twenty-bed smallpox isolation hospital on the General Hospital grounds.—Los Angeles *Times*, April 27.

* * *

Infantile Isolation Building Urged by General Hospital Head

Erection of an isolation hospital at a cost of $1,125,000 to care for patients suffering from infantile paralysis was recommended to the Board of Supervisors today by Everett J. Gray, Superintendent of the Los Angeles County General Hospital.

Gray also recommended that a twenty-bed smallpox hospital be erected, but made no estimate of the cost.

He proposed that both buildings be erected on the General Hospital grounds, south of the present building.—Los Angeles *Herald-Express*, April 22.

* * *

Cancellation Held Void by High Court

Lien Law Not Retroactive

The California State Legislature exceeded its authority in canceling millions of dollars in liens and mortgages taken as surety for relief extended to the needy aged.

This was the ruling of the State Supreme Court today in backing up the stand of the Los Angeles County Supervisors that the Board itself would be held liable for the cancellation of surety deeds should the law prove to be unconstitutional.

Chairman Roger Jessup challenged the constitutionality of that *retroactive part of the law which would cancel liens and mortgages taken prior to last September 1.* This position was upheld by the court.

No attack was made on that part of the law which says that no further lien or mortgage may be taken on property owned by the needy aged, and the court upheld this phase of the legislatioon.

Thousands of persons in the county whose property still has liens against it because of the court's action were reassured that there will be no foreclosure action by the county.

Supervisor Herbert C. Legg said: "The county will use its liens and mortgages only in filing the claims against estates of old-age pensioners after their death in the exact amount of relief that has been extended them."

County Superintendent of Charities Rex Thomson said the county abandoned its practice of taking such liens last September 1, when the law became effective.

Basis of the test case was the refusal of Jessup to cancel twelve mortgage releases, carefully selected to cover every type of case in which liens had been taken in past years.

In Los Angeles County alone there are 400 such liens and mortgages, representing an indebtedness of $960,000 against property valued at $3,500,000.—Los Angeles *Evening News*, May 3.

* * *

County Seeks Way to Curb Hospital Load

Board Orders Study of Budget and Asks Opinion on Banning Communicable Disease Cases

Strict limitation of the number of patients treated in the county's General Hospital as a means of preventing further major increases in costs was ordered studied by the Board of Supervisors yesterday as they allocated $5,742,359 for the institution's 1938-1939 expenditures.

Tentatively granting a $311,000 increase for the coming year above the 1937-1938 budget, the officials declared drastic measures will have to be considered as a means of halting constantly mounting upkeep of the institution.

May Bar Cases

The Supervisors also ordered County Counsel John H. O'Connor to render an opinion on the duty of the county to admit to the General Hospital nonindigent persons, resident in incorporated cities here, who are afflicted with communicable diseases.

Barring of such tuberculosis, smallpox and other communicable disease victims from the General Hospital would compel Los Angeles and others of the forty-four incorporated municipalities in the county to erect their own communicable disease hospitals.—Los Angeles *Examiner*, May 20.

RABIES

1913 Quarantine Statute Not Repealed by 1921 Licensing Law, Rules Judge Emmet Wilson

Elsewhere in this issue appear some press items concerning the rabies situation in Southern California. The following court opinion appeared in the Los Angeles *Daily Journal* of May 18, and should be of interest:

Stating that "A license tag is not an amulet which will immunize against disease," Superior Judge Emmet H. Wilson recently sustained the orders of the State Board of Health quarantining dogs, whether licensed or unlicensed, which were recently issued.

He held that the statute of 1913 authorizing the issuance of quarantine orders was not repealed by the dog license act of 1921 because neither was repugnant to the other and that when two statutes relating to the same general subject are not incompatible with each other, effect must be given to both.

The opinion follows:

Opinion, No. 427355

In the Superior Court of the State of California, in and for the County of Los Angeles.

The Tailwaggers Foundation, a Corporation, Plaintiff vs. Dr. J. L. Pomeroy, County Health Officer, et al., Defendants.

For Plaintiff—James B. Fredericks.

For Defendants—J. H. O'Connor, County Counsel, and Beach Vasey, Deputy County Counsel, Ray L. Chesebro, City Attorney, Robert H. Patton and William Christensen, Deputies City Attorney.

Amici curiae on behalf of defendants—U. S. Webb, Attorney-General, and Bayard Rhone, Deputy Attorney-General.

This action was commenced for the purpose of obtaining an injunction restraining the enforcement of two orders issued by the State Board of Health quarantining dogs, one including a large portion of the county of Los Angeles with the exception of territory within certain incorporated cities,

and the other covering the city of Los Angeles. The orders purport to have been issued pursuant to the quarantine act (Stats. 1913, p. 783, ch. 369; 1 Deering's Gen. Laws, p. 143, act 360) and require all dogs, whether licensed or unlicensed, to be confined within an enclosure or on a leash.

The plaintiff corporation, alleging that it consists of 4,500 dog owners who have procured licenses for their dogs as provided by law, argues that the quarantine act has been repealed by implication, in so far as licensed dogs are concerned, by a later statute relating to the licensing of dogs. (Stats. 1921, p. 1306, ch. 757; am. Stats. 1929, p. 1881, ch. 852; 1 Deering's Gen. Laws, p. 171, act 384.)

The prevalency or nonprevalency of rabies among dogs is not at the present time in issue. It will, therefore, not be necessary to consider any of the affidavits relating thereto or those giving the numbers of licensed and unlicensed dogs that have been found to be afflicted with rabies. A license tag is not an amulet which will immunize against disease. The need of protection to human beings from peripatetic dogs is no less if the dogs be licensed than if unlicensed.

The only question in the case is one of statutory construction. It is not contended that the quarantine orders were not regularly issued pursuant to the requirements of the statute of 1913, or that the orders are invalid or unenforceable, except upon the theory that said statute has been repealed by the statute of 1921 or by the amendments thereto.

It is a rule of statutory construction that the enactment of a law operates to repeal by implication all existing laws inconsistent with or repugnant to the latter, without a formal repealing clause, and where two acts passed at different times are not in terms incompatible with each other, yet if it is clearly evident that the last was intended as a revision of or a substitute for the first, it will repeal the first to the extent in which its provisions are revised or substituted. Another rule of construction is that repeals by implication are not favored and that the repugnancy of one statute to another should be very clear to warrant the court in holding that the one later in time repeals the older when it does not in terms purport so to do. Two statutes must be so construed, if possible, as to give effect to both if it can be done without destroying the evident intent and meaning of the later act.

The act of 1913 has for its purpose the prevention of the introduction of animal diseases dangerous to human beings into portions of the state not infected and to that end authorizes the State Board of Health to establish a quarantine against all animals living within such area as should be specified in the quarantine order. This act is a health and safety measure designed to protect human beings from rabies and other animal diseases. The act of 1921 prohibits the running at large of any dog unless it wears a license tag issued by the proper licensing authority of a city or a county. Nothing in this statute or in any of the amendments thereto purports to be a health measure, and the same contain no provisions relative to the prevention or eradication of disease. It is strictly regulatory, requiring all dogs to be licensed and providing for the impounding of any dog found running at large without a license tag. There is no manifestation of any intent on the part of the legislature to repeal or to modify the health and safety regulations contained in the statute of 1913. The preservation of the public health is one of the most important governmental functions, and the rule against repeal by implication is particularly applicable where the result of such repeal would be to impair a settled prerogative of government. (*County of Inyo* vs. *Hess*, 53 Cal. App. 415, 200 Pac. 373.) Section 4 of the act of 1921, as amended in 1929, declaring it to be unlawful to kill or to impound a dog, the owner of which has complied with that act, "except as otherwise provided herein," cannot be construed as referring to or repealing any part of the act of 1913, but must be held to relate to those portions of the statute of 1921 which, in the cases therein mentioned, permit and authorize the killing of a dog by a person other than the owner.

It is true that dogs are property and that the owners have a property right therein, but, like other property, they must be kept by their owners in such manner as that they will not become a menace to other animals or to human beings.

The act of 1913 being in full force and effect and no claim having been made that the quarantine orders are unnecessary or that the same are not in accord with that act, it is ordered that the several demurrers to the complaint be and they are sustained without leave to amend, the application for a preliminary injunction is denied, the temporary restraining order is dissolved, the order to show cause is discharged, and judgment is ordered in favor of the defendants.

Dated the seventeenth day of May, 1938.

EMMET H. WILSON, *Judge.*

Chemicals Ineffective Against Virus Infections.—The outlook for chemical warfare against virus diseases such as infantile paralysis, influenza, and encephalitis is not encouraging, in the opinion of Dr. Earl B. McKinley, Dean of George Washington University Medical School.

Attempts by himself and his associates, Jean Sinclair Meck and Ellen Gray Acree, to destroy or check the growth of five disease-causing viruses by three chemicals—prontosil, prontylin, and sodium sulphanilyl sulphanilate—under conditions such as would be met in treating patients, all failed, Doctor McKinley reported at the meeting here of the Federation of American Societies for Experimental Biology.

The reason why the chemicals are ineffective against virus infections is, Doctor McKinley suggested, because viruses, unlike bacteria, get inside the cells of the body. The body cells seem to protect the virus from attack by chemicals. Bacteria, such as streptococci, are kept out of the cells and ordinarily occupy the spaces between body cells. Here they are easily attacked by the chemicals which hold the bacteria in check until the germ-fighting cells of the body are able to overcome them.

Clue to Curative Effect.—A clue to why and how sulfanilamid achieves its spectacular cures has been found by Drs. H. A. Davis, L. C. Harris, Jr., and H. C. Schmeisser of the University of Tennessee.

The chemical, it appears from their studies, activates the body's reticulo-endothelial system. Included in this group are cells of the spleen, liver, lymphoid tissue, and the macrophages of the general tissues of the body.

The exact action of sulfanilamid and the related prontosil has been something of a mystery, since the chemicals have not shown much direct germ-destroying power themselves. Solutions of the chemicals put in a test tube with disease germs did not kill the germs to any extent, even though the chemical, when given as medicine, cured the disease caused by the germs.

The clue was found by study of the tissues of white rats that had been given daily injections of the chemical over a period of three months. . . .

A new chemical remedy for burns which may prove superior to the now widely used tannic acid treatment was reported by Drs. K. K. Jones, R. W. Vance, and Quin De Marsh of Northwestern University Medical School.

The chemical is sodium hexametaphosphate. A solution of it prevents infection of burns and other tissue that has lost its skin because of injury. This chemical combines with the fluid oozing from the skinned tissues to form a film that is moist, firm, flexible, and that prevents the growth of bacteria or disease germs.—*Science Service.*

Adie's Syndrome.—Kennedy and his associates call attention to a symptom-complex which has repeatedly been mistaken for syphilis of the central nervous system. Ordinarily it consists merely in tonic reactions of one or both pupils and in the absence of one or all of the deep tendon reflexes. In general, the syndrome has been found in healthy young females without other signs of organic nervous disease. It is generally symptomless except for a not uncommon photophobia on passing from a dark to a light place. The ratio as to sex is about five females to one male. Many of the patients give evidence that the ocular signs have been present since childhood; they have lived many years without the appearance of any other signs or symptoms. Adie restricted the syndrome to those cases in which there are no other neurologic signs and to persons who are otherwise in good health. To report the syndrome in association with every sort of disease is to widen its significance progressively until it loses all meaning and value. Vasomotor instability is also frequently noted in patients presenting this syndrome. Adie's syndrome is a symptom-complex which closely simulates syphilis of the nervous system and is not syphilis. Knowledge of the Syndrome is indispensable to every physician who undertakes to diagnose syphilis of the central nervous system.—*Archives of Ophthalmology.*

In all things relating to disease credulity remains a permanent fact uninfluenced by civilization or education.—Osler.

TWENTY-FIVE YEARS AGO†

EXCERPTS FROM OUR STATE MEDICAL JOURNAL

Vol. XI, No. 6, June, 1913

From Some Editorial Notes:

Legislative Enactments.—Quite a number of public health bills that did not touch upon the "administrative policy" one way or the other, were passed. Whether they will be signed or not of course remains to be seen. When the thirty-day period is over and things are finally settled, they will be discussed. It may be said, however, that all the bills prepared by the Tuberculosis Commission (they will be found in the report of the Commission published in this issue) were passed. Nearly all the bills proposed by the State Board of Health, we understand, were also passed. Later on it will be possible to give some idea of the nature of such of these bills as become laws and what may be expected to result from them.

* * *

New State Insane Asylum.—The legislature, which might well be called the latest experiment in state insane asylums, has adjourned with a record never equaled anywhere at any time. It is conservatively estimated that it will take California at least fifty years to get over the damage done in the last four months. The philanthropic suggestion of Mr. Johnson in his gubernatorial message to the assembled lunatics when they began their banderlog play last January to the effect that any physician licensed to practice medicine anywhere in the United States ought to be given a license in California without further formality, had its due effect; some thirty bills amending the Medical Act or creating new medical laws were introduced; they were nearly all bad; destructive. The prize freak that finally passed, in spite of protests from every school of medicine and from every element of the community, was Senate Bill 813. It is a heart-breaking task to discuss it; it will be found printed in full on another page. It is seldom that a supreme court says anything that is good; but the Supreme Court of California went out of its way to say that it was a wise provision of the legislature (of 1901) to make the standard of the Association of American Medical Colleges the minimum standard for medical education in this state because it is a flexible standard. This "wise provision" the legislature of 1913 has eliminated! There are some parts of this bill which may seem good to you as you read it; but do not be fooled—it is as full of holes and bugs as an infected sponge. Whether the Governor will sign the bill or not, is now the all-important question.

* * *

Insurance Companies' Lies.—Nearly all the insurance companies that are writing indemnity insurance for physicians—insurance against malpractice suits—have been writing and continue to write lies about the Medical Defense of the State Society. And when they do not write absolute and actual lies, they write such clever half-truths that the idea conveyed is just as distorted as though a direct lie had been stated. . . .

* * *

Lack of Support.—. . . If you would take the trouble to look through the advertising pages of your own JOURNAL you would find that nearly everything you may want is therein advertised; and if you would deal with your advertisers—and let them know that you are doing so and taking an interest in them—such an answer would not have been received in this particular case; the advertiser would have continued to help support your JOURNAL. Everything you see in the advertising pages of your JOURNAL is good—remember that. Also remember that the more interest you take in your advertisers the more interest they will take in your JOURNAL and the better journal you will have. But

BOARD OF MEDICAL EXAMINERS OF THE STATE OF CALIFORNIA†

By CHARLES B. PINKHAM, M.D.
Secretary-Treasurer

News

"Hospital routine of an alleged 'abortion mill' at 327 Fillmore Street, was suddenly disrupted yesterday by police raiders. Nine women patients, one of them in bed, were discovered in the place, where a thriving business in illegal surgery has been conducted over a considerable period of time, officers said. Inez L. Brown, well known to police, was taken into custody as the hospital operator, along with Margie Silver, assertedly employed there as a nurse, and booked on a charge of criminal abortion. . . . The Brown woman, volubly protesting that her establishment was only a massage parlor, at first refused admittance to a rear apartment on the third floor. Finally, changing her mind, she showed police into a tiled 'laboratory' or operating room, where instruments and medicinal solutions were found in abundance. She was arrested as the alleged owner of equipment in an abortion hospital raided at the same address in July, 1936, police records revealed. The entire third floor of the building was furnished in semi-hospital style, with eleven beds. Margie Silver, the alleged nurse, was taken to police headquarters for further questioning. (San Francisco *Examiner,* May 5, 1938.) "Inez Brown of abortion mill notoriety has for two years been fighting a $72,500 federal income tax claim, files of a Superior Court lawsuit disclosed today. At one stage of the tax dispute, she was threatened with federal indictment for fraud and was saved by prompt action of an attorney who flew to Washington, pleadings of the lawsuit assert. Assets of the 47-year-old woman, who told raiding police at her Fillmore Street abortion mill last week she was 'just a poor woman trying to rent some rooms,' were listed at $202,956.80 in 1936. The Government claims she failed to file a return on two-thirds of her income between the years 1928 and 1935. Such income as she did report she listed for 'nursing services,' it was learned. Treasury Department agents are checking her income tax returns for the years 1936 to 1938 inclusive, it was reported, as a result of disclosures last week that her income from abortions has reached as high as $550 daily. Mrs. Brown is scheduled to appear before Superior Judge Edmund Mogan tomorrow to resume the civil lawsuit which arose out of a dispute over fees between her and the attorney who represented her before federal authorities in the income tax case. Hartley Russell, tax attorney, said that he was reasonably entitled to $7,000 for representing her and that she has paid only $1,000. Suit against her was brought in the name of V. Snediker, holding an assignment of the claim. She was sued as Inez L. Burns, her legal name. She is the wife of Joseph F. Burns, former assemblyman. Admitting existence of the federal claim, Mrs. Brown claimed Mr. Russell terminated their relationship by agreement. She asks return of $2,000 which she said she paid him." (San Francisco *News,* May 10, 1938.)

"News that Dr. Romano Nicholas Trotsky (Dr. Romano Lukian) was being held for wife desertion in San Angelo, Texas, today recalled a series of hoaxes in the Bay area. Thomas Hunter (Special Agent) and Dr. Charles B. Pinkham of the State Board of Medical Examiners said Doctor Trotsky was refused a medical license here, represented himself as a bachelor nephew of exiled Leon Trotsky and told a thrilling story of his 'escape' from Russia. His police record, according to Mr. Hunter, includes convictions for auto theft, forgery, swindling, violation of the state medical laws, and several suspended sentences for abortions" (San Francisco *News,* May 2, 1938). Newspaper reports relate that Trotsky was brought to Del Rio, Texas, for investigation by the United States Immigration and Naturalization Service in reference to his entrance into the United States. (Previous entry, April, 1937.)

Concerning Cancer.—Cancer has risen in the last twenty-five years from sixth to second place in the rank of killers of mankind—yet today because of scientific progress there is more reason for hope about this disease than ever before, according to the American Society for the Control of Cancer.

This sharp increase in the rate of death from cancer may well be more statistical than real, according to authorities. They point out that two factors contribute largely to it:

1. The upward trend in age levels of our population. As more people live longer, reaching the so-called cancer belt, over forty, there are naturally more deaths from this malignant disease. Improved techniques for dealing with tuberculosis, malaria, scarlet fever, etc., leave more people for the degenerative diseases of old age, among them cancer.

2. Improved diagnostic techniques: when a person dies of cancer now it is recognized as such. Lack of skill in diagnosis usually explains the legends that certain primitive peoples, among them the American Indians, never had cancer.

Cancer of the breast in its early stages is one of the most curable of serious diseases. If taken when still local, it may be cured in 75 per cent of the cases, according to the American Society for the Control of Cancer.

What causes cancer—sudden, wild growth of certain cells—along one of the milk ducts is not entirely understood. It is probably due to chronic irritation of some sort and to hereditary susceptibility.

Good rules for guarding against cancer of the breast:

1. Go to a physician as soon as one notices a lump in the breast. Only 10 or 15 per cent of these will be cancer, but they should be promptly investigated. It is dangerous "to wait and see what will happen" to such a lump. If because of delay cancer cells have metastasized or spread to other parts of the body, the odds are five to one *against* a patient instead of, as in early cancer, three to one in her favor.

2. Be sure to have a complete physical examination once a year by a competent physician.

Despite the widespread popular belief, a blow on the breast will not cause cancer, declare the experts associated with the American Society for the Control of Cancer.—"Bulletin of the American Society for the Control of Cancer."

Expansion of the Sickness Insurance in Germany.—Provisional 1937 statistics for the aggregate of official Sick Insurance organizations indicate an excess of income over expenditure. The number of clubs declined somewhat during the year; there are now 4,598 such units. Total membership increased from 19,400,000 to 22,900,000. Official circles are now attempting to place all Sick Insurance more within the scope of national-political economics. For example, insurance club members with large families are to be eligible for more substantial benefits without any additional contributions being required of them.

Just released by the National Bureau of Statistics are some figures on Sickness Insurance disbursements during the year 1935. These statistics, shown in the accompanying table, represent in round numbers the amounts paid out for various purposes by the clubs under direct governmental control by the Miners' Clubs and by the Supplementary Clubs.

Thus exclusive of the cash benefits paid to members and the costs of administration around 998,000,000 marks was expended by the Sickness Insurance in 1935. It is estimated that the expenditures during 1936 were about 4 per cent greater than in 1935.

Sickness Insurance Disbursements During 1935

Medical and dental treatment	461,000,000 marks
Therapeutic substances and appliances, hospital care and convalescent care	324,000,000 marks
Care of members' dependents	97,000,000 marks
Care during confinement	110,000,000 marks
Prophylaxis and hygiene	5,500,000 marks

Insulin-Hypoglycemia Treatment of Schizophrenia. Cameron discusses certain of the reactions which occurred during the insulin treatment of schizophrenia in twenty patients. Fifteen of the group are considered "old" cases, since the schizophrenic symptoms have persisted for more than a year. The relation between the period of interruption and the subsequent behavior constitutes one of the major guiding principles of the insulin treatment. Not only the behavior prior to termination, but also the depth of the reaction and perhaps the speed of termination have an influence on the succeeding behavior. The relationship between the post-treatment behavior and these three factors varies considerably from patient to patient, but is relatively constant in a given case over periods to be reckoned in terms of weeks. Improvement is most frequently associated with interruption of treatment during any one of four fairly distinct phases. The first phase consists in a period of wakefulness, accessibility and relative clarity, which, with moderate doses, may appear between one and two hours after injection. The second phase consists in the biphasic (clonic) jerking. The third phase consists in the period during which the patient is beginning to enter coma. The fourth phase consists in deep coma in which the patient shows no response to auditory stimulation and in which the corneal reflex is gone. The phases in which the authors have empirically found it most expedient to terminate the reaction are the first and the fourth: the periods of most relative clarity and of deep coma. Importance attaches to the nature of improvement and to the nature of relapse. A further aspect of improvement that is of considerable interest is the concomitant increase of erotic activity. The concept of the "reversal of the psychosis" is considered erroneous. The phenomena so described are considered as arising from an interplay between the growing or lessening stability of the organism and varying degrees of intervals of tissue oxygenization. The author has not witnessed in his cases the high remission rates reported from European centers. Of his twenty subjects, three are able to be at home on a fairly stable basis, and one patient, who had shown previous good remissions sometimes in apparent response to thyroid, sometimes spontaneously, also showed a good remission after a few weeks of insulin treatment and could be discharged if suitable placement was available. Three others have been home on visits, but are still on treatment. A further six are still on treatment, and in the remaining seven treatment has been stopped because of physical conditions or because the response was not sufficiently favorable to warrant further treatment.—*Journal of Nervous and Mental Disease.*

For Acidity and Allied Conditions, we suggest ADAMS SPRINGS MINERAL WATER

● MANY physicians recommend the water in conjunction with the treatment of stomach, liver and kidney trouble.

ADAMS MINERAL SPRINGS is one of the seven known iron and maganese bi-carbonate springs in the world, and the only one in Western America.

It is not a cure-all, but it overcomes acid excesses in the body, and is a very mild but wonderfully effective eliminator. The bowels function without spasm, the kidney output is greatly increased, and there is *marked* drainage of bile from the gall bladder and liver.

There is also some constitutional upset for a few days, particularly in gall bladder cases. But this is soon over and your patient begins to show improvement and is now in condition to profit by any medication you may prescribe. If the case is an operative one, you have improved your patient and made of him a better risk.

We will be pleased to cooperate in any way whatever, and samples of water are yours for the asking.

A Natural Mineral Water
SHOWING MAIN CONSTITUENTS

ADAMS SPRINGS, LAKE COUNTY, CALIFORNIA

Steam heated hotel, open all year around.

3000 feet up in the Lake County Pines.

(Since 1870)

Rest of body and mind, education in regard to what is safe and what is dangerous, good food and fresh air are the medicines that restore health. Intelligent medical supervision, freedom from care and worry, confidence in recovery, conscientiousness in carrying out every detail given by the physician, work miracles, as thousands can testify who have fallen ill of tuberculosis, but who have fought the good fight and won out.—Dr. Lawrason Brown.

LIVERMORE SANITARIUM

• The Hydropathic Department devoted to the treatment of general diseases excluding surgical and acute infectious cases. Special attention given functional and organic nervous diseases. A well equipped clinical laboratory and modern X-ray Department are in use for diagnosis.

• The Cottage Department (for mental patients) has its own facilities for hydropathic and other treatments. It consists of small cottages with homelike surroundings, permitting the segregation of patients in accordance with the type of psychosis. Also bungalows for individual patients, offering the highest class of accommodation with privacy and comfort.

GENERAL FEATURES

1. Climatic advantages not excelled in United States. Beautiful grounds and attractive surrounding country.
2. Indoor and outdoor gymnastics under the charge of an athletic director. An excellent Occupational Department.
3. A resident medical staff. A large and well trained nursing staff so that each patient is given careful individual attention.

Periodic Medical Examination of Automobile Drivers.—At the January 25 meeting of the Académie de médecine a paper was read by Professor Parisot and Dr. G. Richard of Nancy on medical examination of automobile drivers. In 1937 there were 1,700,000 passenger automobiles and 155,000 trucks here as compared with 100,000 twenty years ago. During the last few years there have been between 3,000 and 4,000 deaths and from 50,000 to 70,000 injured annually in France, despite numerous precautions taken to prevent automobile accidents. At the sixteenth medico-legal congress, held in 1931, it was shown that more deaths were due to automobile injuries than to typhoid and diphtheria combined. The human factor is responsible for accidents in from 36 to 80 per cent, according to various statistics cited. Medical examination of chauffeurs has been advocated by the Académie de médecine since 1930. Such tests are already obligatory for drivers of passenger cars and trucks in seventeen European countries. In four others (France, Austria, Belgium, and Switzerland), such an examination is required only of truck drivers. Gratifying results have been noted in Paris since 1928, when medical examination was first required, of all candidates for positions as chauffeurs and mechanics of motor busses and subway trains in Paris. In 1923 there was one accident for each 105,000 passengers and in 1936 only one to 212,300 passengers.

The authorities here have always opposed extension of obligatory medical examination to all chauffeurs, citing England as an example of a country in which there are comparatively few accidents although medical examination is not compulsory. The authors showed the fallacy of this argument by citing statistics of automobile accidents in both England and the United States. There were 204,710 accidents in England in 1933, and as the result of more strict control of the granting of driving licenses this number dropped to 195,892 in 1935. There were 7,343 deaths in 1934 as compared to 6,502 in 1935, and the number of injured dropped from 231,603 in 1934 to 221,726 in 1935. A system of periodic examinations for all taxicab drivers who were above a certain age or showed physical defects was instituted in England in 1936. Every chauffeur above the age of fifty is obliged to submit to a medical examination every six years up to the age of sixty-five, every five years between the ages of sixty-five and seventy-three, and every year thereafter.

A number of examples were mentioned by the authors of fatal accidents due to cardiovascular disturbances in chauffeurs. The authors advocated the passage of a law in France making periodic medical examinations obligatory. This should be carried out according to the following schedule: Every six years for all chauffeurs from eighteen to forty-five years of age, every five years between the ages of forty-five and fifty-five, every three years between the ages of fifty-five and sixty, every two years between the ages of sixty and sixty-five and every year above the age of sixty-five.

Following the reading of this paper, a committee of six fellows of the Académie de médecine was appointed to draw up a law covering these recommendations. (Paris correspondent, Journal of the American Medical Association.)

Low Fat Tolerance in Hot Weather.—During the hot weather, when fat tolerance is lowest, many physicians have found it a successful practice to transfer cod liver oil patients to Mead's Oleum Percomorphum.

Due to its negligible oil content and its small dosage, this product does not upset the digestion, so that even the most squeamish patient can "stomach" it without protest.

There are at least two facts that strongly indicate the reasonableness of the above suggestion: (1) In prematures, to whom cod liver oil cannot be given in sufficient dosage without serious digestive upset, Mead's Oleum Percomorphum is the antiricketic agent of choice. (2) In Florida, Arizona, and New Mexico, where an unusually high percentage of sunshine prevails at all seasons, Mead's Oleum Percomorphum continues increasingly in demand, as physicians realize that sunshine alone does not always prevent or cure rickets.

ADRENALIN CHLORIDE SOLUTION 1:100

THE oral inhalation of Adrenalin Chloride Solution 1:100 is promptly effective in relieving symptoms of bronchial asthma—in most cases results have been quite as satisfactory as those following hypodermic injection of the familiar 1:1000 solution. Nervousness and tachycardia, as well as other reactions which often accompany parenteral administration, are much less frequent following inhalation therapy. Discomfort and inconvenience of hypodermic injection are obviated by this new treatment.

Adrenalin is the Parke-Davis brand of Epinephrine U.S.P. Adrenalin Chloride Solution 1:100 is accepted by the Council on Pharmacy and Chemistry of the American Medical Association; it is supplied in 5-cc. vials, together with dropper for transferring the solution to a suitable atomizer, vaporizer, or nebulizer. The apparatus used must deliver a fine spray entirely free from drops.

Treatment of Acute Alcoholism.—Piker maintains that two cardinal points of attack exist in the treatment of acute alcoholism. They are the stopping of further absorption of alcohol into the blood stream (which involves cessation of drinking and removal of any alcohol remaining in the stomach) and the increasing of circulatory and respiratory efficiency so as to hasten the elimination of alcohol and other existing toxic substances from the tissues, which is best accomplished by caffein. Lavage and caffein, then, provide the core of the therapy of acute alcoholism. Oral magnesium sulfate, alkalis, and fluids are indicated in all cases. For the various more difficult complications, intravenous hypertonic sucrose or dextrose, spinal fluid drainage, paraldehyd, carbon dioxid and oxygen inhalation, heat and apomorphin may be utilized according to the needs in the specific case, but with the use of apomorphin the cardiac condition should be known, as death from heart failure may be the result. Therapy in acute alcoholism, as in all other pathologic conditions, should seek to be rational whenever possible and should not be distorted by the physician's desire to appear spectacular or to relieve himself as quickly as possible of a cumbersome patient.—*Ohio State Medical Journal.*

Marihuana.—Marihuana is the Mexican name for a plant which has recently caused quite a bit of commotion in the United States and also quite a lot of legislation. Nearly every state has passed laws in regard to its distribution, and the Federal Government has considered the situation serious enough to justify a bill to control the growth of the plant and to give marihuana a separate listing among narcotic drugs.

While its use is a new and alarming thing in this country, preparations made from the plant have been either smoked, chewed, or drunk for many centuries in the Old World.

The Assyrians, Egyptians, Greeks, and Romans were familiar with its use and effects, and it was cultivated by the Chinese centuries before the Christian era. It made its first appearance in the western hemisphere in Mexico and from there spread to the United States. Its distribution is now so widespread that, in addition to its cultivation, it may be found growing wild along the roadsides and upon vacant lots in many states, particularly in the West.

The proper name for marihuana is cannabis sativa and cannabis indica; Indian hemp and hashish are synonymous. The plant's commercial value, aside from its narcotic uses, accounts largely for its cultivation throughout the centuries. Twine, rope, bags, and even clothing have been made from its fiber, and it has been found that a rapidly drying oil, useful in paints and varnishes, may be extracted from its seeds.

Indulgence in marihuana in this country is usually by cigarette, and its effects vary with the amount of smoke inhaled, the potency of the leaves (this varies in different plants), and with individual susceptibility.

Usually the first noticeable change in the smoker is the failure to control thoughts and actions, and there is a feeling of increased power and energy and a sense of general well-being. Perception in the matter of time and space is disturbed and illusions occur. Stimulation of the imagination may continue to delirium and a reckless abandon may extend to violence.

In habitual users of the drug the slightest provocation may evoke a violent state and many such subjects are incurable and may end in dementia.

Multiplying Safety.—When your speedometer goes to 50, think of 55 feet. That is how far the car will travel after you decide to stop, before your foot can touch the brake pedal. When the speedometer says 40, think of 44 feet; if 30, 33 feet, and so on. Experts call this the "reaction distance."

To find out how much you need to stop safely at 40 or 50 miles an hour, multiply the "reaction distance" by three. At 50 miles an hour, you would multiply 55 by three, and you know that a distance of 165 feet would be necessary to stop the car.—Barney Oldfield, in *Chicago Journal of Commerce.*

Protection of Eyesight.—Remarkable advances, during the past thirty years, in the program for the protection of eyesight in America—pointing to the possible elimination of the principal diseases causing blindness, the reduction of eye injuries to a minimum, and removal of the chief reasons for eyestrain—are indicated in the recent annual report of the National Society for the Prevention of Blindness, 50 West Fiftieth Street, New York City.

"Efforts to prevent loss of sight from disease were given added impetus in 1937 by the unusual progress of the campaign to stamp out syphilis, an important cause of blindness," the report says. "Laws requiring premarital medical examinations and a blood test for every expectant mother, when adopted by all states, are expected to bring about a great decline in the amount of blindness from syphilis—just as legislation requiring prophylactic drops in the eyes of infants at birth has eliminated ophthalmia neonatorum as a major cause of blindness among children.

"The ten pioneers who established the New York State Committee for Prevention of Blindness, in 1908, were interested mainly in fighting ophthalmia neonatorum, commonly known as babies' sore eyes," the report explains. "From this beginning grew the National Society for the Prevention of Blindness, with its 18,000 members and donors, whose services now extend from the protection of the eyes of the newborn to the preservation of sight in old age.

"Three decades have passed since the small group of public-spirited men and women who organized the movement for prevention of blindness turned their eyes prophetically toward the future. The work they started is, in a most literal sense, enabling thousands of men, women, and children, who might have been blind, to see."

Definite benefits are resulting from the annual campaign for a "safe and sane" celebration of Independence Day, according to the report, crediting state laws which forbid the sale of fireworks except for use by pyrotechnic experts. The Society calls attention, however, to the fact that hundreds of children and adults continue to suffer eye injuries—and that some are blinded—through accidents from fireworks every Fourth of July. "Other sources of accidents to the eyes of children are air-rifles, air guns, and BB guns," the report comments. "New York City and Baltimore during the past year enacted ordinances prohibiting the sale and use of such weapons or toys, and it is expected that these laws will help to reduce accidents to the eyes."

The report discloses that the number of "sight-saving classes" for the education of children with seriously defective vision has increased from the two established in 1913—one in Boston and one in Cleveland—to 558 maintained at the present time in 182 cities throughout the United States; and that forty-four were established in 1937. The children in these classes are provided with books in large type, movable desks, and ideal lighting conditions; and their teachers are specially trained.

The Society's income amounted to $120,000. Since its expenditures amounted to $154,000, it was necessary to use $34,000 from the Reserve Fund. Approximately 500,000 copies of various publications were distributed among doctors, nurses, teachers, social workers, and the general public. A motion-picture film, entitled "Preventing Blindness and Saving Sight," was exhibited to 1,100 audiences with a total attendance of 150,000.

Public Relief.—Costs of public relief in March continued the rise recorded for the five preceding months, according to figures issued today by the Social Security Board. Total federal, state, and local costs incurred for aid to the needy in March, including earnings under the Works Program, amounted to $234,800,000, an increase of approximately $18,000,000, or about 8 per cent, over the total for February.

Figures reported by the Board are compiled regularly in collaboration with other federal agencies and state and local authorities. The March figure includes amounts for the various programs as follows: Public assistance to the needy aged, to the needy blind, and to dependent children

from federal, state and local funds under the Social Security Act, and other public assistance of these special types, $41,244,000; earnings under the Works Program, including the Works Progress Administration and other federal agencies through which wages were paid to persons certified as in need of relief, $124,528,000; Civilian Conservation Corps, $18,558,000; subsistence grants under the Farm Security Administration, $2,583,000; general relief in cash and in kind, by states and localities, $47,887,000. These sums represent substantially all public aid received by the needy, with the exception of aid to transients. Administrative costs are not included.

On the basis of reports received by the Board it was estimated, after allowance for duplications, that in March approximately 6.3 million different households, probably comprising about 19.9 million persons, received public aid of one or more of the types mentioned above. As compared with February, there was an increase of 5 per cent in the number of different households in receipt of public aid.—*Bulletin of the Social Security Board (Press Service).*

Vitamin D and Myopia.—During the last six years there have been forty-eight myopic patients whom Laval has considered young (from 5 to 17 years of age) enough for trial treatment with vitamin D and milk. These patients have taken vitamin D and milk continuously and have been seen at intervals of nine months for from three to six years. In every one of these patients there has been an increase in the amount of the myopia. In some the increase has been only one diopter; in others it has been as much as 2.5 diopters, but not one patient has had a decrease in the amount of the myopia or even an arrest of the progress. All the dietetic and hygienic measures instituted were of no avail in arresting the progress of the myopia. Accordingly, the author disagrees with those who say that treatment with vitamin D and calcium helps patients who have myopia by reducing the amount of the myopia, keeping it stationary or preventing as rapid an increase as is usually found in patients who have not used this form of therapy.—*Archives of Ophthalmology.*

EXERCISE

FOR BOWEL REGULATION

The patient who is unable to exercise or adhere to a suitable diet will appreciate the aid of Petrolagar to maintain a regular bowel movement. Petrolagar softens hard stools and assists the bowel to function normally. Its pleasant flavor, devoid of the oily taste associated with plain mineral oil, makes Petrolagar very easy to take. Prescribe Petrolagar for bowel management, it's "Council Accepted." Petrolagar Laboratories, Inc. • Chicago, Ill.

Petrolagar . . . Liquid petrolatum 65 cc. emulsified with 0.4 Gm. agar in a menstruum to make 100 cc.

Rates, Information and Booklet on Request

"State Medicine" in Rural Areas Cited in Report.—State medicine now exists, in fact, in many rural communities in the United States, and the organized medical profession in those communities likes it.

This situation, which may surprise many, in view of the opposition by organized medicine to anything resembling state medicine, appeared in the report of Dr. R. C. Williams, Medical Director of the Farm Security Administration, to the Conference of State and Provincial Health Authorities of North America at the United States Public Health Service here.

Not Mentioned by Name.—Doctor Williams did not mention state medicine in his report, which is the first public announcement of how the Farm Security Administration is helping farmers secure and pay for medical care for themselves and their families. The system is state medicine in the sense that the money for medical care now comes from the Federal Government. It is not state medicine in that the money is a loan to the farmer, which is being repaid, and in that physicians are not being paid regular salaries by the Government, except in a very few special instances.

Typical of the general program, although details vary in different states and counties, is the situation in Arkansas. There the arrangement has been worked out by agreement between the Farm Security Administration and the Arkansas State Medical Society.

Bills Are Approved.—The Farm Security Administration arranges for each of its farmer clients to pay each month into a medical coöperative fund a certain sum for medical care for himself and family. The amount is fixed by the Administration on the basis of the farmer's estimated annual income. The farmer calls the doctor of his own choice when he or his family needs medical attention. The doctor submits his bill for review by an officer of the medical society who decides on its fairness and authorizes payment on a percentage basis from funds set apart as the coöperative funds for medical services.—*Science Service.*

UMBILICAL AND INCISIONAL HERNIA SUPPORTS

The use of incisional and umbilical hernia supports preliminary to operation is stated by a writer* in the current medical literature as follows:—"... in cases in which the hernia has protruded from the abdomen for some time, if the abdomen can be so compressed by artificial means that the hernia is replaced and the patient can readjust himself to the normal environment of the intestine in the abdomen, there is less likelihood of postoperative distension and vomiting."

Patient with incisional hernia.

Camp incisional hernia supports have proved to be exceptionally efficient when prescribed as a preliminary to operation, for inoperable cases or for those patients who will not consent to an operation.

The lower adjustment strap with the buckle and lacing device anchors the lower sections of the support firmly about the pelvis — thus laying a foundation for the upright sections. With such a firm foundation the upper adjustment strap, coming above the lumbar region, gives added support to the abdomen.

Same patient after application of support.

Modern Weapons Against Cancer.—It is a far cry from the slingshot, the crossbow, the spear, the hideous masquerades, and invocations to spirits of primitive man to the modern machine gun, high explosives, aeroplanes, and poison gas as weapons for both offensive and defensive warfare.

Just so it is a far cry from incantations, wormy chestnuts, buckeyes, rabbit feet, iron finger rings, and similar devices as effective remedies or preventives for all kinds of illness to the modern practice of medicine with its precise laboratory methods, specific antitoxins, marvelous surgical precision, and exact measurements of physical agents used in the war on disease.

Weapons with which the inroads of every disease known to affect humanity have been fought have changed greatly during the ages, and those employed against cancer have shared in this change. Cancer is one of the oldest known diseases, and earliest historical writings are replete with references to weapons used against it. While surgery and heat in some form have been used to treat cancer through the historical era, other methods of little or no value were also employed. As the nature of cancer was but imperfectly understood by the ancients they employed all known artifices in its treatment. Many of their beliefs and practices have persisted to the present time, some modified, others much as they were known at that day.

To mention but a few of these ancient practices, Galen, who lived from 131 to 203 A. D., prescribed very mellow figs, human feces, oils, and pastes for treatment. Guy de Chaullac, whose life dated from 1300 to 1368 A. D., recommended the eating of fish and crabs from rocky streams, the wearing of emeralds and sapphires as preventives, and, for treatment, the daily applications of fresh hen's flesh to the area of cancerous growth held in place by a scarlet cloth.

In the war on cancer the attacking army is composed of but two individuals—the patient and the physician. While these two must act in concert to bring about the desired

(Continued from Preceding Page)

victory, each will use weapons peculiarly adapted to his position on the battle front.

The patient's first act in this battle for life is to rid himself of certain handicaps that interfere with a successful attack. The greatest of these handicaps is the fear that hampers action for self-protection. Cancer is feared because its nature is not understood. It is a mysterious condition to the average person, whose very name strikes terror to the minds of many people. By becoming informed as to the nature and cause of cancer this unreasoning fear can be turned into a healthy protective caution that will become an asset to the patient rather than an ally to the disease.

Among the strongest weapons at the command of the patient are information and knowledge as to the nature and cause of cancer. He must recognize that his cancer is a part of his own tissues, that it is neither contagious nor infectious, nor is there any social stigma attached to the cancer patient.

Before he becomes a cancer patient, the individual should use his most effective weapon, the periodic physical examination, in order to detect the beginnings of the disease. Not only cancer, but many other diseases thus can be detected early in their course and may be prevented by the discovery and correction of minor abnormalities. For both patient and physician this procedure becomes the first line of defense in the warfare on cancer.

If for any reason a person cannot employ the periodic examination as a defensive weapon, he can equip himself with another defense second only in importance to the former. He can know the early signs of cancer, and go at once to his physician when suspicious symptoms develop. The early signs, the "danger signals," are:

1. A painless lump that persists, especially in a woman's breast.
2. A sore that does not heal, particularly about the face, mouth, or lips.
3. An unnatural blood-stained discharge from a natural body opening.
4. Persistent indigestion, often with loss of weight.
5. Sudden changes in size or color of warts and moles.

The cancer patient must use the weapon of courage and be willing to face his situation frankly. He must overcome the fears with which the average patient's mind is so often beset and realize that he cannot run away from his cancer nor influence it by refusing to admit its presence. Cancer cannot be prevented or cured by thinking about it.

An important weapon at the patient's disposal is his confidence in the ability of his physician to see him safely through his treatment. The patient must coöperate with the physician in whatever procedures are necessary in treatment and follow-up. The coöperation between physician and patient has only begun when the first treatment has been given. At least a five-year period must pass before any cancer patient can be classed as cured, and recurrences are found often enough after this period to warrant regular observations during the remainder of the patient's life.

Another excellent weapon against cancer is the patient's willingness to be known as a cured case. This attitude will engender more optimism in the public mind than will almost any other procedure. It will help to dissipate the fallacy that cancer always kills, no matter what treatment is given. When it is realized that there is now an authentic record of more than 29,000 cured cancer patients in the files of the American College of Surgeons, the importance of an optimistic attitude on the patient's part cannot be overemphasized.

The cancer patient plays directly into the hands of the enemy when he resorts to home treatment, listens to the advice of and uses the remedies prescribed by the local druggist, or goes to quacks who advertise or guarantee a cure. Any person who advertises or guarantees a cure, or who demands payment in advance of treatment, is an irresponsible quack and is to be shunned as one would shun a mad dog. No ethical, reputable physician will do any of these things.

If the pastes used by quacks did cure cancer, its treatment by surgery, x-ray, or radium is more precise and effective and much less painful and disfiguring to the patient.

One of the patient's best weapons in his war on cancer is to refuse to listen to the claims of the advertising quack, or the sympathetic advice of friends and relatives extolling the virtues of home remedies, going instead to a reputable physician for such treatment as he deems necessary.

When the public and the medical profession fully realize that cancer is not a single disease, as is tuberculosis or typhoid fever, and that different methods must be used in the diagnosis and treatment of the various types met with, distinct progress will have been made in its control.

The physician has at his command effective weapons with which to fight cancer. One of the most useful is the careful periodic examination of the apparently well person.

Free Breathing for the HAY FEVER SUFFERER

THE difficult breathing accompanying rose fever, hay fever and summer colds can be effectively relieved by use of the synthetic vasoconstrictor, Neo-Synephrin Hydrochloride.

Free breathing is accomplished promptly and without sting. The decongestive effect is of long duration.

Safety—Neo-Synephrin is less toxic in therapeutic dosage than epinephrine or ephedrine, and such untoward symptoms as nervousness or insomnia are rarely encountered following its use.

Colfax School for the Tuberculous

COLFAX, CALIFORNIA

There are two units, The Colfax Hospital and the Bushnell Sanatorium, for the treatment of Pulmonary Tuberculosis.

The Colfax School for the Tuberculous is located in the pine clad Sierra Nevada foothills, at an elevation of 2400 feet; an elevation free from the fogs of the valleys and free from extremes of heat or cold.

This Institution supplies, among other advantages:—

1. Individual care and supervision under skilled physicians.
2. Education as to the essentials of recovery from, and the prevention of the spread of, disease.
3. Complete laboratory and x-ray equipment.
4. Every proved method of treatment, including pneumothorax and phrenic nerve interruption. (Major thoracic surgery referred to skilled thoracic surgeons.)
5. An absence of institutional atmosphere.
6. Reasonable rates.

(Continued from Page 46)

who wishes to know that he is free from this disease. The physician, more than the patient, must know the significance of abnormal conditions that may be either the forerunner of cancer or cancer in its early stages. He must appreciate that cancer detected early is curable in the large majority of cases and take definite action whenever indicated.

The physician who takes lightly an apparently healthy individual's request for an examination to detect the presence or absence of cancer plays directly into the hands of the enemy. All too often the beginnings of cancer are so insidious that the disease is firmly established before giving any visible evidence of its presence. This is the reason why it is necessary to look for it in the apparently healthy person where, if present, it can be found and destroyed without serious consequences to the patient. No physician worthy of the name should ever refuse a reasonable request for an examination to detect the presence of cancer any more than he would refuse to make an examination for any other purpose.

Another modern weapon used by the physician in this warfare against cancer is the microscope. In the hands of a competent physician this weapon searches out the hidden nests of cancer cells in a tissue subjected to examination by it, and often finds these lawless intruders in tissues where their presence was not suspected.

A companion weapon to the microscope is the x-ray, most useful in detecting cancer in internal organs and bones. Cancer in the stomach, intestines, lungs, kidneys, brain, and other internal structures, as well as the bones, is more easily detected by the x-ray than by any other means. Its value as a diagnostic weapon is also being established in regard to other organs and tissues.

Few cancerous growths are so situated that they cannot be removed by surgery or destroyed by radiation, provided they are discovered early in their growth. Surgery with its modifications as cauterization or burning, has been employed as a curative weapon throughout the historical era, and probably long before. Radium and x-rays are the only other curative weapons used against this disease. Their value has been fully established, but they are most effective only when used by physicians with adequate training and experience in the physical problems surrounding their action on living tissue. The use of the x-ray for treatment is more likely to be confined to those with special training in this field because of the expense involved in the purchase and installation of this equipment. On the other hand, radium in almost any desired quantity and form can be rented at no expense to the physician. The use of radium under these conditions is no more a measure of ability to use it than the possession of a kit of surgical instruments would indicate ability as a surgeon.

Occasionally some physician will resort to a weapon now fully discredited and considered almost as much of an outlaw as is cancer itself; the "watchful waiting" weapon, whereby the physician advises the patient with suspicious symptoms to watch them for a few weeks or months to see what additional signs will develop to help in the diagnosis of the case. This weapon is as out of date as is the blunderbuss or bow and arrow as weapons of modern warfare. There is no excuse for a physician to wait longer than the few days needed to establish the diagnosis before beginning the indicated treatment. Each day's delay lessens the patient's chance for a cure.

An important weapon at the disposal of the physician is the knowledge that enables him to be the adviser to his patients about the hopeful aspect of the cancer problem. Knowing that the number of cancer deaths can be reduced by half if existing knowledge about the control of this disease is fully utilized, the physician must maintain an optimistic attitude toward the problem if he is going to help his patient lose his fear and stop his fallacious thinking about his condition. So long as the physician feels that he is fighting a losing battle, just so long will the patient reflect this attitude.—Frank L. Rector, M. D., Field Representative, American Society for the Control of Cancer.

BASIC OPERATIONS IN COMMERCIAL CANNING PROCEDURES

IV. SEALING THE TIN CONTAINER

BRIEFLY, the method of food preservation commonly known as "canning" involves subjecting food in a permanently sealed container to a heat process. The heat process destroys spoilage organisms present on the raw food material; the seal on the container prevents reinfection of the food by such organisms. It is, therefore, obvious that the sealing operation—"closing" or "double-seaming" as it is known in the industry—is one of the most important in the canning procedure.

The manufacture of tinplate and "sanitary" cans is described elsewhere (1).

The open cans are received at the cannery in paper cartons or in washed paper-lined box cars, together with the covers which are contained in fiber shipping tubes. Figure 1 shows a can and end ready for use.

In modern canning practice, the cans are first conveyed by automatic runways to can washers, and thence to the filling tables or fillers where the correct amount of properly prepared raw food is put into the cans. The covers or "ends" are placed in the automatic sealing or "closing" machine to which the open can containing the food is mechanically conveyed. In this machine the ends are "double-seamed" onto the can. This operation is portrayed by the accompanying cross-sectional pictures.

In Figure 2 is shown the relation of can to cover before the sealing operation is started; note the relative position of the "curl" on the cover and the "flange" on the can. In this curl, the can manufacturer has placed a gasket or "compound," usually containing rubber. Figure 3 is a series of photographs illustrating the sealing operation in which the curl and flange are first rolled into position and then the layers of metal flattened together to form the final "double-seam" in Figure 4. The rubber compound originally present on the cover supplies the binding material between the layers of metal necessary to insure a permanent or hermetic seal on the container. Figure 5 illustrates in cross-section a closed sanitary can as it comes to the consumer.

In the past twenty-five years great progress has been made in the development of tinplate, compounds and automatic sealing machines. Collectively, these developments enable present-day canners to impose a permanent seal on the cans containing their products more easily and rapidly than ever before in the history of canning.

CUTTER'S PHASE I CONCENTRATE HAS CERTAINLY SIMPLIFIED PERTUSSIS IMMUNIZATION!

Now only one dose given at each visit

Cutter Phase I concentrate pertussis vaccine contains the same number of organisms, in half the volume, as ordinary pertussis vaccines, and requires only a single injection for each dose.

As with Cutter's regular Phase I pertussis vaccine, Phase I concentrate is grown on human blood media, from fresh cultures, according to the method of Sauer. In addition, both the regular and concentrated Phase I vaccine (Cutter) are checked for toxicity and specific agglutinability according to the criteria of Leslie and Gardiner, and Kendrick and Eldering. The capacity of each lot of Cutter's vaccine to produce Phase I antibodies, when injected into rabbits, is determined.

•

"Entered as second-class matter at the post office at San Francisco, under the Act of March 3, 1879." Acceptance for mailing at special rate of postage provided for in Section 1103, Act of October 3, 1917, authorized August 10, 1918.

FOREWORD

EDITOR'S NOTE.—*For many years, the California Medical Association has printed annually a Membership Directory, some issues having more than two hundred pages. In recent years, the Board of Medical Examiners of the State of California, with headquarters at 417 State Office Building, Sacramento, has also printed a directory, containing the name, date of birth, years of licensures in different states, and the office address of every physician and surgeon licensed under its jurisdiction. The State Board Directory has also contained much other information concerning the Medical Practice Act, and narcotic and other laws related to healing-art practice in California. A copy of each year's directory is sent to every physician and surgeon who has a license to practice in California.*

Directories of the California Medical Association brought off the press in the past have also presented historical and other information of similar nature.

In order to avoid duplication of printing and other costs, the California Medical Association in the last few years has printed a membership roster giving the names of members and the city or location in which they practice, with key numbers to indicate county medical society membership. This information, when used in connection with that given in the directory of the State Board of Medical Examiners, should answer all ordinary needs.

For additional information, inquiry should be made of the secretaries of the California Medical Association or the Board of Medical Examiners of the State of California.

For reference convenience, CALIFORNIA AND WESTERN MEDICINE *is printing this Membership Roster, containing the names of all members through date of December 31, 1937, as a supplement to its February issue. For possible future use, members are advised to place this Membership Roster Supplement in their library files.*

OFFICERS OF THE CALIFORNIA MEDICAL ASSOCIATION

General Officers

President—Howard Morrow 384 Post Street, San Francisco.
President-Elect—William W. Rohlee, 202 Mission Inn Rotunda, Riverside.
Speaker of House of Delegates—Lowell S. Goin, 414 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Vice-Speaker of House of Delegates—John H. Graves, 977 Valencia Street, San Francisco.
Chairman of Council—Morton R. Gibbons, 350 Post Street, San Francisco.
Vice-Chairman—Junius B. Harris, Medico-Dental Building, 1127 Eleventh Street, Sacramento.
Chairman of Executive Committee—Karl L. Schaupp, 530 Medico-Dental Building, 490 Post Street, San Francisco.
Chairman of the Committee on Public Relations—Charles A. Dukes, 601 Wakefield Building, 426 Seventeenth Street, Oakland.
Past President—Edward M. Pallette, 502 Wilshire Medical Building, Los Angeles.
Secretary-Treasurer—Frederick C. Warnshuis, 450 Sutter Street, Room 2004, San Francisco.
Editor—George H. Kress, 945 Roosevelt Building, 727 West Seventh Street, Los Angeles.
General Counsel—Hartley F. Peart, Room 1800, 111 Sutter Street, San Francisco.
Associate General Counsel—Hubert T. Morrow, Van Nuys Building, 210 West Seventh Street, Los Angeles.

Councilors

(In addition to the elected district and at-large Councilors, the Council has as ex officio members, the general officers and the Chairman of the Committee on Public Relations. Chairman of Council, Morton R. Gibbons; Secretary, Frederick C. Warnshius.)

District Councilors

First District—Imperial, Orange, Riverside, San Bernardino and San Diego Counties, Calvert L. Emmons (1938), 206 Emmons Building, Ontario.
Second District—Los Angeles County, Carl R. Howson (1939), 701 Merritt Building, 307 West Eighth Street, Los Angeles.
Third District—Kern, San Luis Obispo, Santa Barbara and Ventura Counties, Louis A. Packard (1940), 563 Haberfelde Building, Bakersfield.
Fourth District—Calaveras, Fresno, Inyo, Kings, Madera, Mariposa, Merced, Mono, San Joaquin, Stanislaus, Tulare and Tuolumne Counties, Axcel E. Anderson (1938), Medical Group Building, 1759 Fulton Street, Fresno.
Fifth District—Monterey, San Benito, San Mateo, Santa Clara and Santa Cruz Counties, Alfred L. Phillips (1939), Farmers and Merchants Bank Building, Santa Cruz.
Sixth District—San Francisco County, Karl L. Schaupp (1940), 530 Medico-Dental Building, 490 Post Street, San Francisco.
Seventh District—Alameda and Contra Costa Counties, Oliver D. Hamlin (1938), 389 Thirtieth Street, Oakland.
Eighth District—Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties, Frederick N. Scatena (1939), Medico-Dental Building, 1127 Eleventh Street, Sacramento.
Ninth District—Del Norte, Humboldt, Lake, Marin, Mendocino, Napa, Siskiyou, Solano, Sonoma and Trinity Counties, Henry S. Rogers (1940), Petaluma.

Councilors-at-Large

Harry H. Wilson (1938), 1919 Wilshire Boulevard, Los Angeles.
C. O. Tanner (1939), 3255 Fourth Street, San Diego.
William H. Kiger (1940), 911 Wilshire Medical Building, 1930 Wilshire Boulevard, Los Angeles.
Morton R. Gibbons (1938), Union Square Building, 350 Post Street, San Francisco.
T. Henshaw Kelly (1939), 830 Medico-Dental Building, 490 Post Street, San Francisco.
Junius B. Harris (1940), Medico-Dental Building, 1127 Eleventh Street, Sacramento.

Standing Committees

Executive Committee

The President, the President-elect, the Speaker of the House of Delegates, the Chairman of the Council, the Chairman of the Auditing Committee, the Chairman of the Committee on Public Relations, the Past President, the Secretary-Treasurer and the Editor. Honorary members	2
Total all members	5867

Seventy-eight members died during the year 1937.

Note.—The California Medical Association by-laws provide for an annual directory. Because every member receives the annual directory of the Board of Medical Examiners of the State of California, and in order to avoid the great cost of duplication of such a directory, the California Medical Association Council has decided to print in the official journal a simple roster of members, giving for each member the city or place of residence, with a key number to indicate the county medical society in which membership is held.

For additional information concerning school of graduation, etc., the State Medical Board directory or the central office of the California Medical Association should be consulted.

Errors in the list here printed should be promptly reported to the central office of the California Medical Association, Four Fifty Sutter, San Francisco.

SALUTATION FROM PRESIDENT MORROW

To Members of the California Medical Association—

Greetings:

I salute you in the name of our profession and extend to you a very cordial invitation to attend the sixty-seventh annual session of your Association in Pasadena, May 9 to 12.

HOWARD MORROW, M.D.
President, California Medical Association
1938

Our annual session affords the opportunity for every member to acquire information upon medical progress by hearing the presentations and discussions of competent clinicians and teachers. In addition, there are the inspiration and pleasure of meeting one's friends, forming new acquaintances, and engaging in the scheduled social functions. The personal benefits received more than compensate for the time spent in attending. A careful reading of the announcements, therefore, should induce you to plan to be present, and I sincerely trust that you will come.

At this time, I desire to officially extend expressions of appreciation to the section officers and speakers for their labor and contribution of time in preparing and taking part in the scheduled program. The success, the benefits, and the good that attends this session will be largely due to your efforts. We are grateful for your services and coöperation.

Lastly, may I emphasize anew that your membership affiliation is one of your most valuable possessions. Your loyalty to your county and state medical organizations will materially enhance the results accruing to you as a member. I bespeak your continued interest and sustained support, to the end that our Association and its constituent units may meet the problems of the times, and formulate well considered and directed solutions that will greatly help to secure public confidence and good will. We can lead, instead of being led.

Cordially,

HOWARD MORROW, *President.*

GUEST SPEAKERS AT THE SIXTY-SEVENTH ANNUAL SESSION CALIFORNIA MEDICAL ASSOCIATION

Speakers at General Meetings

UDO J. WILE, M.D.
Professor of Dermatology and Syphilology, University of Michigan Medical School, Ann Arbor, Michigan

ALFRED BLALOCK, M.D.
Professor of Surgery, Vanderbilt University, Nashville, Tennessee

TINSLEY R. HARRISON, M.D.
Associate Professor of Medicine, Vanderbilt University, Nashville, Tennessee

ALEXIS FRANK HARTMANN, M.D.
Associate Professor of Pediatrics, Washington University, School of Medicine, St. Louis, Missouri

Committee on Public Relations

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is Charles A. Dukes. The Secretary is Frederick C. Warnshuis. The director of the Department of Public Relations is Frederick C. Warnshuis. The chairman of the Committee on Public Relations is, ex officio, a member of the Council.

Fred B. Clarke, Chairman, Committee on Health and Public Instruction.
Daniel Crosby, Chairman, Committee on Hospitals, Dispensaries, Clinics.
Morton R. Gibbons, Chairman, Committee on Industrial Practice.
E. Vincent Askey, Chairman, Committee on Membership and Organization.
John H. Graves, Chairman, Committee on Medical Economics.
Junius B. Harris, Chairman, Committee on Public Policy and Legislation.
Charles A. Dukes, Chairman, Cancer Commission.
John C. Ruddock, Chairman, Committee on Postgraduate Activities.
Howard Morrow, President of California Medical Association.
William W. Roblee, President-elect.
Frederick C. Warnshuis, Secretary-Treasurer.

Communications for the Public Relations Department should be addressed to the Director, Frederick C. Warnshuis, M.D., Room 2004, 450 Sutter Street, San Francisco.

Cancer Commission

Orville Meland (Secretary for Southern Section), Los Angeles....1938
A. Herman Zeiler, Los Angeles....1938
Gertrude Moore, Oakland....1938
Harold Brunn, San Francisco....1939
Henry J. Ullmann, Santa Barbara....1939
Clarence G. Toland, Los Angeles....1939
Charles A. Dukes (Chairman), Oakland....1940
Lyell C. Kinney (Vice-Chairman), San Diego....1940
Otto H. Pflueger (Secretary), San Francisco....1940

Communications for the Cancer Commission should be addressed to the secretary, Otto H. Pfleuger, M.D., Room 2004, 450 Sutter Street, San Francisco.

SPECIAL COMMITTEES

Committee on a Qualifying Certificate (Basic Science) Law

George H. Kress (General Chairman)....Los Angeles
Morton R. Gibbons (Chairman for Bay Region)....San Francisco
Edward M. Pallette (Chairman for Southern California)....Los Angeles
Junius B. Harris (Chairman for Remainder of State)....Sacramento

Committee on Animal Experimentation

Philip K. Gilman (Chairman)....San Francisco
Charles A. Dukes....Oakland
Loren R. Chandler....San Francisco

REGISTRATION INFORMATION

Registration and Information. The registration and information desk is located in the patio, Hotel Huntington. All persons attending the convention, whether members or not, are requested to register immediately on arrival. Beginning Monday, May 9, registration secretaries will be on duty daily from 9 a. m. until 7 p. m.

Programs and "Pre-Convention Bulletin." The registration clerks will give to every member a copy of the program. The "Pre-Convention Bulletin" will be printed in the April issue of CALIFORNIA AND WESTERN MEDICINE. Delegates and alternates are especially requested to read the reports of officers and committees.

Guests and Visitors. All guests and visitors are requested to register. All general meetings and scientific meetings are open to visitors and guests.

Badges. Four kinds of badges will be issued by the registration bureau:

1. *Members.* Only active, associate, retired or honorary members of the California Medical Association will be given the usual membership badge.
2. *Guests.* A guest badge will be issued to all fraternal delegates and visiting physicians who are attending this year's session.
3. *Delegates and Alternates.* The usual official badge for each delegate and alternate is provided for this purpose, and will be issued only to one authorized to wear it.
4. *Officers.* An official badge is provided for all officers and members of the Council.

Suggestions and Constructive Criticism. The officers and committees have tried to do everything possible to make the session a success. Suggestions and constructive criticism calculated to make future sessions more useful will be welcomed by any of the officers. Complaints of whatever character should be promptly made at the registration desk, where they will receive attention.

General Announcements

1. Members are requested to register and obtain their copy of official program and special announcements.
2. Delegates will please file their credentials with the Credentials Committee between 7:00 and 8:00 p. m., Monday, May 9.
3. *Special Announcements:* For these, consult bulletin board.
4. *Visit the Exhibits:* Located in the Patio.
5. *President's Dinner:* Guests of the Hotel Huntington will obtain special tickets from room clerk. Others will obtain banquet tickets at the registration desk. Price $2.50 per plate.
6. Section meeting places are posted on the lobby directory.
7. For general or special information, consult the clerks at the registration desk.

† On Wednesday afternoon the following Sections will join in a Symposium on "Shock": Medicine, Surgery, Obstetrics and Gynecology, Eye, Ear, Nose and Throat, Pediatrics, Pathology and Anesthesiology.

PROGRAM: BY DAYS

Sunday, May 8

9:00 a. m. to 4:30 p. m.—Clinical Pathological Conference. (To be held in Room 359 Science Building, University of Southern California, Thirty-sixth Place and University Avenue, Los Angeles.)

10:00 a. m. to 4:00 p. m.—Radiological Conference. (To be held in Main Ballroom, Huntington Hotel.)

8:00 p. m.—Council Meeting.

Monday, May 9

10:00 a. m.—Opening General Meeting. (Main Ballroom, Huntington Hotel.)

1:30 p. m.—Scientific Section Meetings.

8:00 p. m.—House of Delegates: First Meeting.

Tuesday, May 10

7:30 a. m.—Past Presidents' Breakfast.

8:30 a. m.—Section Meetings.

11:15 a. m.—General Meeting—Clinical-Pathological Conference.

1:00-6:00 p. m.—Recreation. (No scientific meetings during this period.)

7:30 p. m.—President's Dinner; Reception and Dance.

Wednesday, May 11

8:30 a. m.—Section Meetings.

11:15 a. m.—General Meeting.

1:30 p. m.—Section Meetings.

4:15 p. m.—Medical Society of State of California.

8:15 p. m.—House of Delegates.

Thursday, May 12

8:30 a. m.—Section Meetings.

9:00 a. m.—Council Meeting.

* * *

Note.—Council meets daily.

Watch bulletin board for special announcements.

Visit Commercial Exhibits.

Secure tickets for President's dinner at registration desk *before* Tuesday noon.

I—GENERAL MEETINGS

All General Meetings will be held in the Main Ballroom, Hotel Huntington

First General Meeting

Monday, May 9, 10 a. m.

1. *Address of Welcome*—George H. Kress, M. D., President, Los Angeles County Medical Association.
2. *Announcements*—Secretary F. C. Warnshuis, M. D.
3. *President's Annual Address*—Howard Morrow, M. D., San Francisco.
4. *The Relation of Syphilis to Surgical Problems*—Udo J. Wile, M. D., Ann Arbor, Michigan, Professor of Dermatology and Syphilology, University of Michigan. (By invitation.)

Second General Meeting

Tuesday, May 10, 11:15 a. m.

President Howard Morrow, Presiding

1. *Clinical-Pathological Conference*—Conducted by Alfred Blalock, M. D., Professor of Surgery, Vanderbilt University, Nashville, Tennessee; and Tinsley R. Harrison, M. D., Associate Professor of Medicine, Vanderbilt University, Nashville, Tennessee.

 Note.—The clinical history and laboratory findings of three cases will be presented. These case reports will then be discussed and diagnoses suggested. Following this, Dr. A. G. Foord will present the protocols and final pathological diagnoses.

Third General Meeting

Wednesday, May 11, 11:15 a. m.

President Howard Morrow, Presiding

1. *The Clinicol Usage of Estrogenic Hormones*—C. Frederic Fluhmann, M.D., Associate Professor of Obstetrics and Gynecology, Stanford University, California. (By invitation.)

 Modern investigations have revealed a wide distribution of substances capable of stimulating the accessory genital organs. The "estrogenic hormones" are of clinical importance from two standpoints: (1) as diagnostic tests, (2) as therapeutic agents. The present paper is a discussion of the value of such tests and of the indications, preparations, and methods of administration of these substances.

2. *Sulfanilamid, with Particular Reference to Changes in the Acid-Base Bolance and to Methemoglobin Formation*—Alexis F. Hartmann, M. D., Professor of Pediatrics, Washington University, St. Louis, Missouri.

 Very promptly following the administration of sulfanilamid to normal human subjects, there occur hyperpnea and rise in plasma p^H, to be followed promptly by excretion of alkali into the urine and reduction of plasma bicarbonate. The early effect, then, is the production of a carbon dioxid deficit type of alkalosis, and not acidosis. Later, because of the apparently compensatory reduction of plasma bicarbonate, total fixed base deficiency may occur which may facilitate the development of acidosis by contributing factors.

 The development of methemoglobinemia may very effectively be prevented or relieved by methylene blue.

II—SECTION MEETINGS

SCIENTIFIC SECTION PROGRAMS

(Numbers in parenthesis after each section indicate sequence reference numbers of papers read in each section.)

I.—General Medicine (1-15) 11
II.—General Surgery (16-36) 13
III.—Obstetrics and Gynecology (37-46) 15
IV.—Eye, Ear, Nose and Throat (47-52a) 16
V.—Anesthesiology (53-57) 17
VI.—Dermatology and Syphilology (58-70) 17
VII.—Industrial Medicine and Surgery (71-79) 18
VIII.—Neuropsychiatry (80-89) 19
IX.—Pathology and Bacteriology (90-98) 20
X.—Pediatrics (99-107) 21
XI.—Radiology (108-121) 22
XII.—Urology (122-134) 23

Rules Regarding Papers and Discussions at the State Meetings

Upon the recommendation of the Executive Committee the following rules regarding papers have been adopted by the Council:

1. The maximum time that may be consumed by any paper is fifteen minutes, provided that not to exceed ten minutes' latitude may be allowed invited guests at the discretion of the presiding chairman.

2. Motions from the floor to extend the time of an author may be entertained by the presiding officer.

3. The maximum time permitted any individual to discuss a paper is four minutes. This also applies to the author in closing his discussion. No speaker may discuss more than once any one subject.

4. A copy of each and every paper presented at the state meeting must be in the hands of the chairman or secretary of the section or in the hands of the general secretary before the paper is presented.

5. All papers read at the annual meeting shall be published in full in California and Western Medicine as soon after the meeting as space will permit, or at the option of the author, an abstract of the paper of about one column in length shall be published as soon as possible after the meeting, with reprints in full of the entire paper (the cost of setting up type for the reprint to be borne by the Association, and all other costs to be borne by the author).

6. Articles are accepted for publication on condition that they are contributed solely to California and Western Medicine. Authors desiring to publish their papers elsewhere than in the Journal may have their manuscripts returned to them upon written request to the editor.

7. No paper will be accepted by the General Program Committee nor by Section Program Committees unless accompanied by a synopsis of not to exceed fifty words.

8. Papers shall not be "read by title."

9. No member may present more than one paper at any one state meeting, provided that a member may be a collaborator on more than one paper, if these papers are presented by different authors.

10. Failure on the part of an author to present a paper precludes acceptance of future papers from such author for a period of two years, unless the author explains to the satisfaction of the Executive Committee his inability to fulfill his obligation.

Section Papers: How Numbered

For convenience in reference, papers are numbered in serial sequence for the entire session, instead of a separate sequence for each section.

Business Meetings of Sections

Time of business meetings and elections of officers of sections will be scheduled on section blackboards by section secretaries, and through preliminary announcements by section chairmen.

Unless otherwise announced, the business meetings of each section and the election of officers will be held immediately after the reading of the second paper on the second day's section program.

I

GENERAL MEDICINE SECTION

Edwin L. Bruck, M.D., *Chairman*
384 Post Street, San Francisco

Howard F. West, M.D., *Secretary*
1930 Wilshire Boulevard, Los Angeles

First Meeting—Ballroom*

Monday, May 9, 1:30 p. m.

1. *Electrocardiographic Study of Coronary Thrombosis—The Value of the Chest Lead in Determining the Location of the Infarct*—William H. Leake, M.D., 1930 Wilshire Boulevard, Los Angeles; G. Creswell Burns, M.D., 1052 West Sixth Street, Los Angeles; Wilbur A. Beckett, M.D., 3875 Wilshire Boulevard, Los Angeles.

 The death charts of approximately one hundred and fifty patients dying as a result of coronary thrombosis have been reviewed. The electrocardiograms and autopsy findings were analyzed in each case in an attempt to determine the value of the chest lead in localizing the infarct.

 Discussion by John Kent Lewis, M.D., San Francisco; E. Richmond Ware, M.D., Los Angeles.

2. *A Concept of Angina Pectoris with Applications to Therapy*—M. H. Nathanson, M.D., 2007 Wilshire Boulevard, Los Angeles.

 The clinical syndrome, angina pectoris, cannot be adequately explained solely on the basis of occlusive coronary disease with myocardial ischemia. Evidence is presented implicating the cardiac sympathetic enervation and a concept suggested that angina pectoris results from the synergistic action of myocardial ischemia and sympathetic nervous activity. Experiments demonstrating methods to reduce cardiac sympathetic tonus are presented and the practical application to therapy is suggested.

 Discussion by John J. Sampson, M.D., San Francisco; James F. Churchill, M.D., San Diego.

3. *Cardiac Dyspnea*—Tinsley R. Harrison, M.D. (by invitation), Vanderbilt University, Nashville, Tennessee.

 The address will include a discussion of the types of dyspnea occurring in patients with heart disease, the underlying and precipitating causes of such dyspnea, the effects of dyspnea, and the treatment of this symptom.

4. *Heart Failure in Vitamin B_1 Deficiency*—Clifford B. Cherry, M.D., 1030 Kansas Street, San Francisco.

 Heart failure due to deficiency of vitamin B_1 is of not infrequent occurrence. Its early recognition is of especial importance because an adequate therapy is available. Diagnosis and treatment are discussed, and the return of the heart to normal size under treatment is illustrated by roentgenograms.

 Discussion by Jay Marion Read, M.D., San Francisco; Arthur A. Marlow, M.D., La Jolla.

5. *The Heart in Pneumoconiosis*—Charles B. Coggin, M.D., Donald E. Griggs, M.D., and Walter D. Stilson, M.D., 312 North Boyle Avenue, Los Angeles.

 This is a study of the effect of pneumoconiosis upon the heart as it can be elicited clinically, by routine x-ray films, and as it is found at autopsy. The clinical records, x-ray files, and protocols of one hundred autopsied cases at Los Angeles County Hospital are reviewed.

 Discussion by R. Manning Clarke, M. D., Los Angeles; Roy E. Thomas, M. D., Los Angeles.

*Following the adjournment of this program, the California Heart Association will hold its annual meeting in this room. All members of the Heart Association and others interested are urged to remain.

Second Meeting—Ballroom

Tuesday, May 10, 8:30 a. m.

6. *Trichiniasis: Report of an Outbreak of Twenty-Five Cases*—Hyman I. Vener, M.D., C.P.H.; George M. Stevens, M.D., Los Angeles City Health Department, 116 West Temple Street, Los Angeles.

 An epidemiological investigation conducted by the Department of Epidemiology, Los Angeles City Health Department, and confirmed by definite laboratory procedures. The mild clinical manifestations and the necessity for caution are stressed.

 Many instances of supposed influenza with prolonged convalescence could be due to trichiniasis. Laboratory assistance is of value, but does not indicate the clinical severity. Recommendations for control are given.

 Discussion by Edward M. Butt, M.D., Los Angeles; Karl F. Meyer, M.D., Hooper Foundation, University of California, San Francisco.

7. *Clinical Management of Goiter*—Mayo H. Soley, M.D., University of California Hospital, San Francisco.

 Colloid goiters can be largely eliminated by the use of iodin in endemic areas. Nontoxic nodular goiters, toxic nodular goiters, and the majority of toxic diffuse goiters should be subtotally removed. Mortality can be reduced by preoperative preparation of all patients with toxic goiters. From 30 to 40 per cent of patients with toxic diffuse goiters can be successfully treated with x-ray.

 Discussion by Leon Goldman, M.D., San Francisco; Evelyn Anderson, M.D., San Francisco.

8. *Chairman's Address*—Edwin L. Bruck, M.D., 384 Post Street, San Francisco.

9. *The Identification of Fungi Causing Disease in California*—Robert A. Stewart, M.D., University of California Hospital, San Francisco.

 Two general types of procedures are employed in the identification of fungi: descriptive morphology and physiological activity as seen in culture solutions. Difficulty arises when the attempt is made to correlate the results obtained by one method with that of the other. Resolution is possible by the use of chemically defined culture solutions.

 Discussion by H. E. Miller, M.D., San Francisco; N. N. Epstein, M.D., San Francisco.

10. *Dermatomyositis: Report of Case Associated with Rheumatic Heart Disease*—Frederick Kellogg, M.D., 211 Cherry Avenue, Long Beach; Felix Cunha, M.D., 450 Sutter Street, San Francisco.

 A case of dermatomyositis following smallpox vaccination and associated with rheumatic heart disease is presented. The clinical aspects and various forms of therapy are outlined. Particular emphasis is laid on the prevention of deformity during acute stages and on physiotherapy in rehabilitation.

 The paper is supplemented by slides of photographs, microphotographs, and roentgenograms.

 Discussion by William J. Kerr, M.D., San Francisco; Irwin C. Schumacher, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

✲

Third Meeting—Ballroom

Wednesday, May 11, 8:30 a. m.

SYMPOSIUM ON VITAMINS

This will be a joint meeting of the Sections on Pediatrics and General Medicine.

The program of this joint meeting is printed under the second meeting of the Pediatrics Section. (See page 21.)

Fourth Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON SHOCK—ACUTE CIRCULATORY FAILURE

This symposium will be presented by Alfred Blalock, M.D., Professor of Surgery, and Tinsely R. Harrison, M.D., Professor of Medicine, Vanderbilt University School of Medicine, Nashville, Tennessee.

(a) *Peripheral Circulatory Failure*—Alfred Blalock, M.D.

Peripheral circulatory failure is divided into three types: (1) hematogenic, (2) neurogenic, and (3) vasogenic. The reasons for this division and the etiology of each type are considered. The treatment of the several types varies somewhat, according to the cause. Various forms of treatment will be discussed.

(b) *Acute Cardiac Failure Simulating Peripheral Circulatory Failure*—Tinsley R. Harrison, M.D.

Acute cardiac failure is of three types: (1) Sudden death due either to ventricular fibrillations, or cardiac standstill; (2) cardiac syncope, usually brought about by sudden slowing of the rate; and (3) acute cardiac collapse due either to acute myocardial injury, to severe tachycardia, or to sudden mechanical hindrance to the action of the heart. The treatment of these several conditions varies according to the cause. A brief discussion of each of the different causes and of the proper treatment will be given.

Discussion by William Dock, M.D., Professor of Pathology, Stanford Medical School, San Francisco.

✲

Fifth Meeting—Ballroom

Thursday, May 12, 9:00 a. m.

11. *Routine Pulmonary Radiography of Prison Entrants*—George C. Lowell, M.D., Medical Department, California State Prison, San Quentin.

 All prisoners, on entrance to San Quentin, have a radiograph of the chest taken. The series of two thousand entrants shows the radiological evidence of tuberculosis in some form in about ten per cent of all cases, active tuberculosis being found in about one per cent of all cases. Methods of treatment are outlined and unusual cases cited.

 Discussion by Howard Ruggles, M.D., San Francisco; Cabot Brown, M.D., San Francisco.

12. *Tuberculosis in San Quentin State Prison*—Leo L. Stanley, M.D., Medical Department, California State Prison, San Quentin.

 Here are presented excerpts from the biennial medical reports of San Quentin Prison since its establishment in 1851. Accompanying is a graph showing increase in prison population, peaks of incidence of tuberculosis, and death rate. Mortality decreased from seventeen per thousand in 1887 to two per thousand in 1937.

 Discussion by Howard Ruggles, M.D., San Francisco; Cabot Brown, M.D., San Francisco.

13. *Geriatrics*—Leonard J. Brunie, M.D., 60 South Grand, Pasadena.

 This paper introduces a study in longevity, and is a careful analysis of the heredity, habits, medical history, and clinical findings of those fortunate ones who are found active and in good health in the ninth decade of their lives. This is a preliminary study which it is hoped will stimulate interest in that rapidly developing new science, geriatrics.

 Discussion by Robert E. Ramsay, M.D., Pasadena; Franklyn R. Nuzum, M.D., Santa Barbara.

14. *Renal Function in the Aged*—L. Dale Huffman, M.D., 6305 Yucca Street, Hollywood.

 Modern methods of testing renal function should be applied in the examination of persons of advanced age. The reliability and prognostic significance of the findings resulting from such tests are analyzed. Needed caution in the interpretation of them is discussed.

 Discussion by Donald J. Frick, M.D., Los Angeles; Roland G. Cummings, M.D., Los Angeles.

15. *Clinical Evaluation of the Use of Adrenal Cortex in Treating Childhood Asthma*—F. M. Pottenger, Jr., M.D., 1930 Wilshire Boulevard, Los Angeles.

This paper deals with the continued use of the adrenal cortex, mineralized diet, and associated therapy, reported before this Association in 1935. The results discussed will deal with those patients who have been under observation for a period of one or more years. Certain findings in these cases will be discussed and particular reference will be laid on the regimen followed in their treatment.

Discussion by E. Kost Shelton, M.D., Los Angeles; Leland Hunnicutt, M.D., Pasadena.

II

GENERAL SURGERY SECTION*

HARLAN SHOEMAKER, M.D., *Chairman*
1930 Wilshire Boulevard, Los Angeles
NELSON J. HOWARD, M.D., *Secretary*
2957 Divisadero Street, San Francisco
RAY B. MCCARTY, M.D., *Assistant Secretary*
3616 Main Street. Riverside

First Meeting—Crystal Room

Monday, May 9, 1:30 p. m.

16. *Torsion of the Omentum*—Phillip J. Lipsett, M.D., 400 Twenty-ninth Street, Oakland.

A review of the literature, particularly the series of cases by Corner and Pinches, and that of Morris. A detailed discussion of the etiology and diagnosis of the condition. The differential diagnosis from acute appendicitis, with which it is most frequently confused, is stressed. Two additional cases are reported in detail. An analysis of eighteen cases from the literature, not previously included in other studies, and a plea for more careful observation in this condition to help in the diagnosis and greater knowledge of etiological factors.

Discussion by Thomas F. Mullen, M. D., San Francisco; George Rhodes, M.D., San Francisco.

17. *Acute Pancreatitis*—Norman C. Paine, M. D., 118 West Wilson Avenue, Glendale.

Six cases of acute pancreatitis observed in one year led the author to study the sixty-four cases with this diagnosis in the files of the Los Angeles General Hospital. Half of these cases occurred in the last year. Recent literature and experimental work have been reviewed. Conclusions suggest standardization of preliminary laboratory procedure and indications for surgery.

Discussion by W. H. Olds, M.D., Los Angeles; Frank MacDonald, M.D., Sacramento.

18. *Auscultation of the Abdomen*—John Homer Woolsey, M.D., Woodland Clinic, Woodland.

Clinical application of auscultation of the abdomen will be discussed, with attention to the cause for the absence or increase of peristalsis; report of observation in various clinical conditions and in the postoperative course; and interpretation of the same.

Discussion by Charles Sturgeon, M.D., Los Angeles; Frank Wiebe, M.D., Salinas.

19. *Problems in Diagnosis of Acute Appendicitis*—Thomas O. Burger, M.D., and Harold C. Torbert, M.D., 2120 Fourth Avenue, San Diego.

Review of 449 cases of acute appendicitis, 26.9 per cent of which were ruptured at time cases were referred to us, with emphasis on diagnostic aspects. Fourteen atypical modes of onset noted, emphasis on which had led practitioner into error. Occurrence of symptoms and findings when appendix is in unusual location discussed.

Discussion by Einar Eiskamp, M.D., Watsonville; Walter A. Bayley, M.D., Los Angeles.

20. *Actinomycosis in Association with Appendicitis and Ruptured Viscus*—W. Wallace Greene, M.D., and Carleton Mathewson, Jr., M.D., San Francisco Hospital, San Francisco.

A review of the mode of infection, clinical picture, and pathology of actinomycosis following acute suppurative appendicitis and ruptured viscus; presentation of cases and recommendations for treatment.

Discussion by Leon Goldman, M.D., San Francisco; Thomas A. Card, M.D., Riverside.

Second Meeting—Crystal Room

Tuesday, May 10, 8:30 a.m.

21. *Address by Chairman*—Harlan Shoemaker, M.D., 1930 Wilshire Boulevard, Los Angeles.

22. *Regional Anesthesia in the Acute Abdomen*—E. C. Moore, M.D., 511 South Bonnie Brae Street, Los Angeles.

Less shock to patients; less manipulation; less spreading of infection and much less mortality thereby.

Discussion by Verne C. Hunt, M.D., Los Angeles; Whitfield Crane, M.D., Oakland.

23. *Anomalies of the Colon*—W. H. Brownfield, M.D., 2007 Wilshire Boulevard, Los Angeles.

Cause symptoms of other visceral pathological changes. A plea for generous incision and thorough exploration. The commonly called chronic appendix is usually but a part in the process of cecal "immobilization." Extention of the linea terminalis may be responsible for condition of frequently called fixed sigmoid colon. The incidence of diverticulosis and diverticulitis. The various herniations are not discussed.

Discussion by John C. Schmoele, M.D., Los Angeles; Caleb Stone, M.D., Santa Barbara.

24. *The Problem of Multiple Polyposis of the Colon*—Robert Scarborough, M.D., Stanford Hospital, Clay and Webster Streets, San Francisco.

Multiple polyposis of the colon, either hereditary ("primary diffuse polyposis") or secondary to an inflammatory process in the colon ("pseudopolyposis") presents a critical problem to the surgeon. Eradication of all polyps is essential to prevent almost inevitable malignant degeneration. To this end radical surgery alone has been shown to be effective. Three successful cases of excision of the entire colon and rectum are described.

Discussion by William Daniel, M.D., Los Angeles; Fred Foote, M.D., San Francisco.

25. *Colectomy, Complete*—Alanson Weeks, M.D., and G. D. Delprat, M.D., Fitzhugh Building, San Francisco.

Experience with three patients. Three patients are presented in which a complete colectomy is performed. The first for pseudopolyposis, and ulceration of the colon. The other two cases for ulceration, fistula formation, and marked toxemia.

Discussion by A. C. Reed, M.D., San Francisco; Malcolm Hill, M.D., Los Angeles.

26. *Obstruction Following Gastro-enterostomy or Subtotal Resection of the Stomach—A New and Simple Operation for Its Relief*—Carl L. Hoag, M.D., 384 Post Street, San Francisco, and John B. deC. M. Saunders, F.R.C.S. (Ed.), University of California Hospital, San Francisco (by invitation).

Early obstruction following gastro-enterostomy or subtotal resection of the stomach occurs in a comparatively small percentage of cases, but when it does happen it is a serious and frequently fatal condition. If the obstruction persists after seven to ten days of conservative treatment or occurs late in the period of convalescence, it is usually mechanical in character so that an emergency operation becomes imperative, with a resulting mortality of approximately 75 per cent.

The authors have devised a jejunoplasty, based upon the principles of the Finney pyloroplasty, which

* Monitors: Carleton Mathewson, M. D., San Francisco. and Omer Wheeler, M. D., Riverside.

requires a minimum of surgery and gives the same excellent relief. This jejunoplasty is of value not only in relieving the acute obstruction, but it permits visual inspection of the stoma and may be used in chronic cases as an approach, (1) for cauterization or excision of a marginal or jejunal ulcer; (2) to increase the size of the gastric stoma if it is too small; and (3) to completely close the gastric stoma in those cases where restoration of the original continuity of the gut is desired.

Report of cases. Illustration by lantern slides and charts. Report of animal experimentation. Exhibit of museum specimens.

Business Recess

Business meeting and election of officers.

❦

Third Meeting—Crystal Room

Wednesday, May 11, 8:30 a. m.

27. *The Surgical Importance of Papaverin Hydrochlorid*—Donald C. Collins, M.D., 1930 Wilshire Boulevard, Los Angeles.

The alkaloid papaverin should be in the armamentarium of every surgeon. The administration of this drug intravenously has saved over 90 per cent of individuals with recent severe massive postoperative pulmonary embolism. The intra-arterial injection has obviated the necessity of an embolectomy in 84 per cent of those suffering from emboli of the peripheral circulation.

Discussion by Donald A. Charnock, M.D., Los Angeles; Stanley H. Mentzer, M.D., San Francisco.

28. *Muscle Grafts in Surgery of Heart and Lung*—Brodie Stephens, M.D., and Harry Benteen, M.D. (by invitation), 384 Post Street, San Francisco.

Fourteen dogs have had bilateral ligation (in stages) of both the right and left coronary arteries. The pectoral muscle has been employed as a graft in an effort to provide an adequate blood supply to the heart in the animals so treated. These animals have now been observed fourteen to eighteen months. A report of the fate of these grafts amplified with injection preparations will be presented. In humans, muscle grafts have also been used in the closure of lung abscess cavities. The fate of these grafts, too, will be demonstrated by both gross and histologic demonstrations.

Discussion by Paul C. Sampson, M.D., Oakland; Albert H. Elliott, Jr., M.D., Santa Barbara.

29. *Transpleural Repair of Traumatic Diaphragmatic Hernia*—H. E. Schiffbauer, M.D., 1005 Brockman Building, Los Angeles.

A report of six cases, with slides and motion pictures in color.

With the increase in injuries from automobile accidents, the incident of traumatic rupture of the diaphragm has increased, and is more often diagnosed. Routine roentgenological examination of the chest is often not sufficient to make the diagnosis. Treatment consists of a reposition of the viscera, repair of hernia by abdominal or transpleural route.

Discussion by Emile Holman, M. D., San Francisco; Clarence G. Toland, M. D., Los Angeles.

30. *Report of Follow-up and Evaluation of the Injection Treatment of Hernia*—Franklin I. Harris, M. D., 450 Sutter Street, San Francisco, and A. S. White, M.D., 516 Sutter Street, San Francisco.

This follow-up study is by request of the chairman of the 1937 Del Monte meeting; a continuation of the report rendered the Society at the 1937 meeting concerning the cases presented at the 1936 meeting in Coronado.

Open to discussion from the floor.

31. *Venereal Lymphogranuloma in California*—Carleton Mathewson, Jr., M.D., San Francisco Hospital.

This report was requested by the chairman of the 1937 session held at Del Monte.

Fourth Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON SHOCK

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose, and Throat; Pathology; Pediatrics.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 12.)

❦

Fifth Meeting—Crystal Room

Thursday, May 12, 9:00 a. m.

32. *Burn Contractures of the Hand: Their Prevention and Correction by Means of Skin Grafting*—Harry Blackfield, M.D., 350 Post Street, San Francisco.

A detailed discussion of the types of skin grafts used for hand-surface reconstruction following burns is included in this paper. Lantern slides will be shown, illustrating progressive stages of the grafting in early and late cases, and the results achieved.

Discussion by William Kiskadden, M. D., Los Angeles; Gerald B. O'Connor, M. D., San Francisco.

33. *Nerve Grafts*—Sterling Bunnell, M.D., and Joseph H. Boyes, M.D., 516 Sutter Street, San Francisco.

A note of skepticism pervades the literature concerning nerve grafts which is not warranted by clinical experiences based upon thirty-one cases. The indications for the use of nerve grafts are considered, and regeneration through both undegenerated and degenerated free nerve grafts in experimental animals is shown by photomicrographs. The end-results of thirty-one cases of free nerve grafts in humans are shown graphically on lantern slides.

Discussion by Carl Rand, M. D., Los Angeles; Edmund J. Morrissey, M.D., San Francisco.

34. *Spontaneous Hematoma Occurring in the Rectus Muscle*—H. Glenn Bell, M.D., and Harry Benteen, M.D. (by invitation), University of California Hospital, San Francisco.

The recognition, diagnosis, and treatment of this condition are discussed and a report of cases is given. An etiological classification is offered.

Discussion by Ray B. McCarty, M.D., Riverside, and Edgar L. Gilcreest, M.D., San Francisco.

35. *The Treatment of Cancer of the Lip*—Report of 160 cases from 1932 to 1937, inclusive—George Stevenson Sharp, M.D., 605 Professional Building, Pasadena.

One hundred and sixty cancers of the lip with positive pathological reports are discussed. The treatment of the primary growth is performed advantageously by radiation or surgery or both according to the clinical and microscopical type of cancer. The secondary or metastatic growth in the neck is treated by radical surgery. The clinical types of lip cancer, the procedures of treatment and results are demonstrated by lantern slides.

Discussion by Alson R. Kilgore, M.D., San Francisco, and George D. Brown, M.D., Pomona.

36. *Benign Tumors of Female Breasts*—Franklyn D. Hankins, M.D., 3616 Main Street, Riverside.

The normal anatomy and physiology of the female breast will be briefly reviewed. Alterations of the normal physiology will be discussed in relation to the production of the various pathologic states, namely, (1) mazoplasia, (*a*) fibro-adenoma; (2) cystic disease; (3) papilloma; (4) Schimmelbusch's disease. The symptoms, diagnosis, and treatment and their relation to malignant tumors will be described.

Discussion by Edward M. Butt, M.D., Los Angeles; Nelson J. Howard, M.D., San Francisco.

III

OBSTETRICS AND GYNECOLOGY SECTION*

R. Glenn Craig, M.D., *Chairman*
Medico-Dental Building
490 Post Street, San Francisco

George W. Coon, M.D., *Vice-Chairman*
3770 Twelfth Street, Riverside

John N. Ewer, M.D., *Secretary*
411 Thirtieth Street, Oakland

First Meeting—Tap Room

Monday, May 9, 1:30 p. m.

37. *Squamous Cell Epithelioma of the Vulva*—Edward J. Kilfoy, M.D., 1930 Wilshire Boulevard, Los Angeles.

This paper consists of a review of the literature, anatomy, pathology, the diagnosis, the differential diagnosis, and surgical treatment. The value of x-ray and radium therapy. The radical surgical procedure to be carried out, with an analysis of fifty cases, as regards age incidence, degree of malignancy, type of treatments used, and the prognosis as regards longevity. Illustrated by lantern slides.

Discussion by James Percy, M.D., Los Angeles.

38. *The Use of Sulphanilamid in Lower Genital Tract Gonorrhea*—Arnold Manor, M. D., 2355 California Street, San Francisco.

This paper concerns briefly the use of sulfanilamid in the treatment of gonorrhea in the Women's Out-Patient Clinic at Stanford University Hospital, and the results obtained.

Discussion by Norman H. Williams, M.D., Los Angeles.

39. *The Use of Sulphanilamid in Upper Genital Tract Gonorrhea*—Raymond E. Gillett, M.D., (by invitation), 2635 Twenty-Third Street, San Francisco.

Discussion of dosage; clinical therapeutic results obtained with sulphanilamid in (*a*) initial acute salpingo-oöphoritis, (*b*) recurrent acute salpingo-oöphoritis, and (*c*) acute parametritis; the value of this drug in the treatment of cervicitis; toxic complications during medication; deductions.

Discussion by Henry N. Shaw, M.D., Los Angeles; Roy E. Fallas, M.D., Los Angeles; and Norman H. Williams, M.D., Los Angeles.

40. *Gonorrheal Vulvovaginitis in Childhood*—Woodburn K. Lamb, M.D., 2490 Channing Way, Berkeley.

This study presents a series of twenty-three patients studied at the University of Michigan Hospital, with vulvovaginitis of gonorrheal etiology. The physiology concerned in this disease entity is discussed, and slides to demonstrate the changes are presented. Treatment in the twenty-three cases consisted of estrogenic hormone (Theelin) given intramuscularly. In all the cases studied, a positive urethral and vaginal smear was found. The potentialities of the urethra as a focus of reinfection discussed, and the need for careful study stressed.

Discussion by Bernard J. Hanley, M. D., Los Angeles.

41. *Renal Changes Following Toxemias of Late Pregnancy*—Ernest W. Page, M.D., 2560 Bancroft Way, Berkeley, and Alvin J. Cox, M. D., 1905 Laguna Avenue, San Francisco.

A study based on the histologic findings of kidneys from women who have had toxemias of late pregnancy, compared with those from women who have had pregnancies, but no evidence of toxemia. The results are interpreted with the aid of clinical follow-up studies on ninety cases of eclampsia.

Discussion by Lyle G. McNeile, M. D., Los Angeles, and Dwight L. Wilbur, M.D., San Francisco.

* Monitors: Dwight D. Young, M. D., Los Angeles, and James V. Campbell, M. D., Oakland.

Second Meeting—Tap Room

Wednesday, May 11, 8:30 a. m.

42. *Varicose Veins in Pregnancy*—A. M. McCausland, M.D., 3780 Wilshire Boulevard, Los Angeles.

This paper is a preliminary report of the history, treatment, and follow-up examinations of 150 pregnant women, whose varicose veins were cared for at the Los Angeles Maternity Service. Special attention will be given to the treatment of vulvar varicosities. A very short review of the literature on this subject will be included. Slides will be used in presenting the material and in demonstrating the technique used.

Discussion by Nelson J. Howard, M.D., San Francisco.

43. *Induction of Labor*—William Benbow Thompson, M.D., 803 Wilshire Medical Building, Los Angeles.

Within the past few years there have appeared numerous enthusiastic publications advocating induction of labor by means of rupture of membranes accompanied by preliminary castor oil and quinin medication and usually followed by Intranasal Pituitary Extract. As should have been expected, the procedure has been adopted by many with insufficient experience in obstetrics in general and, as a consequence, often the results have been highly unsatisfactory for both mother and child. In general, the failure in induction has occurred because the condition of the cervix has not been recognized. In other instances an unfavorable position of the infant has resulted disastrously. A review of the patients upon whom induction has been performed, gathered from two of the local hospitals, and, in addition, a questionnaire covering the experience of the members of the Pacific Coast Obstetrical Society, forms the basis of this study.

Discussion by Donald Tollefson, M. D., Los Angeles.

44. *Chairman's Address: The Specialty of Gynecology*—R. Glenn Craig, M.D., 490 Post Street, San Francisco.

The scope of gynecology. Its development. A consideration of the anthropological, psychological, and endocrinological characteristics of the female. The importance of these in the selection, application and evaluation of surgical procedures.

45. *The Relation of Estrogenic and Gonadotropic Hormones to Climacteric Symptoms*—Kathleen M. Murphy, M.D., 516 Sutter Street, San Francisco, and C. F. Fluhmann, M.D., Stanford University Hospital, San Francisco.

The recent literature tends to attribute the subjective symptoms of the climacteric to either the loss of ovarian secretion or increase of anterior pituitary hormone. The present study is an analysis of the hormone content of the blood of climacteric women before and after the menopause, and its relation to the patients' symptoms.

Discussion by John C. Irwin, M.D., Los Angeles.

46. *Roentgen-Ray Therapy for Uterine Cancer*—Daniel G. Morton, M.D., University of California Hospital, San Francisco.

An effort is made to assay the value of high voltage roentgen-ray therapy for uterine cancer as reflected by the results obtained during the last six years at the University of California Hospital on cases in which deep roentgen-ray therapy was used. Survival curves are compared with those obtained in comparable cases not so treated. The morbidity and mortality of roentgen radiation is discussed.

Discussion by Robert Stone, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

Third Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON SHOCK

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose and Throat; Pathology; Pediatrics.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 12.)

IV

EYE, EAR, NOSE, AND THROAT SECTION*

FRANK BAXTER, M.D., *Chairman*
1624 Franklin Street, Oakland

DEWEY R. POWELL, M.D., *Vice-Chairman*
Medico-Dental Building, Stockton

CLIFFORD W. WALKER, M.D., *Secretary*
427 West Seventh Street, Los Angeles

First Meeting—Cottage "A"

Monday, May 9, 1:30 p. m.

47. *The Equipment of the Modern Oculist's Office*—George Hosford, M. D., 450 Sutter Building, San Francisco.

Relation of economic pressure to present-day trends in medical and surgical practice. Methods of meeting conditions which are developing. Organization of an ophthalmological office. Climatic considerations and location of building. Floor plans and routing of patients. Waiting rooms, treatment rooms, operating room, homatropin room, field room, refraction charts and equipment, slitlamps, control of illumination.

Discussion by Clifford W. Walker, M. D., Los Angeles; Samuel Durr, M. D., San Diego.

48. *The Surgical Management of Otogenous Brain Abscess*—Leo J. Adelstein, M.D., 1930 Wilshire Boulevard, Los Angeles.

The surgical management of otogenous brain abscess includes: (1) The exact diagnosis and localization by neurologic study. (2) An optimum period of observation to allow the infectious process to thoroughly encapsulate. (3) Surgical drainage by the simplest possible method and adequately maintained for at least six weeks or longer. The method of drainage by choice is the one that permits adequate and prolonged drainage with the least amount of post-operative interference on the part of the operator.

Discussion by George H. Patterson, M. D., Los Angeles; Simon Jesberg, M. D., Los Angeles.

49. *Progressive Essential Atrophy of Iris—A Summary of All Reported Cases*—Etta C. Jeancon, M.D., 523 West Sixth Street, Los Angeles.

Progress of a case which has been under observation for six years. All reported cases (about thirty), compared and studied with especial regard to their final outcome, most of which ended in blindness in the affected eye.

Discussion by Hans Barkan, M. D., San Francisco; George Landegger, M. D., Los Angeles.

50. *The Prognosis in Sarcoma of the Uveal Tract*—M. N. Beigelman, M. D., 1930 Wilshire Boulevard, Los Angeles.

The relative incidence of recurrence and metastases in various clinical stages of the disease. The prognostic value of histologic structure in cases of uveal sarcoma, based on (1) the presence or absence of pigment; (2) the type of cells; (3) the distribution of reticular fibers. Statistical illustrations.

Discussion by Hans Barkan, M. D., San Francisco; H. G. Merrill, M. D., San Diego.

*

Second Meeting—Cottage "A"

Tuesday, May 10, 8:30 a. m.

51. *The Endonasal Tear Sac Operation*—Ben L. Bryant, M. D., 2007 Wilshire Boulevard, Los Angeles.

The various surgical procedures which have been used in the past for the treatment of chronic dacryocystitis are considered, and their respective advantages and disadvantages evaluated. A modified endonasal operation is described, with emphasis placed on those factors which are of greatest influence on the final result, stress being placed on the physiology of the region. The results of a series of cases treated by this method are presented.

Discussion by George P. Landegger, M. D., Los Angeles; John P. Lordan, M. D., Los Angeles.

52. *Exfoliation of the Lens Capsule: Frequency of Occurrence and Significance*—Rodman Irvine, M. D., 700 Roosevelt Building, Los Angeles.

Two hundred and thirty-five cataract patients seen consecutively at the Government Eye Hospital at Madras, India, were examined for exfoliation of the lens capsule. The condition was found in eight per cent of the cases. Of those with exfoliation, 50 per cent had chronic glaucoma. Twenty cases seen in this country were followed and showed an incidence of glaucoma of 75 per cent. The prognosis for these cases is less favorable than for other cataract cases, generally speaking. The relation of senile exfoliation of the lens capsule to zonular lamellar separation, as seen in heat cataract, is discussed with an attempt to explain the etiology of exfoliation.

Discussion by Clinton Wilson, M.D., and George Landegger, M.D.

52a. *Treatment of Sinusitis by the Displacement Method*—Lawrence K. Gundrum, M.D., 1930 Wilshire Boulevard, Los Angeles.

Report of eight hundred cases using ephedrin, neosynephrin, antigen, and foreign proteins.

The cases reported in this paper comprise a study conducted during the past ten years. The discussion is limited to chronic sinusitis. Eight hundred cases are presented with symptoms, findings and results, with treatments. The displacement treatment was used in all cases. One hundred and eighty treated, using ephedrin or neosynerphrin in normal saline; twenty using autogenous bacterial antigen; five hundred using stock antigens; and one hundred with foreign proteins (broth media). The results were most favorable when stock antigens were used.

Discussion by Herman Semenov, M.D., Los Angeles, and Mathew N. Hosmer, M.D., San Francisco.

Business Recess

Business meeting and election of officers.

*

Third Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON SHOCK

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose and Throat; Pathology; Pediatrics.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 12.)

* Monitors: Dewey Powell, M.D., Stockton, and Rodman Irvine, Los Angeles.

V

ANESTHESIOLOGY SECTION*

WILLIAM LEROY GARTH, M.D., *Chairman*
1252 Third Avenue, San Diego

JOHN G. DUNLOP, M.D., *Secretary*
168 So. Kingsley Drive, Los Angeles

First Meeting—Cottage "F"

Monday, May 9, 1:30 p. m.

53. *Chairman's Address: Anesthesia in Europe*—William L. Garth, M. D., 1252 Third Avenue, San Diego.

54. *Present Status of Inhalation Anesthesia for Tonsillectomy with Special Technique when Pulmonary or Renal Complications Exist*—R. G. Henderson, M. D., 1101 Security Building, Long Beach.

Inhalation anesthesia for tonsillectomy is a procedure which requires careful technique and involves much responsibility. Preoperative medication is discussed together with routine methods of anesthesia, using gas and ether vapor. Pulmonary and kidney complications contraindicate the use of ether, and endotracheal cyclopropane is recommended as a desirable alternative method.

Discussion by C. E. Harner, M. D., Long Beach; W. W. Hutchinson, M. D., Los Angeles.

55. *On Respiration*—Arthur E. Guedel, M.D., 1633 Wellington Road, Los Angeles.

Stimulus threshold a variable factor. Response to stimulus depends upon relationship between stimulus and threshold. Anesthetic respiration affords easiest illustration.

Discussion by Clinton Thienes, M.D., Los Angeles.

56. *Experimental Basis for the Use of Stimulants*—Clinton H. Thienes, M. D., 3551 University Avenue, Los Angeles.

Analeptics are drugs that antagonize a state of depression. Drugs may arouse a comatose patient, or simply increase respirations or stimulate the vasomotor centers. The principal drugs of this sort are caffein, theophyllin, strychnin, metrazol, pictrotoxin, coramin, lobelin, and benzedrin. Peripherally acting drugs are the digitaloid glucosides and the sympathomimetic amins. The experimental basis for the clinical use of these drugs will be discussed.

Discussion by Albert J. Wineland, M. D., Los Angeles, and Myron Prinzmetal, M.D., Los Angeles (by invitation).

57. *The Desirability of a Selective Anesthetic Program*—Hall G. Holder, M. D., 233 A Street, San Diego.

Knowledge of the recent advances in anesthesia afford the surgeon considerable choice in selecting the anesthetic best suited for the surgical problem at hand. This choice must also take into consideration physical and emotional handicaps. This paper will discuss these and related problems.

Discussion by George D. Huff, M.D., San Diego; Edwin H. Kelley, M.D., San Diego.

Business Recess

Business meeting and election of officers.

*

Second Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

Section unites with other Sections for symposium on "Shock" in main ballroom. (See page 12.)

* Monitors: Madeline Manuel, M.D., Pasadena; J. G. Dunlop, M.D., Los Angeles.

VI

DERMATOLOGY AND SYPHILOLOGY SECTION*

STANLEY O. CHAMBERS, M.D., *Chairman*
Roosevelt Building
727 West Seventh Street, Los Angeles

NELSON PAUL ANDERSON, M.D., *Secretary*
904 Westlake Professional Building
2007 Wilshire Boulevard, Los Angeles

ARNE E. INGELS, M.D., *Assistant Secretary*
Medico-Dental Building
490 Post Street, San Francisco

First Meeting—Cottage "B"

Monday, May 9, 1:30 p. m.

58. *Chairman's Address*—Stanley O. Chambers, M. D., 727 West Seventh Street, Los Angeles.

59. *Lymphoblastomas*—Udo J. Wile, M. D., Professor of Dermatology and Syphilology, University of Michigan, Ann Arbor, Michigan. (By invitation.)

This paper will treat of the lymphoblastomas as they involve the skin. The various dermatologic manifestations of the leukemias, Hodgkin's disease, and mycosis fungoides will be discussed. The relationship of these diseases to each other will be considered. Illustrated by lantern slides.

Discussion by Howard Morrow, M.D., San Francisco; Samuel Ayres, Jr., M.D., Los Angeles.

60. *Signs of Malignancy in Melanomas*—Clement E. Counter, M.D., 206 Professional Building, Long Beach.

This paper will deal with a large group of melanomas of the skin studied histopathologically with special reference to the signs of malignancy, particularly early malignant changes. Illustrated by photomicrographs.

Discussion by Nelson Paul Anderson, M. D., Los Angeles; John W. Budd, M. D., Los Angeles.

61. *Use of Strontium Bromid in Acute Urticaria*—Hiram D. Newton, M. D., 1203 Bank of America Building, San Diego.

This paper consists of a review of the use of strontium bromid in itching dermatoses, with specific reference to its use in acute urticaria and angioneurotic edema. S. Schubert, in 1929, reported eighteen such cases with phenomenal results by the intravenous use of strontium bromid. This report consists of about twenty cases of acute urticaria, urticarial serum reaction and angioneurotic edema treated by the intravenous injection of strontium bromid. An analysis of the results obtained and a discussion of the indications and contra-indication for the use of strontium bromid is included.

Discussion by William H. Goeckermann, M. D., Los Angeles; Laurence Taussig, M. D., San Francisco.

62. *The Uses of Sulfanilamid in Dermatology*—Franklin I. Ball, M. D., 6253 Hollywood Boulevard, Hollywood.

This paper will be a review of the employment of the drug as a therapeutic agent in such dermatoses as erysipelas, streptococcic lymphangitis and cellulitis, and chronic infectious eczematoid dermatitis. This paper will be illustrated with lantern slides in natural color.

Discussion by Arne E. Ingels, M. D., San Francisco; George Koetter, M. D., Los Angeles.

63. *Scabies: Its Treatment with Benzoyl Benzoate as Compared with Sodium Thiosulphate and HCl*—Arne E. Ingels, M. D., 490 Post Street, San Francisco.

A series of about sixty cases treated with benzoyl benzoate, sapomollis and alcohol, on two consecutive days, will be reported, mentioning untoward reactions and advantages; this, compared with an equal number of cases treated with sodium thio-

* Monitors: Thomas W. Nisbet, M. D., Pasadena, and Anker K. Jensen, M. D., Los Angeles.

sulphate and HCl. A short reference to other antiscabetics will also be presented.

Discussion by Harry J. Templeton, M. D., Oakland; Thomas W. Nisbet, M. D., Pasadena.

64. *Pruritus Ani*—Charles R. Caskey, M. D., 1930 Wilshire Boulevard, Los Angeles.

This paper will discuss the subject from a dermatological aspect. Proctological, urological, and constitutional causative factors will be enumerated but left for discussion to specialists in these fields. Local etiological factors will be discussed, followed by pathology and treatment. Personal clinical deductions will be given with little reference to the literature.

Discussion by Philip K. Allen, M.D., San Diego; William H. Daniels, M.D., Los Angeles.

❋

Second Meeting—Cottage "B"

Tuesday, May 10, 8:30 a. m.

65. *Mapharsen Tolerance in Neoarsphenamin-Sensitive Patients: Analysis of One Hundred Cases*—Katherine H. MacEachern, M. D., 1200 North State Street, Los Angeles. (By invitation.)

This paper is a study of reactions to mapharsen in the treatment of syphilis in patients who previously showed intolerance to neoarsphenamin. Formerly the treatment of such patients was limited to the heavy metals. A certain percentage of these arsphenamin-sensitive patients are able to tolerate mapharsen.

Discussion by Hiram E. Miller, M.D., San Francisco; Frederick G. Novy, Jr., M.D., Oakland.

66. *Studies in Tissue Concentration of Bismuth*—Julius R. Scholtz, M. D., and Albert Cheney, Ph.D. (by invitation), 1930 Wilshire Boulevard, Los Angeles.

This study represents an attempt to show the concentration levels of bismuth which are attained when bismuth is administered in therapeutic doses to human syphilitic subjects. The data presented is from careful chemical analyses of the vital organs of persons who, while under routine bismuth therapy for syphilis, suffered sudden death from other causes. Included are two cases in which the cause of death was acute renal failure due to bismuth nephrosis. None of the other cases showed any clinical evidence of bismuth toxicity. Reports are given on twelve cases; this exceeds by far the total of all cases previously reported in the literature.

Discussion by Clinton Thienes, M.D., Los Angeles; Edward M. Butt, M.D., Los Angeles.

67. *The Absorption and Elimination of Bismuth Following Its Oral Administration to Rabbits*—Ernest K. Stratton, M. D., 490 Post Street, San Francisco.

In a comparative study several oral bismuth preparations were given to rabbits; the bismuth content of the feces and urine was determined following the administration of single doses as well as after multiple daily doses.

Discussion by Udo J. Wile, M. D., Ann Arbor, Michigan; Julius R. Scholtz, M. D., Los Angeles.

68. *The Treatment of Active Interstitial Keratitis in Prenatal Syphilis*—C. Russell Anderson, M. D., 1930 Wilshire Boulevard, Los Angeles.

The treatment of interstitial keratitis by chemotherapy alone is usually disappointing. Means were sought by which quiescence of the process could be brought about, thereby reducing opacities and scarring of the cornea to a minimum. During the past two years, all patients seen in the Los Angeles General Hospital, and all private patients, have been given a course of malaria fever with gratifying results. In some, in which age was a contraindication, typhoid vaccine intravenously was used. The cases are reviewed, and the conclusion is that at the present time malaria is the method of choice in treating active interstitial keratitis.

Discussion by Udo J. Wile, M. D., Ann Arbor, Michigan; Harold F. Whalman, M. D., Los Angeles.

69. *The Ninth-Day Erythema Following Arsphenamin Therapy*—Norman N. Epstein, M. D., and Edward A. Levin, M. D., 450 Sutter Street, San Francisco.

The ninth-day erythema due to arsphenamin therapy is of considerable practical importance in antisyphilitic therapy. Five cases showing this reaction are reported. A discussion, with a review of the literature upon this subject, is presented.

Discussion by Maxwell J. Wolff, M.D., Los Angeles; C. J. Lunsford, M.D., Oakland.

70. *The Nonspecific Provocative Wassermann Reaction*—Charles W. Barnett, M. D., George V. Kulchar, M. D., and Richard B. Jones, M. D., Stanford University Medical School, San Francisco.

In a study of the provocative Wassermann reaction in syphilitic and nonsyphilitic patients, similar effects were noted. The clinical and experimental aspects of the provocative reaction are dealt with, special emphasis being placed on its lack of specificity.

Discussion by Stuart Way, M.D., San Francisco; H. Sutherland Campbell, M.D., Los Angeles.

Business Recess

Business meeting and election of officers.

VII

INDUSTRIAL MEDICINE AND SURGERY SECTION*

Frederic C. Bost, M.D., *Chairman*
384 Post Street, San Francisco

Harvey G. McNeil, M.D., *Vice-Chairman*
523 West Sixth Street, Los Angeles

George H. Sanderson, M.D., *Secretary*
242 North Sutter Street, Stockton

First Meeting—Cottage "D"

Monday, May 9, 1:30 p. m.

71. *Chairman's Address: The Importance of the Emergency Treatment of Compound Fractures*—Frederic C. Bost, M.D., 384 Post Street, San Francisco.

72. *Announcements Regarding Statistical Data on Industrial Accident Practice in the State of California*—Morton R. Gibbons, M. D., 350 Post Street, San Francisco.

73. *Neuropathic Joints: A Study of Their Development, with Particular Emphasis on the Causative Rôle of Trauma. Suggestions for Conservative and Radical Orthopedic Treatment*—Ralph Soto-Hall, M. D., 350 Post Strect, San Francisco, and Keene O. Haldeman, M. D., 350 Post Street, San Francisco.

A group of neuro-arthropathies (Charcot joints) have been studied to determine their manner of development and their relation to trauma. Emphasis has been placed on the very early changes when the diagnostic problems are difficult. In addition to suggestions for conservative treatment, a method of arthrodesis of neuropathic joints, not previously reported, is described. This operation is performed in two stages, the first of which makes the sclerotic bone more viable by revascularization through multiple drilling, which procedure is followed by the arthrodesing operation.

Discussion by Ernst Freund, M.D., Los Angeles; Donald McNeil, M.D., Sacramento.

Business Recess

Business meeting and election of officers.

* Monitors: Mosser Taylor, M.D., Los Angeles, and William Arthur Clark, M.D., Pasadena.

74. *Traumatic Appendicitis*—George K. Rhodes, M. D., 490 Post Street, San Francisco.

Traumatic appendicitis is a diagnosis infrequently made but, nevertheless, one over which there is much controversy. Many claim awards have been made on the basis of such a diagnosis. This subject will be reviewed and the author's personal experience with several cases summarized.

Discussion by Wayland Morrison, M. D., Los Angeles; R. A. Jewett, M. D., Los Angeles.

❊

Second Meeting—Cottage "C"

Tuesday, May 10, 8:30 a. m.

This will be a joint meeting of the Section on Radiology and the Section on Industrial Medicine and Surgery.

The program of this joint meeting is printed under the first meeting of the Radiology Section. (See page 22.)

❊

Third Meeting—Crystal Room

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON NUCLEUS PULPOSUS RUPTURE AND ITS RELATION TO INJURY

75. *Neurosurgical Aspects*—Howard Brown, M. D., 384 Post Street, San Francisco.

A consideration of the antomy; clinical history and findings. Diagnoses by lipiodol studies. Use of intraspinal air as a diagnostic measure. Operative findings and results.

76. *Orthopedic Aspects, Including the Question of Spinal Fusion Following Laminectomy*—Frederick Linde, M. D., 490 Post Street, San Francisco.

The following is a short résumé indicating the salient points in my paper on spinal fusion following laminectomy; (1) Orthopedic aspects of symptoms referable to dislocated intervertebral discs; (2) The desirability of a spinal fusion following complete laminectomy; (3) Technique of operation; (4) Postoperative care and results.

77. *X-ray Aspects*—Kenneth S. Davis, M.D., 2131 Ocean View Boulevard, Los Angeles.

The recognition by Mixter, Barr, and Ayres that protrusions of the intervertebral discs were identical with the lesions described by Schmorl has stimulated great interest in this condition. The roentgenographic signs may be classified as direct and indirect. The *direct* signs (narrowing to the intervertebral space, hypertrophic lipping, etc.), while suggestive, do not justify one in making a positive diagnosis. The indirect signs are obtained either by air myelography or by the use of lipiodol. Lipiodol should only be used in carefully selected cases after a thorough clinical investigation by one competent in doing neurological examination. It should never be used without a preliminary Queckenstedt test, and an examination of the spinal fluid.

78. *The Viewpoint of the Insurance Carrier and Claims Attorney*—Edmund D. Leonard, Esq., Attorney, San Francisco. (By invitation.)

79. *The Present Attitude of the Industrial Accident Commission*—Ross Harbaugh, M. D., 350 Post Street, San Francisco.

Discussion by Carl Rand, M. D., Los Angeles; J. M. Robinson, M. D., San Francisco.

A discussion of cases which have come before the Industrial Accident Commission with diagnosis, treatment, and degree of disability resulting.

VIII

NEUROPSYCHIATRY SECTION*

Fred O. Butler, M.D., *Chairman*
Sonoma State Home, Eldridge

John B. Doyle, M.D., *Secretary*
1930 Wilshire Boulevard, Los Angeles

First Meeting—Tap Room

Tuesday, May 10, 8:30 a. m.

80. *Chairman's Address: The Importance of a State-Wide Program on Mental Hygiene in California*—F. O. Butler, M. D., Sonoma State Home, Eldridge.

While much has been done on general preventive medicine in the State and country, comparatively little has been done on a broad scale along mental lines. A very definite program should be set up in California, especially on account of the big influx of all types of mental cases, which thus far the State has been unable to control.

81. *Geriatric Psychiatry—A Review of Some of the Psychiatric Problems of Senescence*—Charles Lewis Allen, M.D., 214 South Lafayette Park Place, Los Angeles.

Increase in the number of old people being brought to our Psychopathic Hospital. The cause of this increase. The nature of senescence and its physical basis. An outline of the chief psychopathic manifestations observed in our material. What can be included under the subject of psychoses of senescence? Their etiology, pathology, diagnosis, and classifications. Their prognosis and treatment. Complication of this latter problem by the California laws. Medico-legal considerations with regard to the senile psychoses.

Discussion by Paul A. Gliebe, M. D., San Francisco; Verne R. Mason, M. D., Los Angeles.

82. *Insulin Shock Therapy in Dementia Praecox: A Report of a Series of Cases*—Clifford W. Mack, M.D., Livermore Sanitarium, Livermore.

Introduction. Selection of cases. Legal complications. Points to be discussed with the family concerning the dangers and possibilities of treatment. Methods of treatment used. Number of cases. Brief case reports giving duration, symptoms, degree of mental impairment and results of treatment. Conclusion and analysis of results. Psychiatric lessons to be learned from this method of treatment.

Discussion by J. M. Nielson, M.D., Los Angeles; G. S. Johnson, M.D., San Francisco.

83. *Suicide*—F. G. Lindemulder, M. D., 2001 Fourth Avenue, San Diego, and F. E. Toomey, M. D., 233 A Street, San Diego.

It is an established fact that San Diego has the highest suicide mortality in the Western Hemisphere. This study includes research into probable causes of suicide from psychiatric, sociologic, and meteorologic standpoints. An attempt to classify the cases, separately and collectively, to gain more insight into the causation of suicide in this particular location is made.

Discussion by A. J. Rosanoff, M.D., and Glenn E. Myers, M.D., Los Angeles.

84. *An Analysis of the Classification "Epileptic Psychosis"*—Eugene Ziskind, M.D., and Esther Somerfeld-Ziskind, M.D., 2007 Wilshire Boulevard, Los Angeles.

The different types of psychotic reaction seen in epileptics are examined. The point is raised that epilepsy is a symptom or syndrome. The validity of making a major classification of the psychoses dependent on a symptom is questioned. Many epileptic psychoses are identical with psychoses caused by known etiologic agents. Only in the absence of a

* Monitors: Karl O. von Hagen, M. D., Los Angeles, and Cullen W. Irish, M. D., Los Angeles.

known etiologic factor is the condition referred to as an epileptic psychosis. The bearing of repeated convulsions on the possible production of a psychosis is discussed.

Discussion by G. S. Johnson, M. D., San Francisco; William Edler, M. D., Pasadena.

❦

Second Meeting—Cottage "B"

Wednesday, May 11, 1:30 p. m.

85. *Sympathectomy in Angina Pectoris*—R. B. Raney M.D., 727 West Seventh Street, Los Angeles.

A discussion of the cause of symptoms in angina pectoris, with especial attention to their relationship to the autonomic nervous system. The psychologic action of therapeutic drugs is taken up, as well as experimental work on the sympathetic nerve supply to the coronary vessels. An attempt is made to establish a basis for rational surgical therapy. A new operation is described. Five patients have been operated by this method; all obtained complete relief. One of the five gave definite electrocardiographic evidence of coronary disease.

Discussion by D. G. Dickerson, M. D., Los Angeles; Carl W. Rand, M.D., Los Angeles.

86. *Traumatic Intracerebral Hemorrhage: Its Relationship to Delayed Traumatic Apoplexy*—C. B. Courville, M. D., 312 North Boyle Avenue, Los Angeles.

Intracerebral hemorrhage following injury to the head is not uncommon. Judging from its anatomic location, it is probably a contrecoup lesion. On the basis of pathologic evidence, it is doubtful whether the so-called delayed traumatic apoplexy has any etiologic relationship to craniocerebral injury.

Discussion by H. W. Flemming, M.D., San Francisco; R. B. Raney, M.D., Los Angeles.

87. *Contributory Factors in Vascular Encephalopathy*—C. W. Irish, M. D., 1930 Wilshire Boulevard, Los Angeles.

In addition to a general discussion a number of photographs of illustrative lesions, photographs in color of injected specimens and photographs of roentgenologic studies of the cerebral supply will be demonstrated.

Discussion by A. G. Foord, M. D., Pasadena; W. N. Anderson, M. D., Los Angeles.

88. *Relation of the Childhood Infections to Behavior*—Arthur R. Timme, M.D., 1930 Wilshire Boulevard, Los Angeles.

Many behavior difficulties encountered in children have their root in what appears to be a mild encephalitis during the course of one of the infectious diseases. The prototype of this sort of behavior is seen in behavior changes in children following epidemic encephalitis, though usually to a greater degree. The grouping of symptoms is typical enough to be called a syndrome. Central nervous, vegetative nervous and endocrine symptoms are the rule. Localization in the hypothalmic region and basal ganglia is indicated.

Discussion by F. N. Anderson, M. D., Los Angeles; S. J. Glass, M. D., Los Angeles.

89. *Unilateral Cerebral Dominance: A Consideration of Some of Its Manifestations*—Karl O. von Hagen, M.D., 727 West Seventh Street, Los Angeles.

The different parts of the brain are discussed with regard to laterality of function. The degree of unilateral cerebral dominance varies for different functions and in different individuals. For some functions it is complete; for others only relative; while for others no dominance is evident. Recent advances of knowledge on the subject.

Discussion by F. G. Lindemulder, M. D., San Diego; S. D. Ingham, M. D., Los Angeles.

Business Recess

Business meeting and election of officers.

IX

PATHOLOGY AND BACTERIOLOGY SECTION*

Gertrude Moore, M.D., *Chairman*
2404 Broadway, Oakland

George D. Maner, M.D., *Secretary*
657 South Westlake Boulevard, Los Angeles

Paul H. Guttman, M.D., *Assistant Secretary*
1127 Eleventh Street, Sacramento

First Meeting—Cottage "E"

Monday, May 9, 1:30 p. m.

90. *Chairman's Address*—Gertrude Moore, M. D., 2404 Broadway, Oakland.

91. *Bilateral Carcinoma of the Breast, with an Interesting Familial History*—David A. Wood, M. D., Stanford University School of Medicine, San Francisco; E. L. Rixford, M. D., 1795 California Street, San Francisco; and H. H. Darling, M. D., 909 Hyde Street, San Francisco.

This is the report of a typical cancer family in which most of the members of three generations have either succumbed to cancer or are suffering with it at the present time. On both sides of the family tree bilateral carcinoma of the breast has appeared.

92. *Some Bacteriological Studies in Sulphanilamid Therapy*—Paul Michael, M. D., 434 Thirtieth Street, Oakland.

This paper confines itself to a review of the pertinent literature only. The biochemical and physiological reactions of sulphanilamid and its allied substances are discussed. Bacteriological studies *in vivo* and *in vitro* reported, with particular reference to the gonococcus, staphylococcus and streptococcus groups. Rationale of improved method of therapy discussed.

93. *Intracranial Vascular Anomalies—Pathology of Certain Congenital and Acquired Lesions of Intracranial Blood Vessels*—Newton Evans, M. D., 2000 Milan, South Pasadena, and Cyril B. Courville, M. D., 312 South Boyle Avenue, Los Angeles.

In an autopsy series of approximately twenty thousand, a large number of these vascular anomalies have been encountered. These include aneurysms of the circle of Willis and its branches, varices of the dural sinuses, angiomas, angioblastomas, etc. These are discussed from the standpoint of pathogenesis, morphology and effects.

❦

Second Meeting—Cottage "D"

Tuesday, May 10, 8:30 a. m.

94. *Aplastic Anemia: Some Little-Stressed Aspects*—Theodore S. Kimball, M. D., 217 North Central Avenue, Glendale; and Sydney N. Soll, M. D. (by invitation), 2423 Grand Street, Huntington Park.

Aplastic anemia has been usually thought of as a condition in which the severe leukopenia, anemia, and thrombopenia present are the result of a completely aplastic bone marrow. In a series of cases recently autopsied at the Los Angeles County Hospital studies have revealed that the above clinical findings may result from bone marrow which still contains many regenerating cells.

95. *Morphology of Epithelioblastoma*—John W. Budd, Jr., M. D., 2131 West Third Street, Los Angeles.

In an analysis of salivary gland tumors the wide variety of tumor patterns was found to be due to variations in (1) degree in direction of differentiation of the epithelial cells; (2) polarity of secretion; (3) nature of secreted material.

Other forms of epithelial neoplasms are similarly analyzed.

* Monitors: T. S. Kimball, M. D., Los Angeles, and E. M. Butt, M. D., Los Angeles.

96. *Report of an Epidemic of Gastro-enteritis in Infants*—E. M. Butt, M.D., 3551 University Avenue, Los Angeles; and John F. Kessell, Ph.D. (by invitation), University of Southern California School of Medicine, Los Angeles.

This paper will include a summary of the case histories, the necropsy findings, and a report of the bacteriological studies in a series of four cases of gastro-enteritis together with pneumonia in infants. These infants simultaneously contracted the infection during their first few days of life in a local maternity hospital. The epidemic subsided as abruptly as it began and no further cases developed. Pseudomonas aeruginosa was recovered from all four cases. The evaluation of these findings will be discussed in detail in the paper.

97. *Tuberculosis of Animal Origin*—Emil Bogen, M.D., Olive View Sanatorium, San Fernando.

Nearly two thousand reported instances of bovine type tubercle bacillus infection in man emphasize the importance of transmission from animals. An instance of pulmonary tuberculosis of bovine origin discovered at Olive View illustrates this danger. Tuberculosis of animal origin should be eradicated.

98. *Theca Cell Tumors of the Ovary*—A. G. Foord, M.D., 749 Fairmont Avenue, Pasadena.

A report of two cases of theca cell tumors will be given, with discussion of the cases in the literature, aggregating about seventeen at the present time. For years these cases have been classed as ovarian fibromas or some other term. The similarity of the clinical manifestations to those of granulosa cell tumors and the embryologic and histologic diagnostic features will be discussed.

Business Recess

Business meeting and election of officers.

Third Meeting—Ballroom

Wednesday, May 11, 1:30 p. m.

SYMPOSIUM ON SHOCK

This will be a joint meeting of the following sections: Medicine; Surgery; Obstetrics and Gynecology; Eye, Ear, Nose and Throat; Pathology; Pediatrics.

The program of this joint meeting is printed under the fourth meeting of the General Medicine Section. (See page 12.)

X

PEDIATRICS SECTION*

E. Earl Moody, M.D., *Chairman*
829 So. Alvarado Street, Los Angeles

Hartzell H. Ray, M.D., *Secretary*
23 Second Avenue, San Mateo

W. W. Belford, M.D., *Assistant Secretary*
601 Medico-Dental Building, San Diego

First Meeting—Cottage "C"

Monday, May 9, 1:30 p. m.

99. *The Preventorium Child*—Harold G. Trimble, M.D., 508 Sixteenth Street, Oakland.

Our concept of childhood tuberculosis has changed materially since 1920. During this time many structures have been erected for the care of children who were presumably pretuberculous. There is but little need in many areas for these structures for the purpose for which they were originally intended. Such institutions can be used not only as educational centers, but also in specific cases in helping solve physical and psychological problems in individual children other than tuberculosis, as well as providing care for a limited time for a few selected cases of known T.B. contacts.

Discussion by Chesley Bush, M.D., Livermore; Clifford Sweet, M.D., Oakland; W. A. Hodges, M.D., Pasadena.

100. *Treatment of Meningococcic Meningitis*—Paul M. Hamilton, M.D., 248 East Main Street, Alhambra; William J. Mitchell, M.D. (by invitation), 1200 North State Street, Los Angeles, and Albert G. Bower, M.D., 136 No. Central Avenue, Glendale.

A review of 120 cases treated at the Los Angeles County General Hospital during the past two years, with results of treatment with serum, antitoxin, sulfanilamid, and combinations of these agents.

Discussion by Philip E. Rothman, M.D., Los Angeles; Edward B. Shaw, M.D., San Francisco.

101. *Intestinal Obstruction in Children*—W. J. Norris, M.D., 1136 West Sixth Street, Los Angeles.

This paper is based upon the findings in one hundred cases of different types of intestinal obstruction in children who were admitted to the Children's Hospital of Los Angeles. A résumé of the various types will be given with pictures and remarks.

Discussion by Henry Hunt Searls, M.D., San Francisco.

102. *Pyuria in the New-Born*—William M. Happ, M.D., 3875 Wilshire Boulevard, Los Angeles.

Pyuria or so-called pyelitis occurs in new-born babies, but the condition is seldom recognized because urine examinations are not done. The symptoms are fever and digestive upsets. It occurs in boys as often as in girls. The condition is frequently secondary to some congenital obstruction in the urinary tract. These obstructions are outlined in the paper. Illustrative cases presented.

Discussion by Elmer A. Belt, M.D., Los Angeles.

103. *Report of the Committee on Immunization Procedure*—Edward B. Shaw, M.D., 384 Post Street, San Francisco. (Committee report.)

The Committee on Immunization Procedures will submit a brief report detailing its recommendations regarding the use of the various procedures, some of which it is felt should be done routinely, some for special considerations and some not at all. There will be included a brief discussion of recommended methods for the performance of these procedures.

Committee members: Edward B. Shaw, M.D., Chairman, San Francisco; Paul M. Hamilton, M.D., Alhambra; Henry E. Stafford, M.D., Oakland.

Business Recess

Business meeting and election of officers.

Second Meeting—Ballroom

Wednesday, May 11, 8:30 a. m.

SYMPOSIUM ON VITAMINS

Joint meeting with Section on Medicine.

104. *Present Knowledge of Vitamins*—Nina Simmonds, Sc.D., University of California, San Francisco. (By invitation.)

During the past thirty years research in nutrition has yielded a large amount of detailed information regarding the essentials of an adequate diet. An understanding of the dietary properties of foods and the demonstration of the existence of the vitamins were made possible only by animal experimentation. The practical application of this research data to the physician will be the theme of the paper.

Discussion by William Palmer Lucas, M.D., San Francisco.

* Monitors: Ralph Netzley, M.D., Pasadena, and William Riley, M.D., San Francisco.

105. *Studies of the Blood Plasma—Vitamin C in Childhood*—James F. Rinehart, M.D., University of California Medical School, San Francisco.

This report is based upon the analysis of a large series of blood vitamin C determinations in childhood, both in health and disease. The reliability, usefulness and limitations of the method are considered, as is evidence pertaining to the possible influence of C deficiency in certain diseases.

Discussion by Roland P. Seitz, M.D., San Francisco.

106. *Studies on Hypoglycemia in Infants and Children*—Alexis F. Hartmann, M.D., Professor of Pediatrics, Washington University School of Medicine, St. Louis, Missouri. (By invitation.)

An outline will be presented of the various ways in which the hypoglycemia state may be produced, and observations on normal newly born infants, those born of diabetic mothers, and those with intracranial or adrenal hemorrhage, together with observations on the group of children with severe recurrent attacks of hypoglycemia, will be stressed.

107. *Diagnosis and Treatment of Vitamin Deficieney States*—Dwight L. Wilbur, M.D., 490 Post Street, San Francisco. (By invitation.)

In this presentation is discussed the diagnosis of vitamin deficiency states. These conditions most commonly consist of mild pathological and psysiological changes, and the diagnosis depends on the recognition of the clinical features of these deficiencies and on the interpretation of certain so-called diagnostic tests available for vitamins A, C, and D.

Discussion by Stacy R. Mettier, M.D., San Francisco; William C. Boeck, M.D., Los Angeles.

❦

Third Meeting—Ballroom

Los Angeles

First Meeting—Cottage "C"

Tuesday, May 10, 8:30 a. m.

Joint meeting with Section of Industrial Medicine and Surgery.

108. *Normal Angles in the Bones About Various Joints and Reporting in Degrees the Deviations from the Normal*—R. G. Van Nuys, M.D., 2490 Channing Way, Berkeley.

A presentation of normal bone angles about certain joints. An effort has been made to find a standard for measuring deviations from normal, and reporting the same in degrees and centimeters. Special attention is given to the central axis of weight bearing and its relation to the astragalus. The salient angles of the os calsis are of great importance. Wrist, elbow and hip angles are dealt with. Knee joint spaces have been measured and recorded. The paper will be given by aid of slides.

Discussion by Harold E. Crowe, M.D., Los Angeles.

109. *X-ray Evidenee of Healing of Fraetures of the Femoral Neek*—H. A. Hill, M.D., and L. H. Garland, M.D., 450 Sutter Street, San Francisco.

The question has been frequently asked: "What percentage of fractures of the neck of the femur in elderly persons unite by bone?" The answer, up to recent years, was usually "very few." However, since the introduction of various mechanical immobilizing devices, an increasing percentage of fractured femoral necks appear to show bony union. In order to determine the percentage of cases showing x-ray evidence of bony union at varying intervals following fractures, the present study was undertaken. A comparison of the clinical and roentgenological evaluations of union will be outlined, and the roentgenological results to date in the series of cases studied will be presented.

Discussion by K. S. Davis, M.D., Los Angeles.

110. *The Measurement of the Deformity of Alignment in Fraetures*—Clayton R. Johnson, M.D., Murphy Memorial Hospital, Whittier.

A method for exact measurement of the deformity of alignment is proposed, especially for those deformities which may affect the function of adjacent joints. The normal angulation of various joint surfaces is given along with the characteristic deformities which often occur with fracture.

Discussion by J. S. Woolford, M.D., Eureka.

111. *End Result Study on Fraetured Hips Treated at the San Franeiseo City and County Hospital*—Wilbur J. Cox, M.D., 450 Sutter Street, San Francisco.

This is a study of fifty fractures of the neck of the femur in which the Smith-Peterson nail was used as a method of internal fixation.

Discussion by John Wilson, M.D., Los Angeles; G. J. McChesney, M.D., San Francisco.

112. *Experienees with the Smith-Peterson Nail*—William Arthur Clark, M.D., 65 North Madison Avenue, Pasadena.

The author has used the Smith-Peterson pin since 1930, by the open reduction method exclusively. Accurate reduction is essential before fixation. Failures have been due to atrophy of the head and to having the pin too high in the spongy trochanter. A short history of metal fixation for fractures of the hip will be given.

Discussion by E. W. Cleary, San Francisco; Frazer Macpherson,M.D., San Diego.

Medieal Eeonomies meeting.

❦

Second Meeting—Cottage "D"

Wednesday, May 11, 8:30 a. m.

113. *Chairman's Address*—John D. Lawson, M.D., California State Life Building, Sacramento.

114. *The Roentgenologie Demonstration of Gall Bladder Tumors*—J. D. Coate, Peralta Hospital, Oakland.

Six cases will be included in this report, with complete pathologic studies on three proven cases. This series included both the papillomata and the adenomata.

Discussion by Sumner Everingham, M.D., Oakland; Paul Michael, M.D., Oakland.

* Monitors: E. W. Liljedahl, M.D., Los Angeles, and J. F. Chapman, M.D., Pasadena.

115. *The Roentgen Diagnosis of Diseases of the Ileocecal Region of the Gastro-intestinal Tract*—Joseph Jellen, M.D., Department of Radiology, Queen of Angels Hospital, Los Angeles.

There are a large number of diseases which show a special predilection for involvement of the ileocecal region of the gastro-intestinal tract. A classification of these diseases is presented, with a discussion of the roentgen diagnosis. A series of lantern slides will be shown illustrating the roentgen appearance of various diseases mentioned.

Discussion by Irving S. Ingber, M.D., San Francisco; C. M. Richards, M.D., San Jose.

116. *Marked Subperiosteal Calcification in Early Scurvy*—Carl D. Benninghoven, M.D., Mills Memorial Hospital, San Mateo.

Three cases which show the course from early onset to complete healing.

Discussion by James F. Rinehart, M.D., San Francisco; Carl Bowen, M.D., Oakland.

117. *Pulmonary Miliary Lesions*—Ray Carter, M.D., 1200 North State Street, Los Angeles.

Diseases producing them, factors influencing their visability on the film and the roentgen differentiation diagnosis.

Discussion by M. J. Geyman, M.D., Santa Barbara; M. L. Pindell, M.D., Los Angeles.

Business Recess

Business meeting and election of officers.

*

Third Meeting—Cottage "D"

Wednesday, May 11, 1:30 p. m.

118. *Operation of a Multiple Portal Supervoltage X-ray Tube*—A. H. Warner, Ph.D., 1407 South Hope Street, Los Angeles. (By invitation.)

The mechanical and electrical features of a 600,000-volt installation are described. The radiation has been studied and depth dose curves and absorption curves in lead and aluminum are given.

Discussion by Robert S. Stone, M.D., San Francisco.

119. *What Can One Expect from Radiation Therapy in Cancer of the Rectum and Anus*—Orville N. Meland, M.D., 1407 South Hope Street, Los Angeles.

Carcinoma of the rectum offers great obstacles to its successful treatment by radiation alone. This is due to its situation and its radioresistance, so that the results are largely palliative. Carcinoma of the anus, on the other hand, is accessible, and is often successfully treated by radiation alone.

Discussion by G. S. Sharp, M.D., Pasadena; Clyde Emery, M.D., Los Angeles.

120. *X-ray in Treatment of Carcinoma of the Breast*—Lyell C. Kinney, M.D., 1831 Fourth Street, San Diego.

Except in the early localized cases, the newer methods of fractional radiation combined with surgery will practically double the present curability. Newer radiation methods make it possible to restrict the field of operability, as radical surgery offers little paliation in advanced cases. Radiation with or without simple mastectomy offers real paliation and will prolong life. The paper will discuss indications for x-ray treatment and the present conception of what is adequate radiation in carcinoma of the breast.

Discussion by Alson R. Kilgore, M.D., San Francisco.

121. *Use of Radiation Therapy in Acute and Chronic Inflammatory Conditions*—Henry Johnson Ullmann, M.D., 1520 Chapala Street, Santa Barbara.

The discussion includes all inflammatory processes other than dermatoses, malignant and premalignant lesions.

Discussion by William H. Sargent, M.D., Oakland.

XII

UROLOGY SECTION*

Lloyd E. Kindall, M.D., *Chairman*
400 Twenty-ninth Street, Oakland

Carl F. Rusche, M.D., *Secretary*
1680 North Vine Street, Hollywood

First Meeting—Cottage "A"

Wednesday, May 11, 8:30 a. m.

122. *Congenital Solitary Kidney*—Report of Two Cases—Frederick A. Bennetts, M.D., 1921 Wilshire Boulevard, Los Angeles.

One, occurring in an infant seven months of age with hydroureter and hydronephrosis. Another, in a girl seventeen years of age, complicated by hydronephrosis secondary to congenital adhesions and anomalous blood vessels about upper ureter and lower pole of kidney, producing acute Dietl's crisis and anuria.

Discussion by Carl Rusche, M.D., Hollywood; Edward Beach, M.D., Sacramento.

123. *The Cure of Gonorrhea: An Immunologic Problem*—Edward W. Beach, M.D., Medical Dental Building, Sacramento.

Gonorrhea is concededly a self-limiting disease. Stated differently, the cure of gonorrhea is contingent to and predicated upon the development of complete tissue immunity. A much better understanding of this immunologic mechanism must be contrived before the advent of more efficient treatment and more intelligent application. To this end, modern concepts anent this autogenetic phenomena are briefly reviewed herein. An attempt is likewise made to evaluate the newer forms of therapy (particularly chemotherapy and induced fever) in terms of immunologic accomplishments as applied to the problem of cure.

Discussion by Arno Folte, M.D., San Francisco; J. J. Crane, M.D., Los Angeles.

124. *The diagnosis and Treatment of Secondary Anaërobic Infections of Kidney Wounds*—Charles P. Mathé, M.D., 450 Sutter Street, San Francisco.

Report of case presenting secondary anaërobic streptococcic infection of kidney wound following nephropexy and sympathectomy. Elongated nonpus-producing blind sinuses were encountered between abdominal muscular layers. Anaërobic infection diagnosed. Cleared up by local administration, intra and hyperdermic injection of antigen and intramuscular injections of immunized blood. Problem of diagnosis. Treatment. Prognosis and results.

Discussion by Thomas Gibson, M.D., San Francisco; Clark Johnson, M.D., San Francisco.

125. *Suprapubic Bladder Drainage*—Henry A. R. Kreutzmann, M.D., 2000 Van Ness Avenue, San Francisco.

This paper explains in detail the method of inserting the improved suprapubic trocar just above the symphysis pubis into the distended bladder. Its use in cases of acute retention resulting from hyperthrophied prostate or impassable urethral stricture is discussed. The advantages of this method over indwelling catheter for drainage preliminary to prostatectomy and the results obtained by this method in seventy cases are discussed in detail. A motion picture illustrates the operation.

Discussion by Paul A. Ferrier, M.D., Pasadena; Albert M. Meads, M.D., Oakland.

126. *Carcinoma of the Prostate*—Frank Hinman, M.D., 603 Fitzhugh Building, San Francisco.

Introduction: Incidence, diagnosis, treatment. Analysis of 191 cases with type of treatment and results. The result in detail of forty-five cases treated by radical operation.

Discussion by Arthur B. Cecil, M.D., Los Angeles; A. Elmer Belt, M.D., Los Angeles.

* Monitors: Donald Charnock, M. D., Los Angeles, and Chester H. Mackay, M. D., Los Angeles.

126a. *Experimental Production in Animals of Conditions Similar to Those of the Adrenal Syndrome in Humans*—James B. Hamilton, Ph. D., Yale University School of Medicine, New Haven, Connecticut. (By invitation.)

It has been reported that the presence in the female of adequate amounts of male hormone substance will cause masculinization changes in the clitoris and the homologue of the male prostatic glands and cessation of the female reproductive cycle. If given sufficiently early in the prenatal period, embryological defects result. These and other changes following androgen treatment constitute a condition which corresponds even in some fine details to that which occurs in the adrenal syndrome of humans with tumor or hyperplasia of the adrenal.

127. *Chairman's Address: Conservative Renal Surgery—With Particular Reference to Kidney Trauma*—Lloyd Kindall, M.D., 400 Twenty-ninth Street, Oakland.

❦

Second Meeting—Cottage "A"

Wednesday, May 11, 1:30 p.m.

128. *Treatment of Vesical Diverticula*—Roger W. Barnes, M.D., and R. Theodore Bergman, M.D., Suite 707, Medico-Dental Building, Los Angeles.

A comprehensive review of the literature is made pertaining to the etiology, pathology, and treatment of vesical diverticula. A conservative method, transurethral diverticulotomy, is also discussed.

Discussion by J. J. Crane, M.D., Los Angeles; A. A. Kutzmann, M.D., Los Angeles.

129. *Diagnosis and Treatment of Urinary Tract Infections*—James R. Dillon, M.D., 490 Post Street, San Francisco.

Two years ago a report was made on urinary tract infections with clear urine. Further studies and observations on diagnostic technique and treatment will be presented under the above title, illustrated by lantern slides.

Discussion by A. J. Scholl, M.D., Los Angeles; A. M. Meads, M.D., Oakland; Nathan Hale, M.D., Sacramento.

130. *Limitation of Male Sex Hormone Therapy for Benign Hyperthrophy*—Robert V. Day, M.D., 1911 Wilshire Boulevard, and Harry W. Martin, M.D., 6253 Hollywood Boulevard, Los Angeles.

Testosterone itself, and both liposoluble and hydrosoluble testis extracts, are potent in relieving hesitancy, feeble stream and nycturia in Grade 1 and Grade 2 hyperthrophied prostates, and often the residual markedly decreases. It cannot be demonstrated that the prostate is actually decreased in its dimensions. This form of therapy is valuable in certain types of cases where surgery carries too great an element of danger or it seems necessary to the patient himself to postpone a surgical procedure for economic or other reasons personal to him. Like insulin, the treatment should not be discontinued, but the dose may be diminished in many cases. This form of therapy is not in any sense a substitute for surgical relief of major prostatic obstruction.

Discussion by Miley B. Wesson, M.D., San Francisco; Paul A. Ferrier, M.D., Pasadena.

131. *The Cystoscopic Implantation of Radium Element in Tumors of the Bladder—A New Technique*—Thomas D. Moore, M.D., 899 Madison Avenue, Memphis, Tennessee. (By invitation.)

132 *Causes of Persistent Sinus Following Suprapubic Cystotomy with Reports of Unusual Cases*—Ben D. Massey, M.D., 112 North Madison Avenue, Pasadena.

Persistence or reformation of a suprapubic sinus is usually due to obstruction of the bladder neck. The paper discusses a patient with myeloid leukemia who developed a suprapubic abscess and urinary sinus five years after prostatectomy. This sinus failed to heal in the absence of lower urinary tract obstruction. Necropsy findings are reported and the rôle of infection is discussed as a causal factor in these conditions.

Discussion by Robert V. Day, M.D., Los Angeles; H. C. Bumpus, M.D., Pasadena.

133. *Congenital Renal Anomalies, with Special Reference to Horseshoe Kidney, with Motion Picture*—Carl Rusche, M.D., and Samuel K. Bacon, M.D., 1680 North Vine Street, Hollywood.

The congenital renal anomaly—horseshoe kidney (with motion pictures in color showing the operative technique for calculous disease). This paper briefly reviews renal embryology, the anatomical features, frequency, and clinical aspects of horseshoe kidney. The management of a patient with horseshoe kidney and calculous disease is reported and the operative technique is demonstrated by motion picture in color.

Discussion by William E. Stevens, M.D., San Francisco; B. H. Hager, M.D., Los Angeles.

134. *Believe It or Not*—Wirt B. Dakin, M.D., 802 Pacific Mutual Building, Los Angeles, California.

A collection of reports of such a startling and incredible nature as to immediately attract keen interest and curiosity. Cases with strangely baffling symptoms, startling pathological conditions and such weird operative findings that one would scarcely give them credence unless he saw them with his own eyes. They represent contributions from many of our leading urologists that are a refreshing stimulus to what is bound to become at times a jaded medical appetite. Many amusing incidents are included.

III—HOUSE OF DELEGATES MEETINGS

35th ANNUAL SESSION—MAIN BALLROOM, HOTEL HUNTINGTON

Speaker, LOWELL S. GOIN, Los Angeles *Vice-Speaker,* JOHN H. GRAVES, San Francisco
Secretary, F. C. WARNSHUIS, San Francisco

FIRST MEETING

Monday, May 9, 8 p. m.

Order of Business

1. Call to order.
2. Report of Committee on Credentials.
3. Roll call.
4. Announcement and approval of Reference Committees:
 (*a*) Reports of Officers, Standing and Special Committees.
 (*b*) Resolutions, Amendments to the Constitution and By-Laws, and New and Miscellaneous Business.
 (*c*) Credentials.
 (*d*) Report of Council and Secretary-Treasurer.
5. President's address—Howard Morrow.
 Reports:*
6. Annual report of the Council—Morton R. Gibbons, Chairman.
7. Report of the Trustees of the California Medical Association—Morton R. Gibbons, President.
8. Report of Auditing Committee — Karl L. Schaupp, Chairman.
9. Report of Secretary-Treasurer—Frederick C. Warnshuis.
10. Report of Editor—George H. Kress.
11. Report of General Counsel—Hartley F. Peart. Mr. Peart will discuss malpractice insurance problems.
12. Report of Committee on Public Relations—Charles A. Dukes, Chairman.
13. Report of Standing and Special Committees:
 A. Standing Committees:
 Executive Committee—Karl L. Schaupp.
 Committee on Associated Societies and Technical Groups—John V. Barrow.
 Committee on Health and Public Instruction—Fred B. Clarke.
 Committee on History and Obituaries—Frank R. Makinson.
 Committee on Hospitals, Dispensaries and Clinics—Daniel Crosby.
 Committee on Industrial Practice—Morton R. Gibbons.
 Committee on Medical Defense—George G. Reinle.
 Committee on Medical Economics—John H. Graves.
 Committee on Medical Education and Medical Institutions—Loren R. Chandler.
 Committee on Membership and Organization—E. Vincent Askey.
 Committee on Postgraduate Activities—John C. Ruddock.
 Committee on Publications—Ralph Eusden.
 Committee on Public Policy and Legislation—Junius B. Harris.
 Committee on Scientific Work—Frederick C. Warnshuis.
 Committee on Public Relations—Charles A. Dukes.
 Cancer Commission—Charles A. Dukes.
 B. Special Committees:
 Committee on Animal Experimentation—Philip K. Gilman.
 Committee on Syphilis—Howard Morrow.
 Committee on a Basic Science Law—George H. Kress.
 Committee on California Medical Economic Survey—Edward M. Pallette.
14. Unfinished Business.
 A. Amendments to Constitution:
 Amendment to Constitution, Article VII, Section 1.
 (d) *Resolution Regarding Nomination and Election of District Councilors*
 Resolved, That Section 1 of Article VII of the Constitution of this Association be and hereby is amended as follows, by striking out all of the third paragraph of said Section 1 of Article VII, reading as follows:
 "The nine district councilors shall be elected as follows: Prior to the time set for the election of district councilors the delegates of each councilor district for which a councilorship is about to become vacant, shall meet, organize, and in due form elect one or more members of the said councilor district as the nominee or nominees for the said vacancy. Such nomination or nominations shall be submitted in writing, signed by at least two delegates who were present at such meeting, and shall be given to the Secretary-Treasurer, by him to be transmitted to the House of Delegates. The House of Delegates may make additional nominations from the floor of the House, and in the event that the delegates from a councilor district fail to submit a nomination or nominations, shall on its own account proceed to make nominations for each district councilor vacancy. A vote shall then be taken by the House of Delegates to determine who shall be elected to the vacant councilorship"; and by inserting in lieu thereof the following:
 The nine district councilors shall be elected as follows: At least one month prior to the time set for the election of district councilors, the Secretary-Treasurer shall mail a written notice to each delegate, addressed to his address listed in the Association's records, of each councilor district for which a councilorship is about to become vacant, notifying the delegates of the time, which must be at least two weeks after the mailing of the notices, and a place designated by the Secretary-Treasurer, for the nomination meeting of the delegates of said councilor district.
 At the time and place designated in said written notice, delegates shall meet, organize and elect by a majority vote a member of the said councilor district as nominee for district councilor for such councilor district for the ensuing term. The delegates shall then transmit in writing to the Secretary-Treasurer the result of such nomination meeting, and the Secretary-Treasurer shall report the same to the House of Delegates. The nominee, regularly nominated by the delegates present at the nomination meeting pursuant to this section, shall be deemed elected by the House of Delegates at the time of the report of the Secretary-Treasurer. In the event that the delegates from a councilor district fail to submit a nomination, the House of Delegates shall, on its own account, proceed to make nominations from the floor of the House, and in such event a vote shall be taken by the House of Delegates to determine which nominee shall be elected to the vacant councilorship
15. Resolutions and New Business.
 (NOTE: *All resolutions must be presented in writing and in triplicate.*)
16. Approval of Minutes.
17. Recess to Wednesday, 8:00 p. m.

SECOND MEETING

Wednesday, May 11, 8:00 p. m.

Order of Business

1. Call to order.
2. Supplemental Report of Credentials Committee.
3. Roll call.
4. Secretary's announcement of Council's selection of place for the 1939 Annual Session.
5. Elections:
 (*a*) President-Elect.
 (*b*) Speaker.
 (*c*) Vice-Speaker.
 (*d*) Councilors:
 First District—Calvert L. Emmons, Ontario (term expiring).
 Fourth District—Axcel E. Anderson, Fresno (term expiring).
 Seventh District—O. D. Hamlin, Oakland (term expiring).
 (*e*) Councilors-at-Large:
 Harry H. Wilson, Los Angeles (term expiring).
 Morton R. Gibbons, San Francisco (term expiring).
 (*f*) Delegates to the American Medical Association—Incumbents:
 Charles A. Dukes, Oakland (term expiring).
 Edward M. Pallette, Los Angeles (term expiring).
 Robert A. Peers, Colfax (term expiring).
 William R. Molony, Sr., Los Angeles (term expiring).
 (*g*) Alternate Delegates to the American Medical Association—Incumbents:
 Edward N. Ewer, Oakland (term expiring).
 William H. Kiger, Los Angeles (term expiring).
 F. F. Gundrum, Sacramento (term expiring).
 John C. Ruddock, Los Angeles (term expiring).
6. Announcement and Approval of Members of Standing Committees Elected by the Council.
7. Report of Reference Committees:
 (*a*) Report of Council and Secretary-Treasurer.
 (*b*) Reports of Officers, Standing and Special Committees.
 (*c*) Resolutions, Amendments, New and Miscellaneous Business.
8. Unfinished Business.
9. Presentation of Officers:
 President.
 President-Elect.
 Speaker.
 Vice-Speaker.
10. Presentation of President's Certificate to Howard Morrow.
11. Approval of Minutes.
12. Adjournment.

* Reports of Officers, Standing and Special Committees appear in full text in the Pre-Convention Bulletin, printed as an Appendix to this Annual Session program. (See page 33.

IV—OTHER MEETINGS

CANCER COMMISSION PATHOLOGY CONFERENCE

Sunday, May 8, 9 a. m. to 4:30 p. m.

359 Science Building, University of Southern California Medical School, Thirty-sixth Place and University Avenue, Los Angeles

The annual Conference on Pathology, sponsored by the California Medical Association, will take place in Room 359 of the Science Building, 3661 University Avenue, corner of Thirty-sixth Place and University Avenue, Los Angeles.

The meeting is being held in this location rather than at the Hotel Huntington because of better lighting facilities, etc. The program will include morning and afternoon sessions. Interesting cases are to be presented for diagnosis, and it is hoped that reports will be made on cases previously presented.

All those who desire to present cases and slides are requested to notify the chairman of the committee, Alvin G. Foord, M. D., 749 Fairmont Avenue, Pasadena, at once. One hundred prepared slides and a copy of the case history, which has to be mimeographed, are likewise to be sent.

If you wish to attend, register with the chairman of the committee or the secretary of the Cancer Commission, 450 Sutter Building, San Francisco, as soon as possible.

Bring your own microscopes. Attendance will be limited.

CANCER COMMISSION RADIOLOGY CONFERENCE

Sunday, May 8, 9:30 a. m. to 4 p. m.

Hotel Huntington, Pasadena

The Radiological Conference, sponsored by the Cancer Commission of the California Medical Association, will be held at the Hotel Huntington, Main Ballroom, on Sunday, May 8, from 9:30 a. m. to 4 p. m.

The discussion will center about radiotherapy, as well as diagnosis.

Those who wish to attend should register with the chairman of the committee, William E. Costolow, M. D., 1407 South Hope Street, Los Angeles, or with the secretary of the Cancer Commission, 450 Sutter Street, San Francisco. Likewise, those who wish to present material for diagnosis or discussion of therapy should contact Doctor Meland as soon as possible.

It is necessary that everyone who wishes to participate should register as attendance will be limited to insure the greatest benefit to those interested.

MEDICAL SOCIETY OF THE STATE OF CALIFORNIA

Wednesday, May 11, 4 p. m., Crystal Room

There will be a meeting of the members of this legal protection organization. Chairman O. D. Hamlin will preside. Reports will be rendered. Officers will be elected. Plans for expansion will be presented. Every member of the California Medical Association is invited, in fact, urged to attend this annual meeting.

V—SCIENTIFIC EXHIBITS

Patio, Hotel Huntington

1. *Heart Association*—Howard F. West, M. D., 1930 Wilshire Boulevard, Los Angeles.
 Exhibits and daily demonstrations and moving pictures mornings and afternoons. Watch bulletin board for schedule.
2. *Models of the Prostate as Ascertained by Rectal Palpation*—Roger W. Barnes, M. D., Medico-Dental Building, Los Angeles.
 Models of the prostate as ascertained by rectal palpation, demonstrating the normal and eleven different pathological conditions in the prostate. This is to be accompanied by roentgenograms, pathological specimens, and slides of these pathological conditions of the prostate and associated conditions.
3. *Convalescent Serum*—C. M. Hyland, M.D., Children's Hospital Society, 4614 Sunset Boulevard, Los Angeles.
 The exhibit of the Children's Hospital convalescent serum includes a demonstration of serum dehydration by the lyophile machine, a motion picture showing the different steps in the pooling and bottling of convalescent serum, various packages of dried and liquid serum as furnished for prophylaxis and treatment, and case charts which show the result of serum therapy.
4. *Tuberculous Tracheobronchitis*—W. R. Oechsli, M.D., Department of Charities, Los Angeles.
 An exhibit comprised of the clinical, bronchoscopic, x-ray, and pathological findings in tracheobronchitis occurring as a disease entity as well as a complication of pulmonary tuberculosis, based on over one hundred proved cases. The findings are correlated and presented in the form of charts, x-ray films, diagnosis, and pathological specimens.
5. *Muscle-Splitting Extraperitoneal Lumbar Ganglionectomy*—Felix L. Pearl, M. D., 450 Sutter Street, San Francisco.
 This exhibit consists of a colored motion picture depicting the technique of muscle-splitting extraperitoneal lumbar ganglionectomy as developed by the author. The picture shows the steps of the operation, removal of the sympathetic chain, closure, and the advantages of the method. Ureter, vena cava, aorta, and other retroperitoneal structures are well shown.
6. *Plastic Surgery*—Fred Lindenberg, M. D., 1680 North Vine Street, Hollywood.
 Results of reconstructive and cosmetic cases of plastic surgery. Demonstration with life-size masks and unretouched photographs.
7. *Reconstructive Plastic and Oral Surgery*—Arthur E. Smith, M.D., D.D.S., and James B. Johnson, M.D., 1930 Wilshire Boulevard, Los Angeles.
 This exhibit consists of numerous life-sized contact models reproduced in natural colors and arranged in series to demonstrate various congenital and acquired deformities and their correction by reconstructive plastic and oral surgery. These include cases of mutilation from automobile accidents, congenital cleft palate and lip, malignancies of the face and oral cavity and many other classical conditions encountered by the surgeon limiting himself to this field.
8. *Diseases of the Thyroid Gland*—Harold L. Thompson, M.D., 1930 Wilshire Boulevard, Los Angeles.
 The exhibit will consist of charts, outlines, drawings, and pathological specimens covering diseases of the thyroid gland in a general way.
9. *Manipulative Surgery*—G. Mosser Taylor, M.D., 2007 Wilshire Boulevard, Los Angeles.
 Charts showing indications, contraindications, and complications, illustrated by some forty artistic drawings, mounted and well labeled, and grouped under the different joints, such as the neck, low back, so-called "sacro-iliac" lesions, shoulders, elbows, knees, and feet. Besides this, a colored motion picture completes the exhibit. This work has been developed from ten years of clinical practice, and is in keeping with the latest thought, particularly on the subject of low-back pain.

VI—ENTERTAINMENT

Calendar

Sunday Afternoon:

Tea served, Hotel Huntington.

Sunday Night:

First run of moving pictures, Hotel Huntington.

Monday Afternoon:

Trip to moving-picture studio, arranged particularly for Auxiliary, but open to men.

Monday Night:

Musicale, Hotel Huntington.

Tuesday, 7:30 a. m.

Past Presidents' breakfast. Past presidents of the Association will hold their annual breakfast. See bulletin board or inquire at registration desk for name of the private dining room assigned for this function.

Tuesday Afternoon:

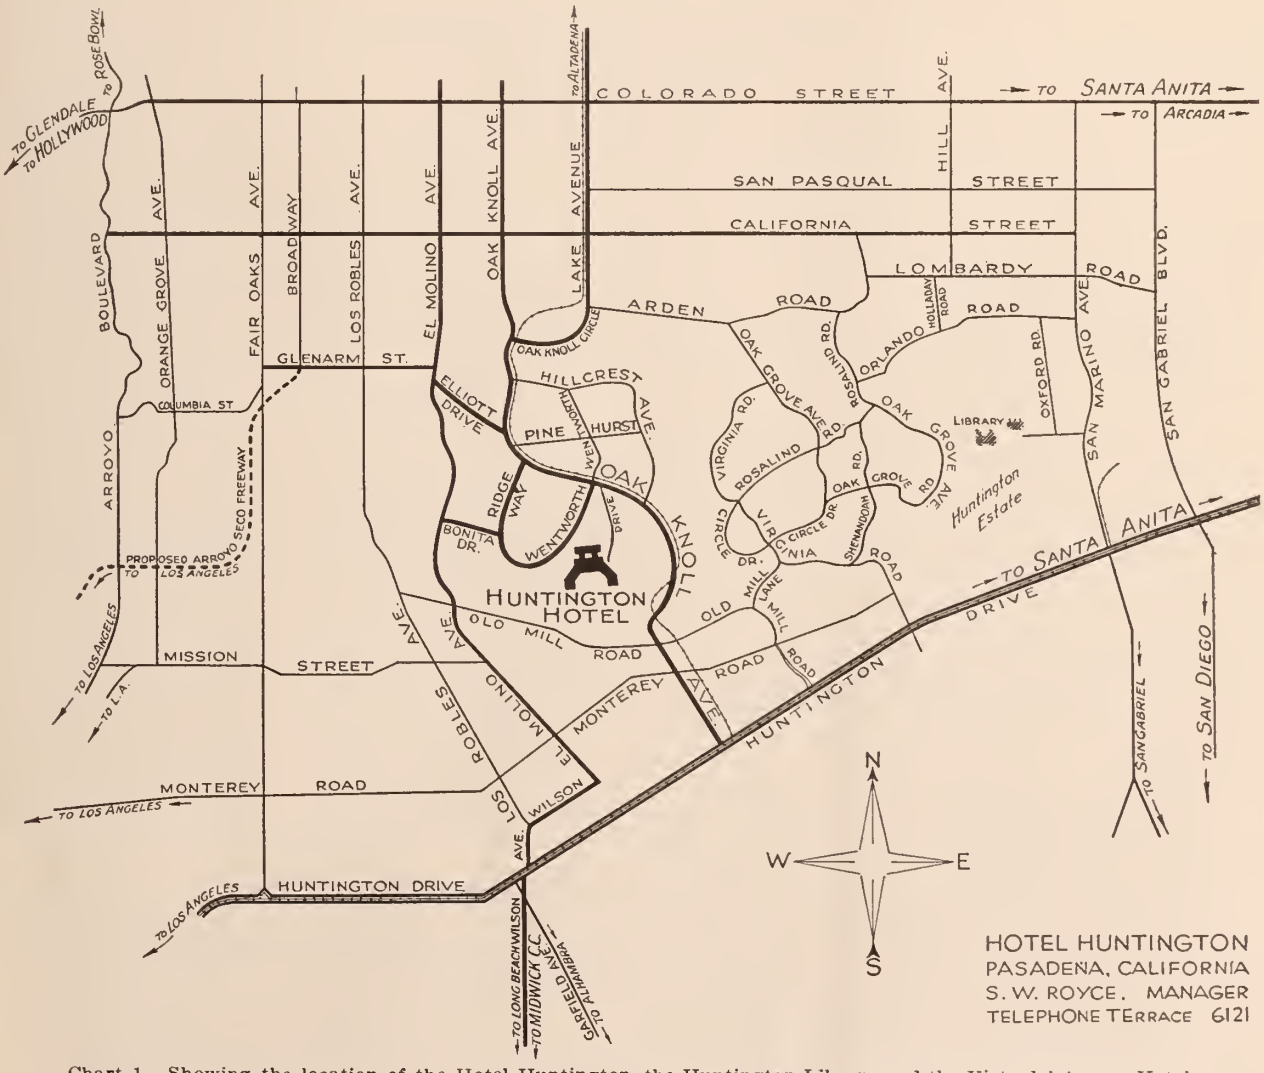
Trip to Griffith Park Planetarium, arranged particularly for the Auxiliary, but open to men.

Tuesday Night:

President's dinner and entertainment, Hotel Huntington. Reservations must be made with the Hotel Huntington management by noon on Tuesday. (Price, $2.50 per plate.) Guests of Hotel Huntington obtain special tickets from room clerk.

Golf Clubs

	Fees
Midwick Country Club	$2.00
San Gabriel Country Club	1.00
Flintridge Country Club	1.50
Altadena Golf Club	1.00
Brookside Golf Course	1.00
Annandale Country Club	2.00



Other Entertainment

Demonstrations of giant x-ray and other electrical equipment has been promised at the California Institute of Technology. Registration at the desk will be necessary in order to provide for accommodations. Definite dates will be set later by the Institute.

Demonstration of astronomical equipment at Mount Wilson Observatory will be possible during afternoons, if sufficient register at the desk. Night observations *may* be possible, but could not be promised this far in advance by the officials at Mount Wilson.

The Arrangements Committee will be glad to arrange any unofficial trips for individuals or parties who will apply in advance, such as charter boats for deep sea fishing, plane trip to Boulder Dam, or reservations at Catalina Island.

Tickets for admission to the Huuntington Library must be applied for well in advance, either through the committee or direct to the Huntington Library. The Gay Lion Farm, the Pasadena Community Playhouse, and Olivera Street in Los Angeles, are other suggested points of interest, as also the Padua Hills Theater and dining room above Claremont.

HOTEL HUNTINGTON
PASADENA, CALIFORNIA

VII—WOMAN'S AUXILIARY

Ninth Annual Session

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION

Headquarters at Hotel Huntington, Pasadena

MRS. HOBART ROGERS, *President*
(1137 Mandana Boulevard, Oakland)

MRS. ARTHUR T. NEWCOMB, *Convention Chairman*
(1 Richmond Place, Pasadena)

Sunday, May 8

Arrival of delegates, members, and guests, greeted by a delegation of hostesses.

3:00-7:00 p. m.—Registration.

4:00 p. m.—Tea and music, Hotel Huntington lobby.

6:00 p. m.—Informal round-table dinner for Auxiliary members.

8:30 p. m.—Moving pictures, Hotel Huntington Ballroom.

Monday, May 9

9:00 a. m. to 7:00 p. m.—Registration.

9:00 a. m.—Pre-Convention State Board meeting, Crystal Room, Hotel Huntington.

10:00 a. m.—Opening session of the California Medical Association. All Auxiliary members are urged to attend.

12:30 p.m.—Informal round-table luncheon.

1:30 p. m.—Trip to Moving Picture Studio. (Subject to change.) (Price, $3; this includes bus fare and entrance to the studio.)

9:00 p. m.—Musicale in honor of Mrs. Howard Morrow, wife of the president of the California Medical Association, with members of the State Board receiving.

10:15 p. m.—Reception. Light refreshments.

Tuesday, May 10

9:00 a. m. to 7:00 p. m.—Registration.

9:30 a. m.—First general meeting of the ninth annual convention at *Hotel Vista del Arroyo,* Mrs. Hobart Rogers presiding.

12:15 p. m.—Luncheon, Hotel Vista del Arroyo, honoring Mrs. Hobart Rogers, with Mrs. James Fulton Percy presiding. Members of the State Advisory Board will be guests of honor. Dr. Lowell S. Goin of Los Angeles will be the guest speaker. Presentation of the Doane Membership Trophy by Mrs. William Henry Sargent of Oakland. (Price $1.25, plus tax.)

2:15 p. m.—Optional trips: (1) Visit to the Huntington Library art exhibits and gardens. (2) Planetarium demonstration and lecture at Griffith Park Observatory, stopping en route to view the noted art wonder, "The Lord's Supper," at Forest Lawn, and returning through the Flintridge Hills to Pasadena. (Price, $1.) Busses leave from both hotels (Huntington and Vista del Arroyo).

7:30 p. m.—President's dinner and dance of the California Medical Association at the Hotel Huntington.

Wednesday, May 11

9:00-11:00 a. m.—Registration.

9:30 a. m.—Second general meeting of the ninth annual convention, Hotel Vista del Arroyo, Mrs. Hobart Rogers presiding.

12:15 p. m.—Luncheon, honoring the incoming president, Mrs. Clifford Andrews Wright, and members of the State Board, with Mrs. Hobart Rogers presiding. The past state presidents will be guests of honor. The program and the speaker will be announced later. (Price $1.25, plus tax.)

2:30 p. m.—Post-Convention State Board meeting, Mrs. Clifford Andrews Wright presiding.

Free afternoon.

Courtesy cards to golf and beach clubs are available to members.

8:30 p. m.—Evening attractions: Pasadena Community Playhouse; moving pictures. Detailed bulletin in the hotel lobby.

(For further information, consult attendants at Woman's Auxiliary information desk.)

President's Report

To the Members of the Auxiliary:

The Woman's Auxiliary to the California Medical Association is making progress. Early in the year a four-point program was outlined, and the county units have worked toward the fulfillment of these aims. The points stressed were:

1. *Organization.*—California has nineteen organized county units out of a possible thirty-nine. We have lost

one county and gained three—Santa Cruz, Butte, and Tulare. The organization of these three counties has added approximately sixty members to the State Auxiliary. Appreciable gains in membership have been recorded in most of the counties. With two more months in our year, we are still striving toward our goal—an Auxiliary in every county where a medical society exists.

2. *Lending Library.*—Our library is being used by county groups in planning programs. Books and plays suitable for health education programs have been added. The Library Committee is conducting a contest in an attempt to secure a suitable book plate for the books in our library. Results of this contest are not yet reported. We are urging that the Auxiliaries use the material in the library in assisting lay organizations to plan health programs.

3. *Public Relations.*—We are happy to report that more and more of our doctors' wives are taking active part in lay organizations and lending their influence in seeing that persons presenting health programs before these groups are capable of doing so. Many of the counties have sponsored lectures on venereal diseases, tuberculosis, cancer control, and other topics of vital interest to the people. These lectures have been well attended by the lay public. Two counties have conducted Health Institutes, and the attendance at these functions has been most gratifying.

As our year closes and the summer approaches, we are not contemplating on a subsidence of interest in our work. We hope to have our members working on a program of districting the patients of doctors in order that voting power may be readily reached relative to the public interest. This task will be undertaken under direct supervision of the California Medical Association.

We have actively sponsored *Hygeia.* Our goal was that each member be responsible for one subscription to *Hygeia.* While so far this goal has not been reached, we have made decided gain in promoting *Hygeia* this year. Marin County reports, on the basis of one subscription per member, 300 per cent subscription. Every county has participated in this campaign to place the lay journal of the American Medical Association before the public.

4. *National Convention.*—We have endeavored to stimulate interest in the National Convention, which meets in San Francisco, June 13 to 17 of this year. This is the first time in the existence of the Woman's Auxiliary to the California Medical Association that we have been privileged to entertain the national organization. The local committee is working very hard to make this convention an outstanding one—one that is worthy of the organization and of California.

The Woman's Auxiliary is fast becoming a leavening influence in the state and nation. We are being called upon for assistance in health programs for lay groups. It is through this affiliation that we are able to promote the conservation of public health and the advancement of medical science. We are attempting to assume our responsibility for leadership in these matters.

The achievements of this year have been accomplished through the fullest coöperation of every department and the enthusiastic effort of the individual members. The progress we feel we have made has been due largely to the guidance and loyal support of our Advisory Board of the California Medical Association. For this help the members in general, and I especially, am indeed grateful.

MRS. HOBART ROGERS, *President.*

WOMAN'S AUXILIARY TO THE CALIFORNIA MEDICAL ASSOCIATION

VIII—RAILROAD INFORMATION*

May 9–13, 1938

Ticket agents of principal rail lines in California, on presentation and surrender of identification certificates, will sell round-trip tickets to Pasadena, California, costing approximately 1½c per mile, and the certificates which you may send for will show the convention fares that will apply to Pasadena from principal California points. Tickets will be sold from May 4 to 13, inclusive, and return limit will be May 23, 1938. Stopovers are allowed. If longer return limit is desired, consult railroad ticket agent at Pasadena prior to May 23, 1938.

Send a stamped, self-addressed envelope to State Secretary to secure a certificate in order to obtain convention rate.

Following are examples of *round-trip convention fares* from points named below to Pasadena, California, available on presentation of certificate:

Auburn	$15.05	Redding	19.05
Bakersfield	5.55	Sacramento	13.95
Barstow	4.00	Salinas	11.15
Calexico	7.50	San Bernardino	1.80
Chico	16.85	San Diego	4.10
El Centro	7.50	San Francisco	14.60
Eureka	23.60	San Jose	13.20
Fresno	8.80	San Luis Obispo	7.15
Los Angeles	.40	Santa Barbara	3.55
Marysville	15.55	Santa Cruz	12.30
Merced	10.45	Stockton	12.50
Modesto	11.60	Tulare	7.45
Redding	19.05	Visalia	7.75
Oakland	14.45	Woodland	14.50
Oroville	16.35	Yreka	23.10
Paso Robles	8.20		

MOTOR CAR ROUTES TO THE HUNTINGTON

From San Francisco:

Follow U. S. Highway No. 99 to State Highway 134 in Glendale. Turn left, follow State Highway 134, which is Colorado Street, in Pasadena. Continue to 800 block on East Colorado, where Oak Knoll Avenue intersects. Turn right on Oak Knoll to The Huntington, 1401 South Oak Knoll Avenue.

From Los Angeles:

Go out North Spring or North Broadway to end, which is Mission Road. Turn left on Mission Road to Huntington Drive, which is a continuation of Mission Road. Follow Huntington Drive to the 1,000 block in San Marino. Turn left on Oak Knoll Avenue to Hotel Huntington.

LOCAL TRANSPORTATION ON PACIFIC ELECTRIC RAILWAY

The out-of-town members who arrive in Los Angeles by train can reach the Hotel Huntington through the Red Cars—Pacific Electric railway, marked "Pasadena via Oak Knoll."

The cars on this route leave the Pacific Electric station on the southeast corner of Sixth and Main streets according to the schedule printed below. The time interval to reach the Hotel Huntington at the Hotel Huntington station in Pasadena is about forty minutes. The fare is 20 cents each way; round trip, 40 cents.

Time table at the date of this printing is as follows:

Leave	Los	Angeles	at..	6:02	a.m.	Leave	Los	Angeles	at..	3:50	p.m.

(First car leaves at 6:02 a. m., and last car at night leaves at 12:23 a. m. from Los Angeles for Pasadena.)

SOUTHERN PACIFIC TRAINS: NORTH AND SOUTH

Southern Pacific Trains arriving from San Francisco, pull into Los Angeles as follows:

"Lark" leaves San Francisco 9:00 p.m.; arrives in Los Angeles at 9:00 a.m.

"Sunset" leaves San Francisco 8:00 p.m.; arrives in Los Angeles at 8:10 a.m.

"Daylight" leaves San Francisco 8:15 a.m.; arrives in Los Angeles at 6:00 p.m.

"Coaster" leaves San Francisco 6:15 p.m.; arrives in Los Angeles at 8:00 a.m.

"Owl" leaves Oakland 6:30 p.m.; arrives in Los Angeles at 8:35 a.m.

On the return trip from Los Angeles to San Francisco, the trains leave and arrive at same time, reversing hours of departure and arrival.

X—LOS ANGELES, PASADENA, AND HOTEL HUNTINGTON—OUR CONVENTION HOSTS

The members of the Los Angeles County Medical Association and its Pasadena branch unit are our hosts for our sixty-seventh annual session. They extend a cordial welcome to all members and bid them to come to this session that promises much through its official program and entertainment features.

A large volume could be written about our host association, the largest in membership in our State organization. This, however, is impossible at this time, and probably unnecessary. Unnecessary, because from time to time its organizational activities have been recorded in our journal. Again, many of our members have had occasion to enjoy attendance at meetings of this unit.

It is not amiss to state that it was the foresight of its officers and members that accomplished the erection and operation of its Association building at 1925 Wilshire Boulevard, and the eventual acquisition of nearly a quarter of a million dollars in property. From this central home the numerous activities of the County Association radiate. Mention is made of its library, café and dining room, its beautiful muraled auditorium and executive offices. The executive and administrative staff render valuable services in incalculable amount to every member. The twenty permanent standing committees concern themselves with the organizational problems of these times.

The twelve branch units and fifteen scientific sections provide programs and meetings of highest merit. The opinion is unanimous that our host unit is an outstanding medical unit not only in California, but also in the nation. The assurance can be given that its guests during this annual session will be the recipients of a most cordial welcome and gracious hospitality. The following constitutes its roster of officers for the current year: George H. Kress, president; Ralph B. Eusden, vice-president; George D. Maner, secretary-treasurer; S. K. Cochems, executive secretary; Fred B. Clarke, chairman of the Council; E. T. Remmen, vice-chairman of the Council; Donald J. Frick, chairman of the Board of Trustees.

The Pasadena branch is officered by: R. C. Olmsted, president; L. J. Brunie, vice-president; Lyle G. Craig, secretary.

This branch meets every third Tuesday in its own auditorium, which is comfortably furnished and has many rare and interesting pictures of outstanding medical men. Distinguished winter visitors frequently appear on its program.

The officers and members of the Pasadena branch will be particularly prominent in the rôle of hosts. Through them opportunities will be provided to visit points of interest that are the pride of the Pasadena area.

It can be safely asserted that all who attend this annual session will return home with many pleasant memories of profitable and enjoyable days amid these genial hosts.

FREDERICK C. WARNSHUIS.

HOTEL HUNTINGTON, PASADENA

The Huntington is internationally known and one of the leading resort hotels in America. It is famous for its beauty, hospitality, and excellent cuisine. The entire staff takes a personal interest in the success of each convention held here and assists in every way possible. There have been many conventions held here and they have all agreed that their Huntington convention was the finest their group had ever held.

ATTRACTIVE SETTING

Location and Grounds.—The Huntington is situated in its own thirty-acre park in the Oak Knoll residential district of Pasadena. It is but ten minutes from the business district of the city by street-car (the interurban line that runs between Pasadena and Los Angeles passes the hotel grounds) and but thirty-five minutes from the downtown section of Los Angeles. There are ample facilities on the grounds to keep your group entertained between meetings. There is a beautiful swimming pool in the midst of our Japanese Gardens and a barbecue pit at one end, which make it an ideal place to hold an alfresco supper or luncheon. Most organizations find the supper at the pool the most delightful affair of their whole convention. We also have tennis courts, badminton courts, a golf putting green, ping pong, and other attractions to keep you busy.

Accessibility.—The Santa Fe Railroad runs through Pasadena, and the station is about ten minutes from the hotel. The Southern Pacific and Union Pacific railroads do not come directly into Pasadena, the Southern Pacific station being at Alhambra, which is about fifteen minutes' drive; and the Union Pacific at East Los Angeles, which is about twenty to twenty-five minutes from the hotel. Both railroads, however, have a bus service and could arrange to transport you right to the hotel door. The Southern Pacific also has a station at Glendale which is quite convenient for those coming down from the North, especially if someone can drive over to that station and meet them. If that is not possible, they can go directly into Los Angeles and take the Pacific Electric from there right to the entrance of the Huntington grounds. Pasadena can be easily reached by any of the automobile routes.

Historical Background of Pasadena.—This part of the country has a wonderful historic background and within sight and easy reach of the hotel are many famous landmarks which were left by the Spaniards, who occupied this territory before it became part of the United States. About twenty-five minutes from here, for instance, is the San Gabriel Mission, which was founded by the Franciscan Padres during the time of the Spanish occupation. In the early days there were no towns, but just these two Missions, and it is interesting to note the number of cities that have grown up around these settlements. Pasadena, itself, is a word derived from the Chippewa Indian dialect, meaning "Crown of the Valley," and in 1770 Don Gaspar de Portola and his band of Spanish explorers camped here. They called this section San Pasqual, and it was not until 1875 that the present name was given the city. It was called Pasadena because it not only described the location of what was then a village overlooking the valley, but also because it was beautiful, musical, and euphonious—a reputation it has held to the present time. The city itself is a cultural center, and it is known the world over for its Tournament of Roses parade on New Year's Day and for the East-West football classic which is held in the Rose Bowl on the same day. The Tournament of Roses is a parade five miles in length, graced with floral tributes from cities all over the Pacific Coast. Some floats require one hundred thousand blossoms to decorate, and no artificial blooms of any kind are allowed to appear on the floats.

Henry E. Huntington Library and Art Gallery.—Within ten minutes of the hotel is the Henry E. Huntington Library and Art Gallery. This ranks among the world's greatest museums. It comprises about two hundred thousand rare books and more than a million and a quarter original manuscripts of very great money value. The Huntington Art Gallery contains the greatest of English portraits ever gathered under one roof. The collection is made up of forty-five paintings: forty-one portraits and four landscapes. The most famous painting in this collection is Gainsborough's Blue Boy, which was bought from the Duke of Westminster in 1921 for the sum of $640,000. Pinkie, the companion picture of the Blue Boy, is also on display at this gallery. When this marvelous collection was opened to the public, Mr. Huntington stipulated that there should be no charge of any kind made for admittance to the gallery or to the library. The only requisite is that reservations be made in advance, inasmuch as the number of people visiting the museum in any one day is limited, and they extend a very cordial invitation to groups such as yours to visit this art center, which is also one of California's garden spots.

California Institute of Technology.—The California Institute of Technology is also located within ten minutes of the hotel. Professors of international repute in the field of technical education and research gather here. The laboratories are equipped with the most modern instruments for scientific research. The million-volt electrical laboratory and the famous Guggenheim Aeronautical Experimental Station make a visit to this institution very interesting. Arrangements can be made for your group to see these special features, and some member of the faculty

will accompany you on their tour and give a little explanatory lecture which will make such a visit worth while. The 200-inch mirror is being ground there for use on Mount Palomar.

Mount Wilson Observatory.—Then, on the summit of mile-high Mount Wilson is situated the Mount Wilson Observatory of the Carnegie Institute of Washington, D. C. The world's largest telescope is located here, as well as a fine exhibition of astronomical photographs. A very interesting lecture is given on Friday nights and at that time visitors have an opportunity of looking through the telescope. From this point there is an excellent view of San Gabriel Valley and the coast line, as well as the lights of fifty-six cities in Southern California—a magnificent sight.

Other Attractions.—There are many interesting things to be seen in Pasadena; in fact, they are too numerous to mention. Among them are the Pasadena Community Playhouse, which is one of the most famous little theaters in the country; Mount Lowe; the Lyons Pony Express Museum, in which relics of early California life are housed. There is also the Civic Center, the Colorado Street Bridge, and many beautiful residential estates, as well as the Santa Anita Racing Park.

Picture Bridge.—One important sightseeing spot right on the Huntington grounds is the picture bridge, which has forty-one oil paintings showing typical landscapes and landmarks of California. For those who do not have an opportunity of taking a post-convention trip this will be a particular boon, for it will enable them to see California at a glance. This is a very unique feature as there is only one other bridge of pictures in the world, and that is the one in Lucerne, Switzerland.

Hotel Accommodations.—The Huntington, which is situated so near the populous center of Southern California is far enough away to afford all the advantages of a country resort combined with the conveniences of a city hotel. It maintains a quiet dignity. The spacious lobby, which is always cool, greets you upon entering the hotel with that luxurious atmosphere which makes you feel immediately at home. It overlooks the San Gabriel Valley with its Spanish type homes with red tile roofs, graceful eucalyptus trees, date palms, peppers, and oaks as well as our own horseshoe gardens. It is indeed a delightful place to gather for a bridge tea, reception, or chat before dinner. Our rooms are all outside rooms, facing the Sierra Madre Mountains on the north and overlooking the San Gabriel Valley on the south. Each room or suite has its own private bath. There are six sleeping floors and, of course, elevator service.

The main dining room is large enough to seat nine hundred for dinner. It is an extremely attractive room, with a very high ceiling and is decorated in green and gold. It lends itself beautifully to any floral decorations, and table flowers are really all that is necessary. It is lined on either side by windows looking out upon the patio, the Japanese Gardens, and the swimming pool. The acoustic properties are splendid and, inasmuch as the floor is completely carpeted, there would be no disturbance or noise from persons walking around the room. There are alcoves on either side of the room in which our regular guests usually sit when a convention is in session. Other rooms are large enough for special luncheons, dinners, or meetings. These rooms seat from fifteen to one hundred for a meal, or twenty-five to one hundred seventy-five for a meeting.

Fig. 2.—Aeroplane view of the Huntington Hotel showing a portion of the twenty-nine acre grounds.

Part II

PRE-CONVENTION BULLETIN*

FOREWORD.—The official reports which follow will be presented at the coming session of the House of Delegates.

Delegates are urged to familiarize themselves with their contents.

Members, likewise, are requested to become familiar with the recommendations of these reports, and to discuss them with other members and delegates.

* * *

I

REPORTS OF GENERAL OFFICERS

REPORT OF THE PRESIDENT

To the Members of the House of Delegates and the Members of the California Medical Association:

Your President intends to transmit his official observations and recommendations to the House of Delegates and the membership at large in his addresses to the House of Delegates, and before the first general meeting.

During the year, in so far as it was possible for me to accept, I have visited, in company with councilors and general officers, or alone, some eleven county societies. I have also attended every meeting of the Council and the Executive Committee.

Respectfully submitted,
Howard Morrow, *President.*

REPORT OF THE PRESIDENT-ELECT

To the President and the House of Delegates:

Your President-elect has attended all meetings of the Council and Executive Committee, and has cared for such committee work as has been assigned to him; and, in company with other officers of the Association, he has visited all the county units in Southern California.

He is most appreciative of courteous and cordial expressions of good will that have been extended to him.

We will all look forward to a happy year of service in behalf of organized medicine in its local, state and national units.

Respectfully submitted,
W. W. Roblee, *President-elect.*

REPORT OF THE SPEAKER OF THE HOUSE OF DELEGATES

To the President and the House of Delegates:

During the past year your Speaker has attended all meetings of the Council and the Executive Committee, of which bodies he is, ex officio, a member. He has performed such special committee duties as have been assigned to him and, in company with the President-elect, Secretary, and Councilors, has visited most of the societies in the southern counties.

The House of Delegates will convene promptly at 8 p. m. on Monday, May 9. Its second meeting will be on Wednesday, May 11. The Speaker urges all delegates to be in their seats at the hour of convening, and takes this occasion to remind the delegates that they have assumed very serious duties in accepting office. These duties are not to be taken lightly, and, even though some small personal sacrifice is demanded, the responsibility of a delegate is such that the inconvenience to himself is to be borne as the price of his office.

The Speaker wishes also to urge all delegates and alternates to read the Pre-Convention Bulletin carefully in order that they may be familiar with the work and the problems of their organization.

Respectfully submitted,
Lowell S. Goin, *Speaker.*

REPORT OF THE CHAIRMAN OF THE COUNCIL

To the President and the House of Delegates:

In order that the Council may present to the House of Delegates a report that embraces all of its official actions up to the time that the House of Delegates convenes, the annual report of the Council will be presented at the first meeting of the House of Delegates.

Respectfully submitted,
Morton R. Gibbons, *Chairman.*

REPORT OF SECRETARY-TREASURER

To the President and the House of Delegates:

In submitting this annual report for 1937 to the Council and, through it, to the members of the Association, I desire to first express a very genuine appreciation to all the officers and members who have contributed so freely to make possible the accomplishments of the past year. Generous credit is given to committees and officers of county units who have given of their time, energy and experience. Unity of action, with a common desire to attain the purposes of organization, has made it possible for our Association to experience a most successful year as is revealed in this report of stewardship.

MEMBERSHIP

The Association's numerical strength is recorded in the following tabulation:

MEMBERSHIP AS OF DECEMBER 15, 1937

Organized	County	No. Members 1936	No. Members 1937	New	Delinquents
1902	Alameda	476	515	37	12
1903	Butte	24	23	2	3
1903	Contra Costa	49	50	0	3
1902	Fresno	112	117	8	0
1903	Humboldt	30	34	4	0
1903	Imperial	27	26	0	1
1902	Kern	48	50	4	2

	218	225	16	7

Comment.—In December, 1936, our membership in good standing numbered 5,492. At the close of the present year there is recorded a membership of 5,854, a *net gain* of 362, and a *gross gain* of 605. A delinquency of 155 for the year, which since the books have been closed, on December 20, has been *reduced* to 104, is most pleasing. The summarization, therefore, is that at the close of the year our membership totals 5,901.

There can no longer be any question of the declaration that the California Medical Association, with over 85½ per cent of licensed, eligible, resident physicians enrolled as members, *is* the representative organization and spokesman of the medical profession of California.

During 1937, seventy-five members responded to their last call. Their names are recorded in our archives associated with memories of their deeds of service and charity:

Edgar William Alexander, San Francisco
Luis Ferdinand Alvarez, Los Angeles
William Gillispie Attwood, Los Angeles
Charlotte LeB. J. Baker, Point Loma
Chester D. Ball, Orange
W. Jarvis Barlow, Los Angeles
John Edwin Beck, Tulare
Mabel T. Bell, Ventura
Marie Antoinette Bennette, San Bernardino
Fred Phelps Bowen, Los Angeles
Walter Vernon Brem, Los Angeles
Harry V. Brown, Glendale
Newbern N. Brown, Bakersfield
James L. Busby, Pasadena
Henry B. Carey, San Francisco
John I. Clark, Orange
Harry Carson Coe, Oakland
Claire H. Denman, Berkeley
Alfred J. Downs, Los Angeles
Albert Knight Dunlap, Sacramento
Irving H. Eddy, Glendale
James A. Ellis, Alameda
Etta Farmer, Sacramento
William Edward Fehliman, Santa Cruz
Joseph C. Friedman, Banning
Willis LeF. Gatchell, Butte, California
David Garrison Ghrist, Los Angeles
Hannah A. Goodridge, San Jose
Frank Pierce Gray, San Francisco
Louis D. Green, San Francisco
John D. Grissim, Oakland
Harold G. Gross, Eureka
Emil O. Hay, Sacramento
John Randolph Haynes, Los Angeles
William T. Heffernan, Imperial
Edgar H. Howell, San Francisco
Leonard Charles Hull, Hollister
Charles Breckenfeld Jones, Sacramento
Edwin Frank Kehr, Carmel
Bert C. Kern, Jackson
Walter D. Lenker, San Bernardino
Melbourne Mabee, Santa Ana
James G. Martin, Long Beach
Frank W. Miller, Los Angeles
Harold A. Miller, Alameda
William P. Millspaugh, Los Angeles
Andrew J. Minaker, San Francisco
Thomas William Moffitt, Hollywood
George Thomas Mountford, Coalinga
Philip Newmark, Los Angeles
T. C. O'Connor, Jr., Murphy
Margaret R. Otis, Los Angeles
John Thomas Peery, Corcoran
John F. Pruett, San Francisco
Thomas Rea, Yreka
Carl Renz, San Francisco
George Henry Roth, Los Angeles
Charles Wesley Rook, Montrose
James W. Seawell, Sonoma
Harlan Lewis Smith, Fair Oaks
Munford Smith, Los Angeles
R. Knight Smith, San Francisco
Jacobus C. Solomon, Los Angeles
John C. Spencer, Palo Alto
William Earnshaw Styan, San Francisco
Earl Bertrand Sweet, Los Angeles
Frank D. Sweet, Long Beach
Richard F. Tomlinson, San Francisco
Dwight Howe Trowbridge, Fresno
J. Russell Van Sickle, Santa Monica
Lyman Trevitt Wade, San Luis Obispo
Albert Samuel Wall, Los Angeles
Oran Lamar Webster, Holtville
Joseph Sully Wheeler, Santa Cruz
Daniel Webster Zirker, Merced

Our sympathies embrace all those in the homes of these departed members.

FINANCES

The following statement of resources, income, and expenditures, as certified to by our licensed, bonded public accountants, transmits a summary of the year's financial operations:

INCOME AND EXPENDITURES

CALIFORNIA MEDICAL ASSOCIATION

For the period December 19, 1936, to December 18, 1937

INCOME

Dues and General

Membership dues	$84,494.75	
Exhibits at annual meeting	5,175.00	
California Medical Society—Services	600.00

INCOME AND EXPENDITURES

TRUSTEES OF THE CALIFORNIA MEDICAL ASSOCIATION

For the period from December 19, 1936, to December 18, 1937

INCOME

Interest on bonds	$1,494.02	
Interest on savings accounts	191.42	
		$1,685.44
EXPENDITURES		
Miscellaneous		30.50
NET INCOME		$1,654.94

Comment.—A net operating gain of $30,226.44 for the year is quite gratifying. This has been accomplished by constant alert supervision. Economy in administrative costs in the amount of some $15,000 instituted during the last two years have been continued. Additional savings of some $3,500 was accomplished during the last year. This economy has by no means limited or hampered any of the Association's functions or activities. Income earnings, outside of annual dues, have been increased by obtaining greater advertising revenue, sale of exhibit space, lessened cost of commissions and the assuming of work that would have required added expense had it been delegated to others.

Unpredictable, but imperative, expenses to the amount of $6,238.14, decreased what otherwise would have been a larger net operating gain for the year.

The governing budget is closely adhered to. The Auditing Committee approves all accounts every month before vouchers are issued. Vouchers are signed by the chairman and the secretary-treasurer. A copy of the monthly balance sheet and statement is sent to every general officer and councilor each month. Association expenditures and reserves are safeguarded and carefully administered.

CALIFORNIA AND WESTERN MEDICINE

Under the able editorship of Dr. George H. Kress, our official publication continues its prestige in the field of medical journals. Grateful acknowledgment is made to the editor for many gracious courtesies and ever willing helpfulness in supervising the business details of publication.

Advertising income was $26,645.95. An average of 6,300 copies were mailed each month. Included in this number are the complimentary copies sent to officers and members of the House of Delegates of the American Medical Association.

Additional comment upon our JOURNAL will be made in the editor's annual report.

ASSOCIATION ACTIVITIES

A studious endeavor has been made each month to report through the medium of our official journal upon the activities of the Council, Executive Committee, and the work of standing and special committees. The purpose being to keep all members abreast with the affairs of the Association and the representation that was being made on behalf of all members. Therefore, at this time, only brief summaries will be recorded for the purpose of recapitulation.

(a) *Annual Conference of Officers, Councilors, County Secretaries, and Standing Committees.*—This was held in October in San Francisco. An innovation was introduced by the presence of those who constitute the membership of standing and special committees. The value of these annual conferences has been attested to by the attendants' comments published in the November and December issues of the JOURNAL. These conferences afford opportunity for better conception of Association policies and problems and inspiring a unity of action in the attainment of desired organizational objectives. There can be no sound solution of any problem without a clear understanding of its nature and portent; hence these informative conferences are of great value and justify the expense involved.

(b) *Postgraduate Program.*—An outstanding expanding Association activity is the Five-Year Postgraduate Program as announced in the Supplement to the November issue of CALIFORNIA AND WESTERN MEDICINE. The foreword in that supplement is explanatory of this Association function and should be referred to.

Program arrangements and the holding of these conferences are under way. Further report will be made to the House of Delegates by the committee.

The details of application and conducting of these sessions places a very greatly increased correspondence responsibility upon the secretary's office that will eventually require the services of a full-time stenographer.

(c) *Public Health Education.*—The secretary's office has arranged several series of educational lectures, and demonstrations for lay organizations that evoked much favorable comment. For the coming year, many such series have been scheduled for Young Women's Christian Associations, Women's Clubs, and Parent-Teacher Association organizations, and other such lay groups.

Your secretary considers this to be an important educational function, and when sound public and private opinion is engendered in regard to questions of public and private health, misunderstandings will disappear and people will no longer be misled by those who prey upon and profit from public lack of understanding of laws governing human health and health welfare. It is purposed to expand this educational activity. The creating of public good will is most vital to our interests.

(d) *Public Contacts.*—Contacts have been established, maintained, and continued with representatives of departments of state and county governments, boards of commerce, and trade, dental, hospital, and nursing organizations, Young Women's Christian Association, Federation of Women's Clubs, Parent-Teacher Association, Safety Council, Forestry Service, trade groups, and similar representative bodies. Daily, many letters of inquiry have been received from these groups, to which prompt answers are sent. Cordial relations are being fostered, and public confidence is being created by these contacts.

(e) *Committees.*—All possible assistance has been rendered to all committees and all the facilities of the headquarters office have been placed at their disposal to aid in every possible way in bringing about the greatest results from committee activities.

(f) *Annual Session.*—Appraisal of each annual session rests with the officers and members. It may be assumed, from expressions and records of attendance, that each annual session is productive of distinct benefits to all participants.

The selection of a meeting place that provides satisfactory and adequate accommodations is becoming, or rather is, a serious question. Increased attendance, larger section and general meetings, expanding technical and scientific exhibits, cause some of the accustomed meeting places of former years to now be inadequate. Your secretary presents a recommendation at the conclusion of this report upon this subject.

(g) *County Charters and Constitutions.*—A survey revealed that a majority of the county units were not in possession of charters. These were lost through changes in county officers and failure to transfer official records. Under Council action, new charters have been issued. Several counties were without constitutions and by-laws, and steps were taken to have them adopt new constitutions and by-laws conforming to the provisions of the Association's Constitution and By-Laws.

(h) *Subscriptions to Medical Libraries.*—A contribution of $2.723 was made to the Lane and the Los Angeles County Medical Libraries.

(i) *Visits to County Societies.*—During the year your secretary has, either in company with President Morrow, President-Elect Roblee, Speaker Goin, Councilor of the District, or alone, attended meetings of the following county societies: Orange, Riverside, San Bernardino, Imperial, Sacramento, Merced, Kings, Monterey, Salinas, Pasadena, Solano, Napa, Sonoma, Kern, Fresno, Contra Costa, Humboldt, and Marin. At these "Association Nights," informative discussions are had upon Association and county questions that are of vital interest to every doctor.

These meetings serve also to cement our constituent units into a state organization with common interests and purposes with central headquarters. Their value is further evidenced by our increased membership, sustained county activity, and interest and live-going units.

In addition, your secretary has attended and participated in meetings of: State Tuberculosis Association; State Safety Council; American Legion; Golden Gate International Exposition; Young Women's Christian Association; Annual conference of State Secretaries; Parent-Teachers Association; Association of American Medical Colleges; State Hospitals Association; State Nurses Annual meeting. Every opportunity was embraced to develop good will and coöperation with these several influential groups. Many citations could be made of the value of these contacts which are self-evident.

(j) *Association Headquarters.*—These are the headquarters of every member, and your secretary seeks to cause it to so serve. Official records are carefully kept and important data are secured and made available for reference. A daily average of one hundred letters are received and answered. An average of six personal interviews per day are had with members, students, visiting doctors, and lay persons. Some days as many as fifteen persons have called. These visits are welcomed and establish a central office, where dependable information may be secured. Likewise, many telephone calls of inquiry are answered each day. No effort is made to tabulate the number of these letters, visits, or telephone inquiries, which amount into the thousands and consume the time of all the office personnel.

Appreciation is sincerely expressed for the loyal, devoted services of all the office personnel. They have been faithful to the duties imposed upon them.

RECOMMENDATIONS

The following recommendations, or rather suggestions, merit consideration and decision.

1. The designation of a central meeting place where adequate accommodations and facilities are available to meet the needs of the annual sessions merits investigation and report to the House of Delegates at a future date.

2. More aggressive action to acquire a permanent endowment fund.

3. That consideration be again given to the acquiring of a permanent headquarters owned by the Association. It may be possible to finance such purchase with the use of a minimum of reserve funds and a Federal Housing loan over a period of ten or fifteen years. Our Association should be housed in permanent headquarters.

CONCLUSION

It can be confidently affirmed that the Association's house is well in order. As an organization, its purposes and policies are sound and consistent. Those who are vested with stewardship and administration have met up to the responsibilities reposed in them, and justifiable pride may be expressed by reason of the record made during the past year and the consummation of constructive endeavor. With confidence instilled by all that the past has wrought, the prediction is warranted that the coming year will witness still greater progress, further reaching expanding activities, and a leadership that will redound to glory of the membership and of benefit to the citizens of California and to the members of the Association.

In concluding this report, your secretary desires to express his deep appreciation for the assistance, consideration, and guidance accorded him by the House of Delegates, the Council, and the membership at large. I am sincerely grateful for having the privilege to serve, which I have sought to do to the best of my ability, and for the best interests of all.

Respectfully submitted,
Frederick C. Warnshuis, *Secretary.*

REPORT OF THE EDITOR

To the President and the House of Delegates:

The editor's report on papers received, printed, awaiting publication, or declined, is as follows:

(a) *Report on papers of the annual session at Del Monte, May, 2-6, 1937:*

At last year's annual session a total of 152 papers were read before the general meetings and different sections.

A summary of the disposition of the papers read at that year's annual session is as follows:

Del Monte annual session papers published in 1937	25
Del Monte annual session papers published in 1938	13
Del Monte annual session papers read, but published elsewhere, declined or not sent in	66
Del Monte annual session papers in CALIFORNIA AND WESTERN MEDICINE files still awaiting publication (annual session papers in this April issue to be deducted)	48
Total annual session papers read at Del Monte	152

(Note: Del Monte annual session papers to appear in the May issue will further reduce the list of unpublished papers.)

(b) *Report on special articles which have been printed in* CALIFORNIA AND WESTERN MEDICINE *during the period April, 1937 to April, 1938 inclusive:*

Special and original articles which were published in CALIFORNIA AND WESTERN MEDICINE during the past year (April, 1937 to April, 1938 inclusive) are as follows:

Section papers from annual session at Coronado, 1936	19
Section papers from annual session at Del Monte, 1937	38
Papers read before general sessions at Del Monte, 1937	4
Lure of Medical History articles	15
Papers read before county and other medical societies	3
Papers accepted from miscellaneous sources (original articles, abstracts of speeches, reprints from other publications, etc.)	18
Clinical Notes and Case Reports	30
Editorials	51
Editorial Comment articles	39
Bedside Medicine symposia	12
Special articles	80
Total papers published during past year	309

(c) *Report on manuscripts in* CALIFORNIA AND WESTERN MEDICINE *files and awaiting publication in April, 1937, and later issues:*

Unpublished papers from annual session at Del Monte (not counting papers to appear in May issue)	48
Unpublished papers read before county and other societies	2
Unpublished papers not read before other societies	13
Lure of Medical History articles	9
Clinical Notes and Case Reports	25
Editorial Comment articles	20
Bedside Medicine symposia	4
Total manuscripts on hand, awaiting publication	121

(d) *Report on non-annual session papers submitted:*

A total of thirty-three papers from county societies and other sources, which were submitted for publication in CALIFORNIA AND WESTERN MEDICINE during this past fiscal year (April, 1937 to April, 1938 inclusive), could not be accepted for various and special reasons.

Non-annual session papers submitted, but declined	33

Comment.—During recent years the official publications of the constituent state medical associations of the American Medical Association have been conforming, one by one, and more and more, to a pattern in which the organization work of the state and component county societies is receiving increased attention and space. The explanation for this is that the many medical-economic problems, which have been constantly coming to the front in recent years, have made it necessary for publication committees to respond to the interests of readers by supplying, in each issue, accurate information on community, state, and national public health and medical practice problems. This new outlook on state medical society journalism has necessitated a departure from the former somewhat stereotyped magazines containing some original articles and editorials on scientific subjects, with a limited amount of space for local items, and it is to the credit of the official journal of the California Medical Association that its founder-editor, the late Philip Mills Jones, some thirty-six years ago was among the first to sense these newer conditions that had thrust themselves upon medical practice. His *Journal of the Medical Society of the State of California* (former name of CALIFORNIA AND WESTERN MEDICINE) presented in general format the style now in use by our own and by an increasing number of state medical publications.

Your editor, naturally, is in full accord with the pattern and division of contents, which, for the last few years, has been found in each issue of CALIFORNIA AND WESTERN MEDICINE, and the members of the Publication Committee assume that the typographical and other set-up must be satisfactory as a desirable and convenient arrangement, since practically no criticisms or suggestions for change have been called to their attention. No apology is made for the space devoted to organization matters, because the understanding of medical-economic issues is today of paramount importance if the scientific interests of the profession and the public health responsibilities of the State are to be safeguarded and promoted. These facts are particularly pertinent in relation to the official journals of state medical societies.

However, in placing emphasis upon medical-economic and organization work, CALIFORNIA AND WESTERN MEDICINE has not neglected the promotion of scientific topics, and it is gratifying to know that the subject matter presented by contributing members measures up to standards that compare favorably with the best in medical literature, with especial reference to the interests and needs of physicians in general practice.

During the last year the experiment of supplements, to cover what are practically reference monographs, has been tried, and it is our impression that these additions to the regular issues have commended themselves to readers.

The sorrow that comes each year, with the advent of each annual session, is the realization that, owing to lack of space, so many of the more technical papers must be released for publication elsewhere. In a large society such as the California Medical Association, there is, however, no other alternative. Essayists who are on the annual session program, and whose papers are of a specialized

nature and who would prefer appearance in a technical journal, are requested to make early requests for release to print elsewhere.

In conclusion, the editor wishes to again thank contributors and the many members of the Association who have so generously responded when called upon for discussions, and other comment and aid. It is our continued ambition to have CALIFORNIA AND WESTERN MEDICINE reflect the highest credit upon the California Medical Association and its members.

Respectfully submitted,
George H. Kress, *Editor.*

REPORT OF THE LEGAL DEPARTMENT

To the President and the House of Delegates:

Events have moved rapidly during the past year, and an unusual number of legal matters have come before the Association since the last report of this department.

In order not unduly to extend this report, only a brief review of the more important phases of the past year's work will be undertaken.

Corporate Practice.—This department's reports for the years 1935 (CALIFORNIA AND WESTERN MEDICINE, May, 1936, page 412), and 1936 (Supplement to CALIFORNIA AND WESTERN MEDICINE, April, 1937, page 42), summarized the decisions in *Pacific Employers' Insurance Company* vs. *Insurance Commissioner,* and *Benjamin Franklin Life Insurance Company* vs. *Insurance Commissioner.* These cases, each decided by a District Court of Appeal, in our opinion firmly establish the California law to be that a corporation cannot directly or indirectly practice medicine or surgery. In addition to the foregoing cases, the legislature in 1937 enacted the Business and Professions Code, several sections of which codify the rule forbidding corporate practice of medicine. It is believed that these sections are of such vital importance to the medical profession that they ought to be quoted in full herein:

2006. The term "person" means a natural person when a right, privilege or power is conferred by this chapter upon a person.

2007. The term "professional" relates to the art and science of medicine and surgery and to such other arts and sciences as may be included within the field of medicine and surgery.

2008. Corporations and other artificial legal entities have no professional rights, privileges or powers.

These three sections are, in effect, a legislative declaration of the public policy which forbids corporations to practice by any means the profession of medicine and surgery.

There is now pending before the California Supreme Court an action entitled *People of the State of California on the Relation of the Board of Medical Examiners* vs. *Pacific Health Corporation.* In this case the Attorney-General has taken the position that the activities of the Pacific Health Corporation constitute, in effect, the practice of medicine by a corporation. Acting pursuant to direction of the Council, we prepared an exhaustive brief upholding the position of the Attorney-General and filed it with the Supreme Court. The court took the matter under submission several months ago, and early in January set aside its order of submission, stating that no four members of the court could agree upon a decision. The case is now again on the calendar for oral argument. The Pacific Health Corporation has argued that its activities do not infringe upon the rule of law forbidding the corporate practice of medicine. The corporation's brief before the Supreme Court contains the statement that:

We do not contend that a corporation can actually or legally practice medicine or any other profession.

In other words, the corporation candidly states that it would be illegal for it to engage in the practice of medicine or surgery.

County Hospitals.—During the past year this department has endeavored to be of full assistance to the special committee on county hospitals, of which Dr. Louis A. Packard is the chairman, and your General Counsel has attended several meetings of this committee, held in San Francisco and Los Angeles. Many legal problems have arisen in connection with this subject, some of them of such a complex nature that a great deal of time has necessarily been spent by the committee and the Council in their consideration.

Proposed Basic Science Law.—Acting pursuant to instructions of Dr. George H. Kress, General Chairman of the Committee on a Basic Science Law, this department reviewed in detail the various drafts of a proposed initiative and prepared for the members of the Council and the committee a detailed memorandum discussing and explaining all of the legal points which appeared to us to be necessarily involved in the proposed basic science initiative. At the present time this department is, pursuant to instructions, working upon a proposed constitutional amendment to be discussed and possibly submitted to the legislature at its next session. It is believed that in a short time it will be possible to submit to the committee a preliminary and tentative draft of a proposed constitutional amendment which will include all of the provisions which have been agreed upon as necessary in any workable basic science legislation.

Los Angeles County Medical Association By-Laws.—Some time ago it was determined by the Los Angeles County Medical Association to revise its by-laws in order that they might be more appropriate for government of the largest component county society. Dr. Edward M. Pallette, Chairman of the Committee on Revision of the By-Laws, requested your General Counsel to assist it in its labors. Inasmuch as the Los Angeles County Medical Association is an incorporated organization, there were a number of technical legal problems confronting the Committee on Revision of the By-Laws. The magnitude of the task which confronted this committee is difficult to describe and cannot be visualized unless one has had personal experience in similar undertakings.

Therefore, it is believed that the excellent code of by-laws which resulted from the labors of the committee, with the legal assistance of this department, is one of the most important and at the same time more satisfactory accomplishments of the past year.

Medical Jurisprudence Column.—As stated in the report of this department last year, a column in CALIFORNIA AND WESTERN MEDICINE, entitled "Medical Jurisprudence," was created by the Council in 1936. During the past year, articles on medical, legal, and other topics of interest to the medical profession have been prepared for this column. The articles in Medical Jurisprudence have been selected from among the subjects which have tentatively been decided upon for inclusion in the proposed Physicians' Handbook. It is the intention of your General Counsel that in the near future a preliminary draft of the Physicians' Handbook may be prepared, using much of the material that has appeared from month to month in the Medical Jurisprudence column. Comments and suggestions of members of the Association, with respect to this column and to the Physicians' Handbook, are cordially invited.

Physicians' Handbook.—As stated under the previous heading, the contemplated Physicians' Handbook is in process of preparation. Your General Counsel, Secretary-Treasurer, and Editor are endeavoring to carry out the directions of the Council and to that end have prepared a tentative outline of the subjects to be included in the handbook and, as above stated, various preliminary drafts of particular subjects have been prepared and printed in CALIFORNIA AND WESTERN MEDICINE, under the heading "Medical Jurisprudence."

Workmen's Compensation Case.—The Council, at its fall meeting, authorized your General Counsel to appear before the California Supreme Court in an action entitled *Pacific Employers' Insurance Company* vs. *Industrial Accident Commission and Kenneth Tator.* Pursuant to the Council's authorization, your General Counsel and Mr. Howard Hassard, one of his associates, appeared before the Supreme Court during oral argument of the case and subsequently prepared and filed a written memorandum of points and authorities on behalf of several physicians who had rendered professional services to Kenneth Tator. This proceeding involved the following question: Where an employee employed in Massachusetts by a Massachusetts employer is injured while temporarily in California on a special job for the employer, and is treated by California

physicians, can the injured employee recover compensation and the physicians a reasonable fee for their services in California, or must both the injured employee and his physicians proceed therefor in Massachusetts? Before the Supreme Court this department argued that it would be against the public policy of this State to require its physicians to go elsewhere to recover the reasonable value of their services. The Supreme Court, speaking through Mr. Justice Douglas L. Edmonds, agreed with our position and decided the case in favor of the injured employee and his attending physicians.

Malpractice Insurance. — Early last fall a number of different types of Lloyd's of London malpractice insurance policies were being issued throughout the State to members of the Association. The legal department received literally hundreds of inquiries from Association members with respect to Lloyd's of London and malpractice insurance generally. A preliminary investigation established that there were at that time at least thirty different kinds of malpractice insurance contracts being issued in the name of Lloyd's of London and that no two of these contracts were alike, some being adequate as to legal form and others obviously affording incomplete protection to the insured.

At the same time requests for assistance were received from several county societies, and in endeavoring to aid these societies, particularly the San Francisco County Medical Society, a model form of Lloyd's of London malpractice insurance policy was eventually prepared.

At the request of the Executive Committee of the Council, a further survey of the entire malpractice field was made and a formal report was presented to the Council at its meeting of January 15, 1938. In this report a brief résumé of the American insurance companies writing malpractice insurance was made and a detailed review of the various surplus line brokers representing underwriters at Lloyd's in London was presented. Since that report your General Counsel has been informed that one of the few American companies writing malpractice insurance has retired from the field. Your General Counsel has also recently been informed that the surplus line brokers in California through their own association have agreed to adopt the Lloyd's of London policy form prepared and approved by this department, and it is said to be their intention to use it exclusively so that in the future all Lloyd's of London malpractice insurance policies will be uniform. It is to be hoped that this information is accurate and will prove to be the fact.

The tremendous amount of research and correspondence carried on by the legal department in the past year on the subject of malpractice insurance is difficult to summarize in this report. Your General Counsel has been requested to, and will, present a full report on this subject to the House of Delegates at its first meeting at Pasadena. Interested members of the Association are also referred to the various reports on malpractice insurance which have been published or will be published in California and Western Medicine, the *Bulletin of the Los Angeles County Medical Association*, and the *Bulletin of the San Francisco County Medical Society*.*

Miscellaneous.—During the past year, opinions have been requested and furnished dealing with such subjects as California Unemployment Reserves Act, the legal and ethical aspects of certain types of group medical practice, the legal scope of the practice of chiropractic, the legal status of methods of operation of county hospitals in effect in several of the counties, and many other subjects. Under instructions from the Council, this department has undertaken the defense of physicians who have been sued for damages as a consequence of testifying in a criminal prosecution based upon the alleged unlawful practice of medicine.

Attendance at conferences of officers at meetings of the Council, Executive Committee, and other standing and special committees, has been maintained throughout the year.

Members of this department have also enjoyed meeting with the members of a number of the county societies, where matters of legal import were considered.

Respectfully submitted,

Hartley F. Peart, *General Counsel.*

II

REPORTS OF DISTRICT COUNCILORS

FIRST COUNCILOR DISTRICT

Imperial, Orange, Riverside, San Bernardino, and San Diego Counties

To the President and the House of Delegates:

Annually each councilor is expected to report to the President and the House of Delegates regarding conditions pertaining to medicine and surgery in his district.

The First Councilor District is third in number of members and first in geographical boundaries. The counties of Imperial, San Diego, Orange, Riverside, and San Bernardino comprise the First Councilor District.

There have been no serious problems before the members of this district during the past year. County Hospital admissions and management have been quite satisfactory to all concerned. The sick and needy have been well cared for by the medical fraternity, and as far as I can gather from many individual contacts, all the men have had a more profitable year than the previous one. Hospital insurance carriers have not invaded the First District to any degree. Each county has seen many new and young men enrolled in the county societies. Few desirable men remain out of the county societies' enrollments.

The State officers, President-Elect Roblee, Speaker of the House of Delegates, Lowell Goin, and Secretary Warnshuis, have visited all the county societies at regular or called meetings and have given them very profitable talks on society matters which ended in round-table discussions for all present.

Postgraduate courses have taken on an added interest this year as evidenced by the Riverside meeting held on February 14. The men are interested in the clinical presentation of the various subjects. The Orange County Postgraduate Conference will be held on March 15 at 4 p. m. at the Ebell Club in Santa Ana. The San Bernardino conference will follow on April 7 at 4 p. m. at the Elks Club in San Bernardino.

Respectfully submitted,

Calvert L. Emmons, *Councilor, First District.*

SECOND COUNCILOR DISTRICT

Los Angeles County

To the President and the House of Delegates:

During the past year steady progress has been made in the growth of the Los Angeles County Association.

The outstanding accomplishment was the drafting and adoption of a new constitution and by-laws. These represented many hours of unselfish labor on the part of the committee which had charge of the revision. In several respects they radically changed our former set-up.

For many years the specialty sections and the geographical branches have had representatives on the Board of Councilors. Because of the great disparity in membership in these various groups, it was realized that this caused definite inequalities of representation. It also made for a rather large deliberative body. A further difficulty arose from the fact that many of these representatives were elected for only one year, with the inevitable result that the greater part of their term of office was occupied in becoming familiar with the organization machinery.

In order to remedy these defects, a Council of twenty-one members has been created, each holding office for a period of three years, their terms being staggered so that seven new members are elected each year, thus making for a preponderance of experienced men and insuring continuity of policy.

Similarly, the five members of the Board of Trustees hold office for five years, with a change of one member each year. It is felt that the longer terms of office for the trustees are in keeping with the financial responsibility which devolves upon this Board.

The by-laws provide for the creation of twenty-one committees, each committee designed to study a present-day problem. It is also the idea that these committees will afford an opportunity for many members to become familiar with our problems and in this way new blood will be constantly introduced and be available for the administrative

work of the organization. Several of these new committees are already extremely active.

The other outstanding feature of the by-laws is the incorporation in its entirety of the recently adopted disciplinary code of the California Medical Association.

The effect of these changes will be greatly to increase the efficiency and smooth working of the organization.

Respectfully submitted,

Carl R. Howson, *Councilor, Second District.*

THIRD COUNCILOR DISTRICT

Kern, San Luis Obispo, Santa Barbara, and Ventura Counties

To the President and the House of Delegates:

The councilor of the Third District has made the customary visits to the component societies. In addition, Santa Barbara, Ventura, and San Luis Obispo counties were hosts at special meetings to President-Elect Roblee and Secretary Warnshuis. Kern County was visited, at its annual banquet, by Doctors Roblee, Goin, and Warnshuis.

All societies in the district are functioning in excellent condition. The San Luis Obispo County Society is especially to be commended for the manner in which it handled its county hospital crisis.

The first postgraduate conference in the district was arranged for March 12 and 13 at Santa Barbara. The committee responsible for this conference is to be congratulated for the work done in its preparation and the excellent program arranged. In spite of various stormy weather there were 110 registered, which exceeded the expectation. The District is already looking forward to next year's conference.

Respectfully submitted,

Louis A. Packard, *Councilor. Third District.*

FOURTH COUNCILOR DISTRICT

Fresno, Madera, Kings, Tulare, Merced, Mono, Mariposa, Inyo, Calaveras, San Joaquin, Tuolumne, and Stanislaus Counties

To the President and the House of Delegates:

Adjustment of some difficulties among members attending Council meetings, promotion of postgraduate conferences and Woman's Auxiliary activities, visits to county medical societies, meetings with the Farm Bureau and other lay organizations in the interest of our organization, and committee work on the County Hospital problem, were some of the activities by which the Councilor has tried to serve the district and the California Medical Association during the past year.

The attention of the membership has been pointedly directed to the importance of conscientious observance of the ethics of the profession and avoiding those errors in deportment which may furnish pretexts for malpractice suits. Adequate professional liability insurance has been a matter of much concern, in view of the alarming increase of suits. The standard form of policy developed by the California Medical Association's legal department and furnished by acceptable underwriters has been explained as offering the best solution of this problem at present.

An expression of majority opinion from constituent societies on expenditures in connection with the proposed basic science initiative was obtained and voted in the Council.

Some progress is being made in the spread of voluntary insurance in this district, but not in sufficient volume as yet to encourage the belief that it will to any great extent solve the problems of our needy sick. Other means to supplement voluntary insurance seem required in this district to offset the ever growing demand of taxpayers and nonindigents for the privilege of hospitalization in tax-supported institutions.

This being the year of another general election, the continuous interest in candidates for county supervisors and members of the legislature has been urged on the membership, and the need of hearty coöperation with our organizations of defense against measures designed to obstruct medical research and practice has been brought to the attention of our county societies.

The profession in general throughout the district is in full accord with the activities of the California Medical Association and is rendering excellent medical service, much of which is donated to the public, and is supporting public health measures that are constantly encroaching on the field of medical practice.

Respectfully submitted,

A. E. Anderson, *Councilor, Fourth District.*

FIFTH COUNCILOR DISTRICT

Monterey, San Benito, San Mateo, Santa Clara, and Santa Cruz Counties

To the President and the House of Delegates:

There have been several instances of notable achievement by the county medical societies in the Fifth Councilor District during the past year. Coöperating with the California Tuberculosis Association, the members of the San Mateo County Society have made possible more extensive school surveys which in themselves have proved valuable and are a means of furthering the effort toward control of tuberculosis in that county. A similar program has been started in Santa Cruz County and has already made progress.

Santa Clara County Medical Society has adopted basic principles for the coördination of its members and the County Hospital in the venereal disease campaign.

San Benito County Medical Society has expressed great interest in a proposed postgraduate program in this district in the near future.

All county societies in the district have been visited at least once, and plans have been made for additional visits with our State Secretary before the annual meeting.

Respectfully submitted,

Alfred L. Phillips, *Councilor, Fifth District.*

SIXTH COUNCILOR DISTRICT

San Francisco County

To the President and the House of Delegates:

The major interest of the members of the Sixth District during the past year has been further study of health and hospital insurance and a thorough study of malpractice insurance.

In the matter of health and hospital insurance our particular efforts have been directed toward working out a plan which will provide a health service for the municipal employees of San Francisco. After many conferences, and after destructive criticism of certain plans, and after the presentation of three plans of our own, we have finally agreed upon one which, we feel, assures proper service to the insured by a physician of the insured's own choice and will, after the first year of operation, give reasonable compensation to the physician for that service.

The subject of malpractice insurance was very carefully surveyed by a committee, of which Dr. Philip K. Gilman is chairman and to which our legal counsel, Hartley F. Peart, was adviser. This has been an outstanding piece of work, and as a result a very satisfactory policy was made available just at the time when another major company withdrew from the field.

We feel that real progress has been made in our district this year.

More detailed reports on the above activities appear in California and Western Medicine.

Respectfully submitted,

Karl L. Schaupp, *Councilor, Sixth District.*

SEVENTH COUNCILOR DISTRICT

Alameda and Contra Costa Counties

To the President and the House of Delegates:

The Alameda County Medical Association has held ten regular meetings during the year, with scientific programs prepared and presented, in large measure, by our membership. One visiting speaker was included.

The Alameda County Medical Association shows steady increase in membership, and the past year, like the years preceding it, has added forty-two members to our number, twenty-nine of which were elected to regular membership, and thirteen to junior associate membership. The Association lost, through resignation, death, and failure to pay

dues, twenty-four members during the year, leaving a net gain of sixteen members.

During the year our Council was honored by a visit from Dr. Olin West, Secretary of the American Medical Association, and a special luncheon meeting was held for Doctor Leland, Director of the Bureau of Economics of the American Medical Association.

Progress can be reported in the development of our Hospital Insurance plan. The project is now fifteen months old, and during that period has shown a uniform and highly satisfactory growth in the number of policyholders and in more perfect understanding of the underlying problems by those entrusted with its management. One important feature has been the opening of the plan to members of the families of the present policyholders, on a financial basis which makes it highly attractive. The premium of the original policyholders is ninety cents, that of the spouse eighty cents, and each dependent child forty cents. This is a long step toward making the plan popular and a satisfactory solution of the problem of the general public in paying hospital costs. The plan is operating in four counties, and has added to its personnel an advisory committee of outstanding lay citizens from each of the four counties. The enthusiasm of this group is most encouraging to all interested in the success of the project.

Contra Costa County has joined with Alameda County in the Hospital Insurance plan, and is progressing as well as could be expected at this time. The Contra Costa Medical Society's regular meetings are well attended, and there are but few eligible men in the county who are not members of the Society.

Respectfully submitted,

O. D. Hamlin, *Councilor, Seventh District.*

EIGHTH COUNCILOR DISTRICT

Alpine, Amador, Butte, Colusa, El Dorado, Glenn, Lassen, Modoc, Nevada, Placer, Plumas, Sacramento, Shasta, Sierra, Sutter, Tehama, Yolo, and Yuba Counties

To the President and the House of Delegates:

During the first half of the present term, Dr. C. E. Schoff served as councilor for this district, and during this period he and several of the California Medical Association officials have made visits to many of the local societies. Doctor Schoff reports that all the meetings were well attended, and that the scientific programs were well presented.

The only accomplishment during my short term has been the reëstablishment of the Intercoast Hospitalization Insurance Association on the approved list of the California Medical Association. The controversial points have been cleared away and perfect understanding now exists.

Respectfully submitted,

F. N. Scatena, *Councilor, Eighth District.*

NINTH COUNCILOR DISTRICT

Del Norte, Humboldt, Mendocino, Lake, Marin, Napa, Solano, Sonoma, and Trinity Counties

To the President and the House of Delegates:

The hardest part of the year's work is preparing the councilor's annual report, as it is impossible to set forth the amount of work accomplished in the various society visits and the multiplicity of details attended to in such a brief report.

It is gratifying to see the intense interest the members of the county societies now take in the activities of organized medicine, as against the apathy and general spirit of do nothing that existed when I first began making councilor visits some years ago. Whether this intense interest is due to the present type of editorials in the JOURNAL, the annual Secretaries' Conference, or the present unrest, is hard to analyze, but I believe the annual mid-year Secretaries' Conference is producing results.

During the past year I have attended all Council meetings, visited all of my societies but one, and to the best of my ability promoted the interest of organized medicine in this district.

Respectfully submitted,

Henry S. Rogers, *Councilor, Ninth District.*

III

REPORTS OF COUNCILORS-AT-LARGE

To the President and the House of Delegates:

During the past year we have attended a number of meetings having to do with the activities of the Association.

The Secretaries' meeting was well attended, and I was impressed with the interest which members of the profession, from one end of the State to the other, are taking in matters pertaining not only to scientific medicine, but to economic phases of the practice of medicine. This increased coöperation on the part of many physicians who formerly took only a casual interest in the work of organized medicine, should be reassuring to all of us.

Respectfully submitted,

W. H. Kiger, *Councilor-at-Large.*

To the President and the House of Delegates:

All of the meetings of the Council have been attended, and an attempt has been made to acquaint the local society with what is going on throughout the State.

Respectfully submitted,

C. O. Tanner, *Councilor-at-Large.*

To the President and the House of Delegates:

Circumstances beyond control and of professional moment to me prevented my attending the last annual session and the meeting of the Council in January, 1938. All other meetings of the Council recorded my attendance. In official capacity, I have attended numerous conferences and hearings that dealt with activities of the city employees of San Francisco, designed to establish a health service for this group.

I have also attended many meetings of the Advisory Committee to the Hall of Science of the Golden Gate International Exposition.

Considerable time has also been devoted to the work of the Legislative Committee and to matters related to malpractice insurance.

Respectfully submitted,

T. Henshaw Kelly, *Councilor-at-Large.*

To the President and the House of Delegates:

As councilor-at-large my time has been almost wholly occupied by duties of the Committee on Public Policy and Legislation. Talks on legislation and legislative trends have been given, both at home and at the neighboring component societies, in company with Dr. F. C. Warnshuis, as he made his visits to the county groups.

Respectfully submitted,

Junius B. Harris, *Councilor-at-Large.*

To the President and the House of Delegates:

Our president and our secretary and councilors who preside over councilor districts will, without doubt, report of their activities, with inadequate emphasis on the time which they have given to the California Medical Association.

This Councilor would invite the attention of the members of the Association to the extraordinarily full coöperation of all Association officers.

Special meetings have been attended, on short notice, and without complaint.

Committee work has been undertaken and completed with care and precision.

Regular meetings have been fully attended.

The interest, energy, and loyalty of all your officers are commended to your attention.

Respectfully submitted,

M. R. Gibbons, *Councilor-at-Large.*

To the President and the House of Delegates:

It has been my privilege, during 1937, as a councilor-at-large, to assist in bringing about an agreement between the Board of Directors of the Associated Hospital Service of Southern California and the medical profession, acting

through the Los Angeles County Medical Association, which eliminated the chief difference in policy and procedure that constantly occurs when lay-controlled organizations enter into the rendering of a professional, or semi-professional, service.

In this instance the fine spirit of coöperation on the part of the representatives of the Associated Hospital Service of Southern California brought about the elimination from their contracts and certificates of agreements to render any and all professional services, including laboratory and x-ray procedures. This agreement follows the definition of the House of Delegates of the American Medical Association as to what constitutes hospital service and, in my opinion, is the only safe method whereby prepayment of hospital service, where solicitation of the beneficiaries occurs, may be carried on that should receive the approbation and support of the medical profession without the danger of encroachment upon professional privilege by lay corporations.

As your councilor-at-large I have maintained a constant affiliation with other groups in the community in order that I might bring a comprehensive knowledge and viewpoint into the meetings of the Council, to assist in the answering of our continuously changing problems. The immediate future will present problems that concern the medical profession in their relationship to the public that will require a broad and deep understanding of the trend of the times in order that we attempt to adjust our relationship on a basis that will permit us to continue to serve, free from restrictions and interference that would decrease the quality of service that is the motivating ideal of every man in the medical profession.

Respectfully submitted,

Harry H. Wilson, *Councilor-at-Large.*

IV

REPORTS OF STANDING COMMITTEES

EXECUTIVE COMMITTEE

Karl L. Schaupp, Chairman

Howard Morrow, President.
William W. Roblee, President-elect.
Edward M. Pallette, Past President.
Lowell S. Goin, Speaker, House of Delegates.
Morton R. Gibbons, Chairman of the Council.
Karl L. Schaupp, Chairman, Auditing Committee.
Charles A. Dukes, Chairman, Committee on Public Relations.
Frederick C. Warnshuis, Secretary-Treasurer.
George H. Kress, Editor.

To the President and the House of Delegates:

The Executive Committee of the Council has met monthly during months for which Council meetings were not scheduled.

The Executive Committee concerns itself with Association policies and work and indicates action as questions arise concerning the Association's interests. Nine officers and councilors contribute their time and judgment in establishing supervision of Association matters.

Thus, questions and representations are promptly considered, eliminating delay and expediting prompt action to the advantages of all members.

Digests of its meetings are published, and at each Council meeting action is taken to cause the minutes to become part of the Council's record.

The Executive Committee diligently seeks to discharge its duties, and account for its stewardship.

Respectfully submitted,

Karl L. Schaupp, *Chairman.*

AUDITING COMMITTEE

Executive Group

Karl L. Schaupp, Chairman

O. D. Hamlin T. Henshaw Kelly

To the President and the House of Delegates:

In compliance with the provisions of the by-laws, we shall submit a draft of the 1938-1939 budget at the opening session of the House of Delegates.

Respectfully submitted,

Karl L. Schaupp, *Chairman.*

COMMITTEE ON ASSOCIATED SOCIETIES AND TECHNICAL GROUPS

Executive Group

John V. Barrow, Chairman, 1940

Edwin L. Bruck, 1938 W. H. Geistweit, 1939

To the President and the House of Delegates:

The work of the committee has been done chiefly by correspondence. Each member has been asked to render a report to be incorporated in the committee report. The dentists, the druggists, and certain officers of the Bar Association, together with an important insurance company, have all been contacted regarding a campaign for the listing of voters.

The plan involves the listing and classification of the physicians of the State Medical Association. These groups will contain from ten to thirty, as convenience dictates. A leader, responsible to the County Association, will have direct telephone contact with each member. Each physician will be requested to furnish names and addresses of his patients who, by virtue of their confidence in him, will support the legislative measures that our State Association recommends. This method alone will yield better than 500,000 votes. The Woman's Auxiliary has signified its willingness to make these listings through our county medical associations. This entails an enormous amount of work, which they are capable and happy to do.

Not many letters need to be mailed, but the one final request direct to the voter must be signed by the physician himself. Whether these letters are mailed through the county medical associations, or the State Medical Association office, or the League of Public Health, is for the determination of the Council. We particularly request the approval of the Council for the Auxiliary coöperation in this matter. The same organization can be accomplished in the allied organizations without forming any legal tie-up.

Doctor Geistweit of San Diego has done much work with the local pathologists and other physicians in the matter of the new law licensing laboratory workers. He recommends a more careful and thorough study of this situation than has been given heretofore. He has also done some work in the line of his convictions that there should be a much stronger law licensing nurses, in which matter he recommends that that subject be studied by our committee.

Locally, and in matters of the State, we have coöperated with the Auxiliary with the greatest pleasure and our best ability.

Respectfully submitted,

John V. Barrow, *Chairman.*

COMMITTEE ON HEALTH AND PUBLIC INSTRUCTION

Executive Group

Fred B. Clarke, Chairman, 1938

W. R. P. Clark, 1939 Benjamin W. Black, 1940

To the President and the House of Delegates:

It is quite apparent to the members of this particular Standing Committee that progress in the field of public health education is dependent upon persistent persistency. Your committee is also of the opinion that visualization of a subject or health fact is the most effective means of educating the public upon health matters.

Your committee has, through the offices of the State Secretary, pursued such a course during the past year. Several series of from three to six public lectures have been arranged for Y. W. C. A. groups, Women's Clubs, and High Schools. Gratifying expressions of appreciation have been received in return.

Some twenty-two lectures have been arranged for other lay groups during the past year. These engagements have inspired other groups to sponsor public meetings and enabled the making of new contacts that will record an expanding program of public education which can be assured by persistency in follow-up work.

Your committee deplores the lack of interest and coöperation on the part of county society members in this program of public education. Lack of interest is also manifested by many local health officers. Except for three or four exceptions, county societies and health officers are wholly disinterested. This lack of interest and seeming unwillingness on the part of members to prepare talks on health questions

and accept engagements to address lay meetings materially delays and limits the work of this committee.

Your committee respectfully submits the following recommendations:

1. That the House of Delegates direct each county unit to sponsor two or more public meetings each year, under the direction of a special local committee charged with this duty.

2. That these county committees be requested to enroll from their members a speakers' group and submit their names and subjects to the State Secretary. Members of these groups to be assigned to address lay meetings in their immediate vicinity.

3. That county or local health officers be requested to take suitable steps to sponsor and support public meetings for the purpose of public health education.

Respectfully submitted,
Fred B. Clarke, *Chairman.*

COMMITTEE ON HISTORY AND OBITUARIES

Executive Group

Frank R. Makinson, Chairman, 1938
A. Elmer Belt, 1940 — J. Marion Read, 1939
The Secretary, ex officio — The Editor, ex officio

To the President and the House of Delegates:

The committee met once during the year. The meeting was held in San Francisco in October, 1937, when all the members were present. The work that had been accomplished was reviewed, but special attention was given to formulating a plan embracing the entire State.

It was considered advisable to suggest to the Council that the committee be enlarged and divide the State into districts so that one member of the committee would be responsible for obtaining the history in his particular district.

Death notices and obituaries were to be obtained and forwarded to California and Western Medicine, which has been satisfactorily carried out.

Requests were to be made of various public libraries of the State to set aside, in a place reserved for such, all books and articles pertaining to California medical history.

It is urged that a county historian be appointed by each component county unit; this has been done in several instances. A splendid appeal was made recently by the editor of California and Western Medicine along this line. A great deal has been accomplished toward collecting the history of the Association, but a still larger portion remains unfinished; yet satisfactory progress can be reported.

Appended hereto is a list of members who during the last year have been called from earthly labors to have their names recorded in the roster of the Chapter Eternal.

Respectfully submitted,
Frank R. Makinson, *Chairman.*

COMMITTEE ON HOSPITALS, DISPENSARIES, AND CLINICS

Executive Group

Daniel Crosby, Chairman, 1939
Karl L. Schaupp, 1940 — George Dawson, 1938

To the President and the House of Delegates:

Although the year has been filled with many questions concerning hospitals, methods of conducting hospital insurance, and the like, nothing has come to the attention of this committee which required any action.

Most of the questions that have been given consideration have been considered by the Public Relations Committee.

Respectfully submitted,
Daniel Crosby, *Chairman.*

COMMITTEE ON INDUSTRIAL PRACTICE

Executive Group

Morton R. Gibbons, Chairman, 1938
Harry E. Zaiser, 1940 — Philip Stephens, 1939

To the President and the House of Delegates:

Attention has been called in the official journal of the California Medical Association to the decision of the Supreme Court of California in the case of *Tator* vs. *Pacific Employers' Insurance Company.*

"The court, in its decision, established that the California Industrial Accident Commission has jurisdiction over all injuries arising in this State, even though the contract of employment was made in another state and even though the employee is only temporarily assigned to work in this State. This obviates any possibility of physicians being required to proceed in other states for compensation for services performed in this State to an employee injured in this State."

The American Medical Association has organized a Council on Industrial Health. There has been one organization meeting. Another will be held before the California Medical Association annual session.

It is not possible to publish a statement regarding the proposed activities and scope of this Council in this bulletin. However, it is probable that definite information may be available before May 9.

The San Francisco County Medical Society has taken measures to secure from the Industrial Accident Commission of California, by means of the facilities of the WPA, statistics on industrial accident practice, and compilation of experiences in that practice. The data to be sought is under consideration, and suggestions from interested members is solicited by the committee of the San Francisco County Medical Society.

Respectfully submitted,

Morton R. Gibbons, *Chairman.*

COMMITTEE ON MEDICAL DEFENSE

Executive Group

George G. Reinle, Chairman, 1938
Fred R. De Lappe, 1939 John P. Nuttall, 1940

To the President and the House of Delegates:

Your Committee on Medical Defense, by the authority of Chapter 5, Section 4, of the by-laws, appointed an Advisory Committee, consisting of Dr. Phillip Gilman, Dr. Stanley Mentzer, and Dr. Gordon MacLean, to assist it in the preparation of a report on malpractice in California.

This committee begs to submit to the House of Delegates of the California Medical Association the following report and recommendations:

The committee has been informed that a number of surplus line brokers were engaged in writing physicians' defense and indemnity insurance contracts on behalf of different groups of underwriters at Lloyd's in London, England. The committee also found that surplus line brokers are authorized by the California Insurance Code to issue contracts of insurance in any particular field after it has been determined by the Insurance Commissioner that less than 50 per cent of the authorized and admitted insurers doing the particular class of insurance business involved (in this case liability insurance) are refusing to issue insurance contracts of the type sought to be issued by the surplus line brokers.

With respect to those insurance companies authorized to transact a liability insurance business in the State of California, the committee found the following: the Medical Protective Company of Fort Wayne, Indiana, issues physicians' defense and indemnity policies to members of the California Medical Association only, at the rate of $32 per annum and with a coverage of $5,000 to $15,000, but excludes the following:

(*a*) Most surgery, unless done in an emergency;

(*b*) Any liability growing out of the ownership, operation and supervision of any x-ray equipment for therapeutic work; or

(*c*) Any liability arising out of the ownership, operation, and supervision of any hospital, sanitarium or clinic, or any business enterprise. Upon payment of a premium of $48 per annum the company will remove the surgery restriction. In other words, a surgeon must pay $48 per year for coverage of $5,000 to $15,000. It appears that the Medical Protective Company will insure against liability arising from the use of x-ray equipment for therapeutic work at a premium of not less than $150 for the minimum coverage.

The Zurich General Accident and Liability Insurance Company, Ltd., according to the committee's information, will issue physicians' indemnity policies in certain instances. But the committee is also informed that the Zurich will not issue a policy to a physician who is not a member of his county society and the State Association, and even though a physician is a member of his state and county societies the company exercises a rigid selection. This company is not at all anxious to enter the malpractice field on a large scale.

There may be other insurance companies authorized to do business in California which will write malpractice policies, but your committee is not aware of their identity.

The large number of surplus line brokers representing various groups of underwriters located at Lloyd's in London, England, who are engaging in the malpractice insurance business in this state, are not so well known to the medical profession nor are their policies, or, in fact, the very nature of Lloyd's insurance.

Lloyd's is divided into many groups of underwriters, each operating independently of the other. In California these groups are represented by approximately thirty-seven agencies known as "surplus line brokers." Insurance agents in the various towns and cities of the State place the insurance of their clients (*i. e.,* physicians) with the surplus line broker. In insurance terminology the insurance agent is known as the "producer," and the surplus line broker is often referred to as the "broker," "underwriter," or "agent." (Mr. Hartley F. Peart, attorney for the California Medical Association, advises that this language utterly disregards the legal distinction between an "agent" and a "broker.")

The various Lloyd's groups (often referred to as "underwriters"), each acting for itself, prepare so-called underlying contracts by the terms of which the particular group authorizes specified agents (surplus line brokers) in various parts of the world to issue contracts of insurance to individuals in the name of "Lloyd's of London." Each member of the underwriting group signs his name to this underlying contract and indicates after his name the proportion of the total liability which may be incurred on all of the insurance contracts ultimately issued which he agrees to be personally responsible for. Copies of this underlying contract are then made available to the agents of the particular underwriting group all over the world. Acting pursuant to the authority contained in an underlying contract, surplus line brokers in California issue and sign malpractice insurance contracts bearing the name "Lloyd's of London."

The question of placing malpractice insurance with surplus line brokers representing underwriting groups at Lloyds in London, England, is a serious and immensely complicated problem. In addition to the problems created by the very nature of Lloyd's there are the legal problems which exist as a consequence of Lloyd's being situated several thousand miles away from the State of California.

Finally, one San Francisco broker submitted a policy form to the committee for its approval or disapproval. This form was submitted to Mr. Peart with the request that he review it. On his recommendation, your committee expressed its approval of this particular policy.

Your committee is informed that within the past two months a number of surplus line brokers issuing Lloyd's of London policies have revised their policy forms to conform with the policy form prepared under the direction of Mr. Peart and approved by your committee. At the present time it is believed that most policy forms now being issued in this State are, in substance, identical with the form which your committe has approved, but it has been impossible to verify this in all instances. Therefore, and in order that no misunderstanding may arise, your committee recommends that an expression of approval or disapproval be withheld with respect to malpractice insurance policies issued in the name of Lloyd's of London for the time being so that your committee and Mr. Peart may have an opportunity fully to verify the information concerning uniformity of policy forms.

The growth of malpractice claims has become a serious problem, and one which the medical profession must face and solve. Just why the problem has grown more acute in recent years cannot be said with certainty; but we can indicate, as the result of our investigations, the course that must be pursued if the growing evil is to be checked.

Some investigators have pointed out the increase has kept pace with the therapeutic use of radium and the roentgen ray. The development of surgery has received a share of the blame. Well founded or not, there is food for thought in the fact many insurance companies operating in this field charge higher premiums for policies written for surgeons, roentgenologists, and radiologists than for policies written for general practitioners.

Your committee strongly recommends that consideration be given to the study of the causes of malpractice claims as outlined by the Medical Defense Committee of the Los Angeles Medical Society. They are:

1. Ill-timed and critical remarks, innuendoes, and inferences by other doctors.

2. Emotional resentment on the part of patients, parents, and friends accompanying tragedy, injury, and accident, which is concentrated upon the doctor, often without reason.

3. Ill-timed and poorly conceived advice from legal, interested parties.

4. Inadequate, inaccurate, unscientific clinical and hospital records.

5. Submission by attorneys of description of the treatment rendered, to another member of the medical profession, who will examine it critically and point out one or two phases wherein he (the critic) would have done differently. The plaintiff's lawyer then immediately seizes upon this information and alleges that in those items the defendant was negligent.

6. Lack of information on the part of the public as to what actually constitutes malpractice.

It is further recommended that there be appointed in every county medical society a medical defense committee whose duties shall be, whenever a malpractice claim is made or threatened, to investigate the case and advise as to its handling in coöperation with all those concerned. In this connection your committee submits the following recommendations:

1. It shall be the policy of this committee and of the component county society to respect the privilege of every member to testify in any case as his conscience and opinion may dictate, and the committees shall not seek to prevent any member from so doing. It shall in all manner act with due regard to the rights of the patient.

2. Whenever this committee is informed that a claim of malpractice is made or threatened, the chairman or secretary shall, as soon as possible, summon a meeting of the committee for the purpose of investigating the circumstances connected with the case.

3. It shall be the duty of every member of the component county society to notify the chairman or secretary of this committee of any malpractice claim made or threatened against him, or against any other member of the profession, and to appear before this committee at any time when he may be called and give the committee all the information he may possess regarding the case.

4. It shall be the duty of every member of this Association who contemplates participation in the preparation of a malpractice claim or suit or testifying in any such suit, to first notify the Medical Defense Committee of his intentions and give his reasons therefor.

5. No member of this Association shall make a charge for services or accept any compensation for acting with regard to a malpractice claim. It is the policy of this Association that no member shall speak disparagingly of the treatment given by any other member until he has made himself thoroughly familiar with all the circumstances as they existed at the time the treatment was rendered.

Your committee wishes to emphasize the fact that the difficulty in getting an acceptable policy in California, due to mushroom growth of malpractice suits, will never be eliminated as long as the present laws remain on the statute books. The committee is informed that a plaintiff need only allege negligence or carelessness in order to obtain a court hearing, and that courts have frequently been prevented from granting a nonsuit by reason of such allegations.

The Council recommends a review of the statutes and decisions of other states in an effort to ascertain whether or not procedural legislation might not be suggested which would afford better protection to licensed persons.

Your committee further recommends that every member of the California Medical Association should be a member of the Medical Society of the State of California; although a member's liability insurance policy provides the member with the services of the carrier's attorney, that attorney, under the ethics and principles of his profession, must represent the insurance carrier first. Hence, the defense service of the member is directed to the fulfillment of his client's conception of its contract with him, and it is the company's interest which he must at all times protect.

The Medical Society of the State of California makes it possible for its members to secure the personalized supervision of and participation in all legal problems and trial conduct of their own personal attorney, thus assuring full protection of each member's personal and professional interest. The Society indemnifies the member for the expense of his attorney. The member's attorney, by means of coöperation with the insurance company's attorney, is able to provide the member with complete legal protection.

Respectfully submitted,

George G. Reinle, *Chairman.*

COMMITTEE ON MEDICAL ECONOMICS

Executive Group

John H. Graves, Chairman, 1938
Edward M. Pallette, 1940 William R. Molony, Sr., 1939

To the President and the House of Delegates:

The committee has held no meetings during the past year.

Meetings of the Committee on Public Relations have been attended by some members of the Medical-Economics Committee, and correspondence has been exchanged among the members.

In view of the development of numerous activities in the field of medical economics, it appears likely that the coming year will present more problems that will come within the scope of the committee than demanded attention during the past twelve months.

Respectfully submitted,

John H. Graves, *Chairman.*

COMMITTEE ON MEDICAL EDUCATION AND MEDICAL INSTITUTIONS

Executive Group

Loren R. Chandler, Chairman, 1939
John B. Doyle, 1940 B. O. Raulston, 1938

To the President and the House of Delegates:

Your Committee on Medical Education and Medical Institutions has considered matters referred to it by the Association concerning the activities at one of the State institutions, making recommendations to our Council.

This committee has coöperated with the Committee on Postgraduate Education and with the four medical schools in California in postgraduate medical education. Inasmuch as the activities of the medical schools in California are described adequately from time to time in bulletins and reports, your committee sees no need to present at this time another report on their activities.

Respectfully submitted,

L. R. Chandler, *Chairman.*

COMMITTEE ON MEMBERSHIP AND ORGANIZATION

Executive Group

E. Vincent Askey, Chairman, 1938
G. Dan Delprat, 1940 Dewey R. Powell, 1939
The Secretary, ex officio

To the President and the House of Delegates:

Your Committee on Membership and Organization has held no special meetings. The attention of your committee has been given to encouraging and noting the various efforts of your county societies in the constant procedure of recruiting members.

Since the recruiting of members must be in the hands of the county societies primarily, we would suggest that your body encourage each county society to make a survey such as was recently made by one large county unit. This survey showed the following statistics:

Total number of nonmembers in county	1,923
Number of former members who have been dropped for nonpayment of dues	313
Number of nonmembers who may be eligible but are over 55 years of age	598
Number of nonmembers who are eligible and are under 55 years of age	798
Number of nonmembers with evidence indicating that they are not eligible	137
Number of nonmembers who have applied but have been rejected	55
Number of nonmembers who are not listed in any directory	22

With this knowledge it is possible to put on an active campaign to induce those eligible and desirable to join without loss of effort and with the greatest efficiency.

We need not again emphasize the importance of the strongest alliance among all doctors of medicine. A membership as large as possible is the first step toward welding our profession into an efficient militant organization, defending scientific medicine and our professional rights.

Respectfully submitted,

E. Vincent Askey, *Chairman.*

COMMITTEE ON POSTGRADUATE ACTIVITIES

Executive Group

John C. Ruddock, Chairman, 1940
F. E. Clough, 1938 F. F. Gundrum, 1939
The Secretary, ex officio

To the President and the House of Delegates:

The Committee on Postgraduate Activities has had several meetings during the past year as well as various correspondence concerning its activities.

The committee this year has carried on the work that had been started in previous years by former committees. The Council of the California Medical Association has recognized the obligation of the California Medical Association to afford apportunity to its members to engage in continuous educational studies with a minimum of inconvenience, time and expense. It has promptly carried out the recommendations of the committee in causing to be published, as a supplement to California and Western Medicine in the November, 1937 issue, a five-year study program for graduates in medicine. There has been listed in this supplement 103 subjects for postgraduate programs. The committee realizes that this supplement is incomplete, and at the present time is revising it as experience shows the need for changes and where subjects have had need to be added and supplemented. The committee feels that the precedent that has been established by the publication of a five-year study program for graduates in medicine is very worth while and answers one of the problems and justifies the existence of organized medicine. The subjects as listed in the supplement are not intended for didactic work in medicine. They are not intended to provide physicians for any specialty, but they are intended to afford an opportunity to the members of the California Medical Association to remain abreast of scientific progress and to apply it in their daily practice with an understanding of the underlying problems and fundamentals.

The committee realized that there are certain members of the California Medical Association who will not embrace the opportunities that are offered them. However, the opportunities will be available and if they are not taken advantage of, then those men will lose who do not embrace them. The committee intends to further report in detail concerning certain problems of its plans for work to the House of Delegates.

Respectfully submitted,

John C. Ruddock, *Chairman.*

COMMITTEE ON PUBLICATIONS

Executive Group

Ralph Eusden, Chairman, 1940
Ruggles A. Cushman, 1938 Oscar Reiss, 1939
The Editor, ex officio The Secretary, ex officio

To the President and the House of Delegates:

The detailed report of the editor may be considered part and parcel of this committee's report.

With the physical arrangement of the contents of the official journal, and its editorial policy and comment and projected plans, the committee is in full accord.

In these days of economic and political unrest, the medical profession is increasingly faced with problems peculiar to its functions, not only with its organization and stability, but to the public.

Therefore, editorial comment and publication of articles pertinent to the Association's place in the political and professional sun will be increasingly forthcoming, to the end that our membership may be well and honestly advised, and our rights and position maintained.

Our official journal has reached an outstanding position in the field of the state and regional medical journals, and its efforts to bind together the membership in a well-advised manner, as well as to give members scientific information of an up-to-date and useful nature, shall continue to be a major purpose.

Complaints have been scarce. Papers submitted are fairly considered, and the editorial policy of giving preference to annual session papers and clinical presentations has our continued approval.

This being an election year the committee urges that you read the official journal in order better to acquaint yourselves with legislative matters of importance to the medical profession.

The committee requests for California and Western Medicine, as the official journal of the Association, the whole-hearted support of the Council and House of Delegates in its present and projected character and policy.

Respectfully submitted,

Ralph Eusden, *Chairman.*

COMMITTEE ON SCIENTIFIC WORK

Executive Group

Frederick C. Warnshuis, Chairman, ex officio
Lemuel P. Adams, 1940 F. M. Pottenger, 1939
J. Homer Woolsey, 1938 Howard F. West, ex officio
Nelson J. Howard, ex officio

To the President and the House of Delegates:

The scientific program for this sixty-seventh annual session represents the major activity of this committee.

Your committee renews its recommendations that the House of Delegates give careful consideration to the desirability and advisability of selecting places for the holding of annual sessions that provide adequate accommodations for section meetings and scientific exhibits.

Respectfully submitted,

F. C. Warnshuis, *Chairman.*

COMMITTEE ON PUBLIC RELATIONS

The Committee on Public Relations consists of the chairmen of the following standing committees and of certain general officers of the Association, all serving ex officio. The chairman of the committee is Charles A. Dukes. The secretary-director is Frederick C. Warnshuis. The chairman of the Committee on Public Relations is, ex officio, a member of the Council. The Committee on Public Relations includes the following:

Fred B. Clarke, Chairman, Committee on Health and Public Instruction.
Daniel Crosby, Chairman, Committee on Hospitals, Dispensaries, and Clinics.
Morton R. Gibbons, Chairman, Committee on Industrial Practice.
E. Vincent Askey, Chairman, Committee on Membership and Organization.
John H. Graves, Chairman, Committee on Medical Economics.
Junius B. Harris, Chairman, Committee on Public Policy and Legislation.
Charles A. Dukes, Chairman, Cancer Commission.
John C. Ruddock, Chairman, Committee on Postgraduate Activities.
Howard Morrow, President of California Medical Association.
William W. Roblee, President-elect.
Frederick C. Warnshuis, Secretary-Treasurer.

To the President and the House of Delegates:

From month to month in the Department of Public Relations in the Association's official journal, the Committee on Public Relations has rendered progress reports on its activities. This report will, therefore, be limited to a few comments and recommendations.

I.

Our professional relations to the public in general, and particularly to governmental agencies concerned with public interest, is most unstable and far from satisfactory. Changes and new proposals related to medicine and medical care occur overnight. Proposals are devised, altered, abandoned, and new plans are projected. There is a palpable instability and unrest. This attitude renders it impossible to submit a clear statement as to what has occurred or to predict what the tomorrows may bring.

Your committee feels that an ultimate and acceptable solution of this problem is dependent upon two fundamental principles that merit concentrated action. They are:

(*a*) The necessity of creating and maintaining public good will and confidence for the individual doctor of medicine and the units of our medical federacy.

(*b*) To cause the public and its governing agencies to recognize that our profession and its organizational units, by reason of their training, past achievements, experience, intimate contacts, and capability, are more competent to devise ways and means to satisfactorily meet the medical needs of all classes of people than any other agency, govern-

mental branches, or self-constituted groups or individuals who are outside the pale of medicine.

Your committee has sought to develop these two principles through several ways and by acquired contacts. Your committee alone is quite impotent to attain this public confidence. Attainment can only be accomplished through the persistent energetic efforts of every member who is called upon in his daily activities to embrace every opportunity to create public good will and confidence in the profession and its organizational representatives and spokesmen.

Your committee stresses the need of this solidarity and coöperation and urges that county societies concern themselves with these questions. Individualism, independent minority groups, and their quests, delay and confuse, thereby retarding early ultimate satisfactory establishment of acceptable relationship between the public and the profession.

II.

Coöperation with Public Agencies.—Maintenance of contacts and coöperation with lay and governmental agencies have been continued during the year.

The director has been elected to an office in the American Legion. He was also elected as a director of the California Safety Council and is serving on two important committees of that organization. Through the California Forestry Medical Service Corps he has maintained official contact and service with the Federal and State Forestry Services, and the State Highway Traffic Department.

Contacts have been maintained and coöperation continued with the following agencies: Department of Education; Board of Medical Examiners; Department of Health; Attorney-General; Insurance Commissioner; Compensation Board; Hospital Association; Nurses' Association; Federation of Women's Clubs; Business Women's Clubs; Young Women's Christian Association; WPA; and public Libraries.

In all of these contacts, a persistent, sustained effort is made to impart dependable information, foster good will, subscribe assistance, and develop mutual interests. Our files contain many expressions that warrant the time and work contributed to these contacts.

III.

Public Education.—The committee is appreciative of the assistance rendered by the Committee on Health and Public Instruction and some eighteen members for their time contributed in giving lectures to Y. W. C. A. and high schools and certain women's clubs. Although uninformed as to the details, the committee notes with commendation the public education program of the Los Angeles County Medical Association and its Speakers' Bureau.

The committee endorses and urges that county societies conform to the recommendations of the Committee on Health and Public Instruction.

An informed public, possessed of dependable information, will be of tremendous value in establishing sound policies.

IV.

Insurance and Hospital Service Plans.—Following investigations, conferences, and reviews, this committee has recommended that the Council endorse the following organizations issuing hospital insurance policies: Insurance Association of Approved Hospitals, Oakland, and San Francisco; Association of Southern California Hospitals; and the Intercoast Hospitalization Insurance Association. The committee will review and prepare recommendations for any other contemplated hospital insurance plans.

Health Service Plans.—The committee is advised, but is without factual details, that the American Medical Association Bureau of Economics is drafting certain recommendations for guidance when the formation of Medical Health Service is contemplated. Until these recommendations are available, it is recommended and urged that formation or affiliation with any and all health service groups or organizations be held in abeyance.

V.

Miscellaneous.—The year's activities include the following services:

(*a*) Information Bureau. Many hundreds of inquiries from the public and the profession are answered.

(*b*) Press releases to local newspapers.

(*c*) Distribution of approved literature to lay organizations and individuals.

(*d*) Maintenance of a reference library.

(*e*) Pacific Tri-State Conference.

(*f*) Golden Gate International Exposition.

IN CONCLUSION

The committee, composed as it is of chairmen of standing committees and officers, has served as an interlocking administrative unit for these Association committees. In this dual capacity it has, we believe, coördinated functions and accomplished worth while results that are beneficial to every member. In consequence, we are of the opinion that specific guiding recommendations should emanate from individual committees, and when approved by the House of Delegates, or the Council, such recommendations will be observed by this committee.

Respectfully submitted,

C. A. Dukes, *Chairman.*

V

REPORTS OF SPECIAL AND COUNCIL COMMITTEES

COMMITTEE ON ANIMAL EXPERIMENTATION

Executive Group

Philip K. Gilman, Chairman

Loren R. Chandler Charles A. Dukes

To the President and the House of Delegates:

Your Committee on Animal Experimentation met and the chairman was authorized to act as the committee's representative on the Executive Committee of the California Society for the Promotion of Medical Research.

It is possible some of you may not be familiar with the history, organization, and objects of this society. The following will make clear these points and emphasize the extreme importance of the organization.

In militant opposition to the so-called "State Humane Pound Law," which will come before the voters by Initiative petition at the General Election next November, the medical fraternity of California and their lay friends are enlisting under the banner of the California Society for the Promotion of Medical Research. This society will conduct the campaign against the latest attempt of the antivivisectionists to throttle scientific research into the causes and cures of disease in California.

For the first time since their defeat in 1922, the self-styled "humane" groups have come before the people with another of their time-worn attacks upon medical research. With plenty of funds apparently at their disposal, proponents of the "State Humane Pound Law" are busily disclaiming that this is an antivivisection measure. Yet high legal authority has declared the proposed law to be, in effect, antivivisection only thinly disguised, since it would cut off the source of supply of animals for experimental purposes.

The California Society for the Promotion of Medical Research was organized in 1915 by medical, educational, and business leaders throughout the State. It led the successful campaigns of 1920, 1922, and previous years against the antivivisectionists, and is today being strengthened for the campaign this fall by increasing its membership among all classes of our citizens.

Dr. Ray Lyman Wilbur, President of Stanford University, is president of the Society. The vice-president is Mr. Frederick J. Koster, Chairman of the San Francisco Chapter of the American Red Cross and former president of the California State Chamber of Commerce. The secretary is Dr. Salvatore P. Lucia of the University of California Medical School, and the treasurer is Mr. J. K. Moffitt.

The Finance Committee for Northern California comprises: President Ray Lyman Wilbur; Dr. Robert Gordon Sproul, President of the University of California; Right Reverend Charles A. Ramm, Rabbi Irving F. Reichert, and William Kirk Guthrie, D.D.

The Campaign Committee for Northern California is headed by Philip K. Gilman, M.D., as chairman. The other

members are: Eldridge J. Best, M.D., Delegate to the American Medical Association; Ernest Sloman, D. D. S., Superintendent of the College of Physicians and Surgeons; Mr. James Leo Halley, President of the West Coast Laboratories, Ltd., and Joe G. Sweet, attorney at law.

The committee for Southern California has for its chairman, Dr. Robert A. Millikan, President of the California Institute of Technology. Serving with Dr. Millikan on the Finance Committee are: Dr. Rufus B. von KleinSmid, President of the University of Southern California; Remsen du Bois Bird, President of Occidental College; Charles K. Edmunds, President of Pomona College; Rabbi Edgar F. Magnin, Robert Freeman, D.D., and Louis B. Mayer.

The California Campaign Committee is under the chairmanship of Dr. B. O. Raulston, member of the Committee on Medical Education and Medical Institutions of the California Medical Association. Included among those serving with Doctor Raulston on the committee are: Donald J. Frick, M.D., Percy T. Magan, M.D., John R. McCoy, D.D.S., Bennett Allen, Professor of Zoölogy of the University of California at Los Angeles; John W. Henderson, General Manager of the California Supply Company; and Robert Jennings, attorney at law.

The campaign against the enactment of the vicious "Humane Pound" legislation will see a preponderance of lay men and women lined up in active opposition to this antivivisection measure. In the opinion of the Society this is everyone's fight—not simply a defense of medical progress by medicine itself. Every effort is being made to attract to the membership rolls as many nonprofessional citizens as possible. Yet stress is being laid upon the fact that physicians and surgeons, dentists, veterinarians, registered nurses, and professional educator throughout California must be alert and actively coöperative if the campaign to defeat the Initiative is to be successful.

Endorsements of the California Society for the Promotion of Medical Research, and of its campaign against the "State Humane Pound Law," are being received daily from scientific and educational organizations in all sections of the country. Among others are the American Medical Association, California Medical Association, Public Health League of California, American Association for the Advancement of Science (250,000 members in affiliated groups), Society of American Bacteriologists, American Genetic Association, Western Society of Naturalists, and Northern California Retail Druggists' Association.

Of more than ordinary importance is this year's campaign of the Society to protect medical research against the onslaughts of sentimentalists. California, with its great university research laboratories, leaders in scientific discoveries tending to ameliorate the ravages of disease, is being made the testing ground for the nation by the antivivisectionists, as they, themselves, admit.

And—to quote *Hygeia*, monthly publication of the American Medical Association,

Let the antivivisectionists win but one victory in their campaign, which has persisted since 1875, and no one can tell where their insidious drive will end!

President Wilbur has urged that all who have received communications from the Society join at once so that the effectiveness of its work may not be delayed.

Headquarters are at 369 Pine Street, Suite 325, San Francisco (Sutter 8118), and 352 Chamber of Commerce Building, Los Angeles (Prospect 1338).

Your committee, therefore, recommends and moves that the House of Delegates authorize and instruct each county society composing the California Medical Association to appoint a special committee whose duty it shall be to enlist the support and arouse the interest of all voters in their community and by proper education cause them to aid in defeating this Initiative. Such committees as organized shall communicate with the secretary of the California Medical Association and the chairman of your Committee on Animal Experimentation for mutual assistance and coördination of activities.*

Respectfully submitted,

P. K. Gilman, *Chairman.*

* EDITOR'S NOTE.—For a recent discussion of the value of animal experimentation, see CALIFORNIA AND WESTERN MEDICINE, April, 1938, on pages 257 and 258.

CANCER COMMISSION

Executive Group

Charles A. Dukes, Chairman
Otto Pflueger, Secretary
Orville Meland, Secretary for Southern Section

A. Herman Zeiler — Harold Brunn
Gertrude Moore — Henry J. Ullmann
Clarence G. Toland

To the President and the House of Delegates:

The Cancer Commission has felt that its first obligation is to the practicing physicians in this State, its duty being to increase the knowledge of cancer in order that patients may receive the best care at the earliest opportunity. The activities during the past year have centered about this obligation.

The annual study meetings for pathologists and roentgenologists were held at the last State meeting in Del Monte and were well attended. Likewise, a midwinter meeting for pathology was held in San Francisco, with forty-five physicians attending, representing all sections of the State. It is gratifying to see the increasing number of general surgeons who attend these meetings, and it has constantly been necessary to have greater space for them. Plans are under way for the meetings to be held in Pasadena in May. We feel these meetings are one of the highlights of our annual State session. The Cancer Commission desires an active part in the postgraduate study program, and feels that cancer should be accorded a special section in this program.

Feeling that it would be worth while to acquaint the medical profession at large concerning the Cancer Commission and its activities, a scientific exhibit at the annual meeting of the American Medical Association in San Francisco is being planned under the direction of Doctor Ullmann.

The Commission is justly proud of its activity in the preparation of the reports on cancer which have been published, and we note with pleasure that this procedure, initiated by the Cancer Commission, is being followed by other organizations, such as the Canadian Medical Association. The compliments of national authorities on our effort have been of the highest. Knowing that the field of cancer is anything but static, we would recommend that these reports be revised and brought up to date at an early day. Your committee has other plans for the future, though perhaps still somewhat visionary. These pertain to a general acceptance of a centralization of activities with regard to the diagnosis and treatment of cancer. We should like to be instrumental in the formation of diagnostic and/or treatment clinics according to plans already worked out by the Commission, to be used in all hospitals throughout the State. Where smaller hospitals have not the facilities, patients could be referred for diagnosis to the group in a near-by larger hospital. We feel that such groups would derive great benefit themselves, be instrumental in spreading knowledge to other physicians, and would make available to patients the best possible service.

Organization of Cancer Committees and Clinics

The following paragraphs outline suggestions for the organization of cancer committees and clinics:

At the present time it appears feasible in California to organize two types of cancer groups:

1. A purely diagnostic group in small hospitals and communities where adequate radium and other equipment for the handling of all types of malignancies cannot be economically maintained. Patients should be referred for treatment to larger centers, where adequate equipment is available.

2. A diagnostic and/or treatment group in hospitals and communities where adequate apparatus and equipment already exist or can be obtained and economically operated.

The principles of organization and conduct of both groups are substantially the same, except for the requirements of equipment.

PRINCIPLES

1. *Purpose.*—The group should bring together knowledge, training, and skill from all the various fields of medicine bearing upon the diagnosis of cancer and its treatment, recognizing that the proper diagnosis and handling of cancer at the present time requires special knowledge, train-

ing, and experience in more fields than any one physician can ordinarily expect to acquire.

2. *Personnel.*—The minimum personnel must include a surgeon, pathologist, a radiologist, and an internist, all specially trained and experienced in cancer. If they are available, it is desirable to include specialists in still narrower fields, *e. g.,* gynecology, eye, ear, nose and throat, genito-urinary organs, neurosurgery, chest surgery, etc. An internist or a young practicing physician who is not too busy to take histories and look after them would be advantageous in the group.

3. *Meetings.*—Regular stated meetings of the entire group should be held for the discussion of all cases referred to it, the frequency of meetings depending upon the volume of cases to be considered (usually not less often than once a week). *Diagnoses and recommendations for treatment should come from the group and not from individuals.* It should be understood that patients once seen for diagnosis will return to the group for regular follow-up examinations.

4. *Records.*—Accurate records of patients and of the discussions of the group about them must be made and kept. The keeping of such records must be the responsibility of some individual and this will doubtless require, for satisfactory operation of any group, a paid full-time or part-time secretary. Sufficient forms for records may be obtained from the American College of Surgeons' Cancer Committee.

5. *Radiotherapeutic Equipment.*—1. X-ray equipment—adequate for all diagnostic purposes, and apparatus for high voltage x-ray therapy. 2. Radium—a minimum of 100 millimeters, preferably as a salt, with the necessary applicators and filters.

If treatment is to be undertaken under the direction of the group, minimum equipment, such as laid down in the report of the Radiology Committee of the Cancer Commission in December, 1932, should be available. Needless to say, the surgery and radiotherapeutic departments should be under the direction of experienced workers. The indiscriminate use of x-ray and radium in the hands of anyone but experts will do more harm than good.

6. *Present Functions of Cancer Clinics.*—The Cancer Commission believes that there are at present desirable cancer committees as follows:

(*a*) Cancer committees in general charity hospitals (county hospitals, etc.). Whether or not the Cancer Committee should operate a separate service, assuming complete charge of diagnosis and treatment of the cancer patients in the hospital, will depend on the wishes of the staff. In general, probably the best plan at present is for the clinic to see all cancer patients in the hospital, advising line of treatment to be undertaken and referring patients back to the services from which they came for carrying out of the treatment. Such patients should be seen from time to time by the committee for check of results of treatment and follow-up.

(*b*) Cancer committees organized to serve a private hospital or the community in general.

The Cancer Commission believes that at the present time such cancer committees should offer a consultation service for physicians, should make no charge for consideration of patients, should accept no patients for examination and diagnosis who are not referred by physicians, and should refer patients back for treatment. If, then, the physician originally referring a patient desires to have treatment carried out by a member of the Cancer Committee, arrangements for this should be on the usual private patient consultation basis.

7. *County Medical Society Support.*—Organization of cancer clinics or groups should be carried out by, and with the coöperation of local county medical societies.

Reference is made to the recommendations of the American College of Surgeons' Committee on the Treatment of Malignant Disases—"Organization of Service for the Diagnosis and Treatment of Cancer: Minimum Standard." This report may be obtained in pamphlet form, published in June, 1931, from the American College of Surgeons, Chicago. Reference is also made to the *Bulletin of the American College of Surgeons* for December, 1931.

Respectfully submitted,

Charles A. Dukes, *Chairman.*

COMMITTEE ON REPORT OF FACTUAL DATA OF CALIFORNIA MEDICAL-ECONOMIC SURVEY

Executive Group

Edward M. Pallette

Howard Morrow George H. Kress

To the President and the House of Delegates:

The special committee appointed last year, and to whose members was delegated the task of bringing off the press the "Report on Factual Data" of the California Medical-Economic Survey, completed its task when, in November, 1937, it placed in the mails, for each member of the Association, a copy of the 221-page report, and transferred one thousand additional copies to the Association office for distribution and sale under Council direction.

Concerning views that may be held regarding the Report as printed, in relation to factual inadequacies, costs, and other phases, it may be in order to state that it was no easy task to try to analyze and make presentable the voluminous copy submitted by the Survey Director, who had been employed to supervise the collection and compilation of the statistical data used in the creation of the tables, charts, and graphs. The burden of this onerous work fell almost entirely upon the shoulders of one member of the committee, the Editor, who generously gave not only hours, but days, to this labor, so important for the California Medical Association, in order to bring it to a conclusion that would be satisfactory both to the Federal authorities (WPA) and to the Association.

Every table, graph, and chart that was included in the Survey Director's report was printed, the committee adding thereto some explanatory addenda and interpretations which it deemed necessary to a proper understanding of the factual data. To what extent the Report may continue to be a subject of discussion by certain interests we do not know, and that need concern us but little, because the Federal authorities at Washington have stated that, in their opinion, the project has been completed; and the California Medical Association having more than done its part, certainly has an equal right to feel the matter is closed, so far as it is concerned.

Your special committee desires to add its personal comment that it hopes that members of future Houses of Delegates will carefully consider enterprises of this nature before embarking the Association on a series of expenditures which, in the present case, resulted in an outlay of the massive sum of $50,000 dollars of its reserve funds.

Respectfully submitted,

Edward M. Pallette, *Chairman.*

SPECIAL COMMITTEE ON A QUALIFYING CERTIFICATE (BASIC SCIENCE) LAW

Executive Group

George H. Kress, General Chairman
Morton R. Gibbons, Chairman (for Bay Region)
Edward M. Pallette, Chairman (for Southern California)
Junius B. Harris, Chairman (for remainder of State)

To the President and the House of Delegates:

As the report of the Special Committee on a Basic Science Law for California, we are submitting the somewhat detailed review of the subject, made to the Council of the California Medical Association at its meeting held on January 15, 1938.

The Council at the meeting referred to, accepted the report and instructed the Special Committee to continue its studies and make future recommendations. (See Minutes, item 24, on page 126, in California and Western Medicine, February, 1938.) The Council, because of the many initiatives to be placed before the electorate this year, also voted that no effort should be made to submit a Basic Science initiative act on the ballot of the November, 1938, state election. There is almost a unanimity of thought on the need of a Basic Science law as a proved means that will both protect the citizenry from incompetent healing art practitioners and at the same time maintain, at least in part, healing-art educational standards. On the other hand, since California has multiple healing-art boards (two of the three, through initiative laws) a Basic Science act, to apply to the three existing boards, and possible future boards, almost necessarily must be brought into existence

through a law that would be enacted by initiative vote of the electorate.

Appended hereto is the committee's report, as submitted to the Council on January 15, 1938. The perusal thereof is commended to all members who wish to orient themselves on the subject.

Respectfully submitted,

George H. Kress, *General Chairman.*

* * *

COPY OF REPORT SUBMITTED TO THE COUNCIL

Los Angeles, January 15, 1938.

To the Council of the California Medical Association:

Your Special Committee on Basic Science Law for California submits herewith a progress report:

At the 1937 annual session at Del Monte, the Reference Committee on reports of standing and special committees reported as follows:

Report of the Special Committee on Qualifying Certificate Law.—Although your committee is in favor of the passage of the Qualifying Certificate (Basic Science) Law, it does not feel that the expenditure of the moneys necessary therefor is feasible at this time, and recommends that this matter be held over for another year.

The committee recommends adoption.

After an explanation [to the House of Delegates] of the necessity of a qualifying certificate law in this State, by Dr. George H. Kress of Los Angeles and Dr. Lowell S. Goin of Los Angeles, a vote was taken and the motion did *not* carry.

At the Council meeting held on October 3, 1937, following the October 2 joint meeting of State Association and county officers and committees, at which a Basic Science law was approved, with no opposing votes cast, the Council voted (item 8, page 337, November, 1937, California and Western Medicine):

. . . that the Committee on Qualifying Certificate Law be instructed to proceed with the preparation of an initiative, in as nearly the final form as possible, and to submit it to the Council. Carried.

The Executive Committee of the California Medical Association, at its December meeting in 1937, upon motion of President-Elect Roblee gave the Special Committee on Basic Science specific instructions to submit to the Council at its January 15, 1938, meeting in Los Angeles, as complete a draft of a final Basic Science law as could be put into form.

Acting under these instructions the general chairman of the special committee proceeded to make, as rapidly as was possible, some formative drafts (copies being sent to the subchairmen, Doctors Gibbons, Harris and Pallette, General Counsel Peart, President Morrow, and President-Elect Roblee, for their information and suggestions.)

* * *

This progress report herewith submitted to the Council is made by the general chairman of the committee, and in it he presents his own and, in good part, the views of Subchairman Pallette, which give the conclusions reached by them since their first Basic Science committee meeting of the Los Angeles County Medical Association, which was held in the year 1927.

Early in their studies, as then taken up, and in order to get the reaction of the profession and the public, they submitted to the California Legislature of the year 1929, Assembly Bill No. 666, a printed copy of which is attached to this report as *Exhibit "A."*

In the years that followed, through the newly instituted Council Special Committee on Basic Science Law, consisting of Dr. George H. Kress as general chairman, Dr. Morton Gibbons as subchairman for the Bay region area, Dr. Edward M. Pallette as subchairman for Southern California, and Dr. Junius B. Harris as subchairman of the remainder of the State, the medical profession of California was reminded that in a State such as our own, with multiple examining boards, and with not only an appallingly large number of cultist and would-be cultist healing-art practitioners (as well as succeeding legislatures, whose members seemed increasingly susceptible to the lures put out by cultist groups seeking legal recognition), it was a grave question whether the medical profession of California should not actively make an effort to protect the standards of scentific medicine and the public health by sponsoring and striving to push to enactment a Basic Science law modeled after those which in other states of the Union had produced much to be desired results.

Accordingly, a number of tentative drafts of Basic Science laws, under the name "Qualifying Certificate Acts," were drafted and studied by the Special Committee and from time to time were referred to editorially and otherwise in the official journal of the Association.

In our last legislature, (1937), in order again to test out the reaction of healing-art groups and the public of California, a draft, known as Assembly Bill No. 1552, was introduced. A printed copy thereof is attached to this report as *Exhibit "B."*

A printed copy of the Iowa Basic Science Law (a state possessing, like California, multiple examining boards), which was enacted in 1936, is attached hereto and marked *Exhibit "C."*

Copies of a mimeographed modification of this recent Iowa law, drafted to permit adaptation to the needs of California, have been sent to each councilor, and a copy, marked *Exhibit "D,"* is attached hereto.

Likewise, a copy of the printed Basic Science law model, drafted by the Medico-Legal Bureau of the American Medical Association, marked *Exhibit "E,"* is submitted.

The undersigned general chairman also submits some American Medical Association analyses of all existing Basic Science laws; and copies of the full text of the same, should occasion arise for their consideration. These are attached as *Exhibit "H."*

The above reports and addenda on this important subject are presented for possible consideration in the decision which the Council should make today—on whether a draft of a Basic Science law should be placed on the State election ballot of November, 1938.

Before a Basic Science law is placed on a state election ballot it will be necessary for the Council to make decisions on the items which follow:

1. *Initiative Law.*—This Council agrees, we believe, that any Basic Science law, to be of real or permanent value to California, should be an initiative act enacted into law by vote of the electorate, and not a legislative enactment.

2. *Costs of Signatures of Voters to Initiative Petitions, etc.*—It should be realized that in order to secure the 185,395 valid signatures of voters, with correct precinct allocations, all in conformity with the State election laws, it will be necessary for our Association to spend between $25,000 and $30,000 as follows:

(*a*) The sum of approximately $20,000 for the necessary signatures. A bid from a well-known California signature firm, marked *Exhibit "F,"* is attached to this report, the bid from this company being $19,350. The matter of securing signatures by doctors through their secretaries, and the amount of moneys to be saved thereby, etc., is not here discussed. It can come up in oral discussion.

(*b*) The sum of $6,000 for purchase of 570,000 postcards . . . (use explained verbally to Council), one hundred of such, with a brief request for support of the Basic Science bill printed thereon, to be sent to every member of the California Medical Association. Each member to be requested to send these one hundred postcards to one hundred of his patients or friends (who, naturally, as patients, are logical supporters of scientific medicine and a Basic Science law).

These 600,000 postcards should provide contacts with twice or thrice that number of voters, and on a proposed law, so evidently needed on its face, this should mean that these one to two million or more voters contacts would put this Basic Science law across to successful enactment by one of the largest majorities yet recorded for a successful initiative measure. Copy for such a postcard, marked *Exhibit "G,"* reading somewhat as follows, is attached:

(Suggested Postcard Request)

(Salutation)

Dear Friend:

On your election ballot you will find Initiative No..... (Basic Science Law). Its purpose would make it necessary for all doctors to have at least a high school education.

Certainly, that is not too much to ask of those in whose hands you and yours place your health and lives.

If you could vote "yes" for this law, and also speak in its favor to your friends, I would greatly appreciate your action.

* * *

Other measures on this year's ballot, on which I shall vote "no," because I think they are against the public health interests of California, include:

(Title) Initiative No.....

(Title) Initiative No.....

Cordially yours,

.....

M.D.

(*c*) Incidental expenses should not exceed $1,000 to cover postage, printed matter, etc., provided we refrain from foolishly expending funds by cheap, controversial argument over the radio networks.

3. *Shall a Basic Science Law Be Submitted in the State Election in the Current Year, 1938, or Shall It Be Postponed for the State Election of Two Years Hence, in 1940?* This thought is referred to at this point simply to remind the councilors thereon before taking up the question of whether the Initiative is to be submitted in 1938 or 1940; a decision which necessarily must depend upon whether we can draft an Initiative Basic Science law, such as we would be willing to place on this year's State election ballot. This subject is further considered in Item 4, which follows.

4. *What Would Be a Satisfactory Draft of an Initiative Basic Science Law?* Facts of fundamental importance in an "Initiative law," to be presented to the California electorate, imply that the proposed law shall be written in soundest legal form, preferably in language which has been found acceptable to the higher courts in previous decisions; that it shall not be overlengthy; that its provisions, while being specific for the ends desired, shall not be of a nature to become frozen sections with the passing years, because amendments to an initiative law may prove just as expensive of enactment as was the original act; and that the proposed law itself shall have sufficient merit in attainable end-results to warrant the expenditure of a sum necessarily approaching so large an amount of the Association's funds as almost $30,000.

For the above reasons the mimeographed Qualifying Certificate law, which was submitted to the last legislature as a form of gesture, was deemed unsatisfactory as a working model, and the Iowa Act of 1936, in which the experience with prior Basic Science laws was utilized, was taken as a good type to modify.

Such a form was drafted, sent to each councilor as *Form "B"* with request for perusal and study, and a copy, with a long list of queries on legal points, was sent by the Special Committee chairman to General Counsel Peart, with request that Mr. Peart analyze the draft and make report thereon at this January 15 meeting of the Council.

Concerning the modification or draft submitted today (*Form "B"*), attention is called to the following points:

The committee has gone back, therein, to the use of the term "Basic Science Law" because every other similar law in the United States is so named, and legal decisions are recorded under that title.

Concerning the number and sciences in which examinations would be given, the committee decided on five absolute subjects, instead of a choice of five out of ten, lest legal complications should arise in giving such a choice (since every candidate would not have taken his examination on exactly the same subjects).

The five subjects chosen are those which are in practically every Basic Science law. Certainly no objection can be made to the three subjects of anatomy, physiology, and chemistry, as Basic Sciences. Bacteriology and hygiene seem to be the two other subjects that might be acceptable to all groups of healing-art practitioners. (Whether these should be designated nonmedical bacteriology or elementary bacteriology, or nonmedical hygiene, or whether subjects like embryology, botany, zoölogy, biology, or even English would be preferable to bacteriology and hygiene, for one, or both, is a debatable question, which the Council may wish to consider.)

The examining board would consist of five members, namely, of faculty members not holding healing-art degrees, attached, one each, to the faculties of the University of California, Stanford University, University of Santa Clara, University of Southern California, and the California Institute of Technology.

A clause was inserted in the draft which provided that the heads of these five universities would suggest to the Governor the names of three to five faculty members, not as nominees for the Basic Board of Examiners, but simply for possible consideration by the Governor. Whether this is desirable in an initiative law, is a question. It may be better to make it mandatory for the Governor to appoint a faculty member from each of the five universities; with a provision, however, that if any one of these institutions passed out of existence in the days to come, he could select some other university or four-year college located in California which had accredited collegiate standing with the State University of California, from which to select a faculty member for the Basic Science Board.

The proposed law would not be made to apply to any healing-art practitioners licensed in California at the time of its enactment, nor to healing-art students who had matriculated prior, say to January 1, 1939, nor to certain other professional and semiprofessional groups. Nor to Christian Scientists, whose publication committee has submitted for inclusion the exemption phraseology of the United States Service exemption clause.

To prevent an Initiative Basic Science law from becoming "frozen" in the years to come, it might be desirable to insert a clause permitting the passing of certain types of amendments, through legislative enactment of appropriate acts, submitted as amendments to the Medical Practice Act of California, or the Professional and Vocational Standards Act, or some pertinent public health act.

Each of the other sections of the proposed law could be commented upon, but since General Counsel Peart may present these to the Council, further discussion in this report may be waived.

In conclusion, it is proper to state that the general chairman of the Special Committee on a Basic Science Law makes this progress report in compliance with the implied instructions of the House of Delegates, and the direct instructions from the Council and Executive Committee to so do.

In common with many other members of the California Medical Association, he believes that a Basic Science law could render a beneficent service to public health and medical standards of our State. The provisions and language of the law, and the form in which such an Act would be submitted to the California electorate, is a decision that must be made by the constituted authorities of the Association, namely, its House of Delegates and Council.*

Respectfully submitted,

George H. Kress, *General Chairman.*

COMMITTEE ON SYPHILIS

Executive Group

Howard Morrow, Chairman
Charles W. Barnett William H. Goeckerman

To the President and the House of Delegates:

The Venereal Disease Act was passed by the legislature in May, 1937, was signed by the Governor, and became a law on August 27, 1937. Under the provisions of the law, the Bureau of Venereal Diseases was created as a separate bureau within the California State Department of Public Health. The State program is administered by the State Department of Health, under the direction of Dr. Walter M. Dickie, Director of the Department. The Bureau was reëstablished in February, 1937, and Dr. Malcolm H. Merrill was appointed as chief of the Bureau.

The system for reporting cases of venereal diseases has been simplified and modernized. The number of cases reported has increased by 50 per cent since these cards went into use, which shows a better coöperation of the physicians in reporting. Surveys have indicated that less than 10 per cent of the cases treated by private physicians have been reported. When the Bureau was established, thirty-five venereal clinics were reporting at monthly intervals to the State Department. The number has increased to seventy-seven. Another step has been to improve the general standard of medical care within the clinics. Almost all clinics have adopted the policies concerning admission laid down by the Bureau of Venereal Diseases, namely:

(*a*) Any patient for initial diagnosis and emergency treatment.

(*b*) Any case referred by a private physician for tests and consultation.

(*c*) Any patient unable to pay a private physician for treatment. Residency requirements have been abolished.

The Sacramento City Health Department Clinic was selected to determine the workability of various procedures of record keeping, treatment schedules, nursing procedures, etc. The same general plan is being inaugurated in the Fresno Hounty Hospital Clinic, and will be extended as rapidly as possible to all clinics of the State that will coöperate with the State Department. The State Department of Public Health is assisting these clinics by providing equipment, clinic record forms, drugs, and personnel. A series of seven pamphlets have been issued. Two hundred thousand have been sent out from the State Department. Over one-half of these have been mailed directly to individuals as a result of requests.

The United States Public Health Service film, "Syphilis," has been shown to over fifty audiences. A series of seminars is being planned for county medical societies, to be carried on during the months of May and June. The services of Dr. Udo J. Wile, Professor of Dermatology and Syphilology of the University of Michigan Medical School, have been obtained for this purpose. This Committee on Venereal Diseases from the California Medical Association is coöperating in every way with the United States Public Health Service and the California State Department of Public Health.

Respectfully submitted,

Howard Morrow, *Chairman.*
